Ans. (d) : Cauliflower belongs to the species Brassica oleracea from the family Brassicaceae. It is a seed reproducing annual herbaceous plant. The edible part of cauliflower is the inflorescence which we use as a vegetable.

475. In some plants, anthers and stigma grow and mature at same time. This phenomenon is called:
(a) Homogamy (b) syngamy
(c) allogamy (d) fusion

AFMC-2005

Ans. (a) : In **homogamy,** the anther and stigma of bisexual flowers of some plants mature at the same time. They are brought close to each other to ensure self-pollination.
Syngamy means fusion of gametes syngamy is the phenomenon in which male gamete fuses with egg in the embryosac of flowering plants.
Allogamy refers to the movement of the pollen grains from the anther of one plant to the stigma of a flower of another member of the same species. It is a type of cross fertilization.

476. The thorn of water chestnut (Trapa bispinosa) is the modification of :
(a) Petals (b) Sepals
(c) Stamens (d) Style

Rajasthan PMT-1996

Ans. (b) : Water chestnut (Trapa bispinosis) is an annual plant with a submerged stem 12-15 feet long that has fine roots that anchor it to the soil.
The fruit of water chestnut is a drupe which develops from a ripened ovary.
All parts of the flower (styles, stamens, and petals) are shed off while the fruit develops and just the sepals remains which get modified to form thorns (spines).

@apna_pdf

477. The nature of a fruit developing from a flower depends on the type of:
(a) gynoecium (b) pollination
(c) fertilization (d) androecium
Karnataka CET-2002

Ans. (a) : The nature of a fruit developing from a flower depends on the type of gynoecium . It is the female reproductive portion as well as the innermost whorl in a flower. Carpel is the main component of gynoecium that consists of ovary, style and stigma.

478. The expression gynoecium is apocarpous implies that the
(a) gynoecium comprises only one pistil which is fused with the stamen
(b) gynoecium comprises more than one carpel which are free from each other
(c) gynoecium comprises only one carpel which is free
(d) gynoecium comprises more than one carpel which are fused
DUMET-2010

Ans. (b) : The expression gynoecium is apocarpous implies that the gynoecium comprises more than one carpel which are free from each other.

479. The spice saffron is obtained from which one of the following?
(a) Corolla (b) Stamen
(c) Stigma (d) Tender tip of leaf
BHU PMT (Screening)-2010
Haryana PMT-2009
CG PMT-2009

Ans. (c) : *Crocus sativus* (saffron) belongs to the family Iridaceae. It is a rhizomatous herb. The dried stigma and top of style make the saffron of commerce. The product is obtained from the stigmas of the flowers, 4000 of which are required to produce 25 gm of saffron.

480. A funnel shaped stigma is found in
(a) Grasses (b) Crocus
(c) Malvestrum (d) Papaver
AMU -2000

Ans. (b) : A funnel shaped stigma is found in Crocus.
- Crocus sativus is the member of family Iridaceae. It is a perennial plant that contain an underground connector, bearing sessile, linear and sheathing leaves.
- **In grasses,** stigma are two in number and feathery. They arise directly from wall of ovary as style is generally absent or short.

481. If both the anthers and filaments are fused together to form a compact structure with sigmoid appearance the condition is termed a
(a) Syngenesious (b) Androecious
(c) Syngynandrous (d) Synandrous
AMU -2000

Ans. (d) : In synandrous condition both the anthers and filaments are fused together to form a compact structure with sigmoid appearance the condition is termed a Synandrous. Ex- Cucurbits.

482. Boat shaped anterior petal in garden pea is called:
(a) wing (b) alae
(c) keel (d) ship
HP CET-2013
Haryana PMT-2001

Ans. (c) : Boat shaped anterior petal in garden pea is called keel. Pea belongs to the family Fabaceae and sub family Papilionaceae. The flowers of pea are characterized with the butterfly shaped corolla which have five petals. The posterior petals is largest and is called as standard or vexillum.

483. Heterospory, seed habit is often exhibited by a plant possessing:
(a) bract (b) spathe
(c) petiole (d) ligule
HP CET-2013
Haryana PMT-2000

Ans. (a) : Heterospory, seed habit is often exhibited by a plant possessing bract. Heterospory means production of two different sizes of spores megaspores and microspore. All bryophytes are homosporous. Heterospory originated in some pteridophytes like Selaginella.

484. Number of carpels in Sida cordifolia is always:
(a) equal to the number of styles
(b) equal to the number of locules
(c) double the number of styles
(d) half the number of locules
AP EAMCET-2003

Ans. (b) : The number of carpels in Sida cordifolia is always equal to the number of locules.
It is the member of family Malvaceae.

485. Which one of the following floral characters, is shared by Ruscus and ray florets of Tridax?
(a) Nature of Perianth (b) Unisexuality
(c) Zygomorphy (d) Number of stigmas
AP EAMCET-2003

Ans. (b) : Ruscus is a member of family Liliaceae. It has unisexual flowers. Ray florets of Tridax are also unisexual flowers. Thus, unisexuality is the floral character of Tridax.

486. Which of the following statements is correct?
(a) Replum is found in the ovary of Pisum
(b) The anthers are introrse in Hibiscus
(c) The ovules are pendulous in Nelumbo
(d) Lateral style is found in Ocimum
AP EAMCET-2003

Ans. (c) : The family Nymphaeaceae is characterized by the possession of bitegmic anatropous ovules.
In *Nelumbo nucifera* and Cabomba the ovules are pendulous.
- Replum is a false septum formed due to the ingrowth of parietal placenta is mainly seen in the ovary of flowers of Brassicaceae (Cruciferae) family e.g, - Mustard, Candytuft etc.
- In Hibiscus, numerous anthers stick out from the filament almost like the feathers on a feather cluster.
- Lateral style is not found in Ocimum.

@apna_pdf

487. What is the location/position of the multilayered sterile tissue in the transverse section of a young anther?
(a) Between the cells of sporogenous tissue
(b) Between tapetum and sporogenous tissue
(c) Between tapetum and endothecium
(d) Between epidermis and endothecium
VMMC-2014

Ans. (c) : These only middle layers are sterile and multilayer thickened and it is located between tapetum and endothecium.
Anther wall of young anther show layers from outside to inside in a transverse section, epidermis, endothecium, middle layers and a tapetum layer.

488. Gynobasic style is found in :
(a) Centella (b) Colocasia
(c) Ranunculus (d) Ocimum
JIPMER-2000

Ans. (d) : Gynoecium forms the female reproductive part of the flower. Ovary is the enlarged basal part, on which lies the style. The style connects the ovary to the stigma.
• The condition when the ovary is lobed and the style emerges from the base of the lobe of the ovary, then style is called as gynobasic style. It is seen in the family Lamiaceae or Labiatae

489. Diadelphous condition is found in :
(a) Mimosa (b) Helianthus
(c) Cassia (d) Pisum
JIPMER-2001

Ans. (d) : Diadelphous condition is found in Pisum sativum. It belongs to the family Fabaceae or Papilionaceae or Leguminosae.
In diadelphous condition, the filaments of nine stamens are united into one bundle and tenth posterior stamen stand apart.
ex - Pea (*Pisum sativum*).

490. The position of the odd sepal in Caesalpiniaceae is:
(a) posterior (b) anterior
(c) lateral (d) oblique
AP EAMCET-2001

Ans. (b) : The position of the odd sepal in Caesalpiniaceae is in the anterior condition.
Caesalpiniaceae is a subfamily of the Fabaceae or Leguminosae family. It is a heterogeneous group of plants with about 160 genera and some 2000 species.
Ex- Soybean, Pea, Common bean, Chickpea, Peanuts etc.

491. When margin of thalamus grows upward enclosing ovary completely and getting fused with it and the other parts of flower arise above the ovary, the flower is said to be
(a) hypogynous (b) perigynous
(c) epigynous (d) inferior
AMU-2012

Ans. (c) : When the margin of thalamus grows upward enclosing the ovary completely and getting fused with it and the other parts of the flower arise above the ovary, such flowers are called epigynous flowers and this type of ovary is said to be inferior.
Ex- Flowers of guava and cucumber and the ray florets of sunflower.

492. In obdiplostemonous androecium the stamens are arranged in:
(a) one whorl and alternate with petals
(b) two whorls with outer whorl alternate with petals
(c) two whorls with outer whorl opposite to the petals
(d) one whorl and opposite to the petals
AP EAMCET-2002

Ans. (c) : This condition is seen in Dianthus. When the stamens of outer whorl alternate with the representatives of the first whorl opposite the petals and those of the second whorl.
Therefore stamens and petals as twice in many flowers, which are opposite the petals in the outer set.

493. In a population of a species, in some plants the style is shorter, but in some others it is longer than the stamens. This conditions is called.
(a) heterostyly (b) homostyly
(c) homogamy (d) heterogamy
AP EAMCET-1997

Ans. (a) : The floral form with reciprocal differences in the length of the style and stamens to prevent self fertilization, condition is called heterostyly.
- The condition in which flowers of the same species have - styles of equal length is called Homostyly
- The condition of having stamens and pistils mature at the same time called homogamy.
- The condition in a flowing plant species having two or more types of flowers is called heterogamy.

494. A stalk like structure found above the stamens and below the ovary is called:
(a) gynophore (b) androphore
(c) flower stalk (d) filament
AP EAMCET-1997

Ans. (a) : Gynophore can be defined as the stalk structure of the flower which support the female reproductive parts or gynoecium, where the androphore is the stalk or column that supports the stamens or male reproductive parts of the flower. The example of gynophores include Telopea and the example of androphore include Sphenophora

495. Sepals (Calyx) are modified into wings in the fruits called samaroid. One such example is
(a) Shorea (sal) (b) Dodonaea
(c) Acer (d) Morenga
VMMC-2008

@apna_pdf

Ans. (a) : The example of samaroid is Shorea (Sal).
In Shorea calyx is persistent and modified into wings in the seeds. Wings help in dispersal of seed.

496. Dispersal of fruits in opium (poppy) occurs through shaking by wind by
(a) Explosive mechanism
(b) Parachute mechanism
(c) Censor mechanism
(d) Jacular mechanism

VMMC-2008

Ans. (c) : In poppy dispersal occurs by censor mechanism. In this type of dispersal seeds are disperse out of the fruit because the latter either change down or bear long stalk which is shaken by the wind.
Parachute mechanism- The appendages develops in the fruits and seeds and various parts of the body are modified and act as parachute.

497. The condition in which gynoecium occupy topmost position of thalamus, the flower is
(a) inferior (b) epigynous
(c) perigynous (d) hypogynous

BVP-2013

Ans. (d) : When the other flower parts are arranged at the base of gynoecium, i.e. gynoecium occupy the topmost position it is hypogynous flower and in this condition the ovary is termed as superior.
• When the ovary is placed below to the other floral organs, it is said to be an inferior ovary. The thalamus appears cup-shaped or hollow. Such flowers are called epigynous flowers as seen in cucumber and other cucurbits.
• When the ovary is half-superior, the flowers are called perigynous.

498. In Benincasa the condition of androecium is described as:
(a) diadelphous (b) polyadelphous
(c) synandrous (d) syngenesious

AP EAMCET-2000

Ans. (c) : When stamen are united with each other the it is called synandrous condition. This condition is found in Benincasa (ash gourd) which is a member of family Cucurbitaceae.
Syngenesious is a condition, in which filament are free but anthers are fused together eg.- Ageratum, disc florets of sunflower.
Diadelphous is a condition in which stamens are united to form two groups. It is found in the member of the Fabaceae family.

499. To which of the following the sepals, petals, stamens and carpels are in the ratio of 2:2:3:1?
(a) Brassicaceae (b) Asteraceae
(c) Solanaceae (d) Liliaceae

AP EAMCET-2000

Ans. (a) : Brassicaceae family has the actinomorphic flowers with 4 sepals in two whorls with imbricate aestivation and 4 cruciform corolla.
• In valvate aestivation eg.- mustard, radish. Cruciform corolla is when the petals are free, known as polypetalous, and the petals are four diagonally located to form a cross. The tetradynamous stamens contain four large inner stamens and two small outer stamens.
• In gynoecium sometimes two carpels are separated by a false partition called replum, so we will consider it as a single carpel.
• Thus in Brassicaceae family the sepals, petals, stamens and carpels are in the ratio of 2:2:3:1.

500. Ovary is half – inferior in the flower of
(a) Apple (b) Guava
(c) Peach (d) Garlic

Rajasthan PMT-2011

Ans. (c) : Ovary is half-inferior/ semi inferior if with the place of insertion of other floral parts are at same level ex- Peach.
Guava- Inferior ovary.
Apple- Inferior ovary.
Garlic- Superior ovary.
Half inferior or half superior (position of ovary) found in Perigynous flower of family Leguminaceae.

501. The term keel is used for special type of
(a) Sepals (b) Petals
(c) Stamens (d) Carpels

Rajasthan PMT-2011

Ans. (b) : The term keel is used for a special type of petal found in the Papilionaceae family.
Papilionaceous or butterfly shaped corolla is characteristic of family Papilionaceae. There are five petals, out of them one posterior is larger called vexillum or standard, two lateral are called wings or alae and two anterior small fused petals called keel or carina.

502. Polyadelphous stamens are found in
(a) Cotton (b) Sunflower
(c) Grain (d) Lemon

Rajasthan PMT-2011

Ans. (d) : Polyadelphous stamens are found in lemons. The filaments are usually free but in citrus the filaments of numerous stamens are united in several bundles called the polyadelphous condition.

503. Perianth is represented by
(a) nines (b) lemma
(c) lodicules (d) palea

Rajasthan PMT-2009

Ans. (c) : In family- Gramineae (Poaceae) the perianth is represented by membranous scales called lodicules. The lodicules are situated above and opposite the superior Palea.
Palea is the bands that develop on the receptacle of a complex flower. Rice is an example of Palea that is bent and facing the lemma.
In grass, the lemma is one of the specialized bracts that surround the florets.

@apna_pdf

504. Proximal end of the filament of stamen is attached to the

(a) Thalamus or petal (b) Anther
(c) Connective (d) Placenta

NEET-2016 Phase-I

Ans. (a) : Proximal part of a filaments means the part which is nearest to the point of attachment and the filament of stamen is attached to the thalamus of the flower or sometimes it is attached to the flower petals. (epipetalous)

- A **sterile** stamen which is not capable of producing pollen is known as a staminode, e.g.- in Stellaria the size of the staminode is very small and it lies inside the innermost whorl of the flower.
- **Placenta-** Ovules are attached to the inner wall of ovary.
- **Anther -** The part of the stamen where pollen is produced

505. The technical term used for the androecium in a flower of China rose (*Hibiscus rosa sinensis*) is

(a) Monadelphous (b) Diadelphous
(c) Polyandrous (d) Polyadelphous

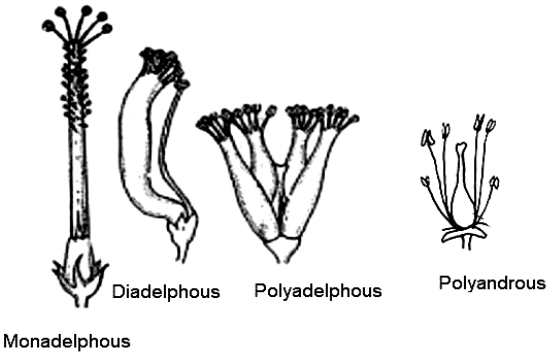
AIPMT (Screening)-2010

Ans. (a) : China rose family shows cohesion of stamen by union of filaments into single bundle known as **monadelphous**. The androecium in China rose is monadelphous.

Polyadelphous flowers are those in which the stamens have united filaments and are fused in two or more groups. A flower having the stamens jointed by their filaments into several separate bundles e.g.- Citrus.

Diadelphous flowers are those in which the filament of the stamens fused and form into two bundles e.g.- family fabaceae.

Polyandrous when the stamens of a flower are free the condition is called polyandrous e.g. - Petunia.



506. Wearing isolated a dormancy inducing substance from the leaves of a plant. From which type of gynoecium does the fruit of that plant develop?

(a) Bicarpellary syncarpous gynoecium with inferior ovary
(b) Bicarpellary syncarpous gynoecium with superior ovary
(c) Tricarpellary syncarpous gynoecium with superior ovary
(d) Monocarpellary gynoecium with half inferior ovary

AP EAMCET-2007

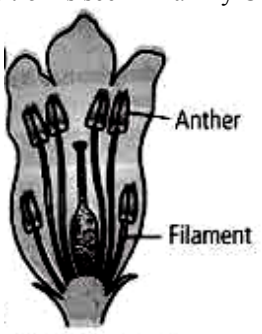
Ans. (b) : In this plant gynoecium is bicarpellary syncarpus, ovary superior. In pistillate flower the ovary is superior (hypogynous) , sessile , bicarpellary and syncarpous in nature.
Wearing isolated a dormancy inducing substance from the leaves of a Platanus occidentalis which belong to the family Plantanaceae.

507. In a tetradynamous androecium, one of the following is seen

(a) Outer whorl of 4 smaller stamens and inner whorl of 2 larger stamens
(b) Outer whorl of 2 larger stamens and inner whorl of 4 smaller stamens
(c) Outer whorl of 4 larger stamens and inner whorl of 2 smaller stamens
(d) Outer whorl of 2 smaller stamens and inner whorl of 4 larger stamens

AP EAMCET-2007

Ans. (d) : In a tetradynamous androecium, outer whorl is of 2 smaller stamens and inner whorl is of 4 larger stamens. This condition is seen in family Cruciferae.



Tetradynamous stamens

508. Carina is

(a) Outermost two petals of pea flower
(b) A boat shaped structure of petals
(c) The innermost two petals that are suppresed together
(d) Both [b] and [c]

VMMC-2013

Ans. (d) : Papilionaceous corolla is the unique aestivation found in the Papilionaceae family.
Carina is another name of keel, which is fused petals of fabaceae family. Carina having C- shaped or boat shaped structure of petals.

@apna_pdf

I. Aestivation

509. Example for twisted aestivation.

(a) calotropis (b) Cotton
(c) Pea (d) Bean

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : Twisted aestivation. is present cotton, ladyfinger, Hibiscus, and Chinarose.

Twisted aestivation : - in twisted aestivation, one edge of petal covers the adjacent petal while the other Border is coverd by another petal.

The margin of one petal overlap those of next and the margins of the next overlap those of the.

- Calotropis → Valvate aestivation.
- Pea + bean vaxillary aestivation.

510. Choose the correct statement related to the morphology of Cassia

(a) Valvate aestivation, Actinomorphic, corymb
(b) Imbricate aestivation, zygomorphic, corymb
(c) Imbricate aestivation, zygomorphic, umbel
(d) Valvate aestivation, zygomorphic, umbel

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : If the margins of sepals or petals overlap one another but not in any particular direction as in Cassia, the aestivation is called imbricate. It is zygomorphic flower. It can be divided into two similar halves only in one particular vertical plane. Corymb is a simple racemose inflorescence, found in Cassia.

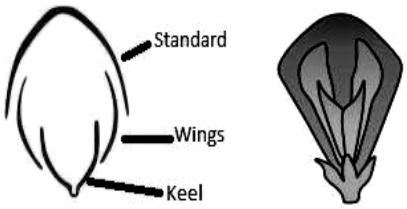
511. In a pea flower, five petals are arranged in a specialized manner with one posterior, two lateral and two anterior. These are named as _____. _____ and _____ respectively.

(a) Keel, Standard and Carina
(b) Standard, Wings and Keel
(c) Keel, Wings and Standard
(d) Vexillum, Keel and Standard

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Aestivation is the arrangement of either the sepals or petals in a flower bud with relation to one another.

- Vexillary is the typical aestivation of the papillionaceae corolla. The posterior vexillum (standard) overlaps the two alae (wing) which again overlap the paired anterior carina (keel).



- In this aestivation, the petal i.e. standard overlaps the two smaller lateral petals that are wings which in turn overlap. The two smallest anterior petals are keel.

512. In Calotropis, aestivation is :

(a) Imbricate (b) Twisted
(c) Valvate (d) Vexillary

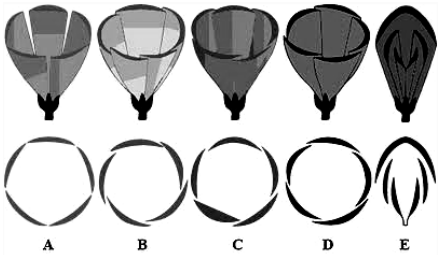
RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (c) : Arrangement of sepals or petals in floral buds called aestivation.

- In velvet floral leaves in a whorl may just touch one another at the margins without overlapping. Ex Calotropis (Asclepiadaceae).
- When overlapping is regular in one direction so that one margin overlaps the next member on one side while the other margin is overlapped by that one before.

Ex- Cotton, (Malvaceae family)

- Imbricate aestivation, the margins of the flower overlap but not in a specific way. Ex- Cassia (Caesalpinaceae).
- In vexillary aestivation is a distinctive arrangement in which one gaint petal covers the other smaller petals. Ex- pea (Leguminaceae).



Different types of aestivation of calyx and corolla
A,Valvate, B, Twisted, C, Imbricate, D. Quincuncial, E, Vexillary

513. Identify the type of aestivation in which at least one petal completely overlaps others in a flower

A) Valvate **B) Twisted**
C) Imbricate **D) Vexillary**

The correct answer is:

(a) A, B only (b) B, C only
(c) A, D only (d) C, D only

TS EAMCET-31.07.2022 Shift-I

Ans. (d) : Vexillary aestivation occurs when the largest petal overlaps the two lateral petals, which overlap the two smallest anterior petals. eg.- Bean flower.

- In imbricate aestivation the margins of sepals or petals overlap without a clear direction. There is an irregular overlapping of petals by each other.

Ex- Cassia and Gulmohar.

514. Match List - I with List - II:

List-I	List-II
A. Imbricate	**i. Calotropis**
B. Valvate	**ii. Cassia**
C. Vexillary	**iii. Cotton**
D. Twisted	**iv. Bean**

Choose the correct answer from the options given below:

(a) (A) - (ii), (B) - (i), (C) - (iii), (D) - (iv)
(b) (A) - (ii), (B) - (i), (C) - (iv), (D) - (iii)
(c) (A) - (ii), (B) - (iv), (C) - (iii), (D) - (i)
(d) (A) - (i), (B) - (iii), (C) - (iv), (D) - (ii)

NEET (Re-Exam)-04.09.2022

@apna_pdf

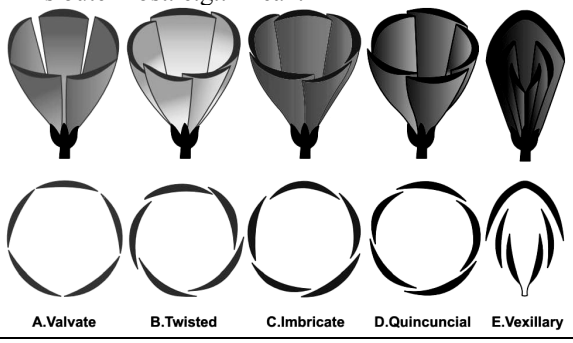
Ans. (b) : Order of inflorescence valvate, twisted, imbricate and vexillary are types of aestivation are present.

(A) Valvate aestivation:- In this sepals or petals or tepals just touch one another without any overlapping e.g.:- *Calotropis procera*.

(B) Twisted aestivation:- Here, one margin of each petal overlap the margin of an adjacent petal and the other margin being overlapped by margin of another adjacent petal.
e.g.:- Cotton, China Rose.

(C) Imbricate aestivation:- If the margin of sepals or petals overlap one another but not in any particular direction as in Cassia and Gulmohar, the aestivation is called imbricate.

(D) Vexillary aestivation:- It is the characteristics aestivation of corolla of pea when posterior petal is outermost. e.g.:- Bean.



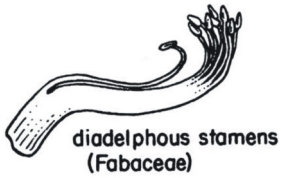
515. Which one of the following plants shows vexillary aestivation and diadelphous stamens?
(a) *Solanum nigrum*
(b) *Colchicum autumnale*
(c) *Pisum sativum*
(d) *Allium cepa*

NEET-2022

Ans. (c) : In family Fabaceae, pea (*Pisum sativum)* plant has bilateral symmetry, vexillary aestivation, diadelphous stamens, marginal placentation.

• Vexillary or descending imbricate aestivation is the arrangement of corolla in which the anterior petal is innermost and the posterior petal is outermost and largest.

Diadelphous - When the filaments are united in two bundles but the anther remain free



Marginal placentation is found in unilocular ovary the placenta forms a ridge along the ventral suture of the ovary and the ovules are borne in this ridge.

516. Smilax possesses the following characters.
(i) Six tepals and six stamens in two whorls, odd tepal of outer whorl is anterior in position and odd tepal of inner whorl is posterior in position, valvate aestivation.
(ii) Pentacarpellary, ovary inferior, pentalocular with few ovules, stigma bifid and simple.
(iii) Fruit is usually capsule, endospermous seed
(iv) Flower is solitary bisexual.
(a) i, ii, iv & iii (b) i & iii
(c) ii & iv (d) ii & iii

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Smilax flower description:- Individual umbels are about $1\frac{1}{2}$-3" across consisting of 20-120 flowers on slender pedicels, the umbels resembles a globe when fully developed. It is dioecious. The green to yellowish green staminate flowers are each 1/4" across, which consist of 6 tepals and 6 stamens with white anthers.

• Fruit in Solanceae is berry or capsule and seeds are many and endospermous.

517. Identify the correct combination
(a) Neem - absence of buds in the axil of leaflets - Pinnately compound leaf
(b) Sunflower - Opposite phyllotaxy - Inferior ovary
(c) Carrot- flowers brought to same height due to varied lengths of pedicels - involucres of bracts
(d) Pistia - Discoid stem- Lateral branch with many internodes

TS EAMCET-2015

Ans. (d) : Pistia is an aquatic plant which has discoid stem and lateral branches with many internodes.

Each node has a rosette of leaves and tufts of roots.

• Neem has pinnately compound leaves but the buds are not absent.

• Sunflower has alternate phyllotaxy and inferior ovary.

• When all the flowers arise from the single point of peduncle then it is called umbel inflorescence. Carrot has involucres of bracts at the base of whole inflorescence.

518. Verticillaster inflorescence is the characterstic feature of family :
(a) Euphorbiaceae (b) Moraceae
(c) Musaceae (d) Lamiaceae

Uttarakhand PMT-2006

Ans. (d) : Verticillaster inflorescence is an inflorescence in which the flowers are arranged in a seeming whorl, consisting infact of a pair of opposite axillary, usually sessile cymes as in many mints. In this type of inflorescence, the leaves are arranged in an opposite manner on the stem. It is common among the lamiaceae family.

Ex- Salvia and Ocimum.

@apna_pdf

• The euphorbiaceae are distinctive in having unisexual flowers with a superior, usually 3-carpellate ovary with 1 ovule per carpel, apical axile placentation.

• Moraceae have milky or sometimes watery latex. Leaves are mostly alternate, simple, entire and pinnately veined.

• Musaceae is the family of monocot perennial herbs and widely distributed in tropical region. It is also called as the banana family, flowers are unisexual or bisexual.

519. Which of the following statements are correct ?

(A) When a fruit develops from the inflorescence, it is composite

(B) Mesocarp is the edible part in apple

(C) Gynobasic style is seen in Ocimum

(D) Hypanthodium is a special type of inflorescence found in Euphorbia species

(a) A and D are correct

(b) A and C are correct

(c) B, C and D are correct

(d) B and D are correct

Kerala PMT-2009

Ans. (b) : When a fruit develops from the inflorescence it called composite fruit. **Ex:-** Pineapple.

Gynobasic style:- When the style originates from the mid basal part of the ovary. The style arises from a central depressed part or cavity of the ovary. It is seen in Salvia, Ocimum. Gynobasic is the feature of Labiatae family or Mint family.

• In apple edible part is pseudocarp which is also known as fleshy thalamus.

• Hypanthodium is a special type of cymose inflorescence. Inflorescence in Euphorbiaceae is of cyathium type.

520. In which of the following plants, pollen is released before the stigma becomes receptive in the same flower?

(a) Solanum (b) Allium

(c) Colchicum (d) Datura

AP EAMCET-2014

Ans. (b) : Protandry- It is a condition where stamens are mature earlier than pistils as a result, pollen is released before the stigma becomes receptive in the same flower. For eg. Allium.

• **Solanum** is a large and diverse genus of flowering plants, which include three food crops of high economic imporatance: the potato, tomato and egg plant.

• **Cochicum** is a genus of perennial flowering plants which grow from bulb like corm.

• **Datura** is a genus of nine species of highly poisonous plant that belongs to the nightshade family.

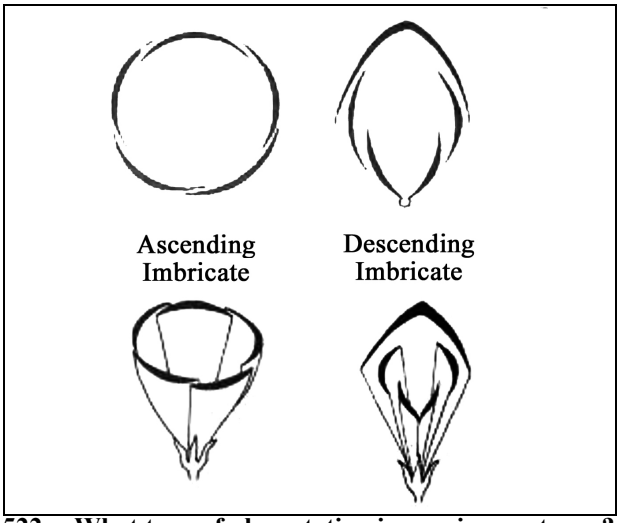
521. When the margins of sepals or petals overlap one another without any particular direction, the condition is termed as:

(a) Vexillary (b) Imbricate

(c) Twisted (d) Valvate

AIPMT-2014

Ans. (b) : When the margins of sepals or petals overlap one another without any particular direction, the condition is termed as Imbricate. If the margins of the sepals or petals overlap each other without any specific direction- Ex. Cassia.



522. What type of placentation is seen in sweet pea ?

(a) Basal

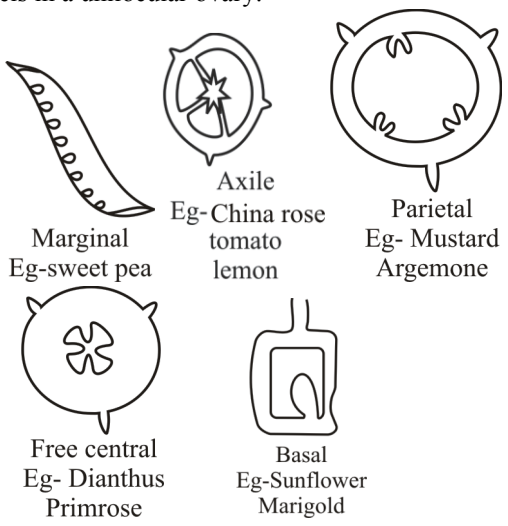
(b) Axile

(c) Free central

(d) Marginal

Haryana PMT-2006
AIPMT-2006

Ans. (d) : Placentation:- The arrangement of ovules within the ovary is known as placentation. In *Pisum sativum* (sweet pea), the placentation is marginal, in which the placenta develops along the junction of two carpels in a unilocular ovary.



523. Which one of the following organisms is correctly matched with its three characteristics

(a) Onion : Bulb, Imbricate aestivation, Axile placentation

(b) Maize : C_3 pathway, Closed vascular bundles, Scutellum

(c) Pea : C_3 pathway, Endospermic seed, Vexillary aestivation

(d) Tomato : Twisted aestivation, Axile placentation, Berry

AIPMT (Mains)-2012
AIIMS-2015

@apna_pdf

Ans. (a) : Onion possess bulb (reduced stem), with imbricate aestivation, axile placentataion and possess perianth.

- Tomato belongs to Solanaceae family having valvate aestivation, axile placentation and berry fruit.
- Pea (Family Fabaceae) has vexillary aestivation, C_3 pathway, ex-albuminous seeds.
- Maize (monocot) has C_4 pathway and closed vascular bundle.

524. When the sepals or petals meet by their edges without overlaping the aestivation is :

(a) lmbricate (b) valvate
(c) twisted (d) axillary

HP CET-2013
VMMC-2003
Haryana PMT-2001

Ans. (b) : When the sepals or petals meet by their edge without overlapping the aestivation is valvate.

• Opening by valves; as certain capsules and anthers, meeting without overlapping, as the parts of certain buds.

Ex- Sepals of Hibiscus, petals of Calotropis and Brassica.

525. Which of these is an example for zygomorphic flower with imbricate aestivation?

(a) Calotropis (b) Mustard
(c) Canna (d) Cassia

BCECE-2012

Ans. (d) : Cassia have zygomorphic flower with imbricate aestivation while in mustard, actinomorphic flower occurs. Cassia belongs to family Fabaceae. Because of the irregularity the corolla also has petal that differ from each other in sizes. Ascending imbricate aestivation is found in Cassia and Gulmohur flower that can be divided into two halves from one plane is known as a zygomorphic flower.

526. Type of aestivation shown by Pisum is

(a) Imbricate (b) Vexillary
(c) Twisted (d) Quincuncial

AIPMT (Screening)-2012
J&K CET-2011

Ans. (b) : Vexillary aestivation occurs in family Fabaceae. When the largest petal overlaps the two lateral petals; which overlap the two smallest anterior petals. The vexillum is the bigger petal, while the wings are the two bent petals that are laterally positioned. The two innermost boat shaped petals are known as keel in this location.

Ex- Bean flower.

527. In Dianthus, placentation is

(a) basal (b) free central
(c) axile (d) marginal

AP EAMCET-1999
JIPMER-2011

Ans. (b) : The arrangement of ovules within the ovary is called placentation.

Ovary is one chambered and the placenta bearing the ovules develops all around the central axis.

528. The flower of Calotropis has which of the following aestivations?

(a) Twisted (b) Imbricate
(c) Valvate (d) Vexillary

J&K CET-2012

Ans. (c) : The arrangement of sepals or petals in flower is called the aestivation. In Calotropis, valvate aestivation is seen in which the sepals or petals do not overlap. In twisted aestivation, regular overlapping occurs, for example China rose. In imbricate aestivation there is the irregular type of overlapping for example Cassia.

529. In which of the following aestivation petals one margin covers the other and the margin of next petal is covered by its previous one?

(a) Valvate (b) Twisted
(c) Imbricate (d) Quincuncial

J&K CET-2006

Ans. (b) : Twisted aestivation : One margin of each petal overlap with the margin of next petal e.g. - Hibiscus, cotton and lady -finger.

Valvate aestivation : Sepals or petals are in a whorl, just touch one another, they do not overlap one another. Example - Calotropis.

Imbricate aestivation : When margins of sepals or petals overlap without a clear direction.

Quincuncial aestivation : It is aestivation of 5 petals where the margin of 2 petals are exterior, two interior and the fifth is having one margin exterior or interior.

530. A perennial shrub has compound leaves and solitary zygomorphic and epigynous flowers. Each flower reveals dichlamydeous condition with many stamens and multiple fruit with exalbuminous seeds. What is the ratio of advanced and primitive characters in it?

(a) 1:2 (b) 2:3
(c) 1:1 (d) 3:2

Manipal-2009

Ans. (c) : The compound leaves, solitary flower, many stamens and exalbuminous condition are primitive nature and zygomorphic , epigynous flowers, dichlamydeous condition with multiple fruit formation is advanced characters.

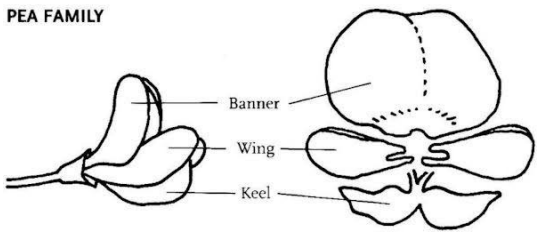
Therefore, the ratio of advanced and primitive characters in the question is 1:1.

531. Keel is characteristic of the flowers of:

(a) Gulmohur (b) Cassia
(c) Calotropis (d) Bean

AIPMT (Screening)-2010

Ans. (d) : Keel is the characteristic feature of vexillary aestivation found in family Fabaceae and Papilionaceae (Ex-Bean, Pea, Indigofera.)



Imbricate aestivation is seen in Cassia and Gulmohar and valvate aestivation is seen in the Calotropis plant .

@apna_pdf

532. Aestivation of petals in the flower of cotton is correctly shown is

(a)

(b)

(c)

(d)

AIPMT (Mains)-2010

Ans. (a) : Aestivation is the arrangement of sepals and petals in floral buds.

• Cotton plant shows the twisted aestivation in which one margin of petal overlaps regularly the margin of the adjacent petal and so on.

Valvate :- The sepals and petals whorls just touch each other at the margin but do not overlap. Ex- Calotropis.

Imbricate – One sepals or petals are totally internal and one are totally external and other are twisted like.

e.g.- Gulmohar, Cassia and Legumes

Quincuncial - 2 sepals or petals are totaly internal and 2 are totally external and other are twisted like.

Ex- Cassia and Delonix.

533. Consider the following four statements 1, 2, 3 and 4. Select the right option for two correct statements.

Statements :

(1) In vexillary aestivation, the large posterior petal is called-standard, two lateral ones are wings and two small anteior petals are termed keel

(2) The floral formula for Liliaceae is

$$Br \oplus \male \overset{\frown}{P_{(3+3)}\ A_{3+3}}\ \underline{G}_{(3)}$$

(3) In pea flower the stamens are monadelphous

(4) The floral formula for Solanaceae is

$$\oplus \male\female\ K_{(3)}C_{(3)}\ A_{(4)}\ \underline{G}_{(3)}$$

The Correct statements are

(a) (3) and (4) (b) (1) and (3)

(c) (1) and (2) (d) (2) and (3)

AIPMT (Mains)-2010

Ans. (c) : Vexillary aestivation has papilionaceous corolla which has a large posterior petal called-**standard**, two lateral ones called wings and two small anterior petals termed as keel.

- Liliaceae floral formula is :- $Br \oplus \male \overset{\frown}{P_{(3+3)}\ A_{3+3}}\ \underline{G}_{(3)}$
- **Diadelphous** stamens have filaments united forming two bundles and anthers are free **e.g-gram, pea, bean**.
- In **monoadelphous** stamens, the filaments of all stamens are united forming a single bundle but the anthers are free, **e.g.-Cotton, lady's finger**.
- Solanaceae, floral formula is :-

$$Ebr \oplus \male\female\ K_{(5)}\ \overset{\frown}{C_{(5)}\ A_5}\ \underline{G}_{(2)}$$

534. Bicarpellary gynoecium and oblique ovary occurs in : -

(a) Mustard (b) Banana

(c) Pisum (d) Brinjal

AIPMT-2001

Ans. (d) : Floral formula of Solanaceae family-

Formula $Ebr \oplus \female\ K(5)\overset{\frown}{C(5)\ A}5\ \underline{G}(2)$

- Brinjal or *Solanum melongena* belongs to family Solanaceae. The fruits are rich in iodine. They are used in the form of vegetable.
- Gynoecium is bicarpellary, syncarpous, forming a superior bilocular ovary. Each locule has many ovule on axile placentation so members of Solanaceae are characterised by the presence of an obliquely placed septum in the ovary and highly swollen placenta.
- The oblique septum is probably due to shifting in the position of the ovary.

535. Tetradynamous conditions occur in : -

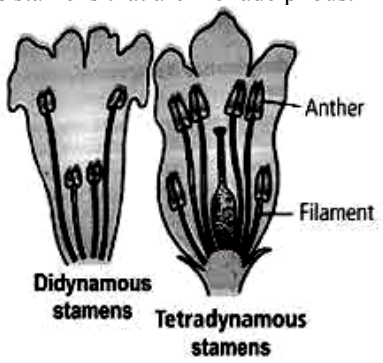
(a) Cruciferae (b) Malvaceae

(c) Solanaceae (d) Liliaceae

AIPMT-2001

Ans. (a) : Tetradynamous condition is found within the **family of Brassicaceae or Cruciferae**.

- In tetradynamous condition there are six stamens, 4 are long and 2 are short i.e. 4+2 arrangement of stamens. It is a characteristic feature of Cruciferae members. In Liliaceae 6 stamens are arranged in whorls of 3 each (3+3).
- In Solanaceae there are 5 stamens, they are epipetalous and polyandrous. In Malvaceae there are numerous stamens that are monadelphous.



536. The correct floral formula of chilli is :

(a) $\oplus \male\female K_5\overset{\frown}{C_5A_{(5)}}\underline{G}_2$ (b) $\oplus \male\female K_{(5)}C_5A_5\underline{G}_{(2)}$

(c) $\oplus \male\female K_{(5)}\overset{\frown}{C_{(5)}A_5}\underline{G}_{(2)}$ (d) $\oplus \male\female K_5C_{(5)}A_{(5)}\underline{G}_{(2)}$

AIPMT (Screening)-2011

Ans. (c) : Chilli belongs to the family Solanaceae

$$\oplus \male\female K_{(5)}\overset{\frown}{C_{(5)}A_5}\underline{G}_{(2)}$$

• Flowers are bisexual actinomorphic ⊕; Calyx-5 & Gamosepalous, Corolla – 5 & Gamopetalous, Androecium – 5, free epipetalous basifixed, inferior ovary gynoecium, bicarpellary, syncarpous and ovary superior.

@apna_pdf

537. In a flower there are five unequal petals. The posterior petal is the largest. The two anterior petals are partially fused to form a boat shaped structure. The two lateral petals are smaller than the posterior petal. Which one of the following characters is not associated with such a flower?

(a) The aestivation of the petals is descending imbricate
(b) The odd sepal is anterior
(c) The pollination is by piston mechanism
(d) The number of carpels is many

AP EAMCET-2005

Ans. (d) : The given description is the characteristic feature of corolla of the family Papilionaceae.

The flowers belonging to the Papilionaceae family has vexillary type of aestivation in which, there is one large posteriorly placed petal called **vexillum** that overlaps the lateral petal called **wings**.

• These wings overlap the anterior petals that are fused to form a boat like structure called **keel or carina**.

• This type of aestivation is also called **descending imbricate**. These flowers also have an odd anterior sepal.

• They show piston mechanism of pollination. Their gynoecium has one carpel, it is monocarpellary, superior, unilocular with marginal placentation. For **example– Pea, Dalbergia etc.**

J. Fruit

538. Pome fruit is found in

(a) mango (b) apple
(c) litchi (d) peach

AIIMS-27.05.2018 Shift-I
Karnataka CET-2013
Manipal-2012
J&K CET-2012
UP CPMT-2011
Punjab MET - 2008
MGIMS Wardha-2007

Ans. (b): Apple is a type of pome fruit in which receptacle is simple fleshy but it is false fruit as it is surrounded by a fleshy thalamus which is edible. The fleshy thalamus is the edible part of apple.

Peach is a drupe type fruit. The fleshy part of the fruit called **mesocarp** is the edible part.

539. In which of the following fruits, the edible part is the aril?

(a) Apple (b) Pomegranate
(c) Orange (d) Litchi

Manipal-2012
CG PMT-2011
CMC Ludhiana-2009
JCECE-2009,2013
AI PMT-2006
Uttrakhand -2005
JIPMER-1997
AFMC-2008

Ans. (d) : Aril is the edible part in the fruit of litchi. The aril is an accessory seed covering often formed from an outgrowth at the base of the ovule.

Fleshy thalamus is the edible part of apple (*Pyrus malus*), juicy testa is the edible part of pomegranate (*Punica granatum*) and endocarpic and mesocarpic juicy hairs are edible part of orange (citrus sp.).

540. Drupes are called stony fruits because they have hard

(a) epicarp and mesocarp (b) mesocarp
(c) epicarp (d) endocarp

JCECE-2012
AMU-2005
Manipal-2004
Uttrakhand PMT-2004

Ans. (d) : Drupes: Drupes are called as hard stony fruits because of the hard endocarp. These fruit usually develop from a single carpel and mostly from flowers with superior ovaries.

Drupes have parts-

Endocarp: Its the hard shell that surrounds the endosperm and is not edible.

Mesocarp: The mesocarp is a fibrous husk and is not edible.

Endosperm: It has seed inside.

For example mango, coconut, plum, raspberry.

541. Lomentum is a kind of:

(a) inflorescence (b) plant
(c) fruit (d) insect

Uttarakhand PMT-2007
Uttarakhand-2005
JCECE-2005
Manipal-2000,2002
Punjab MET-2004

Ans. (c) : Lomentum is a term used to describe a kind of dry, schizocarpic fruit developed from legume or pod which is constricted and partitioned between the seed into a number of one seeded chamber. Ex- Acacia which develops from monocarpellary, superior ovary with marginal placentation.

542. Match the following:

List-I		List-II		List-III	
A)	One seeded bits of fruits	I)	Composite	i)	Pome
B)	Jack fruit	II)	Mericarps	ii)	Rice
C)	Fleshy thalamus	III)	Caryopsis	iii)	Entire inflorescence
D)	Fused pericap & seed coat	IV)	Apple	iv)	Schizocarpic

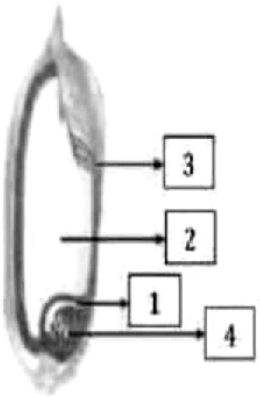
A B C D
(a) I iv, II iii, III ii, IV i
(b) I iv, III i, IV iii, II ii
(c) II iv, I iii, IV i, III ii
(d) I iv, II iii, III i, IV ii

AP EAPCET-23.05.2023, Shift-II

@apna_pdf

Ans. (c) : When schizocarpic fruits mature, they split into single-seeded parts known as mericarps.
The fruit that emerge from the entire inflorescence are known as composite fruit. Jack fruit is a composite or multiple fruit derived from whole of spadix inflorescence.
In few species such as apple, the thalamus also contributes to fruit formation such fruits are called false fruit. Apple is a pome, it is surrounded by fleshy thalamus.
When the pericarp is fused with the thin seed coat is called caryopsis. It is common in rice.

543. Identify the parts labeled 1,2,3,4 in the figure Caryopsis of Oryza?



(a) 1. endosperm, 2. scutellum, 3. embryo, 4. pericarp
(b) 1. pericarp, 2. embryo, 3. scutellum, 4. endosperm
(c) 1. scutellum, 2. endosperm, 3. pericarp, 4. embryo
(d) 1. embryo, 2. pericarp, 3. endosperm, 4. scutellum

AP EAMCET-03.09.2021 Shift-I

Ans. (c) : 1. Scutellum- The shield-shaped cotyledon of a monocotyledon (such as a grass).
2. Endosperm- The endosperm is a tissue produced inside the seeds of most of the flowering plants following double fertilization.
3. Pericarp- The pericarp of fruit develops from ovary wall. It is a type of fruit coat.
4. Embryo-The embryo is formed after the process of syngamy takes place in plants.

544. Caryopsis is present in

(a) wheat (b) ground nut
(c) coconut (d) mango

AP EAMCET-25.09.2020 Shift-I
JIPMER-2018

Ans. (a) : A caryopsis is present is grasses (Poaceae) family. For Ex- Wheat, Barley and Rice.
A caryopsis is a type of simple dry fruit. One that is monocarpellary (formed from a single carpel) and indehiscent (not opening at maturity) and resembles an achene, except that in a caryopsis the pericarp is fused with the thin seed coat.
• The caryopsis is popularly called a grain and is the fruit typical of the family Poaceae.

545. Identify the correct features of Mango and Coconut fruits.

(i) In both fruit is a drupe
(ii) Endocarp is edible in both
(iii) Mesocarp in Coconut is fibrous, and in Mango it is fleshy
(iv) In both, fruit develops from monocarpellary ovary

Select the correct option from below :

(a) (i) and (ii) only
(b) (i), (iii) and (iv) only
(c) (i), (ii) and (iii) only
(d) (i) and (iv) only

NEET-2020 Phase-II

Ans. (b) : The fruits of mango and coconut are drupe, with endocarp being stony and non-edible. They develop from monocarpellary ovary. In coconut mesocarp is fibrous, while in mango it is fleshy and pulpy.

546. In some plants thalamus contributes to fruit formation. Such fruits are termed as:

(a) Parthenocarpic fruit
(b) False fruits
(c) Aggregate fruits
(d) True fruits

NEET-2020 Phase-II

Ans. (b) : When the plants thalamus contributes to fruit formation known as false fruit.
Example- Apple, Pear, etc.

547. Match the types of fruits presented in List-I with the name of the plants given in the List-II

List -I		List-II	
A	**Schizocarpic fruit**	**I**	**Mustard**
B	**False fruit**	**II**	**Acacia**
C	**Parthenocarpic fruit**	**III**	**Strawberry**
D	**Dry fruit**	**IV**	**Banana**
		V	**Cotton**

The correct match is:

	A	B	C	D
(a)	IV	V	III	II
(b)	II	III	IV	I
(c)	V	IV	III	I
(d)	II	V	IV	II

TS EAMCET-08.05.2019 Shift-II

Ans. (b) :

	Types of fruit	Plant
A.	Schizocarpic fruit	Acacia
B.	False fruit	Strawberry
C.	Parthenocarpic fruit	Banana
D.	Dry fruit	Mustarad

548. Match the following:

(A) Siliqua (i) *Lycopersicum esculentum*
(B) Caryopsis (ii) *Triticum aestivum*
(C) Berry (iii) *Helianthus annuus*
(D) Cypsela (iv) *Brassica campestris*

@apna_pdf

(a) A-ii, B-i, C-iii, D-iv
(b) A-i, B-ii, C-iii, D-iv
(c) A-iv, B-ii, C-i, D-iii
(d) A-iii, B-ii, C-i, D-iv

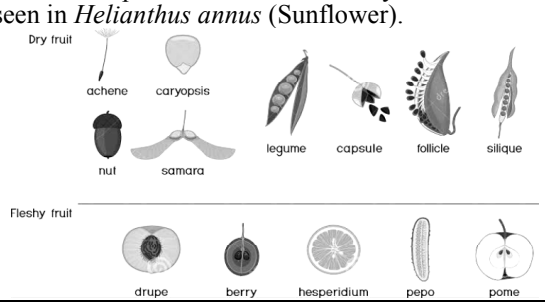
AIIMS-25.05.2019 Shift-I

Ans. (c) : Siliqua is a type of fruit which have two fused carpels. This is seen in *Brassica campestris* (Field mustard).

• **Caryopsis** is present in Poaceae family, and it is a type of fruit in which the seed coat is fused with the fruit coat. This is seen in *Triticum aestivum* (Wheat).

• **Berry** is produced from a single flower with one ovary. It is a fleshy fruit without a stone (seed). This is seen in *Lycopersicum esculentum* (Tomato) .

• **Cypsela** having a single-seeded fruit which develops from a one part of the inferior ovary. This condition is seen in *Helianthus annus* (Sunflower).



549. Which of the following group does not represent monocot?
Apricot, mango, guava, apple, coconut, strawberry
(a) Apricot, mango, guava
(b) Apple, strawberry, coconut
(c) Coconut, apple, cashewnut
(d) Coconut, strawberry, mango

AIIMS-26.05.2018 Shift-I

Ans. (a): Monocots are grass like flowering plants and the seeds of monocot contain only one cotyledon or embryonic leaf. The seeds of dicot have two embryonic cotyledon.
Ex- Wheat, Rice, Corn and Coconut plants.
• The structure of dicot is swollen type as it acts as source of food storage for the developing seeds.
Ex- Apple, Apricot, Mango, Guava and Peaches etc, having dicot structure. Thus these are not represent monocot.

550. Edible part in 'sorosis', a composite fruit, is
(a) cotyledons
(b) endosperm
(c) perianth and peduncle
(d) fleshy thalamus

Tripura JEE-2018
JIPMER-2010
BHU PMT(Screening) - 2005

Ans. (c) : The edible parts are the perianth & peduncle. The term sorosis means the fleshy type of fruit formed by the process of combination of various flowers with their particular container or repository ovaries etc. Sorosis is a composite fruit that develops from a catkin, spike and spadix.
Ex- mulberry, jack fruit and pine apple.

551. The morphological nature of the edible part of coconut is
(a) Perisperm (b) Cotyledon
(c) Endosperm (d) Pericarp

NEET-2017
Manipal-2002

Ans. (c) : The edible part of coconut is endosperm. Coconut consists of free nuclear endosperm (coconut water) and cellular endosperm (white kernel).
Endocarp: It is the hard shell that surrounds the endosperm and is not edible.
Mesocarp: The mesocarp is a fibrous husk and is not edible.

552. Coconut fruit is a
(a) Drupe (b) Berry
(c) Nut (d) Capsule

NEET-2017

Ans. (a) : Coconuts are classified as a fibrous one - seeded drupe. Drupe is a fruit with a hard stony covering enclosing the seed (like a peach or olive) and comes from the word drupa meaning overripe olive.
• A drupe develops from monocarpellary superior ovary and are one seeded.

553. In *Pyrus malus*, the false fruit is formed from:
(a) thalamus (b) pedicel
(c) peduncle (d) calyx

AP EAMCET-2001

Ans. (a) : In apple (*Pyrus malus*) the edible part of the fruit consists of fleshy thalamus, this make apple a false or accessory fruit.
When the develops from the parts of the flower - like base or thalamus , the perianth or other than ovary.
Example of false fruit are apple, strawberry, mulberry, pears, pineapple etc.

554. Geocarpic fruit is : -
(a) Potato (b) Peanut
(c) Onion (d) Garlic

AIPMT-2002

Ans. (b) : Geocarpic fruit is groundnut (Peanut).
Geocarpy refers to an extremely rare means of plant reproduction. Here the plants produce via diaspores within the soil. This has evolved as an effective means of ensuring a suitable environment for the plant's offspring

555. Pepo is a fruit of
(a) Cruciferae (b) Leguminosae
(c) Cucurbitaceae (d) Liliaceae

UP CPMT-2013

Ans. (c) : Pepo is a fruit of the Cucurbitaceae family. A fleshy, several- seeded fruit that has developed from one flower having a single ovary divided into several carpels, which develops a firm or rough rind as it matures.

556. Which of the following promotes softening of fruits?
(a) Polygalacturonase (b) Colchicine
(c) Polyethylene glycol (d) Cellulase
(e) Brazzein

BCECE-2015
Kerala PMT-2008

@apna_pdf

Ans. (a) : Polygalacturonase (PG) is the major enzyme responsible for pectin disassembly in ripening fruit. PG_s are promotes softening of fruits. PG_s becomes abundant during ripening and has a role in cell wall degradation. PG_s is also called as pectinase.

- Colchicine is a historic treatment for gout.
- Polyethylene glycol is an efficient method of transforming plant cells by direct gene transfer.
- Brazzein is used as a sweetener.

557. Berries drupes and pomes are:

(a) simple dry fruits
(b) simple succulent fruits
(c) aggregate fruits
(d) composite fruits

J&K CET-2002

Ans. (b) : Generally berries, drupes and pomes are simple succulent fruits. The fruits arising from the single ovary of a single flower. As they have fleshy juices, they make the succulent fruits.

558. Jackfruit is derived from which of the following?

(a) An inflorescence
(b) All carpels in a flower
(c) One ovary of single flower
(d) Thalamus

Assam CEE-2014

Ans. (a) : Jackfruit is derived from an inflorescence. It is a type of racemose infloresence male and female flowers consist of a single stamen or ovary. Jack fruit is a composite or multiple fruit derived from whole of spadix inflorescence.

559. Pineapple (ananas) fruit develops from

(a) a unilocular polycarpellary flower
(b) a multipistillate syncarpous flower
(c) a cluster of compactly borne flowers on a common axis
(d) a multilocular monocarpellary flower

BHU PMT (Mains)-2010
AIPMT-2006

Ans. (c) : The pine apple fruit is a sorosis i.e type of multiple fruits. The whole inflorescence turns into a compact fruit. In pineapple is fleshy axis, bracts, fused perianth and pericarp are edible.
Pineapple fruit develops from a cluster of compactly borne flowers on a common axis. It develops from spike, spadix or catkin. In such cases, the flower remain with their succulent petals, the axis bearing them grows and become fleshy or woody.

560. Which of the following is a true nuts ?

(a) Walnut (b) Cashew nut
(c) Ground nut (d) Pistachio

JIPMER-2010

Ans. (b) : The nut is the single-seeded fruit. An example of a true nut is cashew nut, Hazelnuts are also a example of true nuts. It is rich source of vitamin C and sugar. The cashew fruit is a kidney shaped drupaceous nut, greenish grey.

- Groundnut is the lomentum type of fruit.
- Coconut is the drupe fruit.
- Walnut is the drupe fruit.

561. A fleshy-fruit with leathery exocarp is called

(a) drupe (b) berry
(c) pome (d) hesperidium

JCECE-2010

Ans. (d) : A fleshy fruit with leathery exocarp is called hesperidium. It is many chambered and many seeded fleshy fruit developed from multicarpellary, syncarpous and superior ovary. Hesperidium fruits, which include most citrus fruit, have leathery rind embedded with glands producing volatile compounds.
The epicarp is leathery and glandular, mesocarp is thin and smooth. Ex- lemon and orange.

562. If a fruit is developed from bicarpellary syncarpus inferior ovary with basal placentation and with a single ovule, the fruit is termed as

(a) siliqua (b) cypsela
(c) silicula (d) lomentun.

AMU-1995

Ans. (b) : Cypsela have possessing basal placentaion, and it is a dry indehiscent single seeded fruits that develop from inferior ovary of a syncarpous bicarpellary gynoecium. It belongs to Asteraceae family. Cypsela is a type of achenial fruits. They are sometimes included with achenes.
Ex- Sunflower.

563. An aggregate fruit is one which develops from:

(a) Multicarpellary syncarpous gynoecium
(b) Multicarpellary apocarpus gynoecium
(c) Complete inflorescence
(d) Multicarpellary superior ovary

AIPMT-2014

Ans. (b) : An aggregate fruit is one which develops from multicarpellary apocarpous gynoecium.
Aggregate fruit usually develops from single flower that had multiple ovaries which were split.

- Fusion of ovaries results in the formation of aggregate fruit. Ex- Strawberry, Raspberry etc.

564. Placenta and pericarp are both edible portions in:

(a) Apple (b) Banana
(c) Tomato (d) Potato

AIPMT-2014

Ans. (c) : Placenta and pericarp are both edible portions in Tomato. Tomato is the example of berry fruit. The placenta can be defined as an outgrowth of a parenchymatous tissue in the inner wall of the ovary to which ovules are remains attached.

- In Banana edible part is endocarp and less developed mesocarp.
- In Apple edible part is thalamus (Pseudocarp).
- In Potato edible part is tuber. It is thickened underground part of a stem.

@apna_pdf

565. Juicy hair-like structures observed in the lemon fruit develop from: -

(a) Exocarp
(b) Mesocarp
(c) Endocarp
(d) Mesocarp and endocarp

Rajasthan PMT - 2007
AIPMT-2003

Ans. (c): The juicy hair-like structures observed in the lemon fruit develop from endocarp, which is the layer inside of the pericarp. It surrounds the seed.
In citrus fruits, the endocarp is separated into sections, called as segments, which contain the juice of the fruit.

566. Composite fruit develops from

(a) Single ovary (b) Inflorescence
(c) Apocarpous ovary (d) Pericarp

AIIMS-2007

Ans. (b) : Composite fruits are multiple fruits which are developed from the complete inflorescence. Aggregate fruit is developed from a single flower with the multicarpellary apocarpous superior ovary and are also called as inflorescence.
They are of two types - Sorosis and Syconus.

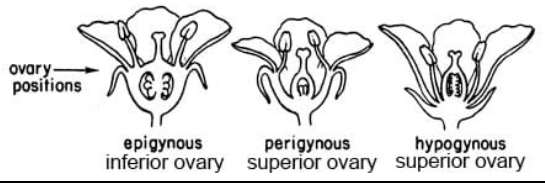
- Spike, spadix and catkin type of inflorescence gives rise to sorosis type of fruit. Ex-Ananas, Artocarpus.
- Syconus type of fruits develop from a hypanthodium inflorescence. Ex- Ficus

567. Plants with inferior ovary usually bear

(a) pseudocarps (b) berries
(c) aggregate fruits (d) seedless fruits

AIIMS-2012

Ans. (a) : The plants having inferior ovaries often lead to involvement of other structure like the thalamus in the formation of the fruits. Thus they are called **pseudocarps**.



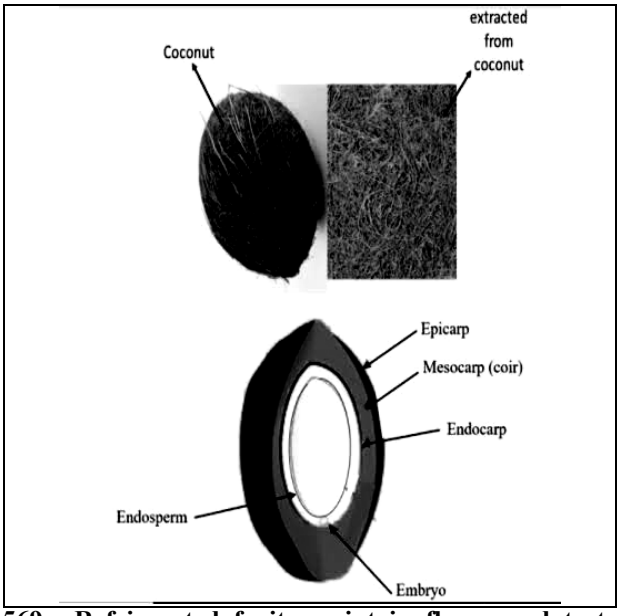
568. Coconut's husk fibre coir of commerce is extracted from

(a) Epicarp (b) Mesocarp
(c) Endocarp (d) Seed coat

AIIMS-2001

Ans. (b) : Mesocarp: The mesocarp is a fibrous husk and it is not edible.

• Coir is the fibrous material found between the hard, internal shell and the outer coat of a coconut. This part is called mesocarp.
Commercial coir is obtained from the fibrous husk (Mesocarp) of fruits of coconut palm. The fibre is valued for its lightness elasticity and exceedingly high resistance to mechanical wear and dampness.



569. Refrigerated fruits maintain flavor and taste for longer period due to:

(a) Non-availability of O_2
(b) Presence of excess of CO_2
(c) Presence of excess humidity
(d) Slower rate of respiration

AIIMS-2015

Ans. (d) : In lower temperature, the respiration rate of fruits is minimized. The respiration method is nothing over an common chemical change. Refrigerated fruits maintain flavor and test for longer time period **due to the slower rate of respirations.**

570. The small projections present on the surface of pineapple fruit represent:

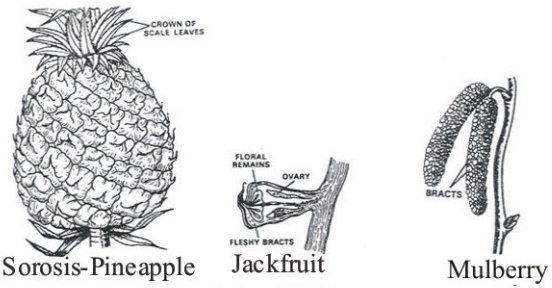
(a) Persistent styles (b) Persistent stamens
(c) Persistent calyx (d) Persistent bracts

AIIMS-2015

Ans. (d) : When the small projections on the surface of pineapple fruit represent the condition is called persistent bracts.
Bracts are specialized plant structures that serve varied functions such as attracting pollinators and protecting inflorescence (flower structures).

■ Pineapple is a **sorosis fruit**.

Example-Mulberry, Jackfruit, Pineapple. It is a multiple fruit developed from a spike, catkin, spadix inflorescence. The edible part of which are the perianth and peduncle.



Composite fruits

@apna_pdf

571. Fruit of Mangifera indica is
(a) berry (b) drupe
(c) capsule (d) siliqua
AIPMT-1991

Ans. (b) : Scientific name of Mango is Mangifera indica.
Mango and coconut is Drupe. Endocarp is strong and hard. Mesocarp is fleshy and epicarp is membranous.

572. Mango juice is obtained from
(a) epicarp
(b) mesocarp
(c) endocarp
(d) pericarp and thalamus
AIPMT-1989

Ans. (b) : Mango belongs to the cashew family Anacardiaceae. In mango (a drupe) edible part is mesocarp which is fibrous, pulpy and juicy.

573. Fruit of groundnut is
(a) legume (b) caryopsis
(c) berry (d) nut
AIPMT-1988

Ans. (a) : Groundnut is a legume crop grown mainly for its edible seeds.
Groundnut belongs to the family fabaceae.

574. Which one of the following belong to the same category?
(a) Coconut, almond and mango
(b) Beetle nut, chestnut and coconut
(c) Tomato, orange and coconut
(d) Chestnut, coconut and cashew nut
BVP-2014

Ans. (a) : Coconut, Mango and Almond are drupes. They come under the category of succulent fleshy fruits.

575. Fig is a:
(a) Sorosis (b) Syconus
(c) Drupe (d) Berry
BCECE-2015

Ans. (b) : The inflorescence of Fig is known as syconium. This is formed by an enlarged, fleshy, hollow receptacle with multiple ovaries on the inside surface. After pollination the floret develops into achenes or drupes, which encloses seeds.

576. The fruit development from the single ovary is said to be:
(a) composite type (b) simple type
(c) aggregate type (d) none of these
J&K CET-2005

Ans. (b) : The fruit development from the single ovary is said to be a simple ovary type fruit. It develops from a single ovary of a single flower.
Composite fruit: develop from an inflorescence. **Aggregate fruit:** develop from multicarpellary apocarpous ovary.

577. Which is correct pair for edible part : -
(a) Tomato – Thalamus
(b) Maize – Cotyledons
(c) Guava – Mesocarp
(d) Date palm - Pericarp
AIPMT-2001

Ans. (d) : The edible part of date palm is fleshy pericarp. Each fruit of date palm is single seeded long berry.
- Tomato-mesocarp,
- maize-endosperm,
- guava-thalamus and pericarp.

578. Which of the following taxons is known for the absence of fruits?
(a) Polypetalae (b) Gamopetalae
(c) Gymnospermae (d) Monochlamydae
AP EAMCET-2001

Ans. (c) : Gymnosperm form the link between pteridophytes and angiosperm, more advanced than pteriodphytes and more ancient group than angiosperm. Gymnosperm originated in the late Paleozoic era.

579. How many plants in the list below have composite fruits that develop from an inflorescence? Walnut, poppy, radish, fig, pineapple, apple, tomato, mulberry
(a) 4 (b) 5
(c) 2 (d) 3
Manipal-2015

Ans. (d) : Composite fruit develop from the whole infloresence and mulberry, fig and pineapple are the composite fruits. The composite fruit is also called the infructesence. The simple fruits develops from single flower. Walnut is a simple fruit that has hard and woody epicarp and is called nut.
Poppy is a simple fruit that is called capsule.
Radish is a root that performs storage function.
Apple is a simple false fruit called pome.
Tomato is simple fruit that has fleshy pericarp and is called fleshy fruit.

580. What is the fruit that develops from a tricarpellary, syncarpous, inferior ovary with parietal placentation?
(a) Pepo (b) Pome
(c) Cypsela (d) Capsule
AP EAMCET-2004

Ans. (a) : The pepo is a kind of fleshy indehiscent fruit which is present is cucurbita. It develops from a tricarpellary, syncarpous, inferior ovary with parietal placentation. Pome is a false fruit as like apple which has an axile placentation. Cypsela is a small single seeded dry fruit and it develops from the bicarpellary syncarpous inferior ovary.

581. A fruit, developing from an inflorescence is called
(a) etaerio (b) composite fruit
(c) achene (d) berry
AMU-2002

Ans. (b) : Composite fruit is developed from an entire inflorescence. These are of two types-
(1). Sorosis- They are developed from the spike, spadix and catkin infloresence. Ex- Jackfruit, Mulberry, Pineapple.
(2). Syconus- They are developed from hypanthodium and coenanthedium inflorescence with flask shaped receptacle becoming fleshy and individual female flower producing small achene like fruitlets. Ex- Peepal, Fig, Banyan.

@apna_pdf

• **Achene-** They are developed from monocarpellary superior or inferior ovary but pericarp and seed coat are free e.g.- *Mirabilis jalapa*, polygonum

• **Berry** is a seeded fleshy fruit developed from monocarpellary to polycarpellary (multicarpellary) may be superior or inferior ovary.

Ex- Tomato, Brinjal, Banana, Grapes, etc.

582. From which part of *Cocos nucifera*, coir is obtained :

(a) Endocarp (b) Mesocarp
(c) Epicarp (d) Any part of fruit

Punjab MET-2009
CMC Vellore-2009
MGIMS Wardha-2003

Ans. (b) : Coir is a type of natural fibre obtained from the mesocarp layer of coconut (*Cocos nucifera*). It is a versatile fibre used in manufacturing mats, ropes, mattresses, brushes, etc.

• Mesocarp is a coarse hairy and husky layer present between the hard endocarp and membranous epicarp of the coconut fruit. Coir can't be obtained from epicarp, endocarp or any parts of fruit. It is only obtained from the mesocarp.

• In coconut (drupe or stone fruit), epicarp is thin mesocarp is fibrous producing coir.

583. Kattha is obtained from the heart wood of:

(a) *Acacia arabica*
(b) *Acacia fornesiana*
(c) *Acacia auriculiformis*
(d) *Acacia catechu*

Manipal-2006

Ans. (d) : Kattha is obtained by boiling the heartwood of *Acacia catechu* which is also known as 'Khair tree'.

It serves to provide mechanical support. Heartwood is the central region of old trees, that is formed earlier during growth, with tannins, resin, and other substances imparting it the black color.

584. Seedless banana is

(a) parthenocarpic fruit (b) multiple fruit
(c) drupe fruit (d) true fruit

WB JEE-2009

Ans. (a) : Seedless banana is parthenocarpic fruit. Parthenocarpy is the formation of fruit without fertilization of ovules and therefore, the fruit is seedless. True fruits develop from the ovary while false fruits are those that develop from some other part of flower except the ovary.

585. In Datura the fruit is

(a) septicidal capsule (b) porous capsule
(c) septifragal capsule (d) loculicidal capsule

Punjab MET-1999

Ans. (a) : The fruit of datura is septicidal capsule but its dehiscence is of septifragal nature in which placenta remains attached in the center of undivided fruit and pericarp's segment becomes separated.

The condition is where, septa between the locules of the capsule split and the fruit opens to release the seeds, then this type of dehiscence is called as septicidal dehiscence. For example - Datura.

Datura plant is poisonous plant and bears fruit capsule.

586. Bicarpellary, syncarpus and with pseudoseptum fruit is:

(a) siliqua (b) akene
(c) capsule (d) all of these

Rajasthan PMT-2004

Ans. (a) : Bicarpellary, syncarpus and with pseudoseptum fruit is called siliqua. Ex- Brassica.

It is a type of dry fruit, it develops from two fused carpels with superior ovary.

Achene- They develop from monocarpellary superior or inferior ovary but pericarp and seed coat are free as - *Mirabilis jalapa*, polygonum.

Capsule- They develop from bicarpellary to multicarpellary, superior or inferior ovary. e.g. poppy, partulaca etc.

587. Maize grain is:

(a) seed (b) embryo
(c) ovule (d) fruit

AFMC-2005

Ans. (d) : Maize grains usually are called as fruits because they are yielded from ripened ovary. Maize grain is not a seed, but a single seed fruit. Its fruits wall and seed coat are fused into a single layer. The grain is monocotyledonous and endospermic There is a small tube near the top of the grain. A very slight, whitish patch on one side of grain marks the embryo.

588. If a tree flowers thrice in a year in October, January and July in Northern India, the plant is

(a) photo and thermo sensitive
(b) photo and thermo insensitive
(c) photo sensitive but thermo insensitive
(d) thermo sensitive but photo insensitive

BHU PMT (Mains)-2009

Ans. (b) : In this condition, a plant flowers thrice in a year, it is photo and thermo insensitive. Plants respond to changing season to initiate their development and flowering.

In Northern India the temperature and light periods are different in the months of October, January and July, because flowering can take place during any periods of the year, therefore, the plant is not sensitive to photoperiod and temperature.

589. Hairy styles help in the dispersal of fruits in : (1) Clematis (2) Aristolochia (3) Naravelia (4) Mango

(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2005, 2008

Ans. (d) : Hairy styles is a morphological feature which helps in dispersal through wind i.e. anemochory. The fruits and seeds are dispersed during periods of high winds. The fruits of Clematis and Naravelia possess persistent hairy style which help in floating in air.

@apna_pdf

590. Select the correct match from the table

List I	List II
1. Capsular fruits	A. Dry, many seeded and split open at maturity
2. Achenial fruits	B. Break into one seeded segments known as mericarps
3. Simple fleshy fruits	C. Have fleshy pericarp which is edible
4. Berry	D. Ripened inflorescence called sorosis.

(a) 1,2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2011

Ans. (d) : Achenial fruits do not burst at maturity but seeds are liberated only by the decaying of the pericarp. Berry is usually many seeded, fleshy fruit.
The correct matches are-
Capsular fruits - Dry, many seeded and split open at maturity.
Simple fleshy fruits - Have fleshy pericarp which is edible.

591. Wheat grain is a :
(a) fruit (b) seed
(c) inflorescence (d) bulbil

BHU PMT-2001

Ans. (a) : The wheat grain is a type of caryopsis fruit. Caryopsis fruits are unilocular and one seeded in which pericarp (developed from ovary wall) is fused with the seed coat.
These fruits are present in Graminae family Ex- Wheat, Rice and Maize.
• Inflorescence is the arrangement of flowers and mode of distribution of flowers on the shoot system of a plant eg.- **Hypanthodium in Ficus.**
• Bulbil is the special type of leaf like structure and function as an vegetative reproductive structure eg. As in **Dioscorea.**

592. The cheapest high energy fruit crop in India is:
(a) guava (b) apple
(c) mango (d) banana

HP CET-2013
JIPMER-1998

Ans. (d) : The cheapest high energy fruit crop in India is Banana. Banana are one of the most energy boosting food available. It is very popular fruit due to its low price and high nutritive value with rich source of carbohydrate and vitamin.
• It contains eleven vitamins and the important ones are A, B, C although fat and protein contents are very low, the fruit is rich in minerals.
• Bananas are among the most traded fruits in the world. In 2017 alone 22.7 million tones of banana, excluding plantains, were traded representing almost 20% of global production that year.

593. Which type of fruit is found in pear?
(a) Berry (b) Drupe
(c) Lomentum (d) Pome

UP CPMT-2012

Ans. (d) : Pear is a type of pome fruit which develops from muilticarpellary, multilocular, inferior ovary. Thalamus becomes fleshy and edible part is thalamus. It is fleshy fruit Ex- Pear, Apple.

594. Geocarpic fruits are produced by:
(a) carrot (b) onion
(c) ground nut (d) watermelon

Haryana PMT-2010
AFMC-2007

Ans. (c) : Ground nut is a schizocarpic fruit which develops from monocarpellary, superior ovary. In case of ground nut, the young fruit are pushed into the soil as a result of post ferilization curvature of the stalk. Geocarpy refers to the ripening of fruits underground.

595. Lemon is sour due to the presence of:
(a) acetic acid (b) carbonic acid
(c) citric acid (d) sulphuric acid

AFMC-2002

Ans. (c) : Lemon is sour due to the presence of citric acid. Lemon is a Hesperidium type of fruit. It is similar to berry or bacca fruits but epicarp is thick leathery with oil gland. Mesocarp is white and fibrous fused with epicarp to form Rind of fruit. Endocarp infolded to form unicellular, juicy hairs which is edible part. Lemon belongs to family Rutaceae.

596. Assertion : Coconut tree is distributed in coastal areas over a large part of the world.
Reason : Coconut fruit can float and get dispersed over thousands of kilometers before losing viability
(a) both assertion and reason are true and reason is the correct explanation of assertion
(b) both assertion and reason are true but reason is not correct explanation of assertion
(c) assertion is true but reason is false
(d) both assertion and reason are false

HP CET-2011

Ans. (b) : Coconut is a simple fleshy fruit in which pericarp is differentiated into three layers as epicarp, mesocarp and endocarp. Coconut epicarp is thick and waterproof. Fibrous mesocarp of coconut renders the coconut to float in water for long distance. The stony endocarp provide protection from external injury. Due to all these reason, coconut can be dispersed through water without long viability. Therefore, it is distributed more near the coastal regions.

597. Dry indehiscent single- seeded fruit formed from bicarpellary syncarpous inferior ovary is
(a) caryopsis (b) cypsela
(c) berry (d) cremocarp

BHU PMT (Screening)-2010
AMU- 2000

Ans. (b) : Dry indehiscent single- seeded fruit formed from bicarpellary syncarpous inferior ovary is cypsela. The fruit wall develops from pericarp and thalamus and is thin and remains attached to the seed at one point, Ex- Helianthus.

@apna_pdf

598. Pear fruits are gritty due to the presence of
(a) tracheids (b) vessels
(c) fibres (d) sclereids
J&K CET-2012

Ans. (d) : Pear fruits are gritty due to the occurrence of stone cell or sclereids.
Sclereids are small, long not pointed at both ends, thick walled due to the deposition of lignin, extremely thick walled, Lumen very much reduced, cells are more less isodiametric or Spherical or rounded.
Stone cells present in-Pear, Guava, Sapota etc.

599. If a fruit is developed from $\left(\overline{2G}\right)$, bilocular with one ovule in each local and pendulously attached and the wall of the ovary possesses vittae, the fruit is designated as
(a) Caryopsis (b) Cypsela
(c) Cremocarp (d) Capsule
AMU -2000

Ans. (c) : Cremocarp is schizocarpic simple, dry, many seeded fruit which breaks up into one seeded indehiscent part, called mericarps, while dehiscent one seeded part is known as coci, in which fruits breaks up into two mericarps, which remain attached to central axis or carpophore by means of stylopod eg. **coriander, fennel etc.**

600. What is the type of fruit that develops from the ovary of a monocarpellate gynoecium and breaks into several one seeded parts at maturity?
(a) Cremocarp (b) Carcerulus
(c) Regma (d) Lomentum
AP EAMCET-2003

Ans. (d) : Schizocarpic fruits splitted into one or more seeded compartment called the mericarp or cocci
Lomentum is the type of schizocarpic fruit which develops from monocarpellary, superior ovary. Fruit contracted into one seeded segment. Cremocarp develops from bicarpellary, inferior ovary. Fruit dehisces into two mericarp. e.g. - family umbeliferae
Carcerulus fruit:- They develops from bicarpellary to multicarpellary (Labiatae family), Althea, Abutilon (Malvaceae family)
Regma:- develops from multicarpellary ovary dehisces into three cocci. e.g. - castor

601. Single seeded winged fruit is called
(a) achene (b) cypsela
(c) samara (d) caryopsis
Haryana PMT-2007

Ans. (c) : Samara develops from bicarpellary to tricarpellary syncarpous ovary, pericarp froms two wings Ex- Terminalia.
When wings derived from the calyx such as samara fruits are called - samaroid Ex- *Shorea robusta*, Ulmus, Dipterocarpous.

602. The dried fruit used for making musical instruments is
(a) snake gourd (b) bitter gourd
(c) bottle gourd (d) all of these
CMC Vellore-2014
Haryana PMT-2007

Ans. (c) : Bottle dried fruit used for making musical instruments is bottle gourd.
Bottle gourd belongs to family Cucubitaceae develops from tricarpellary, inferior ovary with parietal placentation but seed attached on the placenta.

603. Which one of the following is a pseudocarp?
(a) Apple (b) Guava
(c) Tomato (d) Banana
Haryana PMT-2009
CG PMT-2009

Ans. (a) : A pseudocarpic fruit is not formed by ovary. It is formed from other floral parts like Bracts, perianth and thalamus etc. For example in apple and pear thalamus form the major part in fruit formation.

604. In which of the following types of the fruit is multilocular and split open longitudinally along dorsal sutures?
(a) Capsular (b) Loculicidal
(c) Septicidal (d) Septifragal
Manipal-2015

Ans. (b) : Loculicidal are a multicellular variant of capsular fruits which dehisces along a dorsal sutures present at the back of loculi.
Septicidal dehiscence is one in which the line of dehiscence passes through the septal line.
Capsular fruits are formed from a single cell.
Septifragal fruits dehisces by the loculicidal or septicidal and seed are attached on the central column as thorn apple.

605. Plants which flower only once in their life are termed as
(a) monochlamydous (b) monoecious
(c) monocarpic (d) monosomic
CG PMT-2009

Ans. (c) : On the basis of frequency of flowering or fruiting, plants may be either monocarpic or polycarpic. Monocarpic plants bear flower and fruits only once in their life cycle. Ex- All annual, biennial plants and some perennial plants like Bamboo and Agave. Polycarpic plants develop fruits and flowers repeatedly after attaining maturity Ex- Mango, Acacia, Eucalyptus etc.

606. Winged fruits are found in:
(a) Moringa (b) Pinus
(c) Dioscorea (d) Argemone
AMU-2008

Ans. (c) : Winged fruits are found in Acer, Holoptelea, Terminalia, Dioscorea etc. Samara fruits are winged, dry indehiscent fruits. The wing is modified pericarp that help in seed dispersal. Samara fruits develops from bicarpellary to tricarpellary syncarpous ovary.

607. An alkaloid called capsin is obtained from this plant:
(a) chillies (b) potato
(c) tomato (d) tobacco
AP EAMCET-2001

Ans. (a) : Capsin is a natural alkaloid present in plants of the genus Capsicum such as the chilli plant. There are other forms of spicy alkaloids in the plant itself but their degree of spiciness is lower than that of capsin.
Capsin is derived from the metabolism of a fatty acid and the wall of chilli.

@apna_pdf

608. Porous dehiscence of capsular fruits is seen in
(a) okra (b) poppy
(c) cotton (d) datura
AMU-1997

Ans. (b) : Porous dehiscence of capsular fruits is seen in poppy. In poppy, the seeds are liberated through pores, In cotton and okra the seeds are liberated through locules. In datura, the fruits rupture loculicidally throwing valves away from fruit, and leaving seeds attached to the central axis.

609. Explosive fruits are a characteristic of
(a) balsam (b) poppy
(c) castor (d) none of these
AMU-1997

Ans. (c) : Castor fruits shows explosive mechanism in which pericarp after ripening and drying becomes streched due to some external, mechanical pressure as contact with animals, air, water drops or change in humidity. These fruits dehisces suddenly and seed are dispersed in large area.
The seeds of balsam fruits are dry and dispersed by explosion due to the touch of our hands.

610. Fruit of custard apple is:
(a) etaerio of berries (b) etaerio of follicles
(c) etaerio of achenes (d) etaerio of drupes
AFMC-2004

Ans. (a) : Fruits of custard apple (*Annona squamosa*) is etaerio of berries in which the berries are fused but the mesocarp represent the edible part of individual berries. Berry fruits are develops from monocarpellary to multicarpellary may be superior or inferior ovary. Placentation may be axile or parietal. Epicarp is thin, mesocarp fleshy and endocarp also thin but seed get detached from the placenta at the maturity.

611. Opening and closing of flowers represent a kind of
(a) nastic movement
(b) tropic movement
(c) mutation
(d) autonomic movement
VMMC-2005
AMU-2004

Ans. (a) : Nastic movement is non directional movement, in which the direction of response or movement is determined by the structure of responsive region. Opening and closing of the flower is due to variation in light intensity and is an example of photonasty.
Tropic movement is directional paratonic movement of curvature, generally found in cylindrical organ. The direction of movement is related to the direction of stimulus, eg. Geotropism, phototropism, hydrotropism.
Autonomic movement or self controlled movement is spontaneous movement eg. movement shown by shoot apex.
Mutation is defined as sudden change in genetic material of a cell that may cause it to differ in appearance or behaviors from the normal type.

612. Fruit of *Hibiscus esculentus* is
(a) Capsule (b) Cypsela
(c) Legume (d) Pome
MGIMS Wardha-2011

Ans. (a) : Capsule fruit of *Hibiscus esculentus* is capsule.They develops from bicarpellary to multicarapellary, superior or inferior ovary.
• **Cypsela** – They develops from bicarpellary inferior ovary, seed coat and pericarp are free e.g. family compositae.
• **Legume** – They develop from monocarpellary unilocular, superior ovary similar but fruit dehisces by both suture from apex to base as - Leguminosae family like pea, bean etc.
• **Pome** – They develops from multicarpellary multilocular inferior ovary. Thalamus becomes fleshy surround the ovary and edible part is thalamus. It is false fruit as apple, pear.

613. In which of the following types of fruits, dorsiventral dehiscence takes place?
I. Legume **II. Follicle**
III. Siliqua **IV. Capsule**
The correct combination is
(a) I and III (b) I and II
(c) II and III (d) II and IV
VMMC-2010
AP EAMCET-2005

Ans. (a) : Dorsiventral dehiscence takes place legume and siliqua.
Legume and siliqua are dehiscent fruits which can be dehisces through dorsiventral sutures from apex to base. Legume is developed from a monocarpellary, one chambered and superior ovary. Ex- Pea.
Siliqua develops from a bicarpellary, syncarpous and superior ovary. Ex- Mustard.

614. The characteristic fruit type in Asteraceae is:
(a) carcerulus (b) capsule
(c) cypsela (d) caryopsis
AP EAMCET-2002

Ans. (c) : The characteristic fruit type in Asteraceae is cypsela. Cypsela is a dry single seeded fruit formed from a double ovary of which only one ovule develops into a seed. It belongs to Asteraceae family, also called daisy family.
Carcerulus- They develops from bicarpellary to multicarpellary and fruit divided into four single seeded locules, Ex- Ocimum, Salvia (Labiatae family).

615. Hesperidium of orange is a modification of:
(a) berry (b) drupe
(c) pome (d) aggregate fruit
Haryana PMT-2006
DUMET-2006

Ans. (a) : Hesperidium of orange is a modification of a berry with a leathery exocarp. A berry has a fibrous mesocarp fused with epicarp to from rind of fruit, endocarp infolded to form unicellular, juicy hairs which is edible part.
Citrus plants generally have hesperidium fruit.
Ex- Lemon, Oranges, Grape fruit etc.

616. In banana, which of the following part is edible?
(a) Epicarp (b) Mesocarp
(c) Endocarp (d) Both (b) and (c)
Haryana PMT-2003
JCECE-2004
BHU PMT(Main)-2009

@apna_pdf

Ans. (d) : In banana, edible part is rudimentary mesocarp and fleshy endocarp. Banana is a type of a berry fruit, which is an indehiscent fruit with fleshy mesocarp and endocarp but fibrus exocarp. Banana is a seedless fruit, if seeded, seeds are present inside the perisperm. Thus, the edible part in banana is mesocarp and endocarp.

617. The capsules are septicidal in:

(a) Ficus (b) Annona
(c) Aristolochia (d) Solanum

AP EAMCET-1997

Ans. (c) : Septicidal capsules are present in the fruit of Aristolochia. In septicidial capsules longitudinal slits appear on the septae and seeds are attached on the septae as in Linum (flaxes).

618. Botanical name of banana is:

(a) *Musa paradisiaca* (b) *Musa arietinum*
(c) *Mimosa pudica* (d) *Iberis amara*

AFMC-2010

Ans. (a) : The botanical name of the banana is *Musa paradisiaca*.

- *Mimosa pudica* is the scientific name of touch me-not plant. This plant collapses its leaves when gets touched by something. It belongs to family Fabaceae.
- *Iberis amara* is a Brassicaceae family plant which is commonly known as candytuft.
- *Musa arietinum* is not the name of any organism.

619. Bitterness of cucurbits fruit is due to ?

(a) Acids in them
(b) Alkalinity in their pulp
(c) Occurrence of tetracyclic triterpenes
(d) Presence of bitter seeds in them

CMC Ludhiana-2007

Ans. (c) : Bitterness in the cucurbits is a form of evolutionary mechanism of defense against the herbivores which develops due to the presence of bitter triterpenes concentrated in the epicarp and the part of mesocarp. The pulp has not alkaline in cucurbits and the seeds are not essentially bitter.

In the plant family Cucurbitaceae, bitterness is caused by a group of highly oxygenated tetracyclic triterpenes, the cucurbitacins.

620. Term torus applies to

(a) spongy thalamus in lotus
(b) swelling in bordered pits
(c) both (a) and (b)
(d) a condensed petiole

CMC Ludhiana-2007

Ans. (c) : Term torus is related to both, spongy thalamus of lotus and a suberized swelling in membrane of bordered pit. The thalamus is thickened structure at the base of flowers.

621. Nucellus forms which of the following part of fruit?

(a) Seed coat (b) Perisperm
(c) Seed (d) Raphe

BCECE-2008

Ans. (b) : Nucellus is the central part of an ovule which contains embryo sac and female gametophyte and it forms a nutritive tissue layer in the seed of flowering plants. Perisperm is the layer of nutritive tissue formed by nucellus. Thus perisperm is the correct answer.

622. The grittiness of the pulp guava fruit is due to presence of

(a) sclereids (b) tracheids
(c) fibres (d) companion cells

AMU-2001

Ans. (a) : The spherical, oval or cylindrical cells with very narrow lumen, in sclerenchyma are called sclereids. They are usually scattered singly or in groups in the plant body specially in phloem, fruit wall and in the pulp of fruits and seeds. They provide rigidity to the structure, in which they are found. The grittiness of the fruits like guava and pears is due to the occurcence of stone cells or sclereids.

623. Cotyledons and testa respectively are edible parts in -

(a) Cashew nut and litchi
(b) Groundnut and pomegranate
(c) Walnut and tamarind
(d) French bean and coconut

AIPMT-2009

Ans. (b) : Cotyledon and testa are edible in groundnut and pomegranate.

Endosperm the white fleshy part is edible part of the coconut.

Cotyledons are the edible part in walnut and cashew nuts.

Aril is the edible part of litchi.

624. How many plants in the list given below have composite fruits that develop from an inflorescence?

Walnut, poppy, radish, fig, pineapple, apple, tomato, mulberry

(a) Two (b) Three
(c) Four (d) Five

AIPMT (Screening)-2012

Ans. (b) : A composite or multiple fruit is a group of fruitlet which develop from the different flowers of an inflorescence. It cosists of two main types-

(i) Sorosis- They develops from the spike, spadix and catkin inflorencence e.g. mulberry, pineapple

(ii)Synconus- They develop from hypanthodium inflorescence. Ex- Peepal, Banyan, Fig.

- Poppy has capsular fruit.
- Tomato is a berry fruit.
- Radish is a tuber.

625. Arrange the following fruits in descending order based on the number of locules in the ovary from which it develops

(i) Carcerulus (ii) Schizocarp
(iii) Cremocarp (iv) Regma

(a) ii, i, iv, iii (b) i, iv, iii, ii
(c) ii, iv, iii, i (d) ii, iii, i, iv

AP EAMCET-2008

@apna_pdf

Ans. (a) : The maximum number of chamber in the ovary are present in schizocarpic fruits. Order of the chambers of the ovary-
Schizocarp > Carcerulus > Regma > Cremocarp

626. Fruits are formed in
(a) brassica (b) fern
(c) cycas (d) funaria

UP CPMT-2005

Ans. (a): Fruit formation is a characteristic feature of Angiosperms such as Brassica while fern, cycas and Funaria lack flower.
- Funaria is a bryophyte in which true stem, root, leaves are absent.
- Cycas is a gymnospermic plant which is a naked seed plant and fruits are not formed.
- Fern belongs to pteridophyta, ferns are plants that do not have flowers.

627. Among the following sets of fruits, those that belong to the same category, from the point of view of classification, are
(a) coconut, chestnut and cashewnut
(b) coconut, mango and almond
(c) coconut, butternut and chestnut
(d) coconut, orange and tomato.

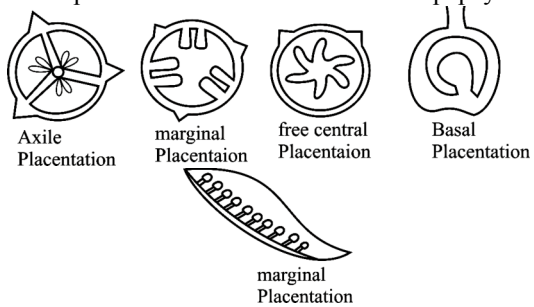
AMU-1997

Ans. (b) : The coconut, mango and almond are all drupes. These fruits develop from monocarpellary or multicarpellary, syncarpous ovary. Epicarp of these fruits forms the skin of the fruit. Orange is hesperidium berry and tomato is a true berry whereas coconut is a drupe.
Chestnut and coconut are drupes whereas betelnut is a nut.

628. Placentation in tomato and lemon is:
(a) Marginal (b) Axile
(c) Parietal (d) Free central

AIPMT (Screening)-2012

Ans. (b) : Placentation found in tomato is axile in which placenta arise from the central axis of ovary.
Lemon (family Rutacace) tomato (family solanaceae) also china rose and orchid have axile placentation.
In Axile placentation the ovary is fragmentated into two or more than chambers by septa.
The placenta is formed in the central region where all the septa intersect or meet and therefore an axile column bearing ovule is formed.
Marginal placentation is found in pea.
- Free central placentation found in Dianthus.
- Parietal placentation found in Radish and papaya.



629. A small dry, one – seeded fruit with its pericarp fused with the seed-developing from a monocarpellary gynoecium is called
(a) Cypsela (b) Siliqua
(c) Caryopsis (d) Samara

Rajasthan PMT-2011

Ans. (c) : Caryopsis is a very small, dry, one seeded fruit developing from superior monocarpellary ovary, with the pericarp fused with the seed coat.
Ex. Family Gramineae
Cypsela - They develop from bicarpellary inferior ovary seed coat and pericarp are free as - Family compositae. (Sunflower, marigold)
Siliqua - They develop from bicarpellary, ovary dehisces by both surface from base to apex, in the begining ovary is unilocular but becomes bilocular due to the false septum called the Replum
Example:- Crucifereae family (Brassica, Radish)
Samara -They develop from bicarpellary to tricarpellary ovary, pericarp form the wings.
Ex. - *Holoptelia, Termindia* etc.

K. Seed and Structure of Seed

630. Match the following :

List - I	List -II	List -III
(A) Persperm	**(I) Zygote**	**(i) Coconut**
(B) Embryo	**(II) PEN**	**(ii) Pepper**
(C) Scutellum	**(III) Nucleus**	**(iii) Tridax**
(D) Endosperm	**(IV) Cotyledon**	**(iv) Maize**

(a) A-I-ii, B-III-i, C-II-iv, D-IV-iiii
(b) A-II-ii, B-I-iii, C-III-iv, D-IV-i
(c) A-II-ii, B-III-ii, C-I-iii, D-IV-i
(d) A-III-ii, B-I-iii, C-IV-iv, D-II-i,

TS EAMCET-10.05.2023, Shift-II

Ans. (d) : • Edible part of coconut is endosperm dut to formation of zygote coconut is a drupe fruit fibrous part called mesoderm and stony layer called endoderm.
- In some seed the nutrelive tissue nucllus present outside the sac containg the embryo presist such nucellus called perisperm. It seen in pepper.
- Cotyledon of maize grain called scutellum. It is very thin but high surface Area, high absorbing nutrient.

631. Choose the correct statements
a. Inability of seed germination due to immature embryo is called Quiescence.
b. Seed coats of fabaceae do not absorb O_2 and H_2O
c . Germination of tomato seeds is inhibited by chemical compounds
d. Seed of polygonum require exposure to low temperature.
(a) a, b, c, d (b) b, c, d
(c) c, d (d) a, b, d

AP EAPCET-22.05.2023, Shift-I

@apna_pdf

Ans. (b) : In seed coat of Fabaceae (Leguminosae), sclerencymatic tissues and waxy covers are cause of difficulty of the entry of O_2 and water.

- Germination of tomato seeds is inhibited by isotonic solutions of sucrose and glucose.
- Treatment of seed is require exposer of low temperature to break its dormancy and to induce germination.

632. Assertion (A) : Dry Dehiscent fruits are usually single seeded.
Reason (R) : Tridax fruit is cypsella with pappus like calyx.

(a) A and R are true and 'R' is the correct explanation to 'A'
(b) A and R are true 'R' is not the correct explanation to 'A'
(c) A is true but R is false
(d) A is false but R is ture

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Tridax is a flowering plant in the family asteraceae. Pappus like calyx and cypsela is a characterstic fruit of the family asteraceae. It is dry single-secded fruit formed from a double ovary of which only one develops into a seed.

A dry dehiscent, one-seeded fruit, similar to those in the Asteraceae family which are produced from two ovaries, only one of which bears seeds.

633. Assertion (A): There is no variation in size of mature seeds in orchids.
Reason (R): Lodecia maldivica is the plant with largest seed.

(a) 'A' and 'R' are true and 'R' is the correct explanation to 'A'.
(b) 'A' and 'R' are true but 'R' is not the correct explanation of 'A'.
(c) 'A' is true but 'R' is false.
(d) 'A' is false but 'R' is true.

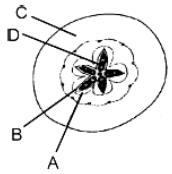
AP EAPCET-23.05.2023, Shift-II

Ans. (d) : Lodoicea maldivica, is a type of palm tree and also known as the double coconut is producing the largest and for heaviest seeds in the world. The weight of seeds is up to 20 kg and are almost 40 cm in diameter which makes them the largest and heaviest seeds in the world.

Orchid seeds are very small, extremely light and produced in great numbers. The typical orchid seed is merely the size of a speck of dust.

Thus, Assertion (A) is false but Reason (R) is true.

634. Which part of the fruit, labelled in the given figure makes it a false fruit?



(a) D → Seed
(b) A → Mesocarp
(c) B → Endocarp
(d) C → Thalamus

NEET-2022

Ans. (d) : As thalamus is involved in fruit formation. Therefore, it is a false fruit.

False fruit is also known as **accessory fruit, spurious fruit, pseudofruit psuedocarp**. A false fruit is a fruit in which some of its flesh is derived not from the the floral ovary but from some other tissue located exterior to the carpel i.e. some other reproductive part of the flower. **eg-** Apple, Pear, Pineapple, Strawberry etc.

- Apple is formed from the thalamus and not from the ovary . So it is known as **false fruit**.

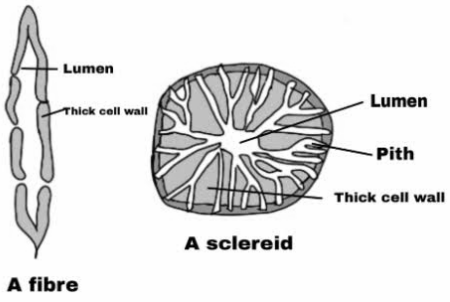
635. The type of tissue commonly found in the fruit wall of nuts is:

(a) Parenchyma
(b) Collenchyma
(c) Sclerenchyma
(d) Sclereid

NEET (Re-Exam)-04.09.2022

Ans. (d) : Sclereids are a reduced form of sclerenchyma cells.

Sclereids are usually found in the fruit walls of nuts, pulp of fruits like guava, pear and sapota; seed coats of legumes and leaves of tea. The gritty texture of pear or guava is because of sclereids.



636. _____gives seeds protection against mechanical shock, dry conditions etc.

(a) Testa
(b) Tegmen
(c) Scutellum
(d) Endosperm

MHT CET-07.10.2020 Shift-I

Ans. (a) : The outer seed-coat is called testa. It is thick and protective layer. It protects the seed from bacteria fungi , insects etc.

The inner seed-coat is called tegmen. It is thin, membranous covering that protects the inner part of the seed.

637. Some seeds produce various structures like wings, pappus calyx, hooks etc, which help in their_____.

(a) protection
(b) dispersal
(c) attraction
(d) germination

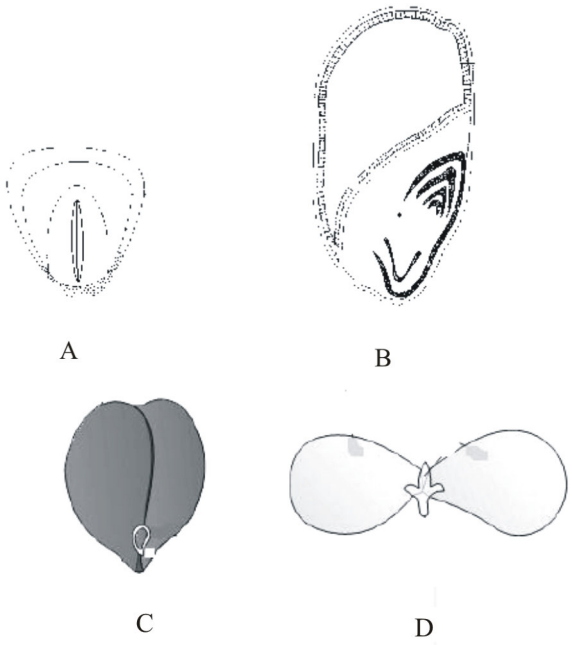
MHT CET-06.10.2020 Shift-I

Ans. (b) : Seed dispersal is the mechanism that helps in the transport of seeds to other place pappus calyx, wings, hooks etc. helps in the dispersal of seed.

Pappus is the modified calyx.

@apna_pdf

638.



Which of the following is correct for above diagrams :

(a) A and B represent ex-albuminous seeds
(b) C and D represent albuminous seeds
(c) A and B represent albuminous seeds
(d) C and D represent perispermic seeds

AIIMS-26.05.2019 Shift-II

Ans. (c) : In albuminous seeds the cotyledons is thin and membranous and the endosperm persists and nourishes the seed during the early development of the seed. Cotyledons function only as food sucking organs, not as food storage organs Example as castor seed, coconut and maize. In the given diagrams A and B represent albuminous seeds.

- Seeds which lack endosperm at maturity are called non-endopermic or ex-albuminous seeds. Example as pea, bean and groundnut.

639. Which of the following is not found in maize seed:

(a) Coleorhiza (b) Coleoptile
(c) Scutellum (d) Perisperm

AIIMS-26.05.2019 Shift-II

Ans. (d) : Perisperm is a layer of nutritive tissue that surrounds the embryo of a seed. There are three parts in an ovule The integument that form the outer layer, nucellus and the female gametophyte in its center. Nucellus in the inner structure of the ovule which may develop into the perisperm that feeds the embryo.

In maize seeds the perisperm is absent. As maize is a monocot coleorhiza, coleoptile and scutellum are found in maize. Hence perisperm is not found in maize seed.

640. 'Scutellum' is the _____ of monocotyledonous plant.

(a) embryo axis (b) cotyledon
(c) endosperm (d) coleoptyle

Tripura JEE-2019

Ans. (b) : Typical dicotyledonous embryo contains two cotyledons. The portion above the level of cotyledons is called epicotyl (embryonic shoot) or plumule and portion below the level of cotyledons is known as hypocotyls (embryonic root) or radicle embryo of monocotyledons have only one cotyledon called scutellum.

641. Persistent nucellus in the seed is known as

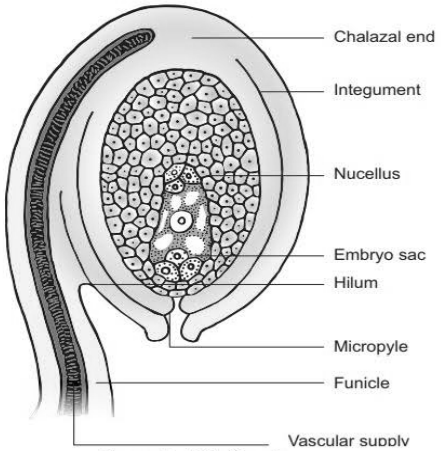
(a) Perisperm (b) Hilum
(c) Tegmen (d) Chalaza

NEET-2019

Ans. (a) : The residual persistent nucellus in the seed is called perisperm.

- Perisperm is the nutritive tissue derived from persistent nucellus that surrounds the embryo of seed in some angiosperm.
  eg – Black pepper, Beet.
- Nucellus is the central cellular mass of the body of ovule, containing the embryo sac.

Helium-Helium is scar left by the stalk which attached the ovule to the ovary wall before it become seed.



642. Placentation in which ovules develop on the inner wall of the ovary or in peripheral part, is

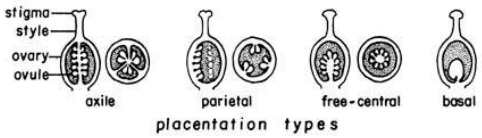
(a) Axile (b) Parietal
(c) Free central (d) Basal

NEET-2019

Ans. (b) : Placentation - ovules are attached to the inner wall of ovary called placenta and arrangement is called placentation.

In parietal placentation, the ovules develop on the inner wall of the ovary or in the peripheral part.

eg - Mustard, Argemone, etc.



643. The scutellum observed in a grain of wheat or maize is comparable to which part of the seed in other dicotyledons

(a) Aleurone layer (b) Plumule
(c) Radicle (d) Cotyledon

JCECE-2018

@apna_pdf

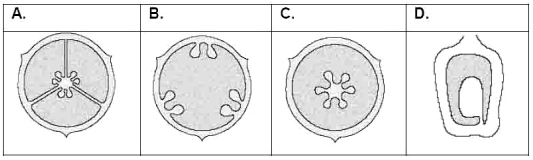
Ans. (d) : Embryo of monocotyledons have only one cotyledons called scutellum.

• The embryonic axis runs the length of the embryo. On end of the embryonic axis is the plumule, the young shoot apex, which includes the shoot apex. Which includes the shoot apical meristem and developing leaf primordia. At the other end of the embryonic axis is the radicle.

• The embryonic axis does not include the catyledons. The portion of the embryo between the cotyledon attachment point and the radicle is known as the hypocotyl.

The portion of the embryonic axis between the cotyledon attachment and the shoot tip is the epicotyl.

644. Select the correct matching



(a) A – Tomato, B - Argemone, C- Dianthus, D - Sunflower
(b) A – Dianthus, B - Argemone, C- Tomato, D - Sunflower
(c) A – Tomato, B - Sunflower, C- Dianthus, D - Argemone
(d) A - Argemone, B - Tomato, C- Dianthus, D - Sunflower

AIIMS-26.05.2018 Shift-II

Ans. (a) :

Placentation - The arrangement of ovules within the ovary is known as **placentation**.

• When the placenta is axial and the ovules are attached to it in a multilocular ovary the placentation is called as axile.

eg- China rose, Tomato and Lemon.

• The ovule develops on the inner wall of the ovary or on peripheral part, is called as **parietal placentation**.

eg- Mustard and Argemone.

• When the ovules are borne on central axis and septa are absent is called **free central placentation.**

eg- Dianthus and Primose.

• The placenta develops at base of ovary and a single ovule is attached to it is called **basal placentation**.

eg- Sun flower and Marigold.

645. Albuminous seeds are found in

(a) Pea, Groundnut, Castor
(b) Castor, Sunflower, Barley
(c) Wheat, Barley, Castor
(d) Pea, Groundnut, Sunflower

AIIMS-26.05.2018 Shift-II

Ans. (c) : Albuminous seeds are those seeds that restores some part of endosperm during the embryonic development.

For example-Maize, Barley, Castor, Wheat and Sunflower.

• **Non albuminous seeds** like that consume the entire endosperm during embro development.

Example - Groundnut and Peas etc.

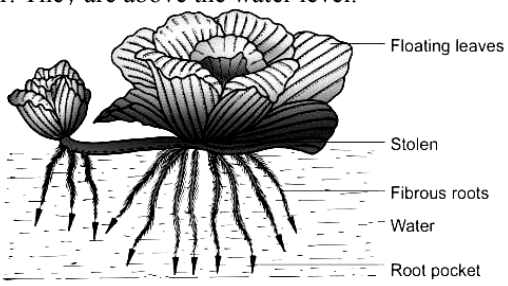
646. Pollination in water hyacinth and water lily is brought about by the agency of

(a) water (b) insects or wind
(c) birds (d) bats

NEET-2016 Phase-II

Ans. (b) : Water hyacinth and water lily despite being hydrophytes, shows pollination by insects or wind, not by water.

• This is because the flowers are not submerged in water. They are above the water level.



647. Heterospory and seed habit are exhibited by a plant possessing :

(a) petiole (b) ligule
(c) bract (d) spathe

BVP-2000
Haryana PMT-2001

Ans. (b) : Heterospory means production of two different sizes of spores - megaspore and microspore. Ligule the word ligule comes from latin "ligula" which mean strap. It is a thin outgrowth at the junction of leaf and leafstalk.

eg:- *Selaginella, marsilea, Azolla, Salvinia* etc.

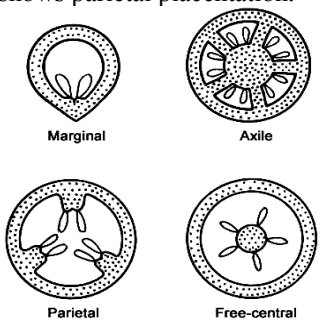
648. Axile placentation is present in

(a) Argemone (b) Dianthus
(c) Lemon (d) Pea

AIPMT (Re-Exam)-2015

Ans. (c) : Placentaion refers to the arrangement of ovules within the ovary.

• Axile placentation is seen in Lemon, chinarose and tomato.
• Free central placentation in dianthus and stellaria,
• Pea shows marginal placentation.
• Argemone shows parietal placentation.



@apna_pdf

• Axile placentation is the type of placentation in which carpels are folded inward with ovules placed along the central axis of the ovary.
Placenta is axial and the ovules are formed at the angles where the septa Join central placenta.

649. Non-albuminous seed is produced in:-
(a) Maize (b) Castor
(c) Wheat (d) Pea

AIPMT-2014

Ans. (d) : Pea is an example of a non-endospermic seed. Endosperm is the nutritive tissue that is found in seeds. In dicots, the endosperm is remobilized into the developing cotyledon which functions as the storage tissues.
Maize, castor and wheat are endospermic or albuminous seeds. Endosperm is a food reserve for the developing plant embryo. Food reserve is in the form of starch, proteins, oils and other nutrients. Except orchids most of the monocotyledonous seeds are endospermic.

650. Which one of the following statements is correct?
(a) The seed in grasses is not endospermic
(b) Mango is a parthenocarpic fruit
(c) A proteinaceous aleurone layer is present in maize grain.
(d) A sterile pistil is called a staminode

AIPMT-2014

Ans. (c) : Grasses belongs to poaceae family and its seeds are endospermic.
• Mango is a seeded fruit.
• A sterile stamen is called staminode e.g. of sterile flower **Ray Florets of Sunflower.**
• The cells of aleurone layer are filled with proteinaceous aleurone grains which play an important role at the time of germination.

651. Seed coat is not thin, membranous in :
(a) Gram (b) Maize
(c) Coconut (d) Groundnut

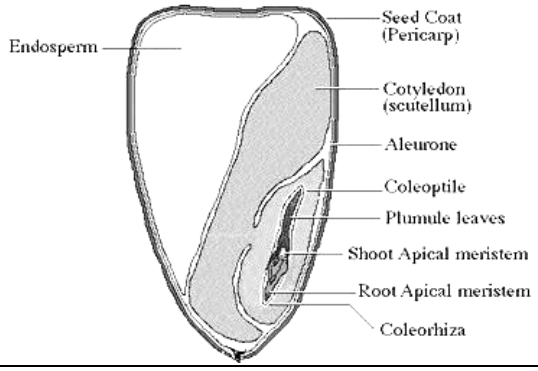
NEET-2013

Ans. (c) : Seed coat is the outer protective covering of seeds that resist deterioration of the quality of seeds.
The seed coat develops from the two integument or it is formed by outer layers of ovules cell. The seed coats are modified distinctly in different species of plant. In drupes that are fleshy fruits, the seed coat is usually membranous. It has an outer fleshy part called exocarp or skin that is surrounded by mesocarp or flesh form inside. The mesocarp further encloses a shell of hardened endocarp having a seed inside it.
In Gram, Maize and Ground nut thin membranous seed coat are present. Groundnut is a dry dehiscent fruit known as legume. Gram and Maize are indehiscent dry fruit known as grain or caryopsis.

652. In a cereal grain the single cotyledon of embryo is represented by
(a) Coleorhiza (b) Scutellum
(c) Prophyll (d) Coleoptile

AIPMT-2006

Ans. (b) : Cereal grain is a monocotyledonous seed. In the monocot seed, cotyledon is represented by the structure called **scutellum.**
Scutellum is the one large shielded cotyledon of a monocot plant. In germinating grains, the scutellum allows the transport of nutrients from the starchy endoperm to the growing embryo.



653. Which of the following crops have been brought to India from new world : -
(a) Cashewnut, potato, rubber
(b) Mango, tea
(c) Tea, rubber, mango
(d) Coffee

AIPMT-2002

Ans. (a) : Cashew plants native to south and central America are mostly grown in Central America, the caribbean and Northern South America, including Northeas Brazil.
• Potato is a native to South America. The major potato growing countries include the USA, Russia, France, Poland, UK etc.
• The rubber tree is a native of the southern Amazon valley in South America.
• Mango is native to Southern Asia (China).
• The Common coffee is native to Abyssinia.

654. Geocarpic fruit is : -
(a) Potato (b) Peanut
(c) Onion (d) Garlic

AIPMT-2002

Ans. (b) : Geocarpy is a very rare type of plant reproduction. Geocarpic means producing or ripening the fruit beneath the surface of the ground. So ground nut (Peanut) is the best example of geocarpic fruit.

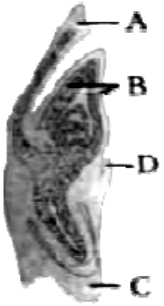
655. Which type of association is found in between entomophilous flower and pollinating agent : -
(a) Mutualism (b) Commensalism
(c) Coperation (d) Co-evolution

AIPMT-2002

Ans. (a) : Mutualism is a biological interaction between organisms of different species in which each individual receives the benefited. **Entomophilous flower** and pollinating agent are shows the mutualistic relationship. The plant uses its pollinator to ensure cross-pollination while pollinator uses the plant as food.

@apna_pdf

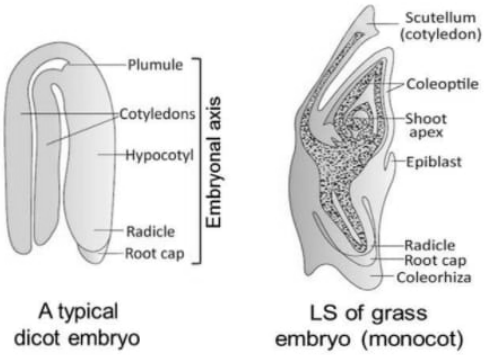
656. Identify the parts labeled A, B, C and D in the given figure and select the correct option.



(a) A–Scutellum; B–Epiblast; C–Coleoptile; D–Coleorhiza
(b) A–Scutellum; B–Coleorhiza; C–Coleoptile; D–Epiblast
(c) A–Scutellum; B–Coleoptile; C–Coleorhiza; D–Epiblast
(d) A–Epiblast; B–Coleoptile; C–Coleorhiza; D–Scutellum

AIIMS-2016

Ans. (c)



A. Scutellum– It is a membrane absorbing nutrients from the endosperm, transferring sugars and amino acids to the developing plant.
B. Coleoptile– Formatin of shoot parts they help in the emergence of the first leaf by protecting it during its passage through the soil.
C. Coleorhiza– Formation of root parts acts as a defense layer for the root and the root cap.
D. Epiblast– It is secondary cotyledon. It store and supplies nutrients to the developing plant.

657. In which one of the following would you expect to find glyoxysomes ?

(a) endosperm of wheat
(b) endosperm of castor
(c) palisade cells in leaf
(d) root hairs.

AIIMS-2005

Ans. (b) : Glyoxysomes are the specialized peroxisomes that contain enzymes for β-oxidation of fatty acids and glyoxylate pathways. It is abundant in germinating oilseeds. They are basically responsible for the glyoxylate cycle in which fats is converted into carbohydrates. Glyoxysomes are found in the endosperm of castor because it contains oil but not found in wheat because it is carbohydrate rich.

658. In groundnut the food/oil reserve is present in

(a) epicarp (b) mesocarp
(c) endosperm (d) cotyledons

AIPMT-1990

Ans. (d) : Cotyledons are the leaves of embryo usually store food for the use of embryo during development Groundnut is economically important plant as edible oil is obtained form the cotyledons. Peanuts are a significant source of **resveratrol** a chemical studied for potential anti-aging effects.

659. Which plant will lose its economic value if its are produced by induced parthenocarpy?

(a) Orange (b) Banana
(c) Grape (d) Pomegranate

AIPMT-1997

Ans. (d) : Seeds having fleshy testa are the edible parts in pomegranate. Thus parthenocarpic seed can not be produced in pomegranates.
Parthenocarpy is the production of fruit without fertilization of ovule the production of fruits which pollination is difficult.

660. For the germination of which of the following dormant seeds, would you recommend scarification method as an effective treatment?

(a) coconut (b) rice
(c) cotton (d) sorghum

AP EAMCET-1998

Ans. (c) : Seed scarification is a technique to physically damage the seed coat to reduce hard seed while keeping the seed viable. To break the dormancy and to promote the germination, scarification process is applied. Seed-coat is very hard in cotton.

661. The embryo of sunflower has:

(a) one cotyledon (b) two cotyledons
(c) many cotyledons (d) scutelum

BHU PMT-2002

Ans. (b) : Typical dicotyledonous embryo contains two cotyledons. Sunflowers have two cotyledons when its seed germinates.

662. The plant part which can respire without oxygen is?

(a) Root (b) Stem
(c) Seed (d) Leaf

Rajasthan PMT-1996

Ans. (c) : Seeds undergo anaerobic respiration to release energy in the absence of oxygen. Therefore seed can respire without oxygen.
Roots respire in presence of oxygen and they die in anaerobic conditions
Leaf and stems exchange gases from the atmosphere due to the presence of stomata. In the absence of oxygen stem and leaf cell undergoes death.

663. The orthodox seed is found in (1) coconut (2) legumes (3) jack fruit (4) cereals

(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2009

@apna_pdf

Ans. (c) : Orthodox seeds (Recalcitrant seeds)- Seed which have ability to with sand in low moisture and temperature. Cereals legumes, can tolerate reduction in moisture content, exposure to low temperatures and anaerobic conditions.

664. The examples of cellular endosperm are (1) Citrus, Malea, Primula (2) Adoxa, Cetranthus, Datura (3) Phoenix, Acer, Arachis (4) Impatiens, Magnolia, Cetranthus

(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2009

Ans. (c) : Endosperm is a nutritive tissue for developing embryos in Angiosperms.When the primary endosperm mother cell divides by mitotic divisions and each division is followed by a cell wall formation, it is known as cellular endosperm, eg. Adoxa, Cetranthus, Datura, Impatiens, Magnolia etc.

• In angiosperm, the endosperm develops from a tripoid (3n) primary endosperm nucleus which is formed as a result of the fusion of a male gamete with the secondary nucleus of central cell.

665. Edible oil is obtained from seeds of : (1) *Helianthus annuus* (2) *Helianthus tuberosus* (3) *Carthamus tinctorius* (4) *Bells perennis*

(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2005

Ans. (d) : Edible oil is derived from sunflowers (*Helianthus annuus*) seeds. It is safe to use in cosmetic and skin care products. It is non - volatile air which is pressed from the sunflower seeds.
Carthamus tinctorius is a high linoleic acid oil (70%) and has only smaller amounts of oleic acid (11%). It contains antioxidant vitamin(E) and might help in reducing the risk of heart diseage.

666. Micropyle occurs in : (1) seeds (2) ovule (3) ovary (4) stigma

(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2005

Ans. (b) : Micropyle is an opening part of the embryo which is covered by the integuments in ovules, after fertilization ovules are converted into seeds. So, micropyle occurs in both ovule and seed.

667. A seed which does not require oxygen for germination ? (1) Pea (2) Rice (3) Onion (4) Typha

(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2005, 2008

Ans. (c) : Rice and Typha can be stored for long time as they can tolerate reduction in moisture content (upto 5%) exposure to low temperature and anaerobic conditions. Rice and Typha seeds are able to germinate anaerobically by means of coleptile elongation.

668. Orchid seeds are

(a) large and sticky (b) Small and hairy
(c) Small and light (d) Large and heavy

BHU PMT (Mains)-2011

Ans. (c) : Orchid seeds are small, dry and light weight and can be carried by wind to over 1000 kms. These are smallest seeds (0.004 mg) is angiosperms.

669. A simple one seeded fruit, in which pericarp is fused with seed coat is

(a) Achene (b) Caryopsis
(c) Cypsela (d) Nut

J&K CET-2008

Ans. (b): Caryopsis is a specialized type of dry, one - seeded fruit (achene), characteristic of grasses, in which the ovary wall is united with the seed coat. Buckwheat is exception of caryopsis. Caryopsis is a type of simple fruit.

• Achene is a small, dry one seeded fruit but this fruit does not open to release the seed.

• Nut is a type of fruit that has edible seed and is covered with a hard inedible shell.

• Cypsela is a dry, one seeded fruit developing from a syncarpous, inferior, bicarpellary ovary.

670. Parachute mechanism of seed dispersal is seen in:

(a) Poppy (b) Helianthus
(c) Plumbago (d) Lotus

JCECE-2005
Manipal-2000

Ans. (b) : Parachute mechanism:- some seeds are light and float in the wind. These seeds land and grow in new places.
It is a characteristic of family compositae (Asteraceae family), e.g. Helianthus (sunflower).

671. Aleurone grains are rich in:

(a) fat (b) protein
(c) carbohydrates (d) auxins

HP CET-2011
Rajasthan PMT-2007

Ans. (b) : The Aleurone layers are found around the peripheral part of endosperm of monocot seed. These grains are rich is protein specially hydrolytic enzymes.

672. Seed may be defined as

(a) Ripened ovule (b) Fertilized ovary
(c) The gynoecium (d) Embryo

BHU PMT (Screening)-2007

Ans. (a) : After fertilization, ovary is converted into fruit and ovule is converted into seed. So, seed may be defined as ripened ovule and fruit may be defined as ripened ovary or fertilized ovary.

673. The portion of embryonal axis above cotyledon is called as

(a) epicotyl (b) hypocotyl
(c) coleoptile (d) radicle

J&K CET-2012

@apna_pdf

Ans. (a) : The portion of embryo below the attachment of cotyledons is called hypocotyl (contains radicle) and portion of embryo above the attachment of cotyledons is called epicotyl (contains plumule)

674. Seeds possess spongy aril in

(a) Eichhornia (b) Potamogeton
(c) Sagittaria (d) Nymphaea

BCECE-2010

Ans. (d) : Seed possess spongy aril in Nymphaea (water lily). The fruit dehiscence by the swelling of mucilage surrounding the seeds. Thus the seed become free. The seeds arillated and they are enclosed in an additional layer of cell i.e. aril. It is a spongy layer of cells having air spaces in between. So, it provides buoyancy to the seeds.

675. The seed coat in both gymnosperms and angiosperms is derived from the

(a) megaspore (b) microspore
(c) megasporangium (d) microsporangium

AMU-1999

Ans. (c) : Megasporangium is a sporangium which produces only megaspores. It produces female gametes or megaspores.

676. The conspicuous protein-storing layer of endosperm in cereal grains Contains

(a) ribosomes (b) microbodies
(c) aleurone grains (d) starch grains

AMU-1999

Ans. (c) : Aleurone grains:- They represent the storage proteins which are generally insoluble and occur inside special leucoplasts called **aleuroplast**.

677. How does the ephemeral Tripulus tide over the dry conditions?

(a) By its tuberous stem
(b) By its aerial stem
(c) By lying in the forming of seeds
(d) By storing water in different parts of its body

AP EAMCET-2003

Ans. (c) : Ephemeral are short lived xerophytes which do not have capacity to endure or tolerate drought. At the return of favorable conditions which are for a very short duration then seeds germinate in new plants they emerge during early spring or rainy season

678. Each carpel of Gloriosa encloses 60 ovules, out of which 27% became abortive and another 13% could not be fertilized due to various reasons. How many seeds occur in the capsule if all the remaining ovules are fertilized in the lone flower of the plant?

(a) 36 (b) 76
(c) 108 (d) 180

AP EAMCET-2004

Ans. (c) : Ovules in the ovary become seeds when the ovary is developing into a fruit.

Since Number of fertilized ovule will be equal to number of seeds produced

Gynoecium of Gloriosa contains 3 carpels, number of ovules in each carpel is given = 60

Therefore, number of ovules in 3 carpels = 60 × 3 = 180

abortive ovules = 27%

unfertilized ovules = 13%

Therefore, total number of fertilized ovules = 100 – (27 – 13) = 60

So, No of seeds in a cone flowers of Gloriosa = 60% of

$180 = \frac{60 \times 180}{100} = 108$

679. Study the following table:

List-I (Structure before seed formation)	List–II (Structure after seed formation)
A. Funiculus	1. Hilum
B. Scar of ovule	2. Tegmen
C. Zygote	3. Testa
D. Inner integument	4. Stalk of seed
	5. Embryo

Identify the correct match.

	A	B	C	D
(a)	4	1	5	2
(b)	3	4	1	5
(c)	5	1	2	4
(d)	4	5	3	2

AP EAMCET-2004

Ans. (a) : Funiculus:- The stalk by which on ovule or seed is connected to the placenta in the ovary.

Funiculus after seed formation develope into the stalk of seed.

Scar of ovule:- The body of the ovule fused with the funicle in the region called hilum. The hilum is the scar that is present on the seed

Zygote:- The fertilized egg is called zygote. The two celled zygotic stage till the initiation of organs in embryo is commonly called proembryo stage

Inner Integument:- Ovule has one or two protective envelope called integuments. The inner integument forms the tegmen

680. The outermost layer of maize endosperm is known as

(a) perisperm (b) aleurone
(c) tapetum (d) endothelium

Haryana PMT-2007

Ans. (b) : Endosperm is the most nutritive tissue for developing embryos in angiosperms. The outer - most layer of maize endosperm is known as aleurone. The cell of aleurone layers are filled with proteinaceous aleurone grains which play an important role at time of germination.

681. The part of the castor seed that yields oil is

(a) cotyledon (b) caruncle
(c) endosperm (d) nucellus

CG PMT-2009
Haryana PMT-2009

Ans. (c) : The part of the castor seed that yields oil is endosperm. Endosperm is a nutritive tissue for developing embryo and also contain protein and oils. castor oil is a nutrient-rich vegetable oil that is used for skin, hair, constipation and in many other cases.

@apna_pdf

Directions: In the following question more than one of the answers given may be correct. Select the correct answer and mark it according to the code:

682. Consider the following statements
(1) the seed of pea is exalbuminous
(2) the fruit of peach is drupe
(3) the seed of tomato is albuminous
(4) the fruit of coconut is berry
(a) 1, 2 and 3 are correct.
(b) 1 and 2 are correct.
(c) 2 and 4 are correct.
(d) 1 and 3 are correct.

BHU PMT (Mains)-2008

Ans. (a) : Albuminous seed :- These are the seeds where endosperm still persists after development till maturity.
Example :- Wheat, maize, barley, sunflower, coconut and castor etc.
Exalbuminous seed:- In this type, the endosperm is completely consumed during development.
Example:- Pea, bean etc.
• Drupe is a fleshy fruit with thin skin and a central stone containing the seed
ex – Mango, Coconut, Peach etc.
• The seed of tomato is albuminous.

Directions: In the following question more than one of the answers given may be correct. Select the correct answer and mark it according to the code:

683. The seeds, which have separate endosperm
(1) maize (2) onion
(3) rice (4) bean
(a) 1, 2 and 3 are correct.
(b) 1 and 2 are correct.
(c) 2 and 4 are correct.
(d) 1 and 3 are correct.

BHU PMT (Mains)-2008

Ans. (a) : Endospermic or albuminous seeds are those seeds which have stored their food materials in endosperm. eg. maize, onion, rice.
The seeds which stored their food materials in cotyledon are called non-endospermic seeds. eg. pea, bean.

684. The cotton thread fibres are
(a) fibres taken out from stem
(b) epidermal hair of seed
(c) epidermal hair of fruits
(d) fibres taken out from roots

CG PMT-2006

Ans. (b) : Cotton fibers come from plants in the malvales order, which is a part of the malvaceae family. Cotton fibers are trichome or seed coat hairs that emerge from the developing cotton seed's epidermal cells. So, cotton fibres are actually epidermal hairs of seeds.

685. Pure cellulose is obtained from
(a) root hairs (b) stem hairs
(c) leaf hairs (d) seed hairs

BHU PMT (Screening)-2011

Ans. (d) : Pure cellulose is odorless, flavorless, hydrophilic, insoluble in water and biodegradable. It has melting point of 467° C. It is obtained from seed hairs.

686. In pulses the proteins are stored in:
(a) endosperm (b) cotyledons
(c) pericarp (d) seed coat

AP EAMCET-2002

Ans. (b) : Cotyledon is also known as the storage unit of a seed, as it provide nutrients to the different parts of an embryo. It refer to the significant part of the embryo found within the seed. So, in pulses the proteins are stored in cotyledons.

687. The number of cotyledons in Cuscuta are:
(a) one (b) two
(c) always polycotyl (d) none of these

Haryana PMT-2003

Ans. (d) : Monocotyledons comprises a single cotyledon emerging from the seeds after seed germination where as two cotyledons emerging from the seeds after seed germination is known as dicotyledonous. Cuscuta is a dicot plant has no cotyledons because they are converted into a thread like hypocotyls. It is parasitic flowering plant that is found in the tropical and temperate regions.

688. Seeds which are able to withstand reduction in moisture and temperature are called:
(a) dormant seeds (b) orthodox seeds
(c) recalcitrant seeds (d) non-viable seeds

CMC Vellore-2007

Ans. (b) : Orthodox seeds can withstand in low moisture and temperature. It can be stored for long time and they can tolerate reduction in moisture content exposure to low temperature and anaerobic conditions.

689. The remnant of nucellus in the seed is:
(a) endosperm (b) aril
(c) cotyledon (d) perisperm

AP EAMCET-2000

Ans. (d) : Persistent nucellus is called perisperm. It persist outside the endosperm as a thin layer.
In some seeds such as black pepper and beet, remnants of nucellus are also persistent. This residual, persistent nucellus is the perisperm.

690. Seed habit was first originated in
(a) ferns (b) cycadofilicales
(c) gymnosperms (d) mosses

CMC Ludhiana-2007

Ans. (a) : The production of two types of spores in heterosporous plants.
(i) The smaller ones are called microspores.
(ii) The larger ones are called megaspores.
• Experimental studies on selaginella and marsilea suggest that nutritional factors mainly govern the heterospory.
• Seed habit is the most complete end evolutionary successful method of sexual reproduction.
• Cycadofilicales:- An extinct order of gymnosperms that flourished in the carboniferous period.

@apna_pdf

691. A fruit in which seed coat and fruit wall is fused known as caryopsis present in

(a) Wheat (b) Sunflower
(c) Mango (d) Tomato

BCECE-2008

Ans. (a) : The pericarp is closely fused with seed coat. Caryopsis is very small, dry and one - seeded fruit. It is also known as grains or cereals.

692. Perisperm is the

(a) remains of nucellus
(b) outer part of embryo sac
(c) degenerated synergid
(d) degenerated secondary nucleus

Haryana PMT-2011

Ans. (a) : Nutritive tissue of a seed derived from the nucellus and deposited external to the embryo sac distinguished from endosperm.
In some seeds such as black pepper and beet, reminants of nucellus are persistent. This residual, persistent nucellus is the perisperm.

693. Scutellum of maize is called

(a) coleorhiza (b) cotyledon
(c) coleoptile (d) hypocotyls

Haryana PMT-2011

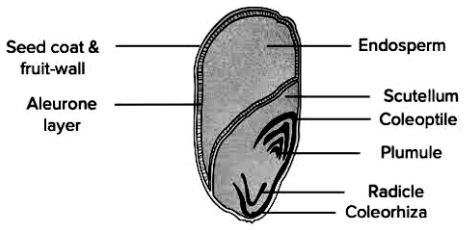
Ans. (b) : Embryos of monocotyledons possess only one cotyledon. In the grass family the cotyledon is called scutellum that is situated towards one side (lateral) of the embryonal axis. At its lower end, the embryonal axis has the radical and root cap enclosed in an undifferentiated sheath called coleorhizae. The portion of the embryonic axis about the level of attachment of scutellum is the epicotyls. Epicotyls has a shoot apex and a few leaf primordial enclosed in a hollow foliar structure, the coleoptiles.

694. Cotyledon of maize grain is called

(a) scutellum (b) plumule
(c) coleorhiza (d) coleoptile

NEET-2016 Phase-I

Ans. (a) : Cotyledon of maize grain is called **scutellum.** In maize grain, the embryo is small and situated in a groove at one end of the endosperm. It consists of one large and shield shaped cotyledon known as scutellum and a short axis with a plumule and radicle. The radicle lies towards, the pointed side of the embryonic region of the seed. It is covered by a protective sheath called **coleorhiza.** The plumule is located towards the upper side of the embryonic region opposite to radicle. It is also enclosed in a protective sheath known as coleoptile.

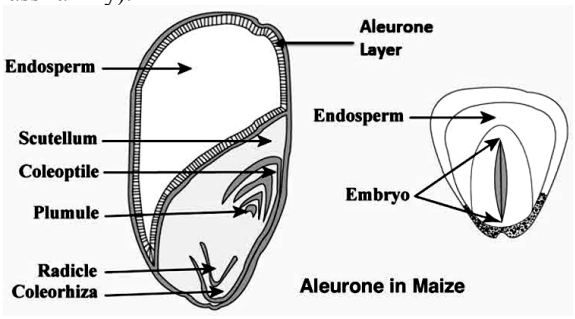


695. The scutellum observed in a grain of wheat or maize is comparable to which part of the seed in other monocotyledons?

(a) Cotyledon
(b) Endosperm
(c) Aleurone layer
(d) Plumule

AIPMT (Screening)-2010

Ans. (a) : The scutellum is referred to as equivalent to thin cotyledon in monocots (especially members of the grass family).



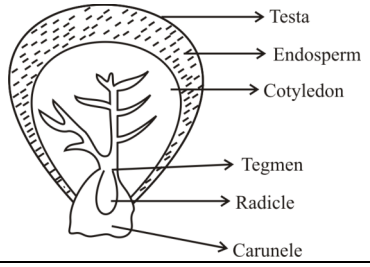
It is very thin with high surface area and serves to absorb nutrients from the endosperm during germination.
Endosperm- endosperm is a tissue produced inside the seeds of the flowering plants following double fertilization. It is triploid in most species.

696. An example of a seed with endosperm, perisperm and caruncle is -

(a) Castor (b) Cotton
(c) Coffee (d) Lily

AIPMT-2009

Ans. (a) : In castor (*Ricinus communis*, family:- Euphorbiaceae) seeds testa and tegmen are united together. They possess, endosperm which acts as the food storage tissue for the seed. They also possess perisperm and caruncle. It is a white spongy bilobed outgrowth present near the narrow end of the seed.



697. The plant whose seeds are known to live the longest viability period is

(a) Carica papaya (b) Triticum aestivum
(c) Zizyphus mauritiana (d) Nelumbo nucifera

JIPMER-2015

Ans. (d) : Viability of Seeds : The ability of seeds to retain their germination power for some time is called viability. It is maximum in lotus *(Nelumbo nucifera),* under favorable conditions, the seeds of this aquatic perennial can remain viable for many years.

698. By which action a seed coat becomes permeable to water:

(a) Scarification (b) Stratification
(c) Vernalization (d) All of the above

AIPMT-2000

@apna_pdf

Ans. (a) : Scarification is a pretreatment of seeds that aims to break seed dormancy and accelerate the occurence of uniform seed germination.

• **Scarification** involves weakening, opening or altering the coat of a seed to encourage the germination. It can be done mechanically, thermally and chemically. This will make the seed coat permeable for water and air, which will help in germination of seed.

• The process by which plants use a prolonged cold period-winter-to promote flowering is known as vernalization.

Somewhere, all these processes are used to break the dormancy the seeds naturally as well as artificially.

699. Albuminous seeds store their reserve food mainly in

(a) Perisperm (b) Endosperm
(c) Cotyledons (d) Hypocotyl

NEET (Karnataka)-2013

Ans. (b) : In some seeds, the endosperm persists in the seed as food storage tissue. Such seeds are called endospermic or albuminous.

eg. castor, maize, wheat, barley, rubber, coconut.

700. The viability of seeds is tested by

(a) Safranine
(b) 2, 6 dichlorophenol indophenols
(c) 2, 3, 5 triphenyl tetrazolium chloride
(d) DMSO

NEET (Karnataka)-2013

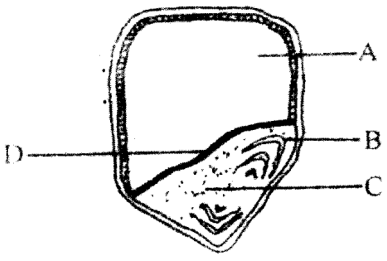
Ans. (c) : Viability of seeds can be known by two methods:

(i) Ability to germinate.
(ii) Testing their ability to respire.

All viable seeds respire. This can be tested by immersing a section of seed containing the embryo in 0.1% solution of triphenyl tetrazolium chloride.

- The viable embryo will turn pink due to conversion of colourless triphenyl tetrazolium chloride into insoluble coloured dye called triphenyl formazan due to reduction.

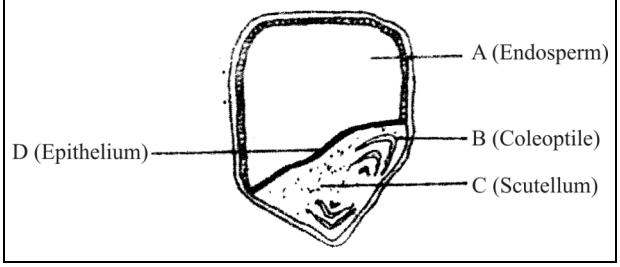
701. The diagram of the section of a maize grain is given below. Identify the parts labelled A, B, C and D.



(a) A - Cotyledon, B - Coleoptile, C - Scutellum, D - Epithelium
(b) A - Endosperm, B - Coleoptile, C - Scutellum, D - Epithelium
(c) A - Endosperm, B - Coleorrhiza, C - Scutellum, D - Epithelium
(d) A - Endosperm, B - Coleoptile, C - Scutellum, D - Alcurone layer

Karnataka CET-2009

Ans. (b)



702. Aleurone layer is found in

(a) embryo (b) nucellus
(c) endosperm (d) endodermis

UP CPMT-2005

Ans. (c): The periphery of the endosperm of many plant species forms an epidermis like layer called the **aleuronic**. During germination, the aleuronic performs an important digestive function secreting hydrolases to break down the starch and proteins stored in the starchy endosperm cells.

703. Aleurone grains are rich in

(a) fat (b) protein
(c) carbohydrates (d) auxins

JIPMER-2014

Ans. (b) : The aleurone grain is specially rich in proteins. Aleurone is taken from the greek word aleuron which means flour. These proteins are present in the protein granules of maturing seed and tubers.

704. Which of the following plant parts can respire even in the absence of oxygen?

(a) Seeds (b) Roots
(c) Stems (d) Leaves

Karnataka CET-2006

Ans. (a) : Seeds can respire even in the absence of oxygen, because seed coats are very tough barriers, to protect the seed from extreme conditions. Seed germination is large energy-driven process. So to compensate for lack of oxygen, germinating seeds adopts anaerobic respiration.

L. Plant Family

705. Lady finger belongs to family

(a) Malvaceae (b) Cucurbitaceae
(c) Liliaceae (d) Brassicaceae

CMC Vellore-2009,2012
JIPMER-2010
Rajasthan PMT-2008,2009
Punjab MET-2009
UP CPMT-2008,2009
BHU PMT(Screening)-2005

Ans. (a) : Lady finger *(Abelmoschus esculentus)* belongs to family Malvaceae. Lady finger is also known as Ochra or Okra.

• In malvaceae family near about 829 genera and 1500 species found in tropical and subtropical areas.

@apna_pdf

706. Pencils are prepared from the wood of:

(a) Pinus vinartex
(b) Juniperus virginiana
(c) Chamaecyparis pisifera
(d) Abies pindrow

Haryana PMT-2005
JIPMER-2005
BHU PMT-2003

Ans. (b) : *Juniperus virginiana* wood is used for preparing pencils. It also known as red cedar, eastern red cedar.

• Chamaecyparis commonly called cypress or false cypress. It is used as a material of building palaces, temples, shrines etc.

707. Identify the floral formula of plant belonging to potato family.

(a) ♀ $K_{(5)}, C_5, A_{(9)+1}, G_1$

(b) ⊕ ♀ $K_{(5)}\ \overset{\frown}{C_{(5)}}\ A_5\ \underline{G}_{(2)}$

(c) ♀, $K_{(10)}, C_{10}, A_{10}, G_{(2)}$

(d) ♂, $P_{3+3}, A_{3+3}, G_{(3)}$

Karnataka CET-20.05.2023

Ans. (b) : The floral formula of plants belonging to solanaceae family like potato, tomato. etc. are,

⊕ ♀ $K_{(5)}\ \overset{\frown}{C_{(5)}}\ A_5\ \underline{G}_{(2)}$

(1) Flower : Bisexual and actinomorphic.
(2) Calyx : Five sepals, united, persistent.
(3) Corolla : petal five, united, valvet aestivation.
(4) Androecium : Stamens five, epipetalous.
(5) Gynoecium : Bicarpellary, syncarpous, ovary superior, bilocular.

708. Bi- collateral vascular bundles can be found in these plants

A - Smilax zeylanica
B - Lilium candidum
C - Lycopersicon esculentum
D - Withania somnifera

(a) A , C (b) B, D
(c) C, D (d) B, C

AP EAPCET-22.05.2023, Shift-I

Ans. (c) : Bicollateral vascular bandles are found in stem of Solanaceae family.
Example-
(C) Cherry tomato → *Lycopersicum esculentum*.
(D) Ashwagandha → *Withania somnifera*.
Other examples-
Potato → *Solanum tuberosum*
Chilli → *Capsicum frutescens*
Tobacco → *Nicotiana*

709. Find the correct matching

(A)	**Carrot**	**:**	**Flowers appear from the same point of peduncle**
(B)	**Cocos**	**:**	**Flowers protected by the modified bract**
(C)	**Achyranthes**	**:**	**Flowers appear in the varied lengths of pedicels**
(D)	**Cassia**	**:**	**Flowers appear on the flattened peduncle.**

(a) A C (b) A D
(c) B C (d) A B

AP EAPCET-22.05.2023, Shift-I

Ans. (d) :
• Carrot → Flowers appear from the same point of peduncle
• Cocos → Flowers protected by the modified bract

710. Match the following:

Column-I		Column -II		Column -III	
A.	Opioids	M.	Opium poppy	I.	Receptors are present in CNS and GI tract.
B.	Cannabinoids	N.	Cannabis sativa	II.	Abused by sports persons
C.	Cocaine	O.	South American Plant	III.	Crack
D.	Heroin	P.	Diacetyl morphine	IV.	Smack

(a) A-M-I B-N-II C-O-III D-P-IV
(b) A-P-IV B-O-III C-N-II D-M-I
(c) A-N-II B-O-III C-P-IV D-M-I
(d) A-O-III B-P-IV C-M-I D-N-II

AP EAPCET-23.05.2023, Shift-II

Ans. (a) :
• Opioids → Opium poppy → Receptors are present in CNS and GI tract
• Cannabinoids → Cannabis sativa → Abused by sports persons
• Cocaine → South American Plant → Crack
• Heroin → Diacetyl morphine → Smack

711. The drugs that cause sleeplessness

(a) LSD (b) Barbiturates
(c) Amphetamines (d) Benzodiazepines

AP EAPCET-23.05.2023, Shift-II

Ans. (c) : Amphetamines cause sleeplessness. Amphetamines are the stimulant drugs. They make the messages between our brain and body move fast. Some people use amphetamines to help them stay awake on the job, driving or to study for exam.

712. Bicollateral vascular bundles are found in

I. Roots of solanaceae members
II. Stems of solanaceae members
III. Leaves of solanaceae members
IV. Stems of liliaceae members

@apna_pdf

(a) I, II, III only (b) II and IV only
(c) II only (d) I, II, III, IV

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : Bicollateral vascular bandles are found in stem of Solanacea members/family. It have phloem on both side which means xylem bundles are sandwiched between phloems.
Plants blonging to this family are tomato, brinjal, potato, spices (chilli), tobacco, petunia, belladonna and ashwagandha.

713. Carpels and Stamens are in 1 : 2 ratio in the following family
(a) Brassicaceae (b) Solanaceae
(c) Fabaceae (d) Liliaceae

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : Liliaceae-commonly known as lily family. It is monocotylendonous plant. Flower of lily family are bisexual and actinomorphic. It have 3 carpels and 6 stamens. So carpels and stamens ratio are in 1:2.

714. In which of the following sets of families, the pollen grains are viable for months?
(a) Rosaceae, Liliaceae and Poaceae
(b) Leguminasae, Solanaceae and Rosaceae
(c) Solanaceae, Poaceae and Lillaceae
(d) Brassicaceae, Liliaceae and Poaceae

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Pollen is a powdery substances produced by flowers of seed plants. It consists of pollen grains, which produce male gametes.
• Pollen viability refers to the ability of pollen to perform its function of deriving male gametes to the embryo sac.
• Pollen viability varies between minutes and years and which primarily depends on abiotic environmental conditions.
• Pollen with a medium life span (approximately 1-3 months). Example Leguminosae, solanaceae, Rosaceae etc.

715. ——— is used as green manure
(a) *Crotalaria juncea*
(b) Azolla
(c) *Azadiracta indica*
(d) *Hevea brassiliansis*

AP EAMCET-12.07.2022 Shift-II

Ans. (a) : *Crotalaria Juncea* known as sun or sun hemp is a tropical Asian plant of the legume family (Fabaceae). It is a green manure crop because it supplies organic matter and additional nitrogen and these are the feature of a green manure crop.

716. Identify the plants having Apocarpous and Syncarpous ovary respectively
(a) Hibiscus, papaver (b) Hibiscus, Annona
(c) Annona,n Michelia (d) Michelia, Papaver

AP EAMCET-12.07.2022 Shift-II

Ans. (d) : Papaver → Syncarpus ovary
Michelia→ Apocarpous ovary
Annona (Custard apple) → Apocarpous ovary
Hibiscus → Syncarpous ovary

717. Which of the following statement is correct with respect to Solanaceae ?
(A) Gamosepalous and persistent calyx.
(B) Epipetalous stamens alternating with the petals.
(C) Free petals in valvate or twisted aestivation
(D) Bicarpellary, syncarpous and bilocular ovary with parietal placentation.
(a) A, B only (b) A, C only
(c) A, D only (d) B, C only

TS EAMCET-30.07.2022 Shift-II

Ans. (a) : Solanaceae family is also called 'potato family.' It is gamosepalous and persistent calyx.
• Epipetalous stamens alternating with the petals.
• Five petals, gamopetalous, valvate aestivation.
• Bicarpellary, syncarpous and bilocular ovary with axile placentation.
Ex. : Potato, Tomato, Atropa, Chilli etc.

718. Which parts of a flower represents the symbols (C), $\underline{G}$ and $\overline{G}$ respectively
(a) Polygamous corolla, inferior ovary and superior ovary
(b) Gamopetalous corolla, superior ovary and inferior ovary
(c) Gamosepalous calyx, inferior ovary, superior ovary
(d) Gamosepalous calyx, superior ovary, inferior ovary

TS EAMCET-30.07.2022 Shift-II

Ans. (b) :
(C) → Gamopetalous corolla
$\underline{G}$ → Superior ovary
$\overline{G}$ → Inferior ovary
A → Androecium
K → Calyx
K_n → Polysepalous calyx
$K_{(n)}$ → Gamosepalous calyx

719. Choose the correct one related to Arachis
(I) Indehiscent (II) Monadelphy
(III) Non-endospermic Seed (IV) Geocarpy
(V) Dehiscent fruit
(a) I, IV only (b) II, IV, V
(c) I, II, V (d) I, II, III, IV

AP EAMCET-11.07.2022 Shift-II

Ans. (d) : *Arachis hypogaea* also known as peanut, groundnut is the source of peanut oil.
• Monadelphy
• Geocarpy
• Indehiscent fruit
• Non-endospermic seed

720. Plant that produces both chasmogamous and cleistogamous flowers is
(a) Oxalis (b) Vallisneria
(c) Zostera (d) Gloriosa

AP EAMCET-11.07.2022 Shift-II

@apna_pdf

Ans. (a) : Some plants produce both chasmogamous and Cleistogamous flowers. These plant are self pollinated plants and do not depend on other plants for pollination. Cleistogamous flowers do not open at all.
Example:- Viola, Oxalis, Commelina etc.

721. Some plants of the following family have swollen leaf base
(a) Leguminosae (b) Asteraceae
(c) Malvaceae (d) Lilliaceae

AP EAMCET-11.07.2022 Shift-II

Ans. (a) : Plants of Leguminosae family have swollen leaf base. A swollen leaf base is also called pulvinus. This swelling occurs due to the change in the turgor pressure. The pulvinus protects the young auxiliary bud.

722. Choose the incorrect statement
(a) Leaves are absent in Taeniophyllum
(b) In Fabaceae root nodules N_2
(c) In onion stem is not fleshy
(d) In potato root tips bulge into tubers

AP EAMCET-11.07.2022 Shift-II

Ans. (d) : Potato tubers are modified stems. They bear, internodes, nodes and axillary buds and used as food.

723. Identify the correct sequence of plants showing the characters given below.
(A) Sunken stomata
(B) Poorly developed mechanical tissue
(C) Plants with mucilage
Options:
(a) Casuarina, Hydrilla, Aloe
(b) Tribulus, Aloe, Hydrilla
(c) Aloe, Tribulus, Hydrilla
(d) Casuarina, Aloe, Opuntia

TS EAMCET-30.07.2022 Shift-I

Ans. (a) :
(A) Sunken stomata :- These stomata are commonly found in plants in arid environments as one of their adaptations to preserve water.
Example :- Casuarina
(B) Poorly developed mechanical tissue:- Mechanical tissues are poorly developed or absent in floating or submerged hydrophytes.
Example:- Hydrilla
(C) Plant with mucilage:- *Aloe vera* contains approximately 98.5% water while the mucilage or gel consists of about 99.5% water.

724. Match the following:

List-I	List-II
(A) Valvate corolla	**(I) Gulmohr**
(B) Funnel shaped corolla	**(II) Vexillary**
(C) Papilionaceous flower	**(III) Calotropis**
(D) Imbricate aestivation	**(IV) Datura**

The correct match is
Options:

	A	B	C	D
(a)	III	II	IV	I
(b)	III	IV	II	I
(c)	I	IV	II	III
(d)	I	II	IV	III

TS EAMCET-30.07.2022 Shift-I

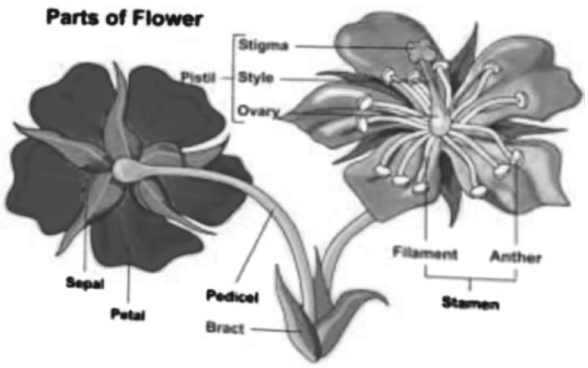
Ans. (b) : **(A) Valvate Corolla –** The aestivation in corolla (petals) of Calotropis is valvate.
(B) Funnel shaped corolla (Infundibuliform) – Datura and several other members of the convolvulaceae family.
(C) Papilionaceous flower – The posterior large petal is called a standard petal, two lateral ones are called wing petals and two fused inferior ones are called keel petals. This type of arrangement of petals is called vexillary.
(D) Imbricate aestivation – In imbricate aestivation the margins of sepals or petals overlap one another but not in any particular direction as in cassia and gulmohur.

725. Find the correct sequence of arrangement of the flower characters in the floral diagram from the posterior to the centre.
(a) A dot or circle, corolla, calyx, gynoecium and androecium
(b) Bract, calyx, androecium and gynoecium
(c) Bract, corolla, calyx, Number of anther lobes and number of locules in placenta
(d) A dot, a circle, calyx, corolla, placentation and number of stamens

TS EAMCET-31.07.2022 Shift-I

Ans. (b) : Each flower has normally four floral whorls from outside to inside as-

Bract → Calyx → Corolla → Androceium → Gynoecium
↓ ↓ ↓ ↓
whorl of sepals | Whorl of petals | whorl of stamens | whorl of pistil/carpel



726. Identify the plant showing following list of characters.
(A) Tepals
(B) Tendrillar climber
(C) Medicinal value
(D) Hypogynous
(E) Ornamental
Options:
(a) Gloriosa (b) Smilax
(c) Asparagus (d) Colchicums

TS EAMCET-31.07.2022 Shift-I

@apna_pdf

Ans. (a) : *Gloriosa superba* is the only species in the autumn - crocus family (colchicaceae)

• The characterstics of this plants are :–

(1) Tepals: - Not clearly differentiated into petals & sepals.

(2) Tendrillar climber:- In glory lily (Gloriosa) leaf tip is changed into a tendril.

(3) Ornamental & Medicinal value:- Climbing lily or glory lilies are grown in green houses or outdoors in the summer & also used for cure arthritis gout, rheumatism, inflammation etc.

(4) Hypogynous:- Hypogynous flowers present in Glory lily.

727. Which of the following statements are correct with respect to the inflorescence in Crotalaria?

A) The peduncle shows an indefinite growth.

B) The peduncle shows a definite growth.

C) The flowers are borne in an acropetal manner on peduncle.

D) The flowers are borne in basipetal manner on peduncle.

Options:

(a) A, D only (b) A, C only

(c) B, C only (d) B, D only

TS EAMCET-31.07.2022 Shift-I

Ans. (b) : Inflorescence in Crotalaria (sunn hemp) family - papilionaceae, the peduncle shows an indefinite growth and the flower are borne in an acropetal manner on peduncle.

728. Plant in which floral buds store food material

(a) Asparagus (b) Agave

(c) Diascorea (d) Onion

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : Floral buds of Agave inflorescence are modified into bulbils. These are aerial modified stem that not only store food material but also involve in vegetative reproduction.

729. The inflorescence found in the family Euphorbiaceae with achlamydeous, unisexual flowers is

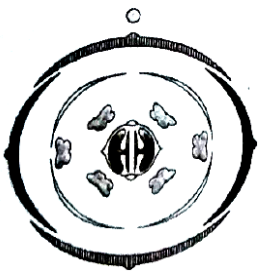
(a) Verticellaster (b) Cyathium

(c) Solitary cyme (d) Hypanthodium

AP EAPCET-11.07.2022 Shift-I

Ans. (b) : The inflorescence found in the family Euphorbiaceae with achlamydeous, unisexual flowers is Cyathium . The existence of achlamydeous flowers which are flowers without a perianth, can be seen in the cyathium inflorescence.

730. The Floral Diagram represents which one of the following families?



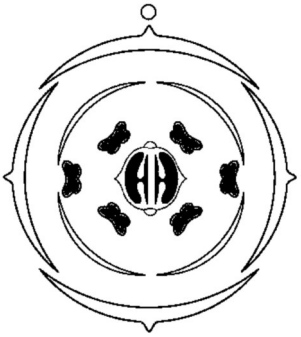
(a) Fabaceae (b) Brassicaceae

(c) Solanaceae (d) Liliaceae

NEET (Re-Exam)-04.09.2022

Ans. (b) : The given floral diagram represent the brassicaceae family.

- The floral diagram of a plant family indicates the structure of its flower. It displays the positioning of the ovary, the number, and arrangement of petals and sepals, as well as all the other components of a flower.
- The *Brassica campestris* plant's floral formula is as follows.



Ebr, Ebrl, ⊕ ♂ K_{2+2} C_4 A_{2+4} $\underline{G}_{(2)}$

731. Which of the following statements are correct with respect to Solanaceae?

(A) Gamosepalous and persistent calyx.

(B) Epipetalous stamens alternating with the petals.

(C) Free petals in valvate or twisted aestivation

(D) Bicarpellary, syncarpous and bilocular ovary with parietal placentation

Options:

(a) A, B only (b) A, C only

(c) A, D only (d) B, C only

TS EAMCET-30.07.2022 Shift-II

Ans. (a) : Characterstic features of solanaceae are

1. Gamoseplous :- Sepals are united or fused.

2. Persistent calyx :- Sepals persist even after fruit formation.

3. Aestivation :- Valvate

732. Which type of carpel is observed in Michelia?

(a) Bicarpellary, syncarpous

(b) Multicarpellary, apocarpous

(c) Multicarpellary, syncarpous

(d) Bicarpellary, apocarpous

GUJCET-2022

Ans. (b) : In Michelia, gynoecium consists of many carpels (multicarpellary) but the carpels are free (apocarpous).

@apna_pdf

733. Match the following lists:

List-I	List-II	List-III
A) Atropa	i) Ornament	I) Number and codes
B) Computer usage in taxonomy	ii) Medicine	II) Pterocarpus
C) Gloriosa	iii) Fabaceae	III) Solananceae
D) Odd sepal anterior	iv) Numerical Taxonomy	IV) Rhizome

The correct match is

	A	B	C	D
(a)	ii, III	iv, I	i, IV	iii, II
(b)	ii, IV	iv, II	iii,III	i, I
(c)	iii, IV	i, III	ii, I	iv, II
(d)	I, I	ii, II	iii, IV	iv, III

TS EAMCET-10.08.2021 Shift-I

Ans. (a) : *Atropa belladonna* known as deadly night shade. It is poisonous perennial plant and belongs to Solanaceae family.
(b) Numerical taxonomy is based on all observable character of organism and gives equal important to character.
Number and codes are assigned to few of the selected characters in numerical taxonomy.
(c) Gloriosa is native to much of Africa and Asia. But it is known as an ornamental plant.
Its rhizome is used in treatment of Gout and Infertility
(d) Odd sepal anterior found in Fabaceae.

734. Match the following lists:

List-I	List-II	List-III
A) China Rose	i) Acropetal succession	I) Branched Peduncle
B) Colocasia	ii) Mesocarp is fleshy	II) Hypogynous
C) Panicle	iii) Alternative Phyllotaxy	III) Epigynous
D) Cucumber	iv) Neuter flowers	IV) Corm

The correct match is:

	A	B	C	D
(a)	I, IV	ii, II	iv, I	iii, III
(b)	ii, II	iii, III	I, I	iv, IV
(c)	iii, II	iv, IV	I, I	ii, III
(d)	iii, I	ii, IV	iv, III	I, II

TS EAMCET-10.08.2021 Shift-I

Ans. (c) : Panicle – Panicle has penducle branched and branches have pedicellate flower. It is character of racemose inflorescence. (Acropetal succession)
(a) China rose – Phyllotaxy is a single leaf, present at a node in an alternate pattern. It have actinomorphic hypogynous with twisted aestivation.
(b) Colocasia – Incomplete flower, condition in flower that does not have androecium and gynoecium.
(d) Cucumber – In Epigynous flower the gynoecium occupies is highest position while the other parts are situated below e.g. Cucumber, Guava.

735. In Cucumber the ovary is ————

(a) Absent (b) Epigynous
(c) Hypogynous (d) Perigynous

AP EAMCET-03.09.2021 Shift-I

Ans. (b) : In Epigynous flowers ovary is present inferior to calyx, corolla and andoecium. The margin of thalamus groups upwards enclosing the ovary completely. Other parts of flower arises above the ovary Hence, ovary is said to be inferior. Ex. Guava & Cucumber.

736. Match the following lists.

List-I	List-II	List-III
A. Parthenocarpic fruit	i. Dichasial and Monochasial cyme	I. Avicennia
B. Verticellaster	ii. Roots grow vertically upwards	II. Agave
C. Swampy areas	iii. Dioscoria	III. Banana
D. Storage of food	iv. Sucker	IV. Lamiaceae

The correct match is:

	A	B	C	D
(a)	ii, III	iii, IV	i, II	iv, I
(b)	iv, III	i, IV	ii, I	iii, II
(c)	iv, II	iii, III	ii, IV	i, I
(d)	i, IV	ii, III	iii, II	iv, I

TS EAMCET-09.08.2021 Shift-II

Ans. (b) :

List-I	List-II	List-III
A. Parthenocarpic fruit	(iv) Sucker	III. Banana
B. Verticellaster	(i) Dichasial and monochasial cyme	IV. Lamiaceae
C. Swampy areas	(ii) Roots grow vertically upwards	I. Avicennia
D. Storage of food	(iii) Dioscoria	II. Agava

737. Identify the plants families and arrange the families based on the numerical numbers in ascending order
Phaseolus, Smilax, Dracaena, Colchicum, Cajanus, Withania, Atropa, Datura, Ruscus, Capsicum, Derris, Cesturm

(a) Fabaceae, Solanaceae, Liliaceae
(b) Solanaceae, Fabaceae, Liliaceae
(c) Fabaceae, Liliaceae, Solanaceae
(d) Liliaceae, Fabaceae, Solanaceae

TS EAMCET-09.08.2021 Shift-II

@apna_pdf

Ans. (c) : Solanaceae family includes a number of ornamental plants such as Petunia, Lyeianthese, Browalia, and other plants such as *Atropa belladonna* mandray ora and Datura.

The common example of Liliaceae family includes *Allium sativum*, *Allium cepa*, *Astragalus membranaceus*, *Convallaria majolis* and Aloe vera.

The Fabaceae or Leguminosae, economically and medicinally important family of flowering plants.

738. Arrange the below mentioned plants as examples of diadelphous, epiphyllous, and polyadelphous respectively.

(A) Citrus **(B) Lilly**
(C) Pea **(D) Banana**

(a) A, B, C (b) C, B, A
(c) B, C, D (d) D, C, B

TS EAMCET-09.08.2021 Shift-II

Ans. (b) : Diadelphous Condition- In this Condition, filament of Nine different stamens are Connected into one unit and the tenth Posterior stamen remains out of the bundle as a stand part e.g-Pea.

Epiphyllous Condition- when the stamens are attached to the Perianth. Androcium, the male reproductive whorl, is made up of units Called stamens. The perianth is a whorl where the petals and sepals are not differentiated and each unit is called a tepal. e g-Lily.

Polyadelphous Condition- the stamens of a flower are fused by their filaments forming several clusters or groups here the filaments are united while the anthers are free. This condition is seen in citrus. e.g- Lemon.

739. Assertion (A) : Petro plants yield Bio-diesel.
Reason (R) : Jatropa is rich in hydrocarbons.

(a) A is correct but R is wrong.
(b) Both A and R are correct and R is the correct explanation for A.
(c) A is wrong but R is correct.
(d) Both A and R are correct and R is not the correct explanation for A.

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Biodiesel can be made from plant. Jatropha an oil yielding plant that grows well in desert, is rich in hydrocarbons. Hence yield Bio-diesel.

740. Choose the number of modifications in *Allium cepa*.

Tunicated bulb; Reduced stem; adventitious roots; umbel inflorescence; solid leaves; fleshy leaf bases; involucre of bracts

(a) 4 (b) 5
(c) 6 (d) 7

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : A bulb of onion is formed from modified leaves. From the base of bulb roots are comes out called adventitious root. Leaf bases are become fleshy due to storage of food. Inflorescence is compound umbel. Stem is highly reduced and show the tunicated bulb.

741. Identify the plants by their characters respectively.

(i) Axillary buds as tendril, inferior ovary, mesocarp edible
(ii) A lateral branch of one internodal length, swollen petiole
(iii) Funnel shaped corolla, dehiscent fruit
(iv) Basal placentation, condensed peduncle
(A) Helianthus
(B) Eichhornia
(C) Cucumber
(D) Datura

Options:

	A	B	C	D
(a)	i	iii	ii	iv
(b)	iii	ii	i	iv
(c)	i	ii	iii	iv
(d)	iv	ii	i	iii

TS EAMCET-09.08.2021 Shift-I

Ans. (d) : (i) Helianthus : Basal placentation, condensed peduncle. Helianthus is a genus comprising species of annual and perennial flowering plants in the daisy family Asteraceae commonly known as sunflowers.

(ii) Eichhornia : A lateral branch of one internodal length, swollen petiole. Eichhornia, commonly called water hyacinths, was a polyphyletic genus of the aquatic flowering plants family pontederiaceae.

(iii) Cucumber : Axillary buds as tendril, inferior ovary, mesocarp edible.

(iv) Datura : funnel shaped corolla, dehiscent fruit.

742. Match the following Liliaceae members with their common names?

Column–I	Column–II
(A) *Colchicum autumnale*	**(i) Spanish dagger**
(B) *Dracaena augustifolia*	**(ii) Sarsaparilla**
(C) *Yucca gloriosa*	**(iii) Medow saffron**
(D) *Smilax zeylanica*	**(iii) Red dragon**

Options:

(a) (A–i), (B–ii), (C–iii), (D–iv)
(b) (A–ii), (B–iii), (C–i), (D–iv)
(c) (A–iii), (B–iv), (C–i), (D–ii)
(d) (A–iii), (B–i), (C–ii), (D–iv)

AP EAPCET-07.09.2021 Shift-I

Ans. (c) :

Column – I		Column - II
A.	*Colchicum autumnale*	Medow saffron
B.	*Dracaena augustifolia*	Red dragon
C.	*Yucca gloriosa*	Spanish dagger.
D.	*Smilax zeylanica*	Sarsaparilla

743. The pulvinate leaf base is present in _____

(a) *Gloriosa superba* (b) *Glycine max*
(c) *Allium cepa* (d) *Solanum tuberosum*

AP EAMCET-05.10.2021 Shift-I

Ans. (b) : The pulvinate leaf base is present in *Glycine max*. In *Glycine max* the leaves are compound and are alternate. There is one leaf per node along the stem. The edge of the leaf blade is entire in *Glycine max* (Soyabean).

@apna_pdf

744. A distinct monocot character shown by the flowers of Liliaceae is _____

(a) Hypogynous flowers
(b) Actinomorphic flowers
(c) Trimerous flowers
(d) Bisexual flowers

AP EAMCET-05.10.2021 Shift-I

Ans. (c) : Trimerous flowers are organized in threes, having parts in numbers that are multiples of three.
• The monocots typically have trimerous flowers shown by the flower of Liliaceae.

745. Match Column-I with Column-II

Column-I		Column-II	
(A)	$\%\,\mathrm{K}_{(5)}\mathrm{C}_{1+2+(2)}\mathrm{A}_{(9)+1}\underline{\mathrm{G}}_{1}$	(i)	Brassicaceae
(B)	$\oplus\, \mathrm{K}_{(5)}\overset{\frown}{\mathrm{C}}_{(5)}\mathrm{A}_{5}\underline{\mathrm{G}}_{2}$	(ii)	Liliaceae
(C)	$\oplus\, \mathrm{P}_{(3+3)}\overset{\frown}{\mathrm{A}}_{3+3}\underline{\mathrm{G}}_{(3)}$	(iii)	Fabaceae
(D)	$\oplus\, \mathrm{K}_{2+2}\mathrm{C}_{4}\mathrm{A}_{2-4}\underline{\mathrm{G}}_{(2)}$	(iv)	Solanaceae

Select the correct answer from the options given below.

	(A)	(B)	(C)	(D)
(a)	(iv)	(ii)	(i)	(iii)
(b)	(iii)	(iv)	(ii)	(i)
(c)	(i)	(ii)	(iii)	(iv)
(d)	(ii)	(iii)	(iv)	(i)

NEET-2021

Ans. (b) :
(A) $\%\,\mathrm{K}_{(5)}\mathrm{C}_{1+2+(2)}\mathrm{A}_{(9)+1}\underline{\mathrm{G}}_{1}$ - Fabaceae
(B) $\oplus\, \mathrm{K}_{(5)}\overset{\frown}{\mathrm{C}}_{(5)}\mathrm{A}_{5}\underline{\mathrm{G}}_{2}$ - Solanaceae
(C) $\oplus\, \mathrm{P}_{(3+3)}\overset{\frown}{\mathrm{A}}_{3+3}\underline{\mathrm{G}}_{(3)}$ - Liliaceae
(D) $\oplus\, \mathrm{K}_{2+2}\mathrm{C}_{4}\mathrm{A}_{2-4}\underline{\mathrm{G}}_{(2)}$ - Brassicaceae

746. In some members of which of the following pairs of families, pollen grains retain their viability for months after release?

(a) Rosaceae ; Leguminosae
(b) Poaceae ; Rosaceae
(c) Poaceae ; Leguminosae
(d) Poaceae ; Solanaceae

NEET-2021

Ans. (a) : Pollen grains in some rosaceae, Leguminosae and Solanaceae families can survive up to a month.
• Pollen viability is the ability to develop into seed and fruit. Rosaceae, leguminosae and solanaceae family plants remains viable for a month due to sporopollenin.

747. Which one of the following plants is an invasive species that has spread to many parts of the Indian subcontinent?

(a) *Prosopis juliflora* (b) *Ficus religiosa*
(c) *Cocos nucifera* (d) *Lotus corniculatus*

KVPY (SA)-2021

Ans. (a) : *Prosopis juliflora* plants is an invasive species that has spread to many parts of the Indian subcontinent.
Prosopis juliflora is a theory shrub 3.5m or tree growing up to 15m height. It is a shrub or small tree in the family fabaceae. It has a thick rough grey-green bark that becomes caly with age.

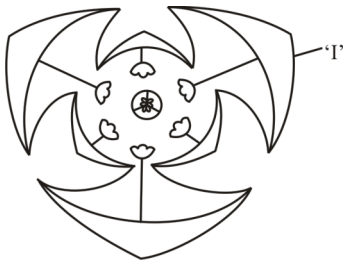
748. The differences between parents and offspring, among offsprings of the same parents and individuals of the same species are called _____.

(a) heredity (b) allelism
(c) variations (d) homology

MHT CET-06.10.2020 Shift-I

Ans. (c) : The differences between parents and offspring. Among offsprings of the same parents and individuals of the same species are called variations. There variations are mainly caused due to crossing over of meiosis which brings shuffling of genetic material.

749. Identify the floral unit 'I' in the given floral diagram.



(a) Sepal (b) Petal
(c) Tepal (d) Perianth

Karnataka CET-2020

Ans. (c) : This floral diagram belong to Liliaceae family. Sepal and petal are fused to each other and they form perianth (tepals). Ovary tricarpellary, syncarpous, superior with axil placentation.
Floral formula : $\oplus\, \mathrm{P}_{3+3}\overset{\frown}{\mathrm{A}}_{3+3}\underline{\mathrm{G}}_{(3)}$

750. Match the following :

Name of the Plant	Fruit	Family
A. Tomato	i. Moraceae	p. Rosaceae
B. Apple	ii. Caryopsis	q. Solanceae
C. Rice	iii. Berry	r. Poaceae
D. Jack	iv. Pome	s. Sorosis

(a) (A–iii–p), (B–ii–s), (C–i–q), (D–iv–r)
(b) (A–iii–q), (B –iv–p), (C–ii–r), (D–i–s)
(c) (A–i–p), (B–ii–q), (C–iii–r), (D–iv–s)
(d) A–ii–p), (B–iii–q), (C–iv–r), (D–i–r)

AP EAMCET-24.09.2020 Shift-II

@apna_pdf

Ans. (b) : (A). Tomato – Tomato is a simple fleshy fruit of Berry type.
Solanum lycopersicum (Tomato) belongs to family - **Solanaceae.**
(B) Apple – An apple is a Pome fruit belongs to family – Rosaceae.
(C) Rice – Rice is caryopsis fruit type belongs to family- Poaceae (Gramineae)
(D) Jack fruit – The fruit in Jack fruit is produced from a spadix inflorescence and thus is called sorosis.
• *Artocarpus heterophyllus* (Jack fruit) belongs to family – Moraceae.

751. Match the following lists:

List I	List II
(A) Sessile, unisexual and neuter flowers arranged in acropetal succession	**(I) Euphorbiaceae**
(B) All the flowers are brought to the same height due to varied length of pedicle	**(II) Jasmine**
(C) Achlamydeous stalked, unisexual flowers arranged in a cup like structure	**(III) Cocos**
(D) A three flower cymose inflorescence	**(IV) Cauliflower**

The correct match is

	A	B	C	D
(a)	III	I	II	IV
(b)	III	IV	I	II
(c)	III	II	I	IV
(d)	IV	III	II	I

TS EAMCET-29.09.2020 Shift-II

Ans. (b) :
Cocos :- Sessile, unisexual and neuter flowers arranged in acropetal succession.
Euphorbiaceae:- Achlamydeous, stalked, unisexual flowers arranged in a cup like structure.
Jasmine:- A three flower cymose inflorescence.
Cauliflower:- All the flower are brought to the same height due to varied length of pedicle.

752. Identify the plants with the following characters respectively.
(I) Herb, pulvinate leaf base, zygomorphic, monodelphous, protandrous.
(II) Herb, hairy stem, exstipulate, axillary inflorescence, persistent calyx, protogynous.
(III) Radical leaves, hypogynous, basifixed anthers, axile placentation, protandrous, polyembryony.
(A) Solanum (B) Allium
(C) Datura (D) Arachis
(E) Crotalaria (F) Asparagus

	I	II	III
(a)	E	A	F
(b)	D	C	F
(c)	E	C	F
(d)	D	A	B

TS EAMCET-29.09.2020 Shift-II

Ans. (d) :
(A) Solanum :- Herb, hairy stem, exstipulate axillary inflorescence, persistent calyx, protogynous.
(B) Allium (onion) :- Radical leaves, hypogynous, basifixed anthers, axile placentation, protandrous, polyembryony.
(C) Arachis (Peanut) :- Herb, pulvinate leaf base, zygomorphic, monodelphous, protandrous.

753. 'Colchicine', a mutagen is extracted from which plant?
(a) Bulb bearing Liliaceae plant
(b) Rhizome bearing Liliaceae plant
(c) Corm bearing Liliaceae plant
(d) Cladophyll bearing Liliaceae plant

TS EAMCET-29.09.2020 Shift-II

Ans. (c) : *Colchicum autumnale* , commonly known as *Autumn crocus*, meadow saffron is toxic autumn - blooming flowering plant belong to family colchicaceae.
• The bulb - like corms of *Colchicum autumnale* contain colchicines, a useful drug & it is also used in plant breeding.

754 $\oplus\varphi K_{(5)}\overset{\frown}{C_{(5)}}A_{(5)}\underline{G}_{(2)}$

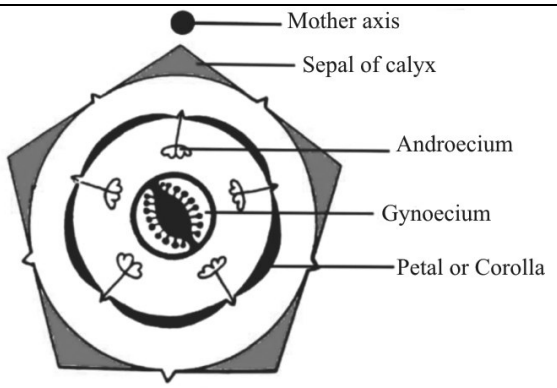
The above floral formula represents ___
(a) Liliaceae (b) Asteraceae
(c) Fabaceae (d) Solanaceae

AP EAMCET-25.09.2020 Shift-I

Ans. (d) :
$\oplus\varphi K_{(5)}\overset{\frown}{C_{(5)}}A_{(5)}\underline{G}_{(2)}$

The above floral formula represented family solanaceae.
• Inflorescence: Typically cymose type.
• **Flower:-** Ebracteate, actinomorphic, bisexual pentamerous & hypogynous
• **Calyx:-** Five sepals, Gamosepalous.
• **Corolla:-** Gamopetalous, 5 - petals.
• **Androecium:-** 5 in number, polyandrous & epipetalous on the corolla.
• **Gynoecium:-** Bicarpellary syncarpous,superior ovary & Bilocular, oblique swallen placenta
• **Placentation:-** Axile placentation

@apna_pdf



755. Correct position of floral parts over thalamus in mustard plant is,

(a) Gynoecium is situated in the centre, and other parts of the flower are located at the rim of the thalamus, at the same level.
(b) Gynoecium occupies the highest position, while the other parts are situated below it.
(c) Margin of the thalamus grows upward, enclosing the ovary completely, and other parts arise below the ovary.
(d) Gynoecium is present in the centre and other parts cover it partially.

NEET-2020 Phase-II

Ans. (b) : Gynoecium occupies the highest position, while the other parts are situated below it. The gynoecium contains the highest position over the other floral parts. The ovary is said to be superior.

756. Which of the following is the correct floral formula of Liliaceae?

(a) $\oplus\ \delta\ K_{(5)}\ \overset{\frown}{C_{(5)}}\ A_5\ \underline{G}_{(2)}$

(b) $\%\ \delta\ C_{1+2+(2)}\ A_{(9)+1}\ \underline{G}_1$

(c) $\oplus\ \delta\ \varphi\ K_{(5)}\ \overset{\frown}{C_{(5)}}\ A_5\ \underline{G}_{(2)}$

(d) $Br\ \oplus\ \delta\ \overset{\frown}{P_{(3+3)}}\ A_{3+3}\ G_{(3)}$

NEET-2020 Phase-II
TS EAMCET-08.05.2019 Shift-II

Ans. (d) : The floral pattern in liliaceae is as follows-

- **'Br'** represent bracteate condition
- **'⊕'** represent actinomorphic condition
- ♂ represent bisexual condition.
- **Perianth:-** Six, in two whorls, gamophyllous, inferior.
- **Androecium:-** Six, in two whorls, polyandrous, epiphyllous,
- **Gynoecium:-** Tricarpellary, Syncarpous, ovary is superior, ovules are numerous, axile placentation, style is simple, stigma is three lobed.

757. Which of the following is called the "Terror of Bengal'?

(a) Carrot grass
(b) Lantana
(c) Bloom-forming algae
(d) Water hyacinth

GUJCET-2020

Ans. (d) : Water hyacinth (*Eichhornia crassipes*). It is also known as the "Terror of Bengal" because it is an exotic shrub which is growing at an alarming rate on the surface of water body. Water hyacinth is accuring in tropical and subtropical South America or native to the Amazon basin. It is known as one of the fastest growing plants.

758. In Salvia and Cestrum, the pollination is achieved with help of ____

(a) insects (b) wind
(c) bats (d) birds

MHT CET-08.10.2020 Shift-I

Ans. (a) : The pollination of Salvia is dependent on insect and *Cestrum nocturnum* (night blooming jasmine) is also pollinated by insect.

759. Which of the following are the characteristic features of the family Fabaceae?
I. Gamosepalous nature
II. Stamens five, epipetalous
III. Marginal placentation
IV. Petals five, polypetalous
V. Fruit is a berry
The correct answer is

(a) I, II, III,V (b) II, III, IV,V
(c) I, II,III, IV (d) I, III, IV

TS EAMCET-08.05.2019 Shift-II

Ans. (d) : Features of family Fabaceae are –
Flower : Bisexual, zygomorphic, Pentamerous & hypogynous.
Calyx : Five sepals, gamosepalous (united)
Corolla : Five petals, one posteriorly placed, two lateral called wings & two anterior enclosing stamens and pistil which is known as keel, polypetalous.
Androecium : Ten stamens, diadelphous.
Gynoecium : Monocarpellary with superior and unilocular ovary.
Fruit : Legume.
Placentation : Marginal

760. Match the following lists :

List –I		List-II	
A	**Musa, Cocos, Colocasia**	**I**	**Corymb**
B	**Crotalaria, Mangifera**	**II**	**Spikes**
C	**Cassia, Cauliflower**	**III**	**Umbel**
D	**Achyranthes, Grasses**	**IV**	**Spadix**
		V	**Raceme**

The correct match is:

	A	B	C	D
(a)	V	IV	III	II
(b)	IV	III	II	I
(c)	IV	V	I	II
(d)	II	III	V	I

TS EAMCET-08.05.2019 Shift-II

@apna_pdf

Ans. (c) :

	Plants	Inflorescence
A.	Musa, Cocos, Colocasia	Spadix
B.	Crotalaria, Mangifera	Raceme
C.	Cassia, Cauliflower	Corymb
D.	Achyranthes, Grasses	Spikes

761. Choose the correct set of plants showing the following features

(A) Medicinally important plant and a tendrillar climber with unisexual flowers

(B) Spice yielding plant with cymose inflorescence, persistant calyx, unilocular ovary

(C) Oil seed plant with monoadelphous stamens, unilocular ovary and indehiscent pod

Options :

(a) Ruscus, Capsicum, Denis
(b) Smilax, Solaman, Arachis
(c) Asparagus, Capsicum, Arachis
(d) Smilax, Capsicum, Arachis

AP EAMCET-24.04.2019 Shift-I

Ans. (d) : ***Smilax Zeylanica*** **–** Its roots & leaves are used for medicinal purposes. Its flowers are unisexual & greenish in colour. It is a climbing shrubs with prickly stem.

Capsicum – Some of the member of capsicum are used as spices, vegetables & medicines.

• **Arachis –** Peanut (*Arachis hypogaea*) is one of the major crops and is the fifth largest source of plant oil in the world.

• In floral characterstics the stamens are monoadelphous & monocarpellary with a superior or inferior unilocular ovary.

762. Which of the following is a source of anthocyanin?

(a) Daucus carota
(b) Catharanthus roseus
(c) Mentha piperita
(d) Datura stramonium

MHT CET-2019

Ans. (a) : *Daucus carota* (carrot) is the most important root vegetable plant which contains anthocyanins. Anthocyanins are a class of water soluble flavonoids widely present in fruits and vegetables.

763. Match the following

List-I	List-II	List-III
(A) Radical leaves	(i) Anterior odd sepal	(I) Protandrous
(B) Exstipulate leaf	(ii) Artificial System of classification	(II) Persistant Calyx
(C) Monocarpellary unilocular gynoecium	(iii) Allium	(III) Geocarpy
(D) plantarum	(iv) Solid or hollow stem	(IV) Linnaeus

The correct answer is

Options:

	A	B	C	D
(a)	iii, I	iv, II	i, III	ii, IV
(b)	iv, I	iii, II	i, III	ii, IV
(c)	iii, II	iv, III	i, I	ii, IV
(d)	iii, I	iv, III	i, II	ii, IV

AP EAMCET-24.04.2019 Shift-II

Ans. (a) : ***Allium cepa*** **(onion)**

Leaf :- A cluster of radical leaves emerges from the underground bulb, cylindrical & fleshy having sheathy leaf base with parallel venation.

Flower:- are protandrous i.e, condition in which male stamens mature before the female carpels.

(b) Solanaceae:-

Leaf:- Leaves are alternate, exstipulate & simple

Calyx:- Five lobed & usually persistent.

(c) Fabaceae :- In fabaceae family monocarpellary unilocular ovary is present. Anterior odd sepals are also found.

• Geocarpy is an extremely rare means of plant reproduction in this family.

(d) - Artificial system of classification was first used by Linnaeus. The cryptogames were included in flowering plants. Linnaeus system is known as sexual system of classification.

• He outlined an artificial system of classification in his book "species plantarum" in 1753.

764. Match the following:

List-I	List-II	List-III
(A) Acropetal arrangement	(i) dichasial cyme and monochasial cyme	(I) Mangifera
(B) Margin of Thalamus Enclosed the ovary	(ii) Inferior ovary	(II) Cypsella
(C) Single ovule attached to the base of ovary	(iii) Simple raceme	(III) False whorl
(d)Lamiaceae	(iv)Persistant pappus like calyx	(IV) Guava

The correct answer is

Options:

	A	B	C	D
(a)	iii, I	ii, IV	iv, II	i, III
(b)	iii, I	iv, IV	ii, III	i, II
(c)	ii, IV	iii, I	iv, II	i, III
(d)	iv, III	i, II	iii ,II	ii, IV

AP EAMCET-24.04.2019 Shift-II

Ans. (a) : ***Mangifera indica*** **(mango)** :- It contains numerous sessile flowers arranged acropetally and racemose type of infloresence.

@apna_pdf

Cypsella :- (Asteraceae-family) curved ovule with the mycropyle almost touching the funiculus. It is a very rare type of ovule.

• Pappus are the modified part of calyx.

Guava :- An epigynous flower is that in which the thalamus is hollow & cup shaped, & completely fused with the lower part of the ovary. The ovary is inferior.

Lamiaceae :- Inflorescence, which begins as a dichasial cyme & ends in a monochasial cyme called thyrsus.

• Verticillaster type of infloresence is called the flase whorl.

765. Read the following statements and identify the correct pairs of plants

(A) modified protective bract and edible pedicel

(B) food storing floral bud and leaf bases

(C) photosynthetic stem and petiole.

Options:

(a) Oryza and Cocos; Aloe and Agave; Nepenthes and Australian acacia

(b) Colocasia and Apple; Diascorea and Opuntia;Australian acacia and Euphorbia

(c) Musa and Ficus; Diascorea and Bryophyllum; Australian acacia and Bouganvillea

(d) Cocas and Anacardium; Agave and Allium; Casuarina and Australian acacia

AP EAMCET-24.04.2019 Shift-II

Ans. (d) : Cocas & Anacardium :- Cashew (*Anacardium occidentale*) fruit, which contains the seed or 'nut' hangs at the end of what is referred to as the cashew ' apple' - the edible swollen fruit stem or pedicel.

• **Agave and Allium:-** Floral buds of Agave are modified into bulbils. These are aerial modified stem that not only store food materials but also involved in vegetative reproduction.

• **Casuarina and Australian Acacia:-** Petiole of Australian Acacia help in photosynthesis. Petiole get modified & becomes flat leaf like and is called phyllode.

766. Identify the correct combination of the plant with the family it belongs to

(a) *Gloriosa superba*-Liliaceae

(b) *Lycopersicon esculentum*-Fabaceae

(c) *Phaseolus mungo*-Solanaceae

(d) *Aloe vera*-Fabaceae

TS EAMCET-08.05.2019 Shift-I

Ans. (a) :

(1) *Gloriosa superba*→Liliaceae

(2) *Lycopersicon esculentum* → Solanaceae

(3) *Phaseolus mungo* → Fabaceae

(4) *Aloe vera* → Asphodelaceae

767. The floral formula Br, Brl, %, ♂, ♀, $K_{(5)}$, $C_{1+2+(2)}$, $A_{(9)+1}$, $\underline{G}_1$ belongs to

(a) *Solanum nigrum*

(b) *Pisum sativum*

(c) *Allium cepa*

(d) *Withania somnifera*

TS EAMCET-08.05.2019 Shift-I

Ans. (b) : *Pisum sativum* (sweet pea)

Br, Brl, %, ♂, ♀, $K_{(5)}$, $C_{1+2+(2)}$, $A_{(9)+1}$, $\underline{G}_1$

1 - Inflorescence :- Axillary, terminal raceme.

2-Flower:- Bracteate, Bracteolate, complete, zygomorphic, hermaphrodite, pentamerous & hypogynous or perigynous.

3- Calyx :- Five sepals united, valvate or imbricate aestivation in bud.

4 - Corolla :- Five petals 1 standard, 2 wings, 3 keel which encloses the stamens & carpels.

5 - Androecium :- Ten stamens, diadelphous 9 stamens are united & 1 stamen remains free.

6 - Gynoecium :- Monocarpellary with superior or partially inferior unilocular ovary.

768. Study the following lists :

	List-I		List-II
A.	Triticum	I.	Anacardiaceae
B.	Lycopersicon	II.	Fabaceae
C.	Mangifera	III.	Poaceae
D.	*Glycine max*	IV.	Liliaceae
		V.	Solanaceae

The correct match is

	A	B	C	D
(a)	III	I	V	II
(b)	III	V	I	II
(c)	II	III	IV	I
(d)	IV	V	I	III

TS EAMCET-08.05.2019 Shift-I

Ans. (b) :

A- *Triticum aestivum* (Wheat) → (Poaceae/ Gramineae)

B - Lycopersicon (Tomato) → Solanaceae

C- *Magnifera indica* (Mango) → Anacardiaceae

D - *Glycine max* (soyabean) → Fabaceae

769. King of spices is:

(a) *Brassica nigra* (b) *Piper nigrum*

(c) *Piper longum* (d) *Curcuma longa*

AIIMS-26.05.2019 Shift-II

Ans. (b) : The black pepper (*Piper nigrum*) the king spices called "Black gold". It belongs to the family Piperaceae. It was one of the very first items of commerce between India and Europe. It is one of the world's most traded spices in the world.

• ***Piper longum*** is also known as the long pepper or pipli. It belongs to the family Piperaceae. It is a flowering vine and it cultivated for its fruit.

• ***Brassica nigra*** is also known as the black mustard. It belongs to the family Brassicaceae. The plant is cultivated annually for its black and dark seeds. It is generally grown in North Africa and in the temperate regions of Europe and parts of Asia.

• ***Curcuma longa*** (Turmeric) is a flowering plants and belongs to the family of zingiberaceae.

@apna_pdf

770. Match the column I and II

Column I	Column II
(A) Apocarpous	**(i) Papaver**
(B) Syncarpous	**(ii) Michellia**
(C) Epiphyllous	**(iii) Cashew**
(D) Cotyledon	**(iv) Aloe**

(a) A – i, B–ii, C–iii, D –iv
(b) A – ii, B–i, C–iv, D –iii
(c) A – iv, B–iii, C–ii, D –i
(d) A – iv, B–i, C–iii, D –ii

AIIMS-25.05.2019 Shift-II

Ans. (b) :
• **Apocarpous** means a flower, or ovary having distinct carpels that are not joined together.
Ex.- Michellia
• **Syncarpous** means a flower, or ovary in which the multiple carpels are fused into a single structure.
Ex.- Papaver
• **Epiphyllous condition** in which the stamens are fused with tepals as found in the liliaceae family.
• Aloe is a succulent plant which have epiphyllous stamens.
• **Cotyledon** is a part of the embryo within seeds that form the first leaves during seed germination which provide nutrition. Cotyledons stored food. Cashew is a tropical evergreen tree that produces the cashew seed (cotyledons) and the cashew apple.

771. Stamens epipetalous, alternate with the petals, usually not equal in length and filaments are basifixed, in_____.

(a) Solanaceae (b) Malvaceae
(c) Arecaceae (d) Rubiaceae

SRM JEEE-2018

Ans. (a) : Stamens epipetalous alternate with the petals usually not equal in length and filaments are basifixed in Solanaceae family. It has more than 90 genera and nearly 3000 species distributed throughout the world.

772. Find the correct floral form the given floral description

Bracteate, ebracteolate, pentamerous, bisexual, actinomorphic; sepals 5, polysepalous, imbricate aestivation; petals 5, gamopetalous, twisted aestivation, stamens 5, epipetalous; pentacarpellary syncarpus, superior ovary with axile placentation.

Options:

(a) Br, Ebrl, ⊕, ♂ ♀ $K_5\ C_5\ A_5\ \overline{G}_{(5)}$
(b) Br, brl, ⊕, ♂ ♀ $K_5\ C_5\ A_5\ \underline{G}_{(5)}$
(c) Br, brl %, ♂ ♀ $K_5\ C_5\ A_5\ \underline{G}_{(5)}$
(d) Br, Ebrl, ⊕, ♂ ♀ $K_5\ C_{(5)}\ A_5\ \underline{G}_{(5)}$

AP EAMCET-25.04.2018 Shift-II

Ans. (d) : In the given floral description the correct floral form is-
Br, Ebrl, ⊕, ♂ ♀ $K_5\ C_{(5)}\ A_5\ \underline{G}_{(5)}$

773. Roots of the following hydrophytes are fixed to substratum, but their long petiolated leaves keep them floating on water surface
(i) Salvinia
(ii) *Victoria regia*
(iii) Utricularia
(iv) Nymphaea
The correct combination is

(a) (i) and (ii) (b) (ii) and (iii)
(c) (iii) and (i) (d) (ii) and (iv)

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : *Victoria regia* - *Victoria amazonica* is the world's largest water Lily and among the largest in the Nymphaeaceae family. The first discovery was in 1801 Bolivia and it is indigenous to the Amozon River basin's shallow waters.
Nymphaea - The numberous species and hybrids of Nymphaea are the most commonly cultivated water lilies.
Salvinia - A genus in the family Salviniaceae, is a floating fern named in honor of Anton Maria Salvini, a 17^{th} century Italian scientist.

774. Smilax possesses the following characters.
(i) Six tepals and six stamens in two whorls, odd tepal of outer whorl is anterior in position and odd tepal of inner whorl is posterior in position, Valvate aestivation.
(ii) Pentacarpellary, ovary inferior, pentalocular with few ovules, stigma bifid and simple.
(iii) Fruit is usually capsule, endospermous seed
(iv) Flower is solitary, bisexual.
The correct answer is

(a) (i), (ii) (iv) and (iii)
(b) (i) and (iii)
(c) (ii) and (iv)
(d) (ii) and (iii)

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Smilax posses six tepal and six stamens in two whorl, odd tepal of outer whorl is anterior in position and odd tepal of inner whorl is posterior in position, Valvate aestivation in its floral structure.
• Pentacarpellary, syncarpous, pentalocular, axile placentation, ovary inferior, many ovules per loculus, style distinct, stigma single, terminal.
• A capsule is the most common fruit type. Fruit is usually capsule endospermous seed.
• The inflorescence is a terminal receme of a salitary flower or rarely an umbel. The flowers are bisexual.

775. Match the following lists :

List-I	List-II
(A) The mesocarp and endocarp are fused to form pulp and the seeds are hard	**(i) Pisum**
(B) Stamens are united into one bunch	**(ii) Asparagus**
(C) The main axis continues to grow and flowers are arranged laterally in acropetal succession on the branch of peduncle	**(iii) Crotalaria**

@apna_pdf

(D) Stamens are united into two bundles **(iv) Tobacco**

(v) Capsicum

The correct answer is

	A	B	C	D
(a)	(v)	(iii)	(ii)	(i)
(b)	(iii)	(v)	(iv)	(ii)
(c)	(iv)	(iii)	(ii)	(i)
(d)	(ii)	(i)	(v)	(iii)

TS EAMCET-02.05.2018 Shift-II

Ans. (a) :

	List – I	List - II
a.	The mesocarp and endocarp are fused to form pulp and the seeds are hard	Capsicum
b.	Stamens are united into one bunch	Crotalaria
c.	The main axis continues to grow and flowers are arranged laterally in acropetal succession on the branch of peduncle	Asparagus
d.	Stamens are united into two bundles	Pisum

776. In plants growing under environmental stress condition, seeds germinate while they are on the mother plant. An example for such a condition is :

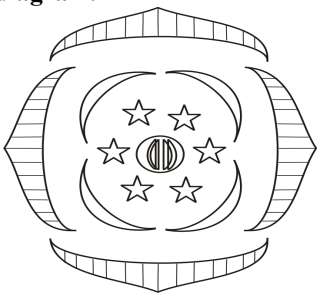
(a) Wolfia (b) Brown alga

(c) Rhizophora (d) Eucalyptus

TS EAMCET-02.05.2018 Shift-II

Ans. (c) : Small genus (the type of the family Rhizophoraceae) of tropical trees and shrubs that have tetramerous flowers and a party inferior ovary forming a fleshy berry. The genus Rhizophora is the most common Mangrove genus worldwide two species.

777. Choose the correct floral formula of the given floral diagram.



(a) $\oplus \delta \varphi K_{(2+2)} C_4 A_{4+2} G_{(3)}$

(b) $\oplus \delta \varphi K_{(3)+2} \overset{\frown}{C_4 A_4} G_{(2+1)}$

(c) $\oplus \delta \varphi K_{2+2} C_{4x} A_{2+4} G_{(2)}$

(d) $\oplus \delta \varphi K_{2+2} C_4 A_{2+4} G_2$

Karnataka CET-2018

Ans. (c) : In Brassicaceae family- Cruciform corolla (4x)/ cross shaped (x) present and stamens shows tetradynamous condition.

• Flowers of brassicaceae family are distinguished by their symmetry and presence of reproductive part.

The floral formula of brassicaceae is

$\oplus \delta \varphi K_{2+2} C_{4x} A_{2+4} G_{(2)}$

778. Which of the following is a monocarpic plant?

(a) Bambusa (b) Sesamum

(c) Lauandual (d) Pinus

TS EAMCET-02.05.2018 Shift-I

DUMET-2002

Ans. (a) : *Bambusa tulda* is a perrenial plants which is monocarpic and might take several years to bloom.

Some bamboo plants complete their entire life cycle in 50 – 100 year during which they flower only once.

779. The following partial floral formula "Brl.⊕.P G" was derived during identification of a plant. These features indicate that the flower possess

i) Bracteoles

ii) Inferior ovary

iii) Petals

iv) Two equal radial halves when cut in any radial plane following to pass through centre of flower.

The correct answer is

(a) i & ii (b) ii & iii

(c) ii & iv (d) i & iv

TS EAMCET-03.05.2018 Shift-I

Ans. (d) :

"Brl. ⊕ .PG"

The features of flower is :-

1. Bracteolate.
2. Actinomorphic
3. Perianth (Calyx + corolla)
4. Superior ovary.

780. Solanaceae family plants are known for

i) Rhizobial association with roots

ii) Production of cigarettes from leaves

iii) Numerous stamens

iv) Seeds are endospermic

The correct combination is

(a) ii & iii (b) iv & i

(c) iv & ii (d) iii & i

TS EAMCET-03.05.2018 Shift-I

Ans. (c) : Tobacco is the common name of Nicotiana belongs to the family Solanaceae are used for production of cigarettes from its leaves. Seeds of solanaceae family are endospermic.

781. The following plants are associated with human health care and Bio- diesel production respectively.

@apna_pdf

(a) Jatropa and Chlorella
(b) Rubber and Pongamia
(c) Chlorella and Arnica
(d) Digitalis and Jatropa

TS EAMCET-03.05.2018 Shift-I

Ans. (d) : ***Digitalis purpurea*** - is used to treat Congestive Heart Failure (CHF) & heart rhythm problem (atrial arrhythmias). It can increase blood flow throughout our body & reduce swelling in our hands and ankles.
Jatropa curcas **-** Its oil has a high cetane rating & low sulfur content both of which are beneficial for biodiesel production.

782. The genus solanum includes the following species.
i) S. melongena ii) S. indica
iii) S. aestivum iv) S. nigrum
The correct answers
(a) i & ii (b) i and iv
(c) ii & iii (d) iii & iv

TS EAMCET-03.05.2018 Shift-I

Ans. (b) : Genus solanum inclucles following species :-
1 - *Solanum nigrum* (makoi)
2 - *Solanum melongena* (Egg plant, Brinjal)
3 - *Solanum tuberosum* (Potato)
4 - *Solanum lycopersicum* (Tomato)

783. Which one of the following in NOT true about Salvia flower?
(a) Flowers are bisexual
(b) Flowers are protandrous
(c) The upper branch of bifurcated connective bears sterile anther lobe and lower branch bears fertile anther lobe
(d) The upper branch of bifurcated connective bears fertile anther lobe and lower branch bears sterile anther lobe

MHT CET-2018

Ans. (c) : One of the anther lobes is sterile (lower branch). And other lobes is fertile (upper branch).
The upper branch of bifurcated connective bears fertile anther lobe and lower branch bears sterile anther lobe.

784. Identify group of plants based on given anatomical characters in sequence,
(A) Bicollateral vascular bundles
(B) Bulliform cells
(C) Ring arrangement of vascular bundles
Answers respectively
(a) Tridax, Nerium, Zea
(b) Helianthus, Grass, Nerium
(c) Nerium, Tridax, Zea
(d) Cucurbita, Zea, Tridax

AP EAMCET-25.04.2018 Shift-I

Ans. (d) : Bicollateral vascular bundle is a type of conjoint vascular bundle where xylem is in between two phloem strands. Example- cucurbita.
Bulliform cells are also known as motor cells, are huge, bubble - shaped epidermal cells found on the top surface of leaves in groups of multiple monocots.
Tridax :- In tridax several vascular bundles are arranged in one ring & very close to the pericycle.

785. Helianthus distinguished from maize based on this anatomical character
(a) Protoxylem lacuna absent, phloem parenchyme absent
(b) Protoxylem lacuna present, phloem parenchyme present
(c) Protoxylem lacuna absent, phloem parenchyme present
(d) Protoxylem lacuna present, phloem parenchyme absent

AP EAMCET-25.04.2018 Shift-I

Ans. (c) : Vascular bundle of monocot stem, protoxylem disintegrates and form a cavity. This is called protoxylem lacuna:
Example: - Maize
• Phloem parenchyma is found in both primary & secondary phloem. It is a part of the phloem elements. These are found in dicot roots, leaves & stem but are absent in monocot plants.
Example :- Helianthus

786. In A,B,C, plants with
(A) Plant grow in arid zone
(B) Absorb more water during rainy reason
(C) Withstand prolonged dryness are
(a) Tribulus, Asparagus, Casuarina
(b) Tridax, Asparagus, Casuarina
(c) Tridax, Tribulus, Asparagus
(d) Maize, tridax, Asparagus

AP EAMCET-25.04.2018 Shift-I

Ans. (a) : ***Tribulus terrestris*****:-** (family - zygophyllaceae) is a widespread pantropic weed, that grow as a weed on sandy soils in tropical and desert climatic regions around the world.
• **Asparagus:-** Asparagus needs regular watering, especially while young, give it 1 to 2 inches of water per week during its first two growing seasons.
• **Casuarina:-**Xerophytes are plants of dry habitats, where the environment favours high rate of transpiration than the absorption. Their leaves are vestigial to cut transpiration & to survive in dry environment.

787. Study the following list

List – I	List – II
(A) Blue dye	**(I) Belladona**
(B) Yellow dye	**(II) Ruscus**
(C) Medicine	**(III) Indigofera**
(D) Edible oil	**(IV) Soyabean**
	(V) Butea

	A	B	C	D
(a)	V	III	II	IV
(b)	III	I	V	II
(c)	III	V	I	IV
(d)	III	II	I	IV

AP EAMCET-25.04.2018 Shift-I

Ans. (c) :
Blue dye (Colour):- The blue or indigo dye is obtained from the leaves of *Indigofera tinctoria*
Yellow dye (Colour):- Isobutrin is a yellow dye extracted from the *Butea monosperma* flower. It is commonly known as flame of the forest.

@apna_pdf

Medicine:- Belladonna (*Atropa belladonna*) has been used in alternative medicine as an aid in treating arthritis pain, colds or hay fever. It is a poisonous plant called deadly nightshade (solanaceae - family)

788. Math the following

List –I	List –II	List – III
(A)Mango	(i)*Dolichos lablab*	(I) Hesperidium
(B Orange	(ii)*Annona squamosa*	(II)Aggregate fruit
(C)Bean	(iii)*Citrus sinensis*	(III) Drupe
(D)Custard apple	(iv)*Mangifera indica*	(IV) Legume

	A	B	C	D
(a)	iii, I	ii, IV	i, III	iv, II
(b)	iv, III	ii, IV	i, II	iii, I
(c)	iv, III	iii, I	i, IV	ii, II
(d)	iii, III	iv, I	ii, II	i, IV

AP EAMCET-25.04.2018 Shift-I

Ans. (c) :

Fruit name	Botanical name	Types of fruit
(A) Mango	*Mangnifera indica*	Drupe
(B)Orange	*Citrus sinensis*	Hesperidium
(C) Bean	*Dolichos lablab*	Legume
(D) Custard apple	*Annona squamosa*	Aggregate fruit.

789. Which of the following is the correct floral formula for the floral diagram given below?

(a) $\oplus\,\male\ \text{Epi}\ K_{5\ \text{or}\ (5)}\ \overset{\frown}{C_5}\ A_{(\infty)}\ \underline{G}_{(2\ \infty)}$

(b) $\oplus\,\male\ K_{(5)}\ \overset{\frown}{C_5}\ A_{(5)}\ \underline{G}_{(2)}$

(c) $\%\,\male\ K_{(5)}C_{1+2+(2)}\ A_{(9)+1}\underline{G}_1$

(d) $\oplus\,\male\ \overset{\frown}{P_{3+3\ \text{or}\ (3+3)}A_{3+3}}\underline{G}_{(3)}$

AIIMS-2013,2018
Kerala PMT - 2013

Ans. (c) : The given floral diagram is of fabaceae family. It is zygomorphic, bisexual, sepals five and gamosepalous, petals five and papilionaceous anther ten and diadelphous ovary superior and monocapellary.

$\%\male K_{(5)}C_{1+2+(2)}A_{(9)+1}\underline{G}_1$

Inflorescence : Racemose

Flower : Bisexual, zygomorphic

Calyx : Sepals five, gamosepalous; imbricate aestivation.

Corolla : Petals five, polypetalous, papilionaceous, consisting of a posterior standard, two lateral wings, two anterior ones forming a keel (enclosing stamens and pistil), vexillary aestivation.

Androecium and gynoecium: Ten, diadelphous superior, monocarpellary, unilocular with many ovules, style single.

Fruit : Legume, seed : one to many, non-endospermic.

790. Omega 3 fatty acid is present in

(a) sunflower oil (b) flax seed oil
(c) groundnut oil (d) butter

JIPMER-2018

Ans. (b) : The three main omega- 3 fatty acids are:-
1 – Alpha - linolenic acid (ALA)
2 – Eicosa pentaenoic acid (EPA)
3 – Docosa hexaenoic acid (DHA)
• ALA is found mainly in plant oils such as flaxseeds, soyabean, & canola oil.

791. Perianth is found in which family?

(a) Cruciferae (b) Solanaceae
(c) Liliaceae (d) Malvaceae

JIPMER-2018

Ans. (c) : Perianth is found in Liliaceae. The perianth is the outermost whorl, of the flower that consists of petals and sepals in an undifferentiated form.
In Liliaceae family, the number of perianth is six which are arranged in two whorl of three each.

792. Study the following lists:

List I		List II	
A.	Spadix	(i)	Acacia
B.	Valvate	(ii)	Tridax
C.	Cassia	(iii)	Calotropis
D.	Schizocarpic	(iv)	Colocasia
		(v)	Zygomorphic

The correct answer is

	A	B	C	D
(a)	(iii)	(iv)	(ii)	(v)
(b)	(iv)	(iii)	(v)	(i)
(c)	(ii)	(iv)	(v)	(iii)
(d)	(iv)	(iii)	(ii)	(i)

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Spadix it is a type of inflorescence having small flowers borne on a fleshy stem. This inflorescence is found in Colocasia, Maize and Palms.

• **Valvate -** In this type of aestivation, the arrangement of sepals and petals in whorls condition just touch each other at the margin but do not overlap. Ex. - Calotropis.

• **Cassia** - It is an example of a zygomorphic flower with imbricate aestivation.

• **Schizocarpic -** This fruit also called splitting fruit, is a type of dryfruit that upon maturing split into one-seeded parts called mericarps.
Ex. : - Acacia, Castor

793. Statement-A: A plant Pentadiplandra brazzeana produces a protein called brazzein.
Statement B: This protein is low caloric sweetner, i.e. it is used in the treatment of diabetes.

@apna_pdf

(a) A and B both are correct but B is not the correct explanation of A
(b) A and B both are correct B is the correct explanation of A
(c) A is correct and B is wrong
(d) A is wrong and B is correct

GUJCET-2017

Ans. (a) : *Pentadiplandra brazzena* belongs to family capparaceae. In this family unilocular with parietal placentation (ovary) is found and indehiscent fruit type lacking a replum.

• The protein Brazzein is a low-calorie sweetener and is heat stable and thus, used for the treatment of diabetes. Hence, the reason is correct.

Both assertion and reason are correct but the reason is not the correct explanation for the assertion.

794. The floral formula of *Pisum sativum* (pea plant)

(a) $\text{Br Ebrl}\oplus\male\female K_{(5)}\overset{\frown}{C_{(5)}}A_5\underline{G}_{(2)}$

(b) $\text{Br Brl \%}\male\female K_{(5)}C_{1+2+(2)}A_{(9)+1}G_1^-$

(c) $\text{Br Ebrl}\oplus\male\female P_{(3+3)}A_{(3+3)}\underline{G}_{(3)}$

(d) $\text{Br Ebrl \%}\male\female K_{(5)}\overset{\frown}{C_{(5)}}A_5\underline{G}_{(2)}$

TS EAMCET-12.05.2017

Ans. (b) :

$\text{Br Brl \%}\male\female K_{(5)}C_{1+2+(2)}A_{(9)+1}G_1^-$

Pisum sativum (pea plant) belongs to Papilionaceae sub – family. The flower is bracteate, bracteolate, bisexual and zygomorphic.

• The inflorescence is racemose.
• They have 5 sepals which are joined to form the tube.
• They have 5 dawed petals.
• They have diadelphous stamens. The 9 stamens are fused to form a sheath around the pistil. The posterior stamen is free.
• The pistil has single carpel. The ovary is superior. It has marginal placentation.

795. Which one of the following does not belong to Solanaceae

(a) *Nicotiana tobacum*
(b) *Withania somnifera*
(c) *Derris indica*
(d) *Lycopersicon esculentum*

TS EAMCET-12.05.2017

Ans. (c) : • *Derris indica* is the genus of leguminous plants of the fabaceae family.

• *Nicotiana tobacum* (tobacco) is an annually – grown herbaceous plant belongs to the family solanaceae.

• *Withania somnifera* commonly known as ashwagandha, is a plant in the solanaceae family

796. Many carpels are free and each carpel of apocarpous gynoecium develops into a fruitlet in

(a) *Oryza sativa* (b) *Acacia arabica*
(c) *Annona squamosa* (d) *Vitis vinifera*

TS EAMCET-12.05.2017

Ans. (c) : The gynoecium is the female reproductive part of a flower, consisting of one or more carpels.

• If a gynoecium has a single carpel, it is called monocarpous. If a gynoecium has multiple, distinct (free, unfused) carpels, it is called apocarpous.

• In some fruits, each carpel of an apocarpous pistil develops into a berry. During this development the margins of the carpels may be fused (e.g. In *Annona squamosa)* or they may remain separate (e.g. In *Artabotrys odoratissimus*).

• In *Annona squamosa*, the mesocarp of berries is edible.

797. Match the following

List–I		List–II		List–III	
A.	**Thorn**	**I.**	**Umbel**	**i.**	**Bougainvillea**
B.	**Unisexual flower**	**II.**	**Polychasial cyme**	**ii.**	**Cocos nucifera**
C.	**Stolons**	**III.**	**Spadix**	**iii.**	**Neriu**
D.	**Storage root**	**IV.**	**Cymule**	**iv.**	**Carro**

The correct answer is
Options:

	(A)	**(B)**	**(C)**	**(D)**
(a)	IV,i	III,ii	II,iii	I, iv
(b)	IV,ii	III, i	IV,iii	I, iv
(c)	IV, i	II, iii	III, ii	I, iv
(d)	IV,i	III,iv	II,iii	I, ii

AP EAMCET-28.04.2017 Shift-II

Ans. (a) :

List – I (Features)		**List - II (Infloresence)**	**List - III (Plants)**
A.	Thorn	Cymule	Bougain villea
B.	Unisexual flower	Spadix	Cocos nucifera.
C.	Stolons	Polychasial chyme	Nerium
D.	Storage root	Umbel	Carrot

798. Which of the following plants produce zygomorphic flowers?

(a) Hibiscus (b) Canna
(c) Gulmohar (d) Mustard

Karnataka CET-2017

Ans. (c) : The largest petal overlaps the two lateral petals called wings while the two anterior petals are the smallest ones.

• Due to this specific arrangement of petals in the corolla, the flower exhibits bilateral symmetry. Therefore, Gulmohar is an example of a zygomorphic flower.

@apna_pdf

799. Stamens with long bifurcated connective are found in ____flower.

(a) Bignonia (b) Bombax
(c) Salvia (d) Cestrum

MHT CET-2017

Ans. (c) : Flower of Salvia have two stamens which are epipetalous. The two anther lobes are connected by a long curved connective.

• One of the anther lobes is sterile (lower branch). And other lobes is fertile (uper branch).

800. Match the following lists

List -I	List-II
(A) Monocarpellary ovary	**(I) Papaver**
(B) Apocarpous ovary	**(II) Dolichos**
(C) Syncarpous ovary	**(III) Allium**
(D) Tricarpellary ovary	**(IV) Michelia**
	(V) Abutilon

The correct answer is
Options:

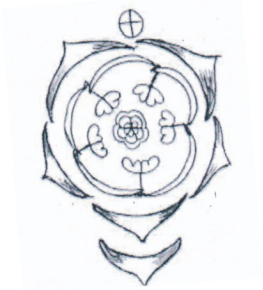
	A	B	C	D
(a)	II	I	IV	III
(b)	II	IV	I	III
(c)	II	V	I	III
(d)	II	III	IV	I

AP EAMCET-28.04.2017 Shift-I

Ans. (b) :

Type of ovary	Plants
A - Monocarpellary ovary.	Dolichos (bean)
B - Apocarpous ovary	Michelia (magnolia)
C - Syncarpous ovary	Papaver (poppy)
D - Tricarpellary ovary	Allium cepa (onion)

801. Find the correct description of the flower in general and 1st and 3rd whorl of flower based on the diagram illustrated below:



(a) Bracteate, ebracteolate, pentamerous, bisexual, Gamosepalous, twisted aestivation. stamens 5, epipetalous
(b) Ebracteate, ebracteolate, pentamerous, bisexual, polysepalous, imbricate aestivation, stamens 5, epiphyllous
(c) Ebracteate, ebracteolate, pentamerous, bisexual, gamosepalous, valvate aestivation, stamens 5, monoadelphous
(d) Bracteate, ebracteolate, pentamerous, bisexual, polysepalous, imbricate aestivation, stamens 5, epipetalous

AP EAMCET-28.04.2017 Shift-I

Ans. (d) : Generally, a flower has four types of whorls-
(i) an outer calyx consisting of sepals.
(ii) the corolla, consisting of petals.
(iii) the androecium, or group of stamens
(iv) the gynoecium, or group of pistil.
The corret description of given floral diagram is-
Bracteate, ebracteolate, pentamerous, bisexual, polysepalous, imbricate aestivation, stamens 5, epipetalous

802. *Ricinus communis* is the host plant of the silkworm called

(a) Mulberry silkworm (b) Tasar silkworm
(c) Eri silkworm (d) Muga silkworm

Tripura JEE-2017

Ans. (c) : *Ricinus communis* (castor) is the host plant of the silkworm called Eri silkworm. Castor oil plant has great commercial use in pharmaceutical industries. The silkworm that feed on mulberry leaves are called mulberry silkworm and important food plants of tasar silkworm are Arjun, Asan (*Terminalia tomentosa*) and Sal.

803. The plant having milky latex is

(a) *Phyllanthus emblica* (b) *Ricinus communis*
(c) *Jatropha curcas* (d) *Euphorbia tirucalli*

SRM JEEE -2017

Ans. (d) : The plant having milky latex is *Euphorbia tirucalli.* Euphorbia tirucalli is a tree native to Africa that grows is semi-arid tropical climates. It produces a poisonous latex that can cause temporary blindness.

804. Which among the following members is not economically important as a food?

(a) *Solanum tuberosum*
(b) *Solanum melongena*
(c) *Lycopersicon esculentum*
(d) *Solanum trilobatum*

SRM JEEE -2017

Ans. (d) : Thuduvalai known by its botanical name *Solanum trilobatum* is an important medicinal plant called as kayakalp herb, used extensively in respiratory issues.

805. One of the following is a source of rubber

(a) *Cedrus deodara* (b) *Tectona grandis*
(c) *Hevea brasiliensis* (d) *Michelia champaca*

SRM JEEE-2017
AIIMS-1998

Ans. (c) : *Hevea brasiliensis* is known as the para rubber tree, sharinga tree or most commonly the rubber tree is a tree belong to the family Euphorbiaceae.

806. Heroin is obtained from plant of family:

(a) Papaveraceae (b) Leguminosae
(c) Cruciferae (d) Liliaceae

JCECE-2004

Ans. (a) : Heroin is obtained from plant of *papaver somniferum* and *papaveraceae* family. The papaveraceae are an economically important family. Mostly occurs in temperate region.

807. Trimerous flower, superior ovary and axile placentation is characteristics of:

(a) Liliaceae (b) Cucurbitaceae
(c) Solanaceae (d) Compositae

BHU PMT (Screening)-2005

@apna_pdf

Ans. (a) : Trimerous flower, superior ovary and axile placentation is characteristics of liliaceae. The lily family Liliaceae, consists of about 254 genera and 4075 species of flowering plant within the order liliales.
They are monocotyledonous, perennial herbaceous.

808. Presence of persistent calyx is a feature of family
(a) solanaceae (b) gramineae
(c) malvaceae (d) compositae
UP CPMT-2006

Ans. (a): The group of sepals is called calyx. Calyx are the sepal of a flower typically forming a whorl that enclose the petals and forms a protective layer around a flower in bud. In Solanaceae, the calyx is having five sepals, green, gamosepalous, tubular showing valvate aestivation. Persistent calyx (one remaining after corolla has withered) is a character of solanaceae as the calyx stays with the matured fruit at the later stage.

809. Opposite decussate and stipulate leaves is the characteristic feature of members of family :
(a) Rubiaceae (b) Asclepiadaceae
(c) Malvaceae (d) Rosaceae
Uttarakhand PMT-2006

Ans. (a) : The Rubiacae are a family of flowering plants, commonly known as the coffee, madder, or bedstraw family. It consists of terrestrial tree, shrubs, Oliaras herbs that are recognizable by simple opposite leaves with interpetiolar stipules and sympetalous actinomorphic flowers.

810. Raticide poisons are obtained from : (1) Dracaena (2) Scilla (3) Colchicum (4) Urginea
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct
BHU PMT (Mains)-2005

Ans. (c) : Reticide poisons are obtained from the bulbs of Seilla and urginea. Rat poison is called rodenticide it is used for the purpose of killing rodents.
• Raticide poisons are obtained from both Scilla and Urginea belongs to the family Asparagaceae. These substances kill by preventing normal blood clotting and causing internal hemorrhaging.
• It is bitter & due to this many animals avoid but rats eat readily & die due to toxic scilliroside (toxic compound).

811. Velamen is found in :
(a) Vanda (b) Rosa
(c) Viscum (d) Sanctlum
Uttarakhand PMT-2004

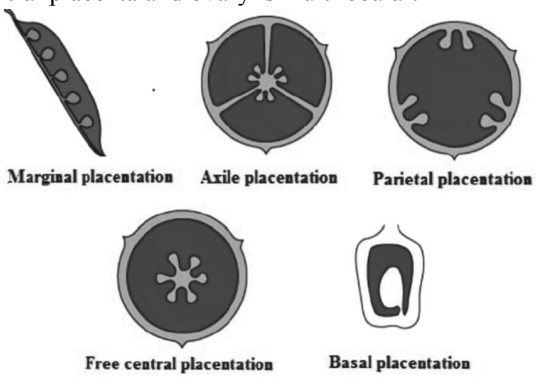
Ans. (a) : Velamen is a multilayered tissue that is spongy in nature which covers the aerial roots of epiphytic plants such as orchids.
Aerial roots of orchids are able to absorb atmospheric water and conduct it to the root interior. The water is absorbed by imbibitions process.

812. Which of the following is exotic species?
(a) Parthenium (b) Lantana
(c) Eichhornia (d) All of these
AFMC -2009

Ans. (d) : An exotic species is known as a species which is living outside its range and was transported to another area by humans.
• Lantana, Eichhornia and Parthenium all are exotic species, which had been introduced in India.
• They have harmful impact resulting in the extinction of indigenous species.

813. Placentation found in tomato is
(a) marginal (b) axile
(c) parietal (d) basal
J&K CET-2014

Ans. (b) : Axile placentation is seen in tomato. In this type of placentation, the ovary is partitioned into two or more chambers by septa. The ovules are borne on the central placenta and ovary is multilocular.



• **Marginal plantation:-** Ex. – Pea & Cassia
• **Parietal Placentation:-** Ex.– Radish, Papaya
• **Basal placentation:-** Ex.– marigold, sunflower

814. Which one of the following is being tried in India as a bio fuel substitute for fossil fuels?
(a) Jatropha (b) Azadirachta
(c) Musa (d) Aegilops
JCECE-2015

Ans. (a) : *Jatropha curcas* belonging to family Euphorbiaceae, a perennial plant produces seed with 31 - 37 percent of oil, which can be combusted as fuel with out being refined.
• Jatropha oil can be used directly after extraction (i.e. without refining) in diesel, generators and engines.

815. Root pockets can be seen in:
(a) Nelumbo (b) Nymphaea
(c) Hydrilla (d) Pistia
AP EAMCET-2000

Ans. (d) : Root pockets are basically root caps but have lost there utility due to non -use. Pitia is a hydrophyte where root pockets are present.
• Root pockets are vestigial (non-functional) because the roots of the plants that hang freely in water have no friction or resistance from the soil particles to overcome. It is found only in floating aquatic plants like Pistia, Water hyacinth and Trapa.

816. Parkinsonia is a good example of
(a) winged fruit
(b) phyllode
(c) parachute mechanism

@apna_pdf

(d) phylloclade.

AIIMS-1994

Ans. (b) : In some plants petiole changes and it looks like a leaf due to environmental reasons and is known as phyllode. Phyllods do not bear leaves, branches flowers and also have potential of photosynthesis.
- *Parkinsonia aculeata* has a high tolerance to drought, simply attaining horter stature.
- Main stems like branches and flower stalks can also become phyllodes.
- The Mexican paloverde (*Parkinsonia aculeata*) also has phyllodes.

817. Syncarpous ovary can be seen in
(a) Mustard (b) Wheat
(c) Maize (d) Butter cup

UP CPMT-2013

Ans. (a) : Syncarpous is a condition in which the carpels of the gynoecium are united in a compound ovary. The syncarpous ovary is responsible for the formation of only one fruit with one or many seeds.
Example: tomato and mustard.

818. Pea plant belongs to the family
(a) Solanaceae (b) Poaceae
(c) Fabaceae (d) Compositae

UP CPMT-2013

Ans. (c) : The fabaceae family is a large family of the plant kingdom. The family Fabaceae is also known as Leguminosae or Papilionaceae family.
Example: Pea (*Pisum sativum*)
- Fabaceae family is divided into three sub-family
1. Papilionaceae 2. Caesalpinaceae 3. Mimosaceae

819. Family Podostemaceae is placed under the Series
(a) Multiovulatae aquaticae
(b) Microembryeae
(c) Daphnales
(d) Unisexuales
(e) Heteromerae

Kerala PMT-2008

Ans. (a) : Podostemaceae family is placed under the series of multiovulatae aquaticae (aquatics with numerous ovules). It is a family of aquatic plants. The ovary is 2-3 carpellate and superior, placenta is fleshy and axillary. The ovules are axile and anatropous.

820. Match the items in Column I with Column II and choose the correct answer

	Column I		**Column II**
(A)	**Artemesia sp.**	**(1)**	**Insecticide**
(B)	**Solidago sp.**	**(2)**	**Santonin**
(C)	***Eclipta alba***	**(3)**	**Dropsy**
(D)	***Chrysanthemum roseum***	**(4)**	**Tonic in spleen enlargement**

(a) A-2, B-3, C-4, D-1
(b) A-1, B-2, C-3, D-4
(c) A-3, B-4, C-2, D-1
(d) A-4, B-3, C-2, D-1
(e) A-3, B-1, C-4, D-2

Kerala PMT-2008

Ans. (a) :	
(A) Artemesia sp.	Santonin
(B) Solidago sp.	Dropsy
(C) *Eclipta alba*	Tonic in spleen enlargement
(D) *Chrysanthemum roseum*	Insecticide

821. Which of the following represents the floral characters of Liliaceae?
(a) Six petals, zygomorphic, six stamens, bilocular ovary, axile placentation
(b) Tetramerous, actinomorphic, polphyllous, unilocular ovary, axile placentation
(c) Trimerous, actinomorphic, polyandrous, superior ovary, axile placentation
(d) Bisexual, zygomorphic, gamophyllous, inferior ovary, marginal placentation
(e) Unisexual, actinomorphic, trilocular, inferior ovary, axile placentation

Kerala PMT-2008

Ans. (c) : Liliaceae is a family of monocotyledonous family. It is also known as the "lily family".
- Characters of Liliaceae are trimerous, actinomorphic, polyandrous, superior ovary, axile placentation. It includes medicinal plants like Aloevera, Colchicum and Vegetable like onion, garlic, asparagus.

822. Potato is included in solanaceae family because
(a) it is epipetalous
(b) it is pentamerous
(c) ovary is slightly diverted from its position
(d) all the above

AIIMS-1997

Ans. (d) : Potato (*Solanum tuberosum*) is the member of family solanaceae, which is characterized by Obliquely placed superior ovary, epipetalous, pentamerous flowers.
It is a large family and world wide distribution plants are motly herbs, shrubs and small trees.

823. Which of the following is the largest and edible bud?
(a) cabbage (b) onion
(c) cauliflower (d) Agave.

AIIMS-1997

Ans. (a) : Cabbage is the largest edible bud . In cabbage plant the stem is so short that the great mass of thick overlapping leaves tend to form a head. Cabbage and head lettuce are enlarged terminal buds. It is a leafy, biannual domesticated plant very popular because of its dense-leaves heads.
- The older leaves surround the younger smaller more tender leaves and the cabbage resembles a huge bud.

824. Wax is obtained from:
(a) jojoba (b) guayle
(c) leucaena (d) subabul

J&K CET-2002

@apna_pdf

Ans. (a) : Wax is obtained from the seed of Jojoba plant (S. chinensis), a shrub belonging to the family - simmondsiaceae.

- Wax plant is also called pig nut, deer nut, goat nut, wild hazel. Jojoba wax is extracted from the seed.

825. In which one of following would you except to find glyoxysomes?

(a) Endosperm of wheat
(b) Endosperm of castor
(c) Palisade cells in leaf
(d) Root hair

CMC Vellore-2013

Ans. (b) : Glyoxysomes are present in cotyledons or endosperm of the germinating fatty acid, rich in fatty acids. They serve as an enzymatic site for reactions including the conversion of stored fatty acids to carbohydrates. It can be found in seeds containing fats and oils like corn, soybean, sunflower.

Therefore, glyoxysomes will be present in endosperm of castor.

826. Plant material, which is used in culture medium is obtained from

(a) Cycos (b) Coconut milk
(c) Pinus (d) Mango

BHU PMT (Mains)-2010

Ans. (b) : *Cocos nucifera* (coconut milk) is the scientific name for coconut. Coconut milk is mainly used as culture medium.

- Skoog observed that coconut milk stimulated cell division. Due to contained a substance was later on called cytokinin.

827. The anthers in Solanaceae are:

(a) monothecus, introrse
(b) dithecus, extrorse
(c) dithecous, introrse
(d) monothecus, extrorse

BVP-2003

Ans. (c) : The family solanaceae is commonly called potato family. The anthers are dithecous and they dehiscence by introrse mode.

Ex. Tomato , Potato, Brinjal.

828. Turpentine oil is obtained from:

(a) *Pinus longifolia* (b) *Melia azadirachta*
(c) Eucalyptus (d) all of the above

BVP-2003

Ans. (a) : Turpentine is a well - known essential oil extracted by distillation from *Pinus longifolia*.

- Turpentine oil is the fluid formed by the distillation of resins that obtained from the pine tree or pinus. It is used as a solvent and oil based paints.

829. *Simmondsia chinensis* is commonly known as:

(a) amia (b) poppy
(c) teak wood (d) jojoba

BVP-2005

Ans. (d) : Jojoba (*Simmondsia chinensis*) also called goat nut pig nut, deer nut and wild hazel belongs to the family simmondsiaceae.

830. Which of the plant yield sunhemp?

(a) Cannabis (b) Crotaleria
(c) Corchorus (d) Hibiscus

BVP-2002

Ans. (b) : *Crotalaria juncea* belong to family fabaceae commonly known as rattlepod, it is a source of natural fibres.

- It is an erect, herbaceous, laxly branched annual.
- The fibres is made into cordage, fishing nets, sacking fabrics and is used to manufacture such paper products as cigarette and tissue paper.

831. Monoadelphous condition of stamens is found in:

(a) Malvaceae (b) Cyperaceae
(c) Cruciferae (d) Solanaceae

BVP-2002

Ans. (a) : Monoadelphous condition of stamens is present in Malvaceae family in which all the filament of the stamens are united into a single bundle to form a tube like structure but anther remains free. For example - China rose

832. Match Column I with II and choose the right option

I	II
1. Artemisia	A. Fibre
2. Astragalus	B. Insecticide
3. Phormium	C. Rat poison
4. Chrysanthemum	D. Medicine
5. Withania	E. Vermifuge
	F. Gum

(a) 1 - D 2 - C 3 - F 4 - B 5 - E
(b) 1 - B 2 - E 3 - D 4 - C 5 - A
(c) 1 - C 2 - E 3 - A 4 - F 5 - D
(d) 1 - F 2 - E 3 - A 4 - B 5 - D
(e) 1 - E 2 - F 3 - A 4 - B 5 - D

Kerala PMT-2009

Ans. (e) : 1. Artemesia is a large and diverse genus of plants belongs to family asteraceae. Santonin is a drug which is obtained from Artemesia as a vermifuge (antihelminthic drug).

2. Astragalus is a genus of herbs and small shrubs belong to family - leguminosae or fabaceae. The natural gum tragtaeanth is made from several species of Astragalus.

3. Phormium is a genus of two plant species belonging to family liliaceae. Phormium produces longleaf fibers that have played an important role in the culture, history and economy of New Zealand.

4. Chrysanthemum is a genus of flowering plants belong to the family Asteraceae. It is economically important as a natural source of insecticide.

5. *Withania somnifera* (Ashwagandha) is the species of plant belong to family solanaceae. It is used in Ayurvedic, Unani medicines

833. Select the characters which are not applicable to the family Solanaceae ?

(A) Epipetalous and syngenesious anthers
(B) Bicarpellary and syncarpous ovary
(C) Oblique ovary with axile placentation
(D) Stamens six, arranged in two whorls

@apna_pdf

(E) Bicarpellary, syncarpous and inferior ovary

(a) B and C only (b) A, D and E only
(c) B, D and E only (d) A and C only
(e) C, D and E only

Kerala PMT-2009

Ans. (b) : Characteristic feature of solanaceae family are :-
i. Inflorescence – Axillary cyme.
ii. Flower :- Pentamerous, bisexual hypogynous.
iii. Calyx :- Gamosepalous, persistent
iv. Corolla :- Gamopetalous, valvate aestivation
v. Androecium :- five stamens, Anther basifixed, epipetalous
vi. Gynoecium :- syncarpous, binocular, superior ovary, bicarpellary axile placentation.

834. Which one of the following represent the floral characters of Poaceae ?

(a) Pedicellate, bracteate, bisexual, tetramerous, actinomorphic, complete and superior ovary
(b) Pedicellate, bracteate, bisexual, pentamerous, zygomorphic, complete and superior ovary
(c) Sessile, bracteate, bracteolate, incomplete, uni or bisexual, perianth modified into lodicules, stamens three, syncarpous, superior ovary and feathery stigma
(d) Bracteate, unisexual, actinomorphic, stamens five and inferior ovary
(e) Bracteate, bracteolate, bisexual, pentamerous, actinomorphic, complete and superior ovary

Kerala PMT-2009

Ans. (c) : Floral characters of poaceae family are as follows:–
i. Flower is without stalk (sessile), spikelet inflorescence, unisexual or bisexual, presence of lodicules.
ii. Androecium has three stamens, anthers are versatile, gynoecium is tricarpellary syncarpous, unilocular ovary, feathery stigma.
iii. Fruit is caryopsis with the embryo situated towards a side at the base, presence of coleoptile and colorhiza.

835. The characteristic type of placentation found in the members of Caryophyllacea is

(a) Parietal (b) Marginal
(c) Basal (d) Axile
(e) Free central

Kerala PMT-2009

Ans. (e) : Free central placentation found in the members of caryophyllaceae family. Here, the pistil is polycarpellary and syncarpous but the ovary is unilocular.

836. Match the following and choose the correct combination from the option given.

Column– I (Family)	Column - II (Androecium Formula)
A. Brassicaceae	**1. A_{3+3}**
B. Fabaceae	**2. $A_{(5)}$**
C. Solanaceae	**3. $A_{(9)+1}$**
D. Liliaceae	**4. A_{2+4}**

(a) A -4 B - 3 C - 2 D - 1
(b) A- 1 B - 2 C - 3 D - 4
(c) A- 2 B - 3 C - 4 D - 1
(d) A- 3 B - 4 C - 1 D - 2
(e) A- 4 B - 3 C - 1 D - 2

Kerala PMT-2012

Ans. (a) : i. Brassicaceae :- Tetradynamous, consisting of 4 long inner stamens and 2 short outer stamens.
ii. Fabaceae :- Androecium is ten and usually diadelphous. It is a condition where the stamens are fused by their filaments while the anthers are free.
iii. Solanaceae :- Androecium contain five stamens epipetalous anthers basifixed.
iv. Liliaceae :- Androecium contains six polyandrous stamens, which are epiphyllous and present in 2 whorls.

837. Find out the correctly matched pair

Palcentation Types	Represented in
(a) Marginal	Tomato
(b) Axile	Pea
(c) Parietal	Primrose
(d) Free Central	Argemone
(e) Basal	Marigold

Kerala PMT-2012

Ans. (e) :

Palcentation Types		Represented in
(a) Marginal	→	Pea
(b) Axile	→	Tomato
(c) Parietal	→	Argemone
(d) Free central	→	Primrose
(e) Basal	→	Marigold

838. The distinct features of Fabaceae are

(a) Zygomorphic, diadelphous and monocarpellary
(b) Actinomorphic, monadelphous and monocarpellary
(c) Zygomorphic, monadelphous and pentacarpellary
(d) Zygomorphic, polyadelphous and tricarpellary
(e) Zygomorphic, diadelphous and bicarpellary

Kerala PMT-2012

Ans. (a) : Fabaceae or leguminosae is a large and economically important family of flowering plants.
- In fabaceae, the flowers are zygomorphic and bisexual.
- The stamens are 10, diadelphous (stamens united by their filaments so as to form two groups.)
- The gynoecium is monocarpellary, syncarpous, superior ovary.

839. Choose the specific characters of flowers of Canna

(a) Actinomorphic and radial symmetry
(b) Irregular and bilateral symmetry
(c) Irregular and zygomorphic
(d) Irregular and radial symmetry

@apna_pdf

(e) Irregular and asymmetric

Kerala PMT-2012

Ans. (e) : The flowers are asymmetric and is composed of 3 sepals and 3 petals that are small, inconspicuous irregular and hidden under extravagant stamens.

840. Match the following lists

List-I	List-II
(A) Alstonia	**(I) Roots at lower nodes of the stem**
(B) *Ananus sativus*	**(II) Leaflets are attached at a common point in the leaf**
(C) Sugarcane	**(III) Swollen placenta**
(D) *Bombax ceiba*	**(IV) more than two leaves at every node**
	(V) Underground lateral branches producing aerial leafy shoots

	(A)	(B)	(C)	(D)
(a)	(IV)	(II)	(V)	(I)
(b)	(IV)	(V)	(I)	(II)
(c)	(V)	(III)	(I)	(II)
(d)	(V)	(III)	(I)	(IV)

AP EAMCET-2014

Ans. (b) :
Alstonia is a genus of evergreen trees and shrubs, family of Apocynaceae. It contains more than two leaves at every node.
Ananus Sativus it undergrounds lateral branches producing aerial leafy shoots.
Sugarcane roots are found at lower nodes of the stem.
Bombax Ceiba in bombax ceiba, leaflets are attached at a common point in the leaf.

841. Four plants (A,B,C,D) are observed. 'A' has cartilagenous endocarp in the fruit and fleshy thalamus as chief edible part 'B' has caryopsis fruit with endosperm as the chief edible part. In 'C' each carpel of apocarpous gynoecium develops into a fruitlet and its mesocarp and endocarp are the chief edible parts 'D' has syconus fruit with edible fleshy peduncle. To which families A, B, C, and D belong respectively?

(a) Rosaceae, Poaceae, Announces Moraceae
(b) Annonaceae, Rosaceae, Moraceae, Rutaceae
(c) Solanacene , Cucurbitaceae, Anacardiaceae, Moraceae
(d) Rustaceae, Anacardiaceae, Rosaceae, Fabaceae

AP EAMCET-2014

Ans. (a) : Rosaceae :- The fruit remains surrounded by fleshy thalamus. The fleshy thalamus makes the edible part, whereas the actual fruit lies within it.

- The outer portion of the pericarp is fleshy and fused with the thick edible portion.
- The inner layer of pericarp is cartilaginous and forms the core surrounding the seeds.

example- Apple, pears etc.

2. Poaceae:- Caryopsis is one - chambered and one - seeded fruit which develops from a superior monocarpellary ovary. Here the pericarp remains fused with the seed coat.
example- maize, wheat, Barley, Millets etc.
3. Annonaceae:- The charactersties example of Annonaceae is found in Rubus (raspberry). It develops from superior, polycarpellary and apocarpous gynoecium. The carpels are borne on a conical thalamus.
4. Moraceae:- Syconus is a type of composite fruit under family moraceae develops from a hollow, pear - shaped fleshy receptacle which encloses numerous minute male & female flower.

842. Identify the characters of mustard, chilli cauliflower respectively

(a) Axile placentation, tricarpellary gynoecium, sessile flowers
(b) Inferior ovary, zygomorphic flower, corymb
(c) Whorled phyllotaxy, unilocular ovary, production of flowers at the same node of the peduncle
(d) Hypogynous flower, unilocular ovary, corymb

AP EAMCET-2014

Ans. (d) : Mustard and the cauliflower belong the the family of Brassicaceae. The characters of the mustard include herbaceous plants bisexual, complete and actinomorphic flowers having hypogynous ovary with a single ovary. The characteristics of the chilli belong to the family of solanaceae which is made of a large number of a vegitable crops, medicinal crops, shrubs or trees with petiolate leaves.

843. Which one of the following families shows both freedom and fusion in four successive whorls of the flower from exterior in different members?

(a) Malvaceae (b) Solanaeeae
(c) Asteraceae (d) Liliaceae

JCECE-2010

Ans. (d) : Liliaceae families shows both freedom and fusion in four successive whorls of the flower from exterior in different members. Liliaceae family has superior ovaries which means they are hypogynous and syncarpous along with three fused carpels and are either trilocular or unilocular.

844. Inflorescence of family-Compositae is

(a) perianth (b) lodicule
(c) capitulum (d) hypanthodium

JCECE-2010

Ans. (c) : Asteraceae or compositae has flowers aggregated in inflorescence called head and capitulum. In this inflorescence, main axis is flat and considered as receptacle. It bears many small and sessile, bisexual florets called disc florets at centre and one or two whorls of sessile unisexual florets called ray florets towards the periphery.

845. *Tectona grandis* belongs to family :

(a) Verbenaceae (b) Anacardiaceae
(c) Rubiaceae (d) Lamiatae

BVP-2000

@apna_pdf

Ans. (b) : *Tectona grandis* (Teak) is a tall tree from Southeast Asia & is widely cultivated for its durable wood.

- It is a member of the mint family lamiaceae, which is better known for its aromatic members such as basil, oregano and rosemary.
- In older classification, it belongs to the family verbenaceae.

846. Aswagandha is called as :
(a) *Raiwolfia serpentine*
(b) *Withania somnifera*
(c) *Datura stramonium*
(d) *Cannabis sativa*

BVP-2000

Ans. (b) : Aswagandha is commonly known as " Indian winter cherry" or " Indian Ginseng",

- Ashwagandha is called as - *Withania somnifera*.
- It is one of the most important herb in Ayurveda.
- Aswagandha belongs to family solanaceae it is used for stress relief and improve general health.

847. Peanut oil is obtained from :
(a) *Glycine max* (b) *Arachis hypogaea*
(c) *Pisum sativum* (d) *Lathyrus odoratus*

BVP-2000

Ans. (b) : Peanut or groundnut oil is obtained from the seed kernels of *Arachis hypogaea*.

- It is the healthy and nutritive source of food, it also used as lubricant oilcake for animal food.

848. Consider the following statements: (1) cucurbits are monoecious plant (2) in mango, neuter, male and female flowers occur together (3) leguminous plants show unisexuality (4) oblique septa is found in Rosaceae
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 1, 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2006

Ans. (b) : Cucurbits are monoecious, (both male and female flowers are present on the same plants). In mango, neutral, male and female flowers occur together. Leguminous plants have bisexual flower that is both stamens and carpels are present in same flowers. Oblique septa is found in solanaceae family.

849. Which one of the following plants is used in paint and varnish industry?
(a) Abies
(b) *Cedrus deodara*
(c) *Pinus roxburghii*
(d) *Pinus gerardiana*

AMU-1995

Ans. (c) : *Pinus roxburghii* plants is used in paint and varnish industry. It is commonly known as chir pine or longleaf Indian pine which is a species of pine tree native to the Himalayas. It was name after William Roxburgh.

850. *Simmondsia chinensis* is an oil yielding plant of Mexico and it has been recently introduced in Indian dessert. What is the common name of this plant?
(a) subabul (b) gauynie
(c) winged bean (d) Jojoba

AMU-1995

Ans. (d) : *Simmondsia chinensis* is an oil yielding plant of Mexico and it has been recently introduced in Indian desert which is commonly known as Jojoba.

851. Which one of the following plant is most commonly used as green manure?
(a) *Dalbergia sissoo*
(b) Polyaithea
(c) *Sesbania aculeate*
(d) none of these.

AMU-1995

Ans. (c) : Sesbania is a legume commonly used as a green manure crop to add nitrogen & organic matter to the soil.

- The most common species of Sesbania used in Asia are *Sesbania cannabina* (former name aculeate).

852. Pollinium is found in family
(a) asclepidaceae (b) rubiaceae
(c) solanaceae
(d) myrtaceae

AIIMS-1995

Ans. (a) : The pollen grains are found in a sac - like structure called pollinium. It is found in family - Asclepiadaceae and orchidaceae family two pollinia are attrached to a glandular adhesive disc called corpusculum are called retina culum.

853. The 3 sub-families of leguminosae are distinguished mainly on the basis of
(a) nature and habit of the plants
(b) nature of gynoecium
(c) nature of fruit and its germination
(d) inflorescence and lower characters

AIIMS-1995

Ans. (d) : The 3 sub-families of leguminosae are distinguished mainly on the basis of inflorescence and lower characters.

854. Black wood is obtained from
(a) Dalbergia (b) Albizzia
(c) Manihot (d) Acacia

AIIMS-1995

Ans. (a) : Black wood is obtained from Dalbergia.

- Black wood is a hardwood. The timber of black wood can be used to make furniture, panels, and decorative pieces.

855. Spirocyclic (hemicyclic) numerous free stamens and apocarpous carpels are found in the family
(a) Cucurbitaceae (b) Cruciferae
(c) Ranunculaceae (d) Labiatae

AIIMS-1998

Ans. (c) : Spirocyclic flower is also known as 'Hemicyclic' having flowering parts such as stamens and carpels are arranged spirally in Ranunculaceae.

@apna_pdf

856. How many plants among Indigofera, Sesbania, Salvia, Allium, Aloe, Mustard, Groundnut, Radish, Gram and Turnip have stamens with different lengths in their flowers?

(a) Three (b) Five
(c) Four (d) Six

NEET-2016 Phase-II

Ans. (c) : Salvia, Mustard, Radish and Turnip plants have stamens of different length in their flowers. It has been found that the family Brassicaceae and Lamiaceae have distinct stamen length.

857. $\oplus\ \female\ K_{(5)}\ \overset{\frown}{C}_{(5)}\ A_5\ G_{(2)}$ is the floral formula of

(a) Sesbania (b) Petunia
(c) Brassica (d) Allium

AIPMT-2015

Ans. (b) : The given floral formula is of family Solanaceae. Among the given options - only Petunia belongs to Solanaceae family, but other options such as-

- Allium is a member of Liliaceae family.
- Brassica is a member of family Brassicaceae family.
- Sesbania is a member of family Leguminosae.

858. From which part of coconut coir is obtained?

(a) Pericarp (b) Mesocarp
(c) Epicarp (d) Endocarp

UP CPMT-2009

Ans. (b) : Mesocarp is found from coconut coir. Coir is the fibrous material found between the hard, internal shell & outer coat of coconut called mesocarp.

859. Most of the economically important fibre yielding plants belong to family

(a) Malvaceae (b) Solanaceae
(c) Cruciferae (d) Poaceae

UP CPMT-2007

Ans. (a) : Malvaceae is a mallow family.
Example cotton, ladyfinger etc.

- It is the most important fiber plant which supply more than 70% of the world consumption of fibers.
- This family is used for obtaining cortical fiber which is used for cordage, ropes & floor covering.

860. Cocoa is the plant from which chocolate is made. Which part is used to extract it?

(a) Flower (b) Fruit
(c) Seeds (d) Bark

AIIMS-2007

Ans. (c) : Cocoa is obtained from seeds of cocoa plant theobroma. It belongs to family sterculiaceae. This plant is a native of tropical America and its seeds are used to prepare cocoa and chocolate.

861. Identify the plants in correct sequence, which exhibit marcescent calyx, herkogamy, mucilagenous cavities and inferior ovary respectively.

i. Sphaeranthus ii. Capsicum
iii. Gloriosa iv. Kydia
The correct sequence is

(a) i, iii, ii, iv (b) ii, i, iii, iv
(c) ii, iii, i, iv (d) ii, iii, iv, i

AP EAMCET-2008

Ans. (d) : Capsicum- It is genus of flowering plants in the nightshade family **solanaceae** native to the America,cultivated worldwide for their chilli pepper or bell pepper fruit.

Gloriosa- *Gloriosa superba* is a species of flowering plant in the family **Colchicaceae**. Common names include **flame lily.**

Kydia-*Kydia calycina* is a species of flowering plants in the genus kydia found in the Indian subcontinent, Southern China and south east Asia.

Sphaeranthus - It is a genus of Asian, Africans and Australian plants, in the inuleae tribe within the daisy family.

862. Identify three of the following plants, which exhibit the physiological process described to 'Necessary Evil'

i. Potamogeton ii. Sagittaria
iii. Limnophila iv. Nymphaea
The correct match is

(a) i, ii, iii (b) ii, iii, iv
(c) i, ii, iv (d) i, iii, iv

AP EAMCET-2008

Ans. (b) : Sagittaria- It is a genus of aquatic plants Mostliy are native to South, Central and North America

(a) **Potamogeton-** It is a genus of aquatic-mostly freshwater, plants of the family **potamogeonaceae.**

(c) **Limnophila** - It is a genus of flowering plants in the family **Plantaginaceae**. It is distributed in tropical and sub-tropics region of Africa' Asia, Australia, and the Pacific islands species are known commonly as **marshweeds**. These are annual or perennial herbs.

(d) **Nymphaea-** It is a genus of **hardy and tender** aquatic plants in the family **Nymphaeaceae.** The genus has a cosmopolitan distribution. Some taxa occur as introduced species where they are not native and some are weeds. It's also known as **Water lily.**

863. Study the following lists

List-I	List-II
(A) Arachis	**1. Basket making**
(B) Mangifera	**2. Saky**
(C) Cajanus	**3. Fixed oil**
(D) Oryza	**4. Diuretic**
	5. Nitrocellulose

	A	B	C	D
(a)	3	4	1	2
(b)	2	3	4	5
(c)	3	1	5	4
(d)	5	3	2	1

AP EAMCET-2008

Ans. (a) :

(a) Arachis - Fixed oil
(b) Mangifera - Diuretic
(c) Cajanus - Basket making
(d) Oryza - Saky

@apna_pdf

864. In the flowers of a plant, the ovarian part is fused, but styles and stigmas are free. Its ovary becomes unilocular due to breakdown of partition wall and the ovules are attached to a central axis. Identify the plant.

(a) Dianthus (b) Abutilon
(c) Nymphaea (d) Michelia

AP EAMCET-2008

Ans. (a) : Dianthus-It is a genus of the family **Caryophyllaceae,** native mainly to Europe and Asia,

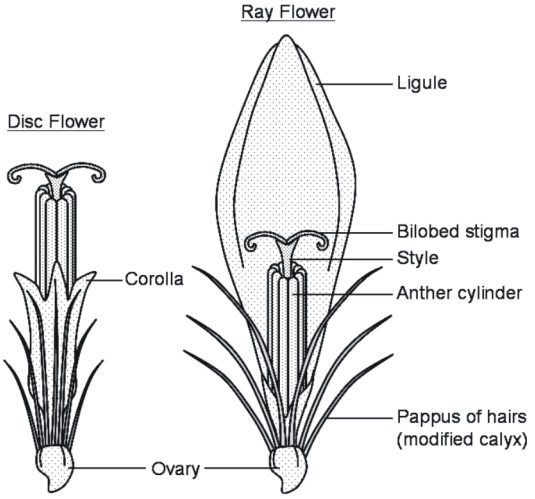
- **Abutilon,** also known as **Indian mallow,** is large genus of flowering plants in the **mallow** family
- **Nymphaea,** also known as **''Water lily''** is a genus of hardy and tender aquatic plants in the family **Nymphaeaceae**.The genus has a cosmopolitan distribution. Many species are cultivated as ornamental plants.
- **Michelia** is a historical genus of flowering plants belong to the **Magnolia family**. The genus included about 50 species of evergreen trees and shrubs, native to tropical and subtropical South and Southeast Asia, including Southern China . Today it is regarded as a synonym of magnolia.

865. Pappus helps in dispersal of pollen in?

(a) Asteraceae (b) Brassicaceae
(c) Malvaceae (d) Solanaceae

AIIMS-2011
J&K CET - 2000

Ans. (a) : Pappus is found in the plant belonging to the family of Asteraceae. The pappus may be formed of bristles or scales. These hairy structure help in dispersal of pollen by wind. This makes the seed light which help in easy dispersal by the wind.



866. Which one of the following is correct matching of a plant, its habit and the forest type where it normally occurs ?

(a) Prosopis- Tree-scrub
(b) Saccharum- Grass-forest
(c) *Shorea robusta*- Herb - Tropical rain forest
(d) *Acacia catechu*- Tree - Coniferous forest.

AIIMS-2005

Ans. (a) : Prosopis trees are present in the family of **Fabaceae.** They are evergreen plant.

- Prosopis is a deep-rooted perennial tree, which is able to absorb water from either water table or moist strata. It is found in desert shrub forests.
- **Saccharum** is common grass found in grasslands and tropical savannah. Both *Shorea robusta* and *Acacia catechu* are trees found in tropical deciduous forests. In tropical deciduous forests, vegetation includes broad-leave trees, which shed their leaves during the dry season.

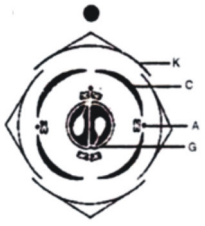
867. The family containing mustard and its main characters are

(a) Brassicaceae – Tetramerous flowers, six stamens, bicarpellary gynoecium, siliqua type fruit
(b) Brassicaceae – Pentamerous flowers, many stamens, pentacarpellary gynoecium, capsule type fruit
(c) Solanaceae – Pentamerous flowers, five stamens, bicarpellary gynoecium, berry type fruit
(d) Poaceae – Trimerous flowers, three stamens, monocarpellary gynoecium, caryopsis type of fruit

AIIMS-2005

Ans. (a) : Mustard, condiment made from the pungent seeds of either of two main herbs belong to the family **Brassicaceae**. The principal types are white or yellow, mustard (*Sinapis alba*), a plant of Mediterranean origin; and brown, or Indian mustard **(*Brassica juncea*)** which is of Himalayan origin. Diagnostic features Herbaceous, exstipulate, alternate leaves.

- **Inflorescence** typical racemose type.
- **Flowers-** Tetramerous.
- **Ovary -** Syncarpous.
- **Placentation-** Parietal placentation.
- **Fruit-** Siliqua or silicula.



FLORAL DIAGRAM

868. Censar mechanism of seed dispersal is found in

(a) Papaveraceae (b) Liliaceae
(c) Leguminosae (d) Rosaceae

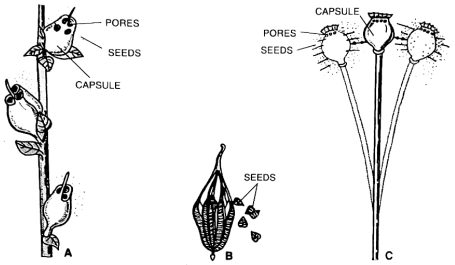
AIIMS-2014

Ans. (a) Whenever the fruit is shaken forcefully with the help of wind, the seeds come out in small aggregates and this mechanism is called censor mechanism.

- **Censer mechanism** is seen in papaveraceae family
- the fruit splits however the force is simply too low to disperse or scatter the seeds.

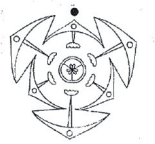
@apna_pdf

- Zoochory involving beetles and ants is seen within the seed dispersal of lily family (Liliaceae).
- In Rosaceae seed dispersal happens by endozoochory. Seed dispersal mechanism through ingestion by vertebrate animals, mostly birds and mammals is known as **endozoochory**.



Censer mechanism: A–*Antirrhinum*; B–*Aristolochia*; C–Poppy.

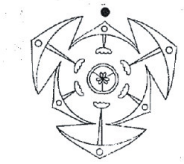
869. Plants having the below given floral diagram are:



(a) leguminous
(b) dicots
(c) medicinal and perennial
(d) having pinnately compound leaves

AIIMS-2012

Ans. (c) :



$\oplus\ \delta\ P_{3+3}\ A_{3+3}\ \underline{G}_{(3)}$

Floral diagram with floral formula

The given floral diagram is of Liliaceae family. Liliaceae is the family of around 2500 species of perennial, herbaceous monocots. It is also known as the Lily family. Most plants of this family are good ornaments (Lilium, Tulips, Glorisoa etc.), source of medicine (Aloevera, Smilax etc.), vegetables.

870. Pulses are obtained from

(a) Fabaceae (b) Asteraceae
(c) Poaceae (d) Solanaceae

AIPMT-1993

Ans. (a) : A pulse is the edible seed from a legume plant. Pulses include beans, lentils and peas. The fabaceae or Leguminosae is commonly known as legume, pea or bean family. Pulses are economically as well as nutritionally very important for human beings

871. Epipetalous stamens with free filaments and fused anthers occur in

(a) Asteraceae (b) Solanaceae
(c) Liliaceae (d) Poaceae

AIPMT-1992, 1991

Ans. (a) : Epipetalous stamens with free filaments and fused anthers occur in asteraceae. Anthers are united together to form a tube like structure the filaments remain free so syngenesious conditions are also present. These two type of conditions are found in the family Asteraceae.

872. Floral formula of tomato/tobacco is

(a) $\oplus\ \delta\ \varphi\ K_{4-5}A_{10}G_{(2)}$ (b) $\oplus\ \delta\ \varphi\ K_{2+2}C_4A_{2+4}G_1$
(c) $\oplus\ \delta\ \varphi\ P_2A_3G_1$ (d) $\oplus\ \delta\ \varphi\ K_{(5)}\overset{\frown}{C_{(5)}}A_5\underline{G}_{(2)}$

AIPMT-1992, 1989

Ans. (d) :

The floral formula of tomato is - $\oplus\ \delta\ \varphi\ K_{(5)}\overset{\frown}{C_{(5)}}A_5\underline{G}_{(2)}$. It is belong to solanaceae family. Solanaceae has some identifying characteristics – actinomorphic bisexual, bicarpellary, syncarpous superior ovary, axial placentation.

873. Syngenesious condition is found in

(a) Asteraceae (b) Labiatae
(c) Solanaceae (d) Fabaceae

AIPMT-1991

Ans. (a) : In family Asteraceae, anthers are syngenesious in this condition the stamens are united by their anthers only filaments free.

874. A characteristic feature of ovary of *Brassica campestris* is :

(a) presence of replum (b) axile placentation
(c) epigynous (d) multilocular nature

Punjab MET-2006

Ans. (a) : In Brassica the ovary is unilocular in the beginning but it becomes bilocular due to the formation of a false septum (Replum). Replum is the false septum.

875. Reserpine is obtained from :

(a) Asafoetida
(b) *Rauwolfia serpentina*
(c) *Curcuma longa*
(d) *Papaver somniferum*

Punjab MET-2006

Ans. (b) : *Rauwolfia serpentine* root bark contains the alkaloid reserpine.

• It is an antiphychatic and antihypertensive indole alkaloid. It is used to treat acute agitation in those who have mental illneses and also used to treat high blood pressure.

876. Verticillaster inflorescence is the characteristic of family:

(a) Cucurbitaceae (b) Rubiaceae
(c) Labiatae (d) Asteraceae

JCECE-2002

Ans. (c) : Verticillaster is a special type of inflorescence seen is Basil and leucas. Verticillaster refers to a fascicle with the structure of a dichasium. It is a common feature among the members of the labiatae (Lamiaceae) family.

877. *Rauwolfia serpentine* is used in:

(a) curing high blood pressure
(b) kidney failure
(c) eye defect
(d) diabetes

JCECE-2006

@apna_pdf

Ans. (a) : *Rauwolfia serpentine* root bark contains the alkaloid reserpine. Roudixin, serpalan and serpasil are some of the commercial names for it.

• It is an antiphychatic and antihypertensive indole alkaloid. It is used to treat acute agitation in those who have mental illneses and also used to treat high blood pressure.

878. Placentation in Brassicaceae is:

(a) parietal (b) marginal
(c) axile (d) basal

JCECE-2006

Ans. (a) : Brassicaceae is the family of Angiosperms that includes species such as *Raphanus sativus* (Radish), *Brassica oleracea* (cabbage).

• The flowers is tetradynamous, Actinomorphic with four saccate sepals, four petals, superior ovary and a single bilocular pistil with parietal placentation.

879. The anthers in family-Solanaceae

(a) introse, monothecus
(b) extrose, dithecus
(c) introse, dithecus
(d) extrose, monothecus

BVP-2014

Ans. (c) : The anthers of plants in the solanaceae family are generally dithecous and dehysis are in the introse mode.

880. The origin centre of potato is

(a) Mexico (b) Panama
(c) Brazil (d) Peru

BVP-2014

Ans. (d) : The oldest archeologically verified remains of potato tubers have been found at the coastal site of Ancon (Central Peru) of 2500BC.

881. Turpentine oil, a ingredient in paint and varnishes is obtained from

(a) *Melia azadirachta* (b) *Pinus longifolia*
(c) Eucalyptus (d) Cedrus

BVP-2014

Ans. (b) : *Pinus longifolia* is one of the pine tree from which turpentine is obtained. It belong to the pinaceae family of gymnosperms.

882. The characteristic inflorescence features of family-Moraceae and poaceae are

(a) racemose and hypanthodium
(b) spike and spike of spikelet
(c) hypanthodium and spadix
(d) hypanthodium and spike of spikelet

BVP-2014

Ans. (d) : Moraceae → The infloresence is axillary are variable in morphology including spike **(catkin like in Morus)**, raceme, head (in some taxa with flowers borne upon the surface of an invaginated compound receptacle), or in ficus an enclosed hypanthodium.

Poaceae (Gramineae) :-
The inflorescence of grasses is the spikelet, a small structure consisting of a short axis, the rachilla, to which are attached chaffy, two - ranked, closely overlapping scales.

883. The botanical name of cabbage is:

(a) *Brassica oleracea* var. botrytis
(b) *Brassica oleracea* var. capitata
(c) *Brassica oleracea* var. gongylodes
(d) *Brassica compestris*

AFMC-2003

Ans. (b) : *Brassica oleracea* includes cabbage, cauliflower, broccoli etc. of them belong to the family brassicaeae family. so, the botanical name of cabbage is - *Brassica oleracea* var. capitata. *Brassica oleracea* var. botrytis is a botanical name of cauliflower.

884. Which of the following is a fatty oil yielding plant?

(a) Sunflower (b) Acacia
(c) Butea (d) Casuarina

AFMC-2003

Ans. (a) : Sunflower (*Helianthus annus*) is a fatty oil yielding plant. The seeds of this flower are the main source of oil. There are various type of fatty acids in this oil which can be used to reduce the risk of cardiovascular (heart) diseases.

885. Swollen and spongy petioles are characteristic of–

(a) Trapa (b) Wolffia
(c) Ceratophyllum (d) Limnophila

Uttarakhand PMT-2010

Ans. (a) : Air filled swallen and spongy petioles of leaf stalks provides buoyancy to the water hyacinth.
Aerenchyma helps in buoyancy as well as in the respiration of aquatic plants.
Example:- Trapa, Eichhornia.

886. A plant with low CO_2 compensation point is–

(a) *Atriplex patula*
(b) *Leucopoa kingu*
(c) *Gossypium hirsutum*
(d) *Tidestromia oblongifolia*

Uttarakhand PMT-2010

Ans. (d) : In C_4 plants, the compensation point is lower due to the high affinity of enzyme PEP - Carboxylase .
Example: - *Tidestromia oblongifolia*

887. The characteristic fruit type in Asteraceae is

(a) carcerulus (b) capsule
(c) cypsela (d) caryopsis

Uttarakhand PMT-2010

Ans. (c) : Cypsela is a characteristic fruit of family asteraceae. It is dry single seeded fruit formed from double ovary of which only one develops into a seed.

• Cypsella is a dry fruit which develop from single carpel inferior ovary. Cypsella seed is attached to the fruit wall only at one point

888. Which of the following has thorns bearing leaves and flowers on them?

(a) Duranta (b) Artabotrys
(c) Carissa (d) Bougainvillea

Uttarakhand PMT-2010

Ans. (a) : The thorn is a hard straight and pointed structure. The thorn sometimes bears leaves, flowers and fruits as seen in Duranta.

• The thorn not only check the rate of transpiration but also protect the plant from herbivorus animals.

@apna_pdf

889. Which of the following pairs of families possess pollinia ?
(a) Orchidaceae and Apocynaceae
(b) Orchidaceae and Asclepiadaceae
(c) Asclepiadaceae and Mimosaceae
(d) Asclepiadaceae and Apocynaceae

Punjab MET-2007

Ans. (b) : Pollinia is a cluster of pollen grains formed on each lobe of anther & transferred as a single mass for pollination.
• Family possess pollinia are - Asclepiadaceae & Orchidaceae.

890. Epigynous flowers with numerous stamens are found in
(a) *Ranunculus muricatus*
(b) *Fragaria indica*
(c) *Croton roxburghii*
(d) *Syzygium cuminis*

Punjab MET-2007

Ans. (d) : *Syzygium cuminis* (Jamun) family - Myrtaceae, which possess epigynous flower with numerous stamens.

891. A commonly used mastigator called supari is obtained from the plant
(a) *Acacia catechu* (b) *Areca catechu*
(c) *Piper betel* (d) None of these

Punjab MET-2007

Ans. (b) : The betel nuts of the areca nut are called supari. •They are similar to the palm plants, they belong to the arecaceae or palmaceae family.
• It is obtained from the plant - *Areca catechu*

892. The aquatic weed which is popularly called terror of Bengal is
(a) Erythroxylum (b) Eichhorniaa
(c) Echinus (d) Echidna

AP EAMCET-2016

Ans. (b) : *Eichhornia crassipes* (Water hyacinth) is called the terror of Bengal.
• It is an exotic species. It grow very fast & competed with the native species for survival.

893. From the options given below, find out the correct floral formula for a flower having the following characters namely actinomorphic, bisexual, five united sepals, five united petals, stamens five and epipetalous, bicarpellary, syncarpous with superior ovary :

(a) ⊕ ♀ K(5) C(5)A5 $\underline{G}$(2)

(b) ⊕ ♀ K(5) $\overline{C(5)A5}$ $\underline{G}$(2)

(c) ⊕ ♀ K(5) C(5)A5 $\underline{G}$(2)

(d) ⊕ ♀ K(5) $\overline{C(5)A5}$ $\bar{G}$(2)

(e) ⊕ ♀ K(5) C(5)A5 $\bar{G}$(2)

Kerala PMT-2011

Ans. (b) : Flower → Actinomorphic, bisexual,
Calyx → five united sepals
Corolla → five united petals
Androecium → stamen five epipetalous
Gynoecium → Bicarpellary, syncarpous, with superior ovary.

⊕ ♀ $K_{(5)}$ $\overset{\frown}{C_{(5)}A_5}$ $\underline{G}_{(2)}$

894. Select the correctly matched pair :

(a)	Colchicum autumnale	Solanaceae
(b)	Petunia	Solanaceae
(c)	Gloriosa	Fabaceae
(d)	Trifolium	Liliaceae
(e)	Sesbania	Solanaceae

Kerala PMT-2011

Ans. (b) :
(a) Colchicum autumnale - Colchieaceae
(b) Petunia - Solanaceae
(c) Gloriosa - Colchicaceae
(d) Trifolium - Leguminaceae
(e) Sesbania - Fabaceae (Leguminaceae)

895. This is an insectivorous plant:
(a) Opuntia (b) Eichhornia
(c) Utricularia (d) Crotalaria

Karnataka CET-2001

Ans. (c) : Insectivorous plants are mainly grow in Na deficient soil.
Insectivorous plants are the plant that consume insects to nutritional requirement.
• Few Examples of insectivorous plants are Utricularia (Bladderwort), Pitcher Plant, Venus flytrap etc.

896. Seeds of *Brassica compestris* provide:
(a) oil and oil cake (b) medicines
(c) oil (d) none of these

JIPMER-1996

Ans. (a) : Seeds of *Brassica compestris* provide rapeseed oil which is a vegetable oil derived from the seeds of the rapeseed plant. It provide edible oil & oil cake used as fodder.

897. Botanical name of tea is
(a) *Piper nigrum* (b) *Camellia sinensis*
(c) *Coffea arabica* (d) *Tectona grandis*

CG PMT-2005

Ans. (b) :

Botanical name	**Plants**
(1) *Piper nigrum*	Black pepper
(2) *Camellia sinensis*	Tea plant
(3) *Coffea arabica*	Coffee
(4) *Tectona grandis*	Teak

898. What is the order of Tulsi ?
(a) Lamiaceae (b) Lamiales
(c) Poales (d) Sapindales

BCECE-2015

@apna_pdf

Ans. (b) : Tulsi belongs to the angiosperm family of the lamiaceae. The order of Tulsi (*Ocimum sanctum*) is lamiales. Tulsi is cultivated for religious and traditional medicine purposes and for its volatile oil.

899. Long fibres of cotton seed are known as

(a) coir (b) fuzz
(c) lint (d) flax

WB JEE-2007

Ans. (c) : Cotton is the most important fiber plant in the world.

- The fibers are actually hair that grow out of the seed coats. Some epidermal cells make long lint hairs.
- Other cells stop growing before they become too long, we call these fuzz hairs.

900. *Carthamus tinctorius* belongs to family

(a) Asteraceae (b) Solanaceae
(c) Malvaceae (d) Fabaceae

WB JEE-2007

Ans. (a) : *Carthamus tinctorius* (Safflower) is highly branded, herbaceous, thistle – like annual plant in the family – Asteraceae.

901. Match the following column I with column II.

	Column I		Column II
A.	Sago	1.	*Urgenia martini*
B.	Turpentine oil	2.	*Gossypium hirsutum*
C.	Rat poison	3.	Pinus
D.	Cotton fibre	4.	Extract of lichens
E.	Litmas paper	5.	*Cycas revoluta*

Codes

(a) A-1 B-2 C-3 D-4 E-5
(b) A-5 B-3 C-1 D-2 E-4
(c) A-3 B-2 C-4 D-1 E-5
(d) A-4 B-5 C-3 D-2 E-1
(e) A-4 B-2 C-5 D-3 E-1

CMC Vellore-2015

Ans. (b) : (A). Sago – *Cycas revoluta* popularly known as sago palm.
(B). Turpentine oil – Turpentine is a well known essential oil extracted by distillation from Pine.
(C). Rat poison – Rat poison is called Rodenticide. The most common rodenticides includes red squill and ANTU (Alpha Naphthyl Thiourea). Red squill is obtained from a plant *Urgenia martini* in the powder form.
(D) Cotton fibre – *Gossypium hirsutum* is the scientific name of cotton which belongs to family Malvaceae. These are also known as upland cotton or Mexican cotton.
(E) Litmus paper – It is obtained from organisms called Lichens. Lichens are symbiotic associations of Algae & fungi.

902. Choose the correct option depicting the floral formula of the diagram given below.

(a) Br $\oplus \male\!\!\female$ P_{3+3} A_{3+3} $\underline{G}_{(3)}$
(b) Br $\oplus \male\!\!\female$ Epi_{5-7} $k_{(5)}$ $C_5A_{(\infty)}\underline{G}_{(5)}$
(c) Ebr $\oplus \male\!\!\female$ K_{2+2} C_4 A_{2+4} $\underline{G}_{(2)}$
(d) % $\oplus \male\!\!\female$ K_5 C_5A_{7+3} $\underline{G}_{(1)}$

MGIMS Wardha-2015

Ans. (b) : Br $\oplus \male\!\!\female$ Epi_{5-7} $k_{(5)}$ $C_5A_{(\infty)}\underline{G}_{(5)}$
Inflorescence – Solitary axillary or terminal.
Flower – Bracteate, bracteolate, pedicellate, complete, hermaphrodite (Bisexual), actinomorphic, pentamerous & hypogynous,
Epicalyx – An involucre of bracteoles which forms the epicalyx. Epicalyx has 3 to many.
Calyx – Usually five, free or connate sepals which shows valvate aestivation in bud.
Corolla – 5 petals, free or basally connate with the staminal column as in Hibiscus. It shows twisted aestivation.
Androecium- It consist numerous monadelphous stamens.
Gynoecium – 5 in number, superior ovary
Fruit – Fruit is a loculicidal capsule.
Seeds – Seeds are obovoid with a scanty endosperm.

903. The plants which have antidiabetic properties

(a) Ocimum sanctum (b) Gymnema sylvestre
(c) Adathoda vasica (d) Phyllantus emblica

Karnataka CET-2013

Ans. (b) : *Gymnema sylvestre* (Gurmar) helps lower Blood sugar levels.
It reduces sugar cravings by making sweet foods tasteless appealing.
It is regarded as one of the plants with potent antidiabetic properties.

904. The Flora formula $\oplus \female$ $K_{(5)}$ $\overset{\frown}{C}_{(5)}$ A_5 $\underline{G}_2$ **is that of**

(a) Hibiscus (b) Banana
(c) Tulip (d) Vinca

Karnataka CET-2013

Ans. (d) :

$\oplus \female$ $K_{(5)}$ $\overset{\frown}{C}_{(5)}$ A_5 $\underline{G}_2$

***Catharanthus roseus* –** (Vinca or Sadabahar)
(1) Inflorescence – Axillary or terminal cymose flora are solitary.
(2) Flower - Bracteate, bractiolate, hermaphrodite actinomorphic, pentamerous.

@apna_pdf

(3) Calyx – gamosepalous, five lobed.
(4) Corolla – Gamopetalous, five lobed.
(5) Androecium – Epipetalous, dithecous.
(6) Gynoecium – Bicarpellary with superior ovary.

905. Compositae is also called:
(a) Asteraceae (b) Myrtaceae
(c) Fabaceae (d) Zingiberaceae
DUMET-2002

Ans. (a) : Compasitae is also called Asteraceae.
Special features -
- Infloreescence head or capitulum or Racemose
- Ray florate and disc flarate
- Calyx modified into pappus
- Stamen syngenesious, epipetalous inferior ovary with basal placentation.

Distribution - Largest family of the Angiosperm, near about 950 genera and 13000 species, cosmopolition in distribution.

906. A plant species which has been exploited for the production of Hirudin is
(a) *Brassica napus* (b) *Zea mays*
(c) *Solanun nigrum* (d) *Oryza sativa*
DUMET-2011

Ans. (a) : *Brassica napus* – Hirudin is a protein that prevents blood clotting. The gene encoding it has been synthesized chemically & transferred into *Brassica napus*. It is then extracted and purified to be used as a medicine.

907. Oblique ovary is found in family :
(a) brassicaceae (b) compositae
(c) leguminosae (d) solanaceae
DUMET-2004

Ans. (d) : In solanaceae - Androecium polyandrous, epipetalous basifixed, anther dithecous introrse and Gynoecium – bicarpellary, bilocular but multilocular due to the formation of false septum e.g. - Tomato.
Swollen Placenta, **oblique septum, carpals arranged at 45° angle, ovary** superior with axile placentation**.**

908. Botanical name of tea is:
(a) *Camellia sinensis* (b) *Coffea arabica*
(c) *Theobroma cacao* (d) None of these
Rajasthan PMT-1997

Ans. (a) : The botanical name of tea is *Camellia sinensis*. Blongs to family Theaceae
Coffea arabica is common name of coffee
Theobroma cacao is common name of cocoa.

909. Gossypium sp. (cotton) concerned with family:
(a) Malvaceae (b) Solanaceae
(c) Cruciferae (d) Compositae
Rajasthan PMT-1997

Ans. (a) : Gossypium is a genus of flowering plants in the tribe Gossypieae of the mallow family – Malvaceae from which cotton is harvested.

910. The floral formula of Solanaceae family is:
(a) $K_{(5)}C\overset{\frown}{_{(5)}}A_{(5)}G_{\underline{(2)}}$ (b) $P_3K_5C_5A_3G_{(2)}$
(c) $P_3K_3A_3G_{(3)}$ (d) None of the above
Rajasthan PMT-1997

Ans. (a) : The floral formula of solanaceae is-
$K_{(5)}C\overset{\frown}{_{(5)}}A_{(5)}G_{\underline{(2)}}$
Calyx – Five lobed and usually persistent.
Corolla – Gamopetalous, five lobed.
Androecium – Usually five, polyandrous & epipetalous
Gynoecium – Bicarpellary & syncarpous Ovary is superior & bilocular with axile placentation.

911. Edible part of Cauliflower is:
(a) inflorescence (b) flower
(c) leaf (d) stem
Rajasthan PMT-1997

Ans. (a) : Edible part of cauliflower is inflorescence which we used as a vegetable belongs to family Brassicaceae (cruciferae).

912. Which of the following is not represent an aquatic plant?
(a) Eichhornia (b) Wolffia
(c) Nepenthes (d) Vallisnaria
Rajasthan PMT-1997

Ans. (c) : Nepenthes is also called tropical pitcher plant. It is terrestrial plant.
- Aquatic plants are supported by their buoyancy in water & do not need a regid stem. Nepenthes is a insectivorous plant which grows in Na deficient soil. It consume nitrogen from the insect

913. *Atropa belladonna* is the member of family:
(a) Liliaceae (b) Solanaceae
(c) Malvaceae (d) Cucurbitaceae
Rajasthan PMT-1997, 1999

Ans. (b) : *Atropa belladona* also called deadly nightshade, tall, bushy herbs of the nightshade family (solanaceae),
- Atropin alkaloid extract from root of Belladonna used in dilate pupil of eye.

914. The number of stamens present in Cruciferae family are:
(a) 4 (b) 7
(c) 2 (d) 6
Rajasthan PMT-1997

Ans. (d) : In the family Brassicaceae (Cruciferae).
6 stamen (2+4), 2 outer short antisepalous and 4 inner long antisepalous thus Tetradynamous condition. which are the characteristic feature of Brassicaceae family,

915. A nutrient not required / has no function in plants except in Fabaceae, but essential nutrient of animals whose deficiency makes a person anemic as it is an integral part of vitamin B-12; and this nutrient is:
(a) Iron (b) Calcium
(c) Cobalt (d) Cadmium
MP PMT-2013

Ans. (c) : • Vitamin B_{12} contains the mineral cobalt, compound with vitamin B_{12} activity are collectively called 'Cobalamins'.
- Vitamin B_{12} also known as cobalamin, comprises a number of forms including cyano methyl, deoxyadenosyl (coenzyme B_{12}) and hydroxy – cobalamin.
- The mineral cobalt is an essential part of the B_{12}.

@apna_pdf

916. Seed dispersal by parachute type mechanism is found in:
(a) Pea of Fabaceae
(b) Mustard of Brassicaceae
(c) Cotton of Malvaceae
(d) Taraxacum of Asteraceae

MP PMT-2013

Ans. (d) : Parachute mechanism of fruit and seed dispersal is due to a structure called pappus. Pappus is the calyx.
Parachute mechanism the appendages develops in fruits and seed, which act as parachute. Various part are modified as-
Pappus in several members of family compositae like Tagetus (marigold), Taraxacum etc.
Calyx are modified into cluster of hairs called pappus which acts as parachute.

917. The association of ants and the members of the family Rubiaceae is known as:
(a) Ornithophily (b) Entomophily
(c) Myrmecophily (d) Anemophily

MP PMT-2013

Ans. (c) : The association between ants and the member of the family Rubiaceae is known as Myrmecophily.
• Myrmecophily is the symbiotic relationship of ants and plants in which the ants get food & place to stay while plants get a pollinator or a method of seed dispersal. It is widely used by family Rubiaceae.

918. Which pair for plants placed in the family-Solanaceae?
(a) Datura and Petunia
(b) Datura and Asphodelus
(c) Petunia and Sesbania
(d) Petunia and Pisum

AMU-2014

Ans. (a) : Family Solanaceae is commonly called as potato family. It is widely distributed in tropical, subtropical & even temperate zones.
• Plant belongs to the family are tomato, brinjal, potato, chilli. Datura (belladonna), Ashwagandha, tobacco & Pitunia etc.

919. The following is a non-succulent xerophytes having thick leathery leaves with white sticky waxy coating:
(a) Nerium (b) Calotropis
(c) Bryophyllum (d) Ruscus

AP EAMCET-1998

Ans. (b) : Calotropis has waxy coating on their thick leaves. It has milky latex. Calotropis is a non-succulent xerophytic plant belongs to the family Apocynaceae.

920. Transversely arranged carpels are found in:
(a) Solanum (b) Tridax
(c) Brassica (d) Allium

AP EAMCET-1998

Ans. (b) : Transversely arranged carpels are found is Tridax. Tridax is a genus of the family Asteraceae. Tridax is native primarily to the tropical regions of North and South America.
Tridax procumbens has been in use in India for wound healing and as an anticoagulant, antifungal, and insect repellent.

921. Nimbin and Nimbidin are got from:
(a) Emblica officinalis
(b) Cinchona officinalis
(c) Azadirachta indica
(d) Rauwolfia serpentina

AP EAMCET-1998

Ans. (c) : Nimbin and Nimbidin are got from Azadirachta indica (NEEM). Neem tree or Indian lilac, is a tree in the mahogany family Meliaceae. It is one of two species in the genus Azadirachta and is native to the Indian subcontinent and most of the countries in Africa.

922. Translator mechanism is found in:
(a) Arachis (b) Solanum
(c) Calotropis (d) Salvinia

AP EAMCET-1998

Ans. (c) : Calotropis has a characteristic feature i.e. presence of translators. Translator consists of a corpusculum and one or two pollinia.
Calotropis blonging to the family Apocynaceae. These plants are indigenous to North Africa and Southern Asia.

923. The scientific name of amla is:
(a) *Emblica officinalis* (b) *Phyllanthus niruri*
(c) *Musa paradisica* (d) *Tamarindus indica*

AP EAMCET-1998

Ans. (a) : The scientific name of amla is *Emblica officinalis Gaertn* or *Phyllanthus emblica Linn*, commonly known as Indian gooseberry or amla.
Amla belongs to the family phyllanthaceae its native range is tropical and Southern Asia.

924. In Agave Americana, bulbil is a modification of:
(a) terminal bud (b) vegetative bud
(c) cauline bud (d) floral bud

AP EAMCET-1998

Ans. (d) : The common method of vegetative propagation in ***Agave Americana*** is the formation of bulbils. These bulbils are modified from the floral buds.

925. Secondary rachis is modified as phyllode in:
(a) Parkinsonia (b) Casuarina
(c) Bryophyllum (d) Ruscus

AP EAMCET-1998

Ans. (a) : In Parkinsonia, the primary rachis and stipules modify into spines while the secondary rachis are modified into phyllodes. Phyllodes are flat, green-coloured leaf-like modifications of petioles or rachis.

926. Compound head is found is:
(a) Zinnia (b) Tagetus
(c) Echinops (d) Tridax

AP EAMCET-1998

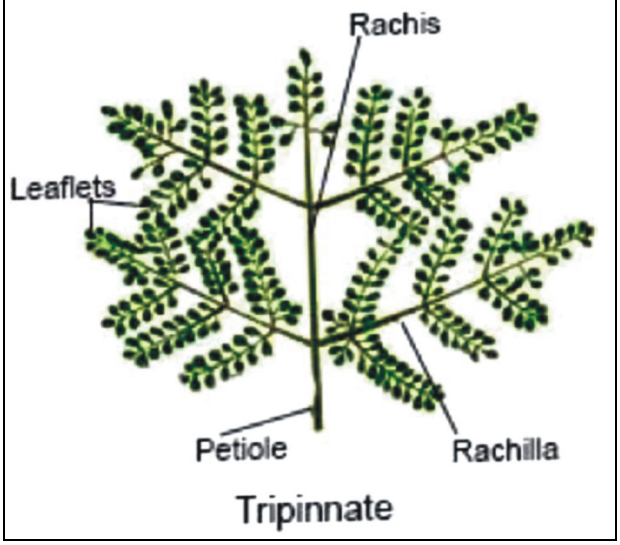
Ans. (c) : Compound head is found is Echinops. Echinops is a genus of about 120 species of flowering plants in the family Asteraceae, commonly known as globe thistles. They have spiny foliage and produce blue or white spherical flower heads.

927. Tripinnate leaves are found in:
(a) Moringa (b) Acacia
(c) Oxalis (d) Gynandropsis

AP EAMCET-1998

@apna_pdf

Ans. (a) : The term tripinnate means the pinnately compound leaves in which the leaflets are themselves bipinnate. Such an arrangement of the leaflets found in the drumstick tree i.e., *Moringa oleifera*



928. The spines in the following, represent the first leaf of the axillary branch:
(a) Citrus (b) Opuntia
(c) Ziziphus (d) Acacia
AP EAMCET-1998

Ans. (a) : In citrus plant, spines are present on the stem. These spines are the modification of the first leaf of axillary bud. Citrus in the family, Rutaceae. Citrus fruits for example - Oranges, Lemons, Pomelos and Limes.

929. In the following plant, male flower is represented by a single stamen:
(a) Ficus (b) Poinsettia
(c) Lenotis (d) Leucas
AP EAMCET-1998

Ans. (b) : Some members of Euphorbiaceae family like poinsettia and Euphorbia etc have the Cyathium inflorescence. In this special type of inflorescence, the male flower is represented only by a single stamen.

930. Buttress roots are found in:
(a) Sorghum (b) Banyan
(c) Terminalia (d) Pandanus
AP EAMCET-1998

Ans. (c) : Buttress root a stilt root, most commonly found in large, tropical trees, that emerges adventitiously from the trunk and is flattened, so it resembles an approximately triangular broad. This type of root provides the tree with mechanical support. Buttress roots are found in Terminalia, Salmalia, ficus and Borntoax etc.

931. In which of the following are orchreate stipules found ?
(a) Cruciferae (b) Papilionaceae
(c) Compositae (d) Polygonaceae
Punjab MET-2011

Ans. (d) : Ochreate stipules are found in polygonaceae family.
- Leaves of some plants have lateral parts on each side of leaf base known as stipules. Main function of stipules is to protect the leaf in the bud.
- Ochreate stipules are formed when both stipules of the leaf join on the outer & inner margin & make a hollow tube which surrounds the stem up to the upper part of node.

932. Inflorescence of Liliaceae is
(a) zygomorphic (b) trimerous
(c) pentamerous (d) imperfect
Punjab MET-2011

Ans. (b) : Inflorescence in liliaceae is generally variable ranging from solitary to cymose. It is often present as umbellate clusters.
- Flower of liliaceae family are trimerous. Perianth is present, stamens epipetalous, Gynoecium-tricarpellary syncarpous, superior ovary with axile placentation.

933. Family Lilliaceae is characterized by :
(a) trimerous flower (b) tetramerous flower
(c) pentamerous flower (d) zygomorphic flower
Rajasthan PMT-2002

Ans. (a) : Family Liliaceae are characterized as complete, bisexual, bracteate, trimerous actinomorphic, hypogynous flower.
Perianth is present, stamens epipetalous, Gynoecium-tricarpellary suncarpous, superior ovary with axile placentation.

934. A characteristic feature of ovary of *Brassica campestris* is :
(a) presence of replum (b) axile placentation
(c) epigynous (d) multilocular nature
J& K CET - 2006
Rajasthan PMT-2002

Ans. (a) : Brassica belongs to family Brassicaceae (Cruciferae).
In brassica- Gynoecium bicarpellary, Syncarpous, unilocular in the beginning but due to the formation of false septum (replum) ovary becomes bilocular superior with parietal placentation.

935. Reserpine is obtained from:
(a) Asafoetida
(b) Rauwolfia serpentine
(c) Curcuma longa
(d) Papaver somniferum
Rajasthan PMT-2002

Ans. (b) : Reserpine is an indole alkaloid obtained from *Rauwolfia serpentine* belongs to family Apocynaceae.
- It is used as antipsychotic and antihypertensive agent for the control of high blood pressure and for the relief of psychotic symptoms respectively.

936. The characteristics of family Malvaceae is :
(a) monoadelphous (b) diadelphous
(c) tetradelphous (d) none of these
Rajasthan PMT-1999

@apna_pdf

Ans. (a) : Malvaceae-
Distribution- Near about 82 genera and 1500 species, found in tropical and subtropical region.
Special features-
- Presence of epicalyx
- Twisted aestivation of corolla
- Epipetalous stamens and monodelphous condition (androecium), monothecous and dorsifixed anther.
- Ovary superior with axile placentation.

937. The fruit of Solanaceae family is :
(a) Berry (b) Capsule
(c) Pome (d) None of these

Rajasthan PMT-1999

Ans. (a) : The fruit of solanaceae family is Berry or Capsule.
- In solanaceae family the fruits are either berry/bacca or septicidal capsule.
- Berries usually have a thin epicarp fused with the thalamus to form the skin or exocarp, fleshy mesocarp and a thin endocarp. They usually develop from a superior ovary and their seeds get detached from the placenta at maturity.

It is Mostly herb (Tomato, Rasbhari), few shrub (Ashwagandha) and rarely tree (*Solanum gigantium*).

938. Timber yielding plant *Shorea robusta* belong to the family
(a) Fabaceae (b) Rubiaceae
(c) Verbenaceae (d) Dipterocarpaceae

Manipal-2014

Ans. (d) : Timber yielding plant *Shorea robusta* belongs to family Dipterocarpaceae. In this family near about 16 gnera and 695 species are found. It is used as an astringent in ayurvedic medicine and making for caulk boats and ships.

939. Which of the following characteristic represent family-Asteraceae?
(a) Superior ovary, syngenesious, single basal ovule
(b) Inferior ovary, monoadelphous, basal placentation
(c) Inferior ovary, syngenesious, axile placentation
(d) Syngenesious, basal placentation and epigynous

Manipal-2014, 2005

Ans. (d) : Family Asteraceae (compositae) contain inferior ovary i.e. stamen, calyx, corolla are localized above ovary level, syngenesious androecium (stamens) i.e. all anthers are united but filaments are free and basal placentation i.e. ovule seems to arise from the base of loculus.

940. What is the botanical name of mulberry?
(a) Morus (b) Antherea
(c) Attacus (d) Solanum

Manipal-2005

Ans. (a) : The botanical name of Mulberry plant is *Morus alba*, which belongs to family Moraceae. *Morus alba* fruit contains abundant protein, lipid, carbohydrate fiber, minerals and vitamins but low calories. It is a fast growing deciduous medium-sized tree.

941. Which of the following plants root is medicinal and leaves, flowers and fruits are edible as vegetable?
(a) *Helianthus annus*
(b) *Cucurbita maxima*
(c) *Solanum tuberosum*
(d) *Holostemma adakodien*

Manipal-2001

Ans. (d) : The roots of *Holostemma adakodien* (Arkapushpi) are useful in treating ophthalmopathy or chitis, cough, burning sensation stomach pain, constipation, fever, and tridoshas. The root can also be used as a rejuvenative drug, imparting resistant to diseases.
- Arkapushpi can be used as food. Fleshy flower buds and tender fruits are cooked as vegetable. Buds some times eaten raw.

942. Replum is found in family :
(a) Malvaceae (b) Brassicaceae
(c) Rosaceae (d) Cucrubitaceae

Manipal-2001

Ans. (b) : Replum is present family Brassicaceae. It is a frame like placenta through which the septum stretches. During dehiscence, the valves fall away, hence it is also called the false septum.

943. Gynoecium in the members of family Leguminosae is composed of ……..
(a) One carpel (b) Two carpels
(c) Three carpels (d) Five carpels

Karnataka CET-2005

Ans. (a) : Gynoecium in the members of family leguminosae is composed of superior ovary, mono-carpellary, unilocular with many locules and single style.
e.g. Gram, soya bean, sweet pea etc.

944. Free-central placentation is found in_____
(a) Dianthus (b) Argemone
(c) Brassica (d) Citrus

Ans. (a) : Free central placentation is present in single chambered ovary with ovules borne on the central axis.
Ex. Dianthus.

945. Read the following and identify correct combinations

	Genus	Family	Character
(a)	Datura	Solanaceae	Epipetalous stamens
(b)	Allium	Solanaceae	Tricarpellary gynoecium
(c)	Petunia	Solanaceae	Didynamous stamens
(d)	Crotalaria	Fabaceae	Diadelphous

AP EAMCET-2015

Ans. (a) : Datura : It is a poisonous flower plant belongs to the family solanaceae because of the presence of solitary flowers. The stamens are attached to the petal (epipetalous) and five in numbers.
(b) **Allium :** The perennial herb known as the onion or *Allium cepa* is high in dietary fibre. It is a member of liliaceae family. The flower of this family are actinomorphic, bisexual & gynoecium is tricarpellary.

@apna_pdf

(c) **Pitunia :** It belongs to the family Solanaceae. It has 5 sepals 5 petals, 5 stamens & 2 corpels. It is a type of pentamerous flower.
(d) **Crotalaria :** Crotalaria (sunnhemp) is a tropical Asian plant of the legume family Fabaceae (Leguminaceae). The stamens of Crotalaria are united into two bundles is called diadelphous.

946. Study the following combinations

(I) Cymose inflorescence — Epipetalous — Solanum
(II) Homochlamydeous — Polyandrous — Allium
(III) Axile placentation — Radical leaves — Smilax
(IV) Zygomorphic — Diadelphous — Butea

(a) (I), (III) (b) (II), (IV)
(c) (I), (IV) (d) (III), (IV)

TS EAMCET-15.05.2016

Ans. (c) : Solanum species belongs to the family solanaceae
Solanum : Shows cymose inflorescence
Epipetalous means stamens fused with the petals.
Butea : Flower is zygomorphic.
Stamens are 10 in number & diadelphous (9 + 1)

947. Study the following lists

List-I		List-II	
(A)	**Strobilanthus**	**(I)**	**Tiger claw plant**
(B)	**Martynia**	**(II)**	**Century plant**
(C)	**Lodoicea**	**(III)**	**Neelakuranji**
(D)	**Viola**	**(IV)**	**Common pansy**
		(V)	**Double coconut**

The correct match is

	A	B	C	D
(a)	(II)	(III)	(I)	(V)
(b)	(III)	(II)	(IV)	(V)
(c)	(II)	(I)	(III)	(V)
(d)	(III)	(I)	(V)	(IV)

TS EAMCET-15.05.2016

Ans. (d) : 1. Strobilanthus is the botanical name of Neelakuranji plants which belongs to family – Acanthaceae.
2. Martynia is the botanical name of the Tiger claw plant which belongs to Martyniaceae family.
3. Lodoicea is the botanical name of double coconut & belongs to palm family, Arecaceae.
4. Viola is the botanical name of common pansy & it belongs to Violaceae family.

948. Arrange the following plants in descending order based on the number of locules in their ovaries

(I) Anacardium **(II) Citrus**
(III) Asparagus **(IV) Solanum**

(a) (II), (III), (IV), (I) (b) (III), (I), (IV), (II)
(c) (IV), (III), (I), (II) (d) (I), (IV), (III), (II)

TS EAMCET-15.05.2016

Ans. (a) : Citrus : It belongs to the family Rutaceae and shows the multilocular ovary.
Asparagus : It belongs to the family Asparagaceae and shows the trilocular ovary.
Solanum : It belongs to the family solanaceae and shows bilocular ovary.
Anacardium : It belongs to the family Anacardiaceae and shows unilocular ovary.

949. Identify the family belonging to the order Sapindales

(a) Poaceae (b) Anacardiaceae
(c) Solanaceae (d) Convolvulaceae

TS EAMCET-15.05.2016

Ans. (b) : Anacardiaceae belongs to the order 'Sapindales'.
- Solanaceae belongs to order 'Polemoniales'
- Convolvulaceae belongs to order 'Solanales'.
- Poaceae is another family belongs to order 'Poales'.

950. Vascular bundles are arranged in a ring in the members of family

(a) Orchidaceae (b) Iridaceae
(c) Euphorbiaceae (d) Lilliaceae
(e) Palmae

CMC Vellore-2008

Ans. (c) : Euphorbiaceae family shows the presence of bi-collateral bundles arranged in a ring form.
- In Euphorbiaceae, the primary vascular tissue consist of vascular bundles, usually in one or two rings around the pith. Vascular bundles are uniform in size. Each vascular bundle is conjoint, collateral or bicollateral and open.

951. The cloves which are used in food preparation are

(a) seeds (b) leaves
(c) flower buds (d) stem tips
(e) terminal buds

CMC Vellore-2008

Ans. (c) : The cloves that are used in food preparation are aromatic flower buds. Cloves are a versatile spice that looks like reddish brown spikes of 1 cm in length with a bulbous top.
- Cloves are the dried flower buds of an evergreen tree native to eastern Indonesia.
- In dicot family vascular bundle are arranged in ring. cloves belongs to family myrtaceae which is used as spice

952. How many female flowers occur in a cyathium ?

(a) One (b) Two
(c) Three (d) Four
(e) Many

CMC Vellore-2008

Ans. (a) : Cyathium has one reduced female flower. It is present in the centre and surrounded by many male flowers.
Each male flower is represented by a single stamen while a single pistil represents a female flower. Ex. Euphorbia.

@apna_pdf

953. Which of the following features is absent in the family-Asteraceae?

(a) Cypsela fruit
(b) Capitulum inflorescence
(c) Hypogynous flowers
(d) Syngenesious anthers
(e) Pappus calyx

CMC Vellore-2008

Ans. (c) : The flowers of Asteraceae are not hypogynous.

• In hypogynous flowers the perianth and stamens are attached to the receptacle below the gynoecium, the ovary is superior to these organs and the remaining floral organs arise from below the point of origin of the carpel.

954. In the members of family-Malvaceae anthers are described as

(a) diadelphous and dithecous
(b) diadelphous and monothecous
(c) monoadelphous and monothecous
(d) monoadelphous and dithecous
(e) None of the above

CMC Vellore-2008

Ans. (c) : The androecium of Malvaceae members consists of numerous monadelphous stamens with apically divergent filaments bearing 1 – celled anthers.

The stamen are united into single bundle but anthers are free this condition is called as monoadelphous condition.

When stamen has only one lobed anther, called monothecous.

955. Diadelphous condition is found in

(a) rosaceae (b) papilionaceae
(c) leguminosae (d) cucurbitaceae

Rajasthan PMT-2003

Ans. (b) : In 'diadelphous' condition, the filaments of nine stamens are united into a bundle and tenth posterior stamen stand apart. This is the characteristic feature of family 'Papilionaceae' For e.g. Pea *(Pisum sativum)* Diadelphy is very commonly seen in family papilionaceous flowers. In diadelphy condition stamen are arranged into two bundle. (9 + 1).

956. Which one of the following is a monocarpic plant?

(a) Pear (b) Citrus
(c) Mango (d) Bambusa

Rajasthan PMT-2003

Ans. (d) : Monocarpic plants reproduce only once in their whole life span. The term monocarpic was first used by Alphonse de candolle Monocarpic plants can be divided into annuals, biennials and perennials.

e.g. Bamboo, rice, radish, carrot, wheat etc.

957. Match the names of plants given under Column I with the families to which they belong given under Column II; choose the answer which gives the correct combination of the alphabets:

	Column-I (Plant names)		Column-II (Family names)
A	*Nerium indicum*	p	Arecaceae
B	*Cassia fistula*	q	Solanaceae
C	*Caryota urens*	r	Liliaceae
D	*Nicotiana tobacum*	s	Apocynaceae
		t	Caesalpiniaceae

(a) A = s, B = t, C = p, D = q
(b) A = s, B = t, C = q, D = p
(c) A = t, B = s, C = q, D = p
(d) A = s, B = p, C = t, D = q

Karnataka CET-2000

Ans. (a) :

	Plant Name	Family Name
A.	*Nerium indicum*	Apocynaceae
B.	*Cassia fistula*	Caesalpiniaceae
C.	*Caryota Urens*	Arecaceae
D.	*Nicotiana tobaccum*	Solanaceae

958. Oval and eccentric starch granules are present in:

(a) Rice (b) Maize
(c) Potato (d) Ground nut

Rajasthan PMT-1995

Ans. (c) : Starch grains are tiny structures mode by plant during photosynthesis which is act as a store of glucose sugar units. The shape and size of the starch grains vary with the different plant species.

• Potato **:** The starch granules of potato are oval or eccentric in shape.

• Maize : Starch granules of maize are angular shaped.

• Rice : Polygonal & angular shaped starch granules.

959. Bicollateral vascular bundles are the characteristic of family:

(a) Malvaceae (b) Liliaceae
(c) Cucurbitaceae (d) Leguminosae

Rajasthan PMT-1995

Ans. (c) : Bicollateral vascular bundles are the characterstic of family – Cucurbitaceae.

• In such vascular bundle there are two patches of phloem one on each side of xylem.

• In such a vascular bundle there are two strips of cambium one on each side of xylem.

e.g. Cucurbita.

960. Axile placentation is present in family:

(a) Malvaceae and Liliaceae
(b) Cruciferae
(c) Cruciferae and Malvaceae
(d) All of the above

Rajasthan PMT-1995

@apna_pdf

Ans. (a) : Axile placentation is found in bicarpellary to multicarpellary, syncarpous ovary, the carpels fused to form septa forming a central axis & ovules are arranged on the axis. This type of placentation is found in Liliaceae, Solanaceae, Malvaceae.

961. Green potatoes are toxic due to

(a) phytoalexins (b) solanine
(c) triazine (d) hormones

JIPMER-2012
VMMC-2009

Ans. (b) : Solanine is a glycoalkaloid poison or natural nerve toxin produced in the green part of the potato. It is a bitter poisonous crystalline alkaloid, which helps the plant to defend against predators, insects, diseases etc. Ingestion of it may cause vomiting, diarrhoea, headache and even paralysis of central nervous system.

962. In one of the constituent laboratory located in Lucknow, but attached to the following organization, extensive and exclusive research on medicinal and aromatic plants is carried out:

(a) IARI (b) ICMR
(c) NBRI (d) CSIR

AP EAMCET-1998

Ans. (d) : For research on medicinal and aromatic plants, Central Institute of Medicinal and Aromatic Plant (CIMAP) was established in Lucknow. This Institute is concerned with Council of Scientific and Industrial Research (CSIR) in Delhi.

ICMR– Indian council of medical Research.
IARI – Indian agriculture Research institute
NBRI- National botanical research institute.

963. Which of the following is correctly matched?

(a) aerenchyma-opuntia
(b) age pyramid-biome
(c) *Parthenium hysterophorus*- threat to biodiversity
(d) stratification-population

NEET-2016 Phase-II

Ans. (c) : *Parthenium hysterophorus* (congress grass or carrot weed). It is herbaceous, and annual plant belongs to the family **Asteraceae**. It is an alien species or deadly weed which rapidly covers the new surroundings and poses a serious threat to the environment.

964. Read the following four statements (A–D)

(A) Both, photophosphorylation and oxidative phosphorylation involve uphill transport of protons across the membrane
(B) In dicot stems, a new cambium originates from cells of pericycle at the time of secondary growth
(C) Stamens in flowers of Gloriosa and Petunia are polyandrous
(D) Symbiotic nitrogen-fixers occur in free-living state also in soil

How many of the above statements are right

(a) Four (b) One
(c) Two (d) Three

AIPMT (Mains)-2012

Ans. (c) : Polyandrous condition (having large and indefinite number of stamens) is present in Gloriosa (Family Liliaceae) and Petunia (Family Solanceae).

- Nitrogen fixation is the conversion of inert atmospheric nitrogen into utilizable compound of nitrogen like nitrate, ammonia, amino acid etc.
- Biological nitrogen fixation is performed by free living and symbiotic bacteria and cyanobacteria. Symbiotic nitrogen fixers occur in association with roots of higher plants.

965. Study the following lists

List I	List II
(A) Arachis	**1. Swollen placenta**
(B) Cichorium	**2. Epicalyx**
(C) Lilium	**3. Fasciculate tuberous root**
(D) Physalis	**4. Geocarpy**
	5. Bulbils

	A	B	C	D
(a)	4	3	2	5
(b)	4	1	2	3
(c)	5	4	3	1
(d)	4	3	5	1

AP EAMCET-2008

Ans. (d) :
(A) Arachis - Geocarpy
(B) Cichorium - Fasiculate tuberous root
(C) Lilium - Bulbis
(D) Physalis - Swollen placenta

966. Which is expressing right appropriate pairing:

(a) Brassicaceae - Sunflower
(b) Malvaceae - Cotton
(c) Papilionaceae - Catechu
(d) Liliaceae - Wheat

AIPMT-2000

Ans. (b) : Malvaceae is also known as cotton family or mallow family. The plants of this family are cosmopolitan in distribution, although more common in tropical (warm) regions. Gossypium (cotton) is an important genera of this family.

- Sunflower belongs to family compositae.
- Wheat belong to family poaceae.
- Catechu belongs to family mimosaceae.

967. The given formula belongs to:

$\mathbf{Br \oplus \male\ Epi_3\ K_{(5)}\ C_5\ A_{(\infty)}\ G_{(\underline{5})}}$

(a) Solanaceae (b) Malvaceae
(c) Gramineae (d) Compositae

Haryana PMT-2005
JIPMER-2005
BHU PMT-2003

Ans. (b) : The floral formula of hibiscus is written in the form as follows- $Br \oplus \male\ Epi_3\ K_{(5)}\ C_5\ A_{(\infty)}\ G_{(\underline{5})}$. In this formula every symbol and number has been appointed a specific meaning and characteristics to it.

@apna_pdf

For example:-

• 'Br' symbolises that the hibiscus is a bracteate flower, '⊕' this sign symbolises that hibicus is an Actinomorphic flower.

• ♂ ♀ symbolize the fact that the china rose is a bisexual flower, 'Epi_3' symbolizes epicalyx. The total number of three epicalyx.

• 'K_5', K stands as a term for the calyx whorl of flowers. The total number of five sepals in the calyx whorl symbolises K in $K_{(5)}$. The gamosepalous condition is represented by the brackets given here.

• C_5 symbolises the carolla whorl consist of five petals in a state known as polypetalous, $A_{(\infty)}$ represent the androecium whole of the flower.

• There are a huge number of stamens present in the hibiscus fused into a single tube (monoadelphous condition) which is attaching line from C_5 to $A_{(\infty)}$ explain the epipetalous condition of flower. The gynoecium whorl of the flower is represented by $G_{(5)}$ where 5 representing 5 fused carpels . The line below 'G' represented superior ovary (hypogynous condition)

968. Which of the following is used as green manure?

(a) *Azolla* (b) *Azadirachta indica*
(c) *Crotolaria juncea* (d) *Hevea brasilliansis*

JIPMER-2005
BHU PMT-2003

Ans. (c) : *Crotalaria juncea* known as sunn or sunn hemp is used as green manure. It is a tropical Asian plant of the legume family. It is a source of green manure, fodder and lignified fiber, which is obtained from its stem.

969. Commercial cork is obtained from:

(a) *flax* (b) *Juglans regia*
(c) *Hevea brassiliansis* (d) *Quercus suber*

JIPMER-2005
BHU PMT-2003

Ans. (d) : Commercial cork is obtained from periderm layers of a *Quercus suber* plant (cork oak tree). Cork has many uses including urine bottle stoppers, bulletin boards, coasters, fishing bobbers, gaskets for engines, tenis, racket etc. It is native to southwest Europe and north west Africa.

970. $\oplus ♂ ♀ K_{(5)} C_{(5)} A_5 \underline{G}_{(2)}$ is die floral formula of :

(a) Solanaceae (b) Asteraceae
(c) Malvaceae (d) Cruciferae

Punjab MET-2003
AIPMT-1991

Ans. (a) : Family solanaceae contribute several important food, drug and ornamental plants to humans. The floral formula for solanaceae is

$\oplus ♂ ♀ K_{(5)} C_{(5)} A_5 G_{(2)}$

971. Obliquely placed ovary and swollen placenta is associated with which of the following families?

(a) Asteraceae (b) Solanaceae
(c) Brassicaceae (d) Malvaceae

J&K CET-2012

Ans. (b) : Solanaceae : Gynoecium of solanaceae is characterised by bicarpellary, syncarpous, superior ovary axile placentation, many ovule in each locule, ovary obliquely placed, posterior carpel to the right about 45° from median and anterior to the left.

972. On the basis of position of the ovary, mustard plants are

(a) hypogynous (b) perigynous
(c) epigynous (d) zygomorphic

J&K CET-2012

Ans. (a) : Hypogynous : Mustard belongs to family Brassicaceae (Cruciferae). The flowers in this family are bisexual or hermaphrodite complete, pedicillate Hypogynous, tetradynamous or bimerous. Androceium in tetradynamous condition, anther dithecous, basifixed and stamens introrse. Gynoecium bicarpellary, syncarpous unilocular in the beginning but due to the formation of false. Septum (Replum) ovary becomes bilocular, ovary superior, parietal placentation but tricarpellary in lepidium, and tetracarpellary in Nasturtium, style short and stigma bilobed.

• The flowers of family Asteraceae are epigynous, usually pentamerous.

973. Which one of the following is being utilized as a source of bio-diesel in the Indian country side?

(a) Euphorbia (b) Beetroot
(c) Sugarcane (d) Pongamia

Rajasthan PMT-2010

Ans. (d) : Pongamia : Biodiesel produced from pongamia oil has been considered as promising option for diesel engines because of its environmental friendliness.

• Pongamia (Kanjar) is a genus of fabaceae family. In the Indian country side, pongamia (Kanjar) is being utilized as a source of biodiesel oil is extracted from the seeds of pongamia,

974. One of endangered species of Indian medicinal plants is that of

(a) Podophyllum (b) Ocimum
(c) Garlic (d) Nepenthes

Rajasthan PMT-2010

Ans. (a) : An endangered species is a type of organism that is threatened by extinction. Species become endangered for two main reasons :

(i) Loss of habitat

(ii) loss of genetic variation.

Cutting down of forests have drastically decreased the population of medicinal and aromatic plants ex- *Podophyllum hexandrum, Atropa acuminata, Skimmia anquetilia* etc.

975. The anthers in Solanaceae are :

(a) monothecus, introrse
(b) dithecus, extrorse
(c) dithecus, introrses
(d) monothecus, extrorse

BCECE-2006

@apna_pdf

Ans. (c) : The third whorl of a flower is called the androecium. Androecium is composed of stamens and each stamen is made up of filament and an anther. Depending on the number of anther lobes the stamens are termed as monothecous (one lobed), dithecous (two lobed).

Three types of dehiscence of anther as – extrores introrse, and latrose.

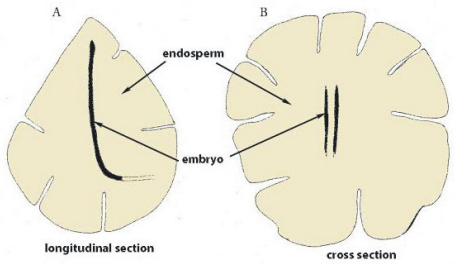
- In extrorse type of dehiscence, anthers dehisce towards the petals.
- In introrse type of dehiscence anther dehisce towards gynoecium
- In latrose type of dehiscence anther dehisce laterally.
- In Solanaceae, anthers, are of dithecous type dehiscing introrse.

976. Ruminate endosperm found in

(a) Cruciferae (b) Asteraceae
(c) Euphorbiaceae (d) Annonaceae

BCECE-2010

Ans. (d) : Ruminate endosperm is found in annonaceae family : A structure of the endosperm made of albumen of a seed which gives a mottled appearance to its section, and which results from the infolding dark inner layer of the seed coat into the light coloured matter of the endosperm, as in the nutmeg. Example of families with Ruminate endosperm – Rubiaceae, Annonaceae Aristolochiaceae, Palmaceae and Myristicaceae.



RUMINATE ENDOSPERM

977. Asafoetida is a

(a) tannin (b) alkaloid
(c) resin (d) oil

AMU-2011

Ans. (c) : The dried latex secreted from the rhizome or tap roots of various species of Ferula is known as asafoetida.

It is commonly known as heeng and is used as a digestive aid, as a condiment in food and also in pickling.

- Resins are greyish-white in colour where fresh and become amber coloured when dried.

Used in different diseases such as whooping cough, asthma, ulcer, week digestion, influenza, epilepsy etc.

978. Resupinate condition is characteristic of the flowers belonging to the most advanced family of monocots

(a) Palmae (b) Liliaceae
(c) Orchidaceae (d) Gramineae

AMU-2011

Ans. (c) : Resupinate condition is characteristic of flower belonging to the family Orchidaceae. In resupinate condition the flowers are usually resupinate at anthesis as the pedicel or ovary twists at an angle of 180^{o} during development.

Orchidaceae is considered as the most advanced family of monocots. The members of this family are used in making perfumes, in horticulture and some are also used as food.

979. The petiole modified into flattened lamina like structure is present in

(a) Acacia nilotica
(b) Acacia Arabica
(c) Acacia Australasia
(d) Acacia anuriculoformis

AMU-2011

Ans. (d) : Xerophytic plants are adapted to survive in an environment with little water. In these plants, the leaves are changed into spines.

The petiole modified into the flattened lamina like structure is known as phyllode.

- Phyllode is a modified petiole that connects the leaf to the stem or branch or rachis (common axis of the leaflets of a compound leaf) that has become flattened and green to perform the functions of a leaf it is found in several species of Australian Acacia.

example:- *Acacia auriculoformis.*

980. Tea and coffee are affected by:

(a) Phytophthora (b) Cephaleuros
(c) Herviella (d) Albugo candida

Haryana PMT-2005
JIPMER-2005

Ans. (b) : Cephaleuros is a geen alga which causes disease in tea & coffe plant called Red rust of tea. This algae is parasitic on some economic plants of tropical and subtropical plants.

981. Feathery stigma belongs to

(a) Wheat (b) Pea
(c) Datura (d) Caesalpinia

MGIMS Wardha-2011
AIIMS-2011

Ans. (a) : Feathery stigma are generally found in Poaceae family and wheat belong to this family. Wheat has feathery stigma so it is wind pollinated and feathery stigma are necessary for capturing pollen grain.

982. A feature of Selaginella that is of great evolutionary significance in the presence of:

(a) rhizosphere
(b) heterosporous condition
(c) strobili
(d) protonema

JIPMER-1998

Ans. (b) : A feature of selaginella that is of great evolutionary significance in the presence of heterosporous condition means different types of spores which are different in function size and structure of the plant.

@apna_pdf

983. Phytochrome was discovered by

(a) W Went (b) Gamer and Allard
(c) F F Blackman (d) R Hill

CG PMT-2006

Ans. (b) : Phytochrome was discovered by Gamer and Allard. Phytochrome are group of proteins bound to light absorbing pigment. Phytochrome is a class of photoreceptors protein.

984. Simple sieve plate with single perforation is found in

(a) Cucurbita (b) Prunus
(c) Pyrus (d) Vitis

J&K CET-2007

Ans. (a) : Sieve plates are mostly located on the overlapping adjacent end walls. The sieve plates have a larger pore than the other sieve areas in the cell, sieve plate help in transport of nutrients stem and leaves from the roots. Cucurbita is a genus of herbaceous plants which belong to the family cucurbitaceae.

985. Placentation of Mimosa pudica is

(a) basal (b) marginal
(c) axial (d) parietal

Haryana PMT-2011

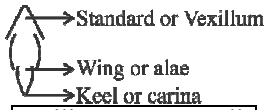
Ans. (b) : *Mimosa pudica* (touch me not) belongs to Mimosaceae family. Gynoecium is monocarpellary, Apocarpous with ovules on marginal placentation.

986. The standard petal of a papilionaceous corolla is also called

(a) Corona (b) Carina
(c) Pappus (d) Vexillum

NEET-2016 Phase-I

Ans. (d) : Papilionaceous corolla, this type of aestivation includes the presence of five petals in it. Out of these petals, the largest one is called standard or vexillum, the two lateral petals are known as wings and two small anterior petals are termed as keel.



Papilionaceous corolla

987. Tricarpellary, syncarpous gynoecium is found in flowers of

(a) Poaceae (b) Liliaceae
(c) Solanaceae (d) Fabaceae

NEET-2016 Phase-I

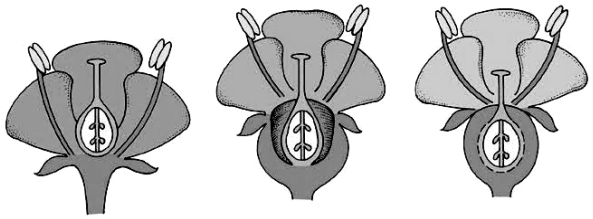
Ans. (b) : Tricarpellary syncarpous gynoecium is a characteristic features of flowers of Liliaceae.
Liliaceae family is a monocot family eg- Onion, Garlic etc.
Poaceae- Monocot family, flower is trimerous, fruit is caryopsis.
Solanaceae - Persistent Calyx, Superior ovary, epipetalous condition eg- Potato, tomato, brinjal etc.
Fabaceae - fabaceae family are known as pulse family, flower bisexual, diadelphous condition.

988. Ovary is half-inferior in the flowers of –

(a) Guava (b) Plum
(c) Brinjal (d) Cucumber

AIPMT (Screening)-2010

Ans. (b) : Perigynous Flowers are found in rose, peach, cherry, plum, prunes etc.
- Guava and cucumber have epigynous flower.
- China rose and brinjal have hypogynous flower.

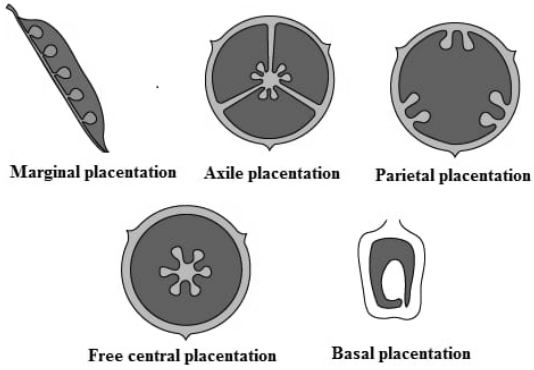


989. In unilocular ovary with a single ovule the placentation is:

(a) Marginal (b) Basal
(c) Free Central (d) Axile

AIPMT (Screening)-2010

Ans. (b) : Placentation- Ovule are attached to the inner wall of ovary is called placenta and arrangement is called placentation.
- In basal type of placentation the ovary is unilocular and ovules generally reduced to one borne at the base of the ovary e.g. compositae family.



990. The correct floral formula of soyabean is

(a) % ♀ $K_{(5)}C_{1+2+(2)}A_{1+(9)}\underline{G}_1$

(b) % ♀ $K_{(5)}C_{1+(2)+2}A_{(9)+1}\bar{G}_1$

(c) % ♀ $K_{(5)}C_{1+(2)+2}A_{(9)+1}\underline{G}_1$

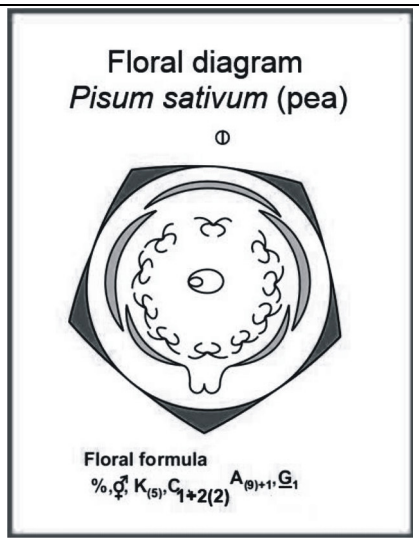
(d) % ♀ $K_{(5)}C_{1+2+(2)}A_{(9)+1}\underline{G}_1$

AIPMT (Mains)-2010

Ans. (d) : The plant belonging to the family fabaceae such as Soyabean, Pea, Sem, moong , gram etc have the floral formula:-

% ♀ $K_{(5)}C_{1+2+(2)}A_{(9)+1}\underline{G}_1$

@apna_pdf



991. Which of the following plant species you would select for the production of bioethanol ?

(a) Jatropha (b) Brassica
(c) Zea Mays (d) Pongamia

AIPMT-2009

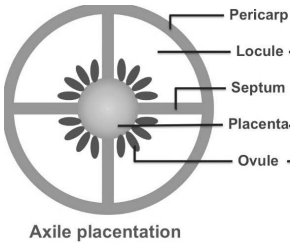
Ans. (a) : The oil obtained from Jatropha seeds can be processed to yield the biofuel. The production of bioethanol from plants depends on their glucose content. There are various crop plants like maize that have good glucose content but these are used as a food crop. Therefore, the best alternative is to choose plants that can be used as biofuel source. The seeds of this plant are rich in fatty acid methyl esters and these produce a high amount of energy.

992. An example of axile placentation is -

(a) Marigold (b) Argemone
(c) Dianthus (d) Lemon

AIPMT-2009

Ans. (d) : The placentae develop from the central axis which correspond to the confluent margins of carpels, it occurs in bi to multilocular ovary ex- solanaceae. Malvaceae and Rutaceae family. Axile placentation is found in multicarpellary syncarpous gynoecium. The number of these chambers are equal to the number of carpels.

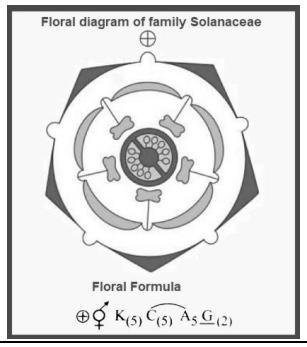


993. The floral formula $\oplus\ \delta\ K_{(5)}\ \overset{\frown}{C_{(5)}}\ A_5\ \underline{G_{(2)}}$ is that of :

(a) Tobacco (b) Tulip
(c) Soyabean (d) Sunnhemp

AIPMT-2009

Ans. (a) : The floral formula of tobacco is $\oplus\ \delta\ K_{(5)}\ \overset{\frown}{C_{(5)}}\ A_5\ \underline{G_{(2)}}$. Tobacco belongs to family solanaceae. The flower is actinomorphic, bisexual, 5 sepals gamosepalous, 5 petals gamopetalous, corolla, 5 stamens epipetalous, superior ovary and axile placentation.



994. Rauwolfia - serpentina belongs to ..... family.

(a) Liliaceae (b) Fabaceae
(c) Apocynaceae (d) Solanaceae

Karnataka CET-2007

Ans. (c) : Sarpagandha (*Rauwolfia Serpentina*), is a genus of evergreen trees and shrubs, widely distributed to India, commonly known as devil peppers in the family Apocynaceae.

- They are used to treat high blood pressure (Hypertension)

995. Cellulose fibre is obtained from gossypium.

(a) stem surface
(b) seed hair
(c) leaf surface
(d) root hair

JIPMER-2004

Ans. (b) : Cellulose fibers are made with ethers or esters of cellulose, which can be obtained from the bark, wood or leaves of plant, or from other plant-based material. In addition to cellulose, the fibers may also contain hemi-cellulose and Lignin, with different percentages of these components altering the mechanical properties of the fibers.

996. A monocarpic plant is one, which

(a) has only one carpel
(b) flowers once in a life-time
(c) produces only one seed
(d) produces only one fruit

JIPMER-2012

Ans. (b) : Monocarpic plant are mostly biennial and annual and very few are perennial.

- Monocarpic plant is a plant which produces flowers and fruits only once in life e.g. Pea, Mustard, Bamboo and Agave.
- Polycarpic plants can have flowers and seeds many time during its lifetime.

@apna_pdf

997. Two plants A and B belonging to Solanaceae are observed. In plant A the number of locules in the ovary of a flower is half of that of its carpel number. In plant B, the number of locules in the ovary of a flower is double the number of carpels. Identify the plants A and B respectively

(a) Capsicum, Datura
(b) Cestrum, Petunia
(c) Withania, Solanum
(d) Lycopersicon, Nicotiana

AP EAMCET-2007

Ans. (a) : In *Datura matal* an annual wild herb, poisonous.

• Herbaceous, aerial, erect, branched, hairy green, leaves alternate, exstipulate, flowers actinomorphic, stamen epipetalous, alternating with petals, ovary bicarpellary, syncarpous, axile placentation and inflorescence cymose, ovary obliquely placed. Saptum oblique with highly swallen placenta, many ovules in each locule, fruit berry or capsule is known as solanaceae.

• In Capsicum, gynoecium is bicarpellary, syncarpous, ovary superior. Due to the imperfect development of the cross wall, ovary is unilocular in the upper part.

998. Identify the characters of gynoecium found a members of Asteraceae. Fabaceae, Liliaceae and Solanaceae, respectively

I. Tricarpellary syncarpous, ovary superior and trilocular
II. Bicarpellary syncarpous, ovary superior and usually bilocular
III. Bicarpellary syncarpous, ovary inferior and unilocular
IV. Monocarpellary, ovary half-inferior and unilocular

(a) II, I, III, IV (b) III, IV, I, II
(c) IV, III, II, I (d) I, II, IV, III

AP EAMCET-2007

Ans. (b) : In the members of family Compositae (Asteraceae) gynoecium is bicarpellary, syncarpous, ovary inferior, Unilocular, basal placentation, and style short and simple, and stigma bifid.

• In Leguminosae (fabaceae) gynoecium is monocarpellary ovary superior, unilocular with marginal placentation.

• In liliaceae androecium is polyandrous epipetalous and gynoecium is tricarpellary, syncarpous, Ovary superior, trilocular with axile placentation.

• Solanaceae. gynoecium is bicarpellary syncarpous, Ovary superior, carpel placed obliquely generally bilocular with axile placenatation.

999. Which one of the following families shows both freedom and fusion in four successive whorls of the flower from exterior in different members?

(a) Malvaceae (b) Solanaceae
(c) Asteraceae (d) Liliaceae

AP EAMCET-2007

Ans. (d) : The flower of the Liliaceae family are actinomorphic, bracteate, hypogynous, complete and bisexual.

Perianth is of six tepals in 2 whorls of 3 each (3+3). They are free or united (**e.g-Alium**). The perianth segments are usually petaloid and the two whorls are generally undifferentiated into calyx and corolla. Anther dithecous, introrse and may be dorsifixed or basifixed.

1000. Study the following lists

List–I	List–II
(A) Laxative	**1. Neem**
(B) Anticorrosion	**2. Groundnut**
(C) Lubricants	**3. Cotton**
(D) Nitro cellulose	**4. Mango**
	5. Rice

Code :

	A	B	C	D
(a)	2	3	5	1
(b)	4	5	2	3
(c)	5	4	3	2
(d)	1	2	4	5

AP EAMCET-2007

Ans. (b) :

A	B	C	D
4	5	2	3

List - I	List - II
(A) Laxative	4. mango
(B) Anticorrosion	5. Rice
(C) Lubricants	2. Groundnut
(D) Nitro cellulose	3. Cotton

1001. Arrange the following plants in ascending order based on the number of xylem strands in their roots

I. Trapa **II. Pisum**
III. Castanea **IV. Nicotiana**

(a) II, IV, III, I
(b) III, IV, II, I
(c) IV, III, I, II
(d) I, II, III, IV

AP EAMCET-2007

Ans. (d) :

Trapa spinosa < Pisum < Castanea sativa < Nicotiana tobacum

Only one xylem strand occurs in the slender root of the **hydrophyte Trapa natans**. In **Nicotiana** the root are diarch. In Pisum the root is triarch. In Castanea, the root is tetrarch.

1002. The internal structure of a plant stem is observed. There is a discontinuous ring of angular collenchyma below the epidermis. Type of vascular bundles are of the same type as in the stems of solanaceous plants. Sieve tube elements possess simple sieve plates identify the plant

(a) Helianthus (b) Cucurbita
(c) Zea (d) Hydrilla

AP EAMCET-2007

@apna_pdf

Ans. (b) : Cucurbita belongs to family cucurbitaceae, stem pentangular, fistular (hallow) usually protrats, hairy, may be climber through the tendrils. Bicollateral vascular bundle occur in stem.
Hypodermis in the stem of Cucurbita is made up of angular collenchymas.

1003. Arrange the following plants in the descending order based on the number of their mericarps

I. Ricinus **II. Coriandrum**
III. Ocimum **IV. Abutilon**

(a) IV, III, II, I
(b) II, I, III, IV
(c) IV, III, I, II
(d) I, IV, II, III

AP EAMCET-2007

Ans. (c) : Following plants are arranged in the descending order based on the number of their mericarps
(IV) Abutilon > (ii) Ocimum > (i) Ricinus > (ii) Coriandrum

1004. Identify the plant in which the tangential walls of collocytes are excessively chickened but radial walls are thin

(a) Monstera (b) Cucurbita
(c) Lactuca (d) Eupatorium

AP EAMCET-2010

Ans. (d) : Eupatorium have tangential wall of collocytes which are excessively thickened but radial wall are thin.
Monstera – One of the best ways to train your monestra to grow upward is to use a support such as a **moss pole**. You also have other options since monsterds can adapt to climbing on all sorts of supports.
Cucurbita – Cucurbita is native to the Andes and Mesoamerica five species are grown worldwide for their edible vegetable variously know as **squash pumpkin**. Texture of butter cup squash 'Delica' during storage and the effect of cooking on the texture.
Lactuca – *Lactuca sativa* uptake by roots and internal transport of food in plant is determined by the concentration and speciation of the trace element in the soil solution and binding of the root cell wall.

1005. Fruits, which break at maturity into number of pieces equal to the number of carpels are found in.

I. Aristolochia II. Datura
III. Dolichos IV. Abelmoschus
(a) I, II (b) II, III
(c) I, IV (d) III, IV

AP EAMCET-2010

Ans. (c) : Aristolochia – Fruits of **Aristolochia** and **Abelmoschus** break at maturity into number of carpel.
Datura – Datura is genus of nine species of poisonous, vespertine flowering plant belonging to the nightshade family **Solanaceae**. They are commonly known as **Thornapples or Jimsonweeds** but are also known as **devils trumpets**.
Dolichos – Dolichos is a genus of flowering plant in the legume family **Fabaceae.** These are herbs and shrubs growing upright sometimes with climbing stems.

1006. A teacher was explaining about a plant, whose venation pattern is basically similar of eryngium. Fruit is berry and stem show sign of perennation.
He was trying to arrive at one of the following.

(a) Musa (b) Brinjal
(c) Glory Iily (d) Mango

AP EAMCET-2010

Ans. (a) : • Musa (Banana) belong to the family Musaceae, and spadix inflorescence is found in Banana.
Musa (banana) plant show parallel venation pattern which is also in eryngium, the fruit of musa is berry and stem show signs of perennation i.e. survival of plant from one year to the next by vegetative means.

1007. Study the following lists.

	List I	List II
(A)	Cohesion among the anthers only	(i) Citrus
(B)	Cohesion of staminal filaments only into bundles	(ii) Cucurbita
(C)	Adhesion of stamens to tepals	(iii) Allium
(D)	Adhesion of stamens to sepals	(iv) Grevillea
		(v) Helianthus

The correct match is :

	A	B	C	D
(a)	5	2	4	3
(b)	4	1	2	5
(c)	5	2	4	3
(d)	5	1	3	4

AP EAMCET-2010

Ans. (d) :

List I	List II
Cohesion among the anthers only	Helianthus (*Helianthus annuus*) is an emollient that makes product smoother and more spreadable. It is a member of the compositae family.
Cohesion of staminal filament only into bundle	Citrus – Citrus is a genus of flowering tree, shrubs and in the family, Rutaceae, plant in the genus produce citrus fruit.
Adhesion of stamen to tepals	Allium – Allium is a genus of monocotyledonous flowering plant that include 100 of species.
Adhesion of stamen to Sepal	Grevillea – Grevillea commonly known as spider flowers and family Proteaceae.

@apna_pdf

1008. Study the following lists

List-I		List-II	
A.	**Arachis**	**1.**	**Swollen placenta**
B.	**Cichorium**	**2.**	**Epicalyx**
C.	**Lilium**	**3.**	**Fasciculate tuberous roots**
D.	**Physalis**	**4.**	**Geocarpy**
		5.	**Bulbils**

The correct match is

	A	B	C	D
(a)	4	3	2	5
(b)	4	1	2	3
(c)	5	4	3	1
(d)	4	3	5	1

AP EAMCET-2008

Ans. (d) :

List-I		List-II	
A.	Arachis	1.	Geocarpy
B.	Cichorium	2.	Fasciculate tuberous roots
C.	Lilium	3.	Bulbils
D.	Physalis	4.	Swollen placenta

1009. Study the following table

i.	**Peperomia**	**Leaf succulent**	**Leaf epidermal**
ii.	**Calotropis**	**Non-succulent**	**Root cells with thickened cell walls**
iii.	**Tribulus**	**Ephemeral**	**Stem stores water**
iv.	**Ammophila Dicot plant**	**Dicot plant**	**Rolling in of leaves to check water loss**

Identify the correct pair of answer.

(a) i, ii (b) i, iii
(c) ii, iii (d) ii, iv

AP EAMCET-2008

Ans. (a) : Succulents or drought avoiding plant store H_2O when available in excess in form of mucilage. Leaf succulents are Peperomia.
Peperomia obtusifolia also known as baby rubber plant, American rubber plant.
True xerophytes are non succulent like Calotropis.

1010. Identify three of the following plants, which exhibit the physiological process described as 'Necessary Evil'

(i) Potamogeton (ii) Sagittaria
(iii) Limnophila (iv) Nymphaea

The correct match is

(a) i, ii, iii (b) ii, iii, iv
(c) i, ii, iv (d) i, iii, iv

AP EAMCET-2008

Ans. (b) : • The physiological loss of water in the form of water vapour mainly from the stomata in leaves but also through evaporation from the surface of leaf, flowers and stems.
• Cuticle is usually absent in submerged form as Potamogeton and poorly developed in floating forms as Nymphaea. The stomata are completely absent in Potamogeton. Therefore, the physiological process called necessary evil does not take place.

1011. Study the following related to used plants and identify the correct match for sorghum and cotton respectively

(i) Blood purification and organs fertilizer.
(ii) Animal feed and paper industry.
(iii) Vitamin 'B' and cosmetics.
(iv) Explosives and organic fertilizer.

The correct pair is:

(a) i, ii (b) ii, iii
(c) iii, iv (d) ii, iv

AP EAMCET-2008

Ans. (d) : Cotton contains cellulosic textile fiber suitable for a wide range of clothing, house hold and industrial product. The Sorghum crop is quite valuable for forage and can be used for feeding to animals.

1012. Study the following lists

List-I		List-II	
A.	**Arachis**	**1.**	**Basket making**
B.	**Mangifera**	**2.**	**Saky**
C.	**Cajanus**	**3.**	**Fixed oil**
D.	**Oryza**	**4.**	**Diuretic**
			Nitrocellulose

The correct match is:

	A	B	C	D
(a)	3	4	1	2
(b)	2	3	4	5
(c)	3	1	5	4
(d)	5	3	2	1

AP EAMCET-2008

Ans. (a) :

List-I		List-II	
A.	Arachis	1.	Fixed oil
B.	Mangifera	2.	Diuretic
C.	Cajanus	3.	Basket making
D.	Oryza	4.	Saky

1013. Read the following lists

List-I		List-II	
A.	**Extra foliar nectarines**	**1.**	**Achras**
B.	**Schizogenous cavities**	**2.**	**Tropaeolum**
C.	**Laticiferous ducts**	**3.**	**Passiflora**
D.	**Hydathodes**	**4.**	**Eucalyptus**
			Pinus

@apna_pdf

	A	B	C	D
(a)	3	1	2	4
(b)	2	1	3	4
(c)	3	5	1	2
(d)	5	2	1	3

AP EAMCET-2008

Ans. (c) :

List-I		List-II	
A.	Extra foliar nectaries	1.	Passiflora
B.	Schizogenous cavities	2.	Pinus
C.	Laticiferous ducts	3.	Achras
D.	Hydathodes	4.	Tropaeolum

1014. In the flowers of a plant, the ovarian part is fused, but styles and stigmas are free. Its ovary becomes unilocular due to breakdown of partition wall and the ovules are attached to a central axis. Identify the plant.

(a) Dianthus (b) Abutilon
(c) Nymphaea (d) Michelia

AP EAMCET-2008

Ans. (a) : Dianthus belongs to the caryophyllaceae family commonly called the pink family.
In the flower of Dianthus, ovarian part is fused but style and stigma are free. Its ovary becomes unilocular due to break down of partition wall and the ovule are attached to a central axis i.e. ovary is syncarpous, superior, unilocular, with many ovule and free central placentation.

1015. Read the following lists

List-I		List-II	
A.	**Gall flowers**	**1.**	**Theobroma**
B.	**Sympodial axis**	**2.**	**Bougainvillea**
C.	**Achlamydeous**	**3.**	**Ficus**
D.	**Cauliflory**	**4.**	**Euphorbia**
		5.	**Hemelia**

The correct match is:

	A	B	C	D
(a)	3	5	1	2
(b)	3	4	2	1
(c)	3	4	1	2
(d)	3	5	4	1

AP EAMCET-2008

Ans. (d) :

List-I		List-II	
A.	Gall flowers	1.	Ficus
B.	Sympodial axis	2.	Hemelia
C.	Achlamydeous	3.	Euphorbia
D.	Cauliflory	4.	Theobroma

Hypanthodium inflorescence is found in ficus
Polychasial cymose inflorescence is found in Hemelia.
Cyathium inflorescence is found in euphorbia.

1016. Identify the set of characteristics related to plants belonging to family Fabaceae from the following:

(a) Actinomorphic flower, syncarpous ovary and marginal placentation
(b) Peristent calyx, epipetalous stamens and leguminous fruit
(c) Papilionaceous corolla, axile placentation and leguminous fruit
(d) Vexillary aestivation of corolla, diadelphous stamens and monocarpellary, unilocular ovary

Karnataka CET-2014

Ans. (d) : Plant belonging to the family fabaceae show descending imbricate aestivation of corolla stamen 10 (9 + 1) Diadelphous condition 2 bundles. Filaments of 9 stamens united but anther remains free and one stamen free and marginal placentation.

1017. Match the names of the economically important plants (or their products) listed in Column-I with the families to which they belong given in Column-II. Choose the answer which gives the correct combination of alphabets of the two columns:

Column-I	Column-II
(A) Sunflower	**p. Acanthaceae**
(B) Tulsi	**q. Compositae**
(C) Coffee	**r. Labiatae**
(D) Vasaka	**s. Rubiaceae**
	t. Euphorbiaceae

(a) A = q, B = r, C = s , D = p
(b) A = q, B = s, C = p , D = t
(c) A = s, B = r, C = p , D = q
(d) A = r, B = t, C = s , D = q

Karnataka CET-2009

Ans. (a) :

Plants	Family
Sunflower	Compositae
Tulsi	Labiatae
Coffee	Rubiaceae
Vasaka	Acanthaceae

Compositae- Ovary inferior, bicarpellary syncarpous, unilocular, with basal placentation.
Labiatae- Gynoecium bicarpellary, syncarpous bilocular but tetralocular due to the formation of false septum. superior ovary with axile placentation.
Acanthaceae- Gynoecium bicarpellary, syncarpous bilocular, superior ovary with axil placentation.
Rubiaceae- Gynoecium bicarpellary rarely polycarpellary, syncarpous inferior ovary rarely half inferior or superior, sometimes unilocular with axile placentation.

1018. A plant has an androecium with monadelphous stamens, monothecous and reniform anthers. The corolla exhibits contorted aestivation. The plant could be

(a) Vinca (b) Nerium
(c) Hibiscus (d) Rauwolfia

Karnataka CET-2009

@apna_pdf

Ans. (c) : Monadelphous stamens, monothecous and reniform anther lobes are seen in malvaceae family.

- **Monoadelphous:-** Filament of all stamens are united to form a single bundle but anthers are free.
- **Monothecous:-** Has only one anther lobe anther
- **Reniform:-** Kidney shaped
- **Contorted aestivation:-** Sepals (partly inner 2 partly outer

1019. Given below is the floral diagram of a flower. Which of the following descriptions of the flower matches the floral diagram ?

(a) Heterochlamydeous, gamopetalous, pentamerous and bisexual
(b) Heterochlamydeous, gamopetalous, tetramerous and bisexual
(c) Homochlamydeous, polypetalous, pentamerous and bisexual
(d) Homochlamydeous, gamopetalous, tetramerous and unisexual

Karnataka CET-2012

Ans. (b) : According to the floral diagram of flower, it is a heterochlamydeous, gamopetalous, tetramerous and bisexual type of flower.

1020. The host for Cercospora personata belong to this family of angiosperms :

(a) Graminae (b) Leguminosae
(c) Malvaceae (d) Asclepiadaceae

Karnataka CET-2012

Ans. (b) : *Cercospora personata* host (ground nut) belongs to Leguminosae family of angiosperms. Leguminosae is an important family of flowering plants. It is also known as pea or legume family. Most species are plant pathogens. It causes leaf spots in groundnut. The cercospora is a fungus belongs to deuteromycotina subdivisions.

1021. The following diagrams A, B, C, D and E show the different types of arrangement of statements based on the cohesion of their parts in different plants Assign the statements to their respective plants. Choose the correct answer.

(a) **A=** *Hibiscus rosa sinensis*, **B** = *Bombax ceiba*, **C** = *Cucurbita pepo*, **D** = *Crotalaria juncea*, **E** = *Helianthus annus*.
(b) **A** = *Hibiscus rosa sinensis*, **B** = *Helianthus annus*, **C** = *Cucurbita pepo* **D** = *Crotalaria juncea*, **E** =*Bombax ceiba*.
(c) **A** = *Hibiscus rosa sinensis,* **B** = *Crotolaria juncea,* **C** = *Bombax ceiba* **D** = *Helianthus annus,* **E** = *Cucurbita pepo*.
(d) **A** = *Hibiscus Rosa sinensis*, **B** = *Bombax ceiba* **C** = *Helianthus annus,* **D** = *Cucurbita pepo,* E = *Crotalaria juncea*.

Karnataka CET-2010

Ans. (c) : A = *Hibicus rosa sinensis*, **B** = *Crotalaria juncea*, **C** = *Bombax ceiba* **D** = *Helianthus annus,* **E** = *Cucurbita pepo*.

1022. The presence of corollary corona, sagittate anthers and dumb-bell shaped stigma are the characteristic fetaurs of

(a) *Hibiscus rosa sinensis*
(b) *Musa paradisiaca*
(c) *Ravenala madagascariensis*
(d) *Catheranthus roseus*

Karnataka CET-2010

Ans. (d) : *Catharanthus roseus* belong to apocynaceae family. It possesses corolla with corona, anthers cohesing or separate from one another, adnate. Stigma is bell–shaped (the head usually massively thickened contracted in the middle with a ring).

1023. Pappus helps in dispersal of pollen in:

(a) Asteraceae (b) Brassicaceae
(c) Malvaceae (d) Solanaceae

JIPMER-2016

Ans. (a) : In Asteraceae family, Pappus is a modified calyx. They have hairy structures that help in the dispersal of pollen by the wind that makes the seed light. dispersal of seed in Asteraceae family occurs by parachute mechanical.

1024. Source of commercial chewing gum latex is

(a) Hevea brasiliensis (b) Carica papaya
(c) Ficus elastica (d) Achras sapota

JIPMER-2016

Ans. (d) : Chewing gum is a salt substance designed to chewed without swallowed. The latex of some plants is commercially, important such as -

i. Source of commercial rubber is the latex of have a brasiliensis, ficus, elastica, cryptostegia, manihot.
ii. Source of enzyme papain is the latex of *Carica papaya.*
iii. Source of chewing or chewing gum is the latex of *Achvas sapota.*

1025. In which one of the family formation of endosperm doesn't take place?

(a) Orchidaceae (b) Cactaceae
(c) Ranunculaceae (d) Malvaceae

JIPMER-2016

Ans. (a): Some families like Orchidaceae and Trapaceae do not produce endosperm to nourish the developing embryo. Some plants like the orchid, lack endosperm in their seeds.

@apna_pdf

1026. Which pair of the following plants represent, the condition of modification of stipules into spines?

(a) Euphorbia and Zizyphus
(b) Citrus and Euphorbia
(c) Zizyphus and Bougainvillae
(d) Bougainvillae and Citrus

AP EAMCET-2005

Ans. (a) : Spine or stipular spines are modified stipules present at the base of a leaf. Stipules are modified into spines in Zizyphus on Euphorbia.

- Spines are sharp and pointed structure. In Bougainvillae and citrus, a sharp and pointed structure is also present similar to the spines, named thorn which is the modification of axillary bud.

1027. Study the following lists:

	List-I (Taxon)		List-II (Number of chromosomes in the endosperm cells)
A.	*Pisum sativum*	1.	72
B.	*Oryza sativa*	2.	24
C.	*Nicotiana tabacum*	3.	60
D.	*Alium cepa*	4.	36
		5.	21

The correct match is:

	A	B	C	D
(a)	5	4	1	2
(b)	2	5	3	1
(c)	1	2	5	4
(d)	4	1	2	5

AP EAMCET-2005

Ans. (a) : In angiosperm endosperm is a triploid structure it is formed due to fusion of second male gamete (n) with the Secondary nucleus (24) all the given taxon are belong to angiospermic group hence their endospermic will contain three sets of their haploid number of chromosome (3n).

- Pea (*Pisum sativum*)(n=7) with contain endosperm with 21 (3n) chromosome.
- Rice (*Oryza sativa*)(n-12) will contain endosperm with 36 (3^{rd} chromosome
- Tobacco *(Nicotiana tabacum*) (n=24) will contain endosperm with 72 (3n) chromosome and
- Onion (*Allium cepa*)(n=8) will contain endosperm with 24 (3n) chromosome.

1028. Which one of the following is used for external application in the cure of leprosy?

(a) Rice bran oil
(b) Neem seed oil
(c) Cotton seed oil
(d) Groundnut seed oil

AP EAMCET-2005

Ans. (b) : Neem seed oil is used for external application in the cure of leprosy.
Rice bran oil has gained a status as a 'heart-healthy oil'.
Ground nut oil is used to make medicine.
Cotton seed oil is ued for salad oil.

1029. Study the following lists:

	List-I		List-II
A.	Solanaceae	1.	Launea
B.	Malvaceae	2.	Pongamia
C.	Fabaceae	3.	Petunia
D.	Asteraceae	4.	Withania
		5.	Thespesia

The correct match is:

	A	B	C	D
(a)	3	4	1	2
(b)	2	5	1	4
(c)	4	5	2	1
(d)	5	2	3	4

AP EAMCET-2005

Ans. (c) : Withania is the member of family Solanaceae, **Thespesia** is the member of family Malvaceae. **Pongamia** is the member of family Fabaceae and **Launea** is the member of family Asteraceae.

1030. Study the following lists:

	List-I		List-II
A.	Tridax	1.	Synandrous
B.	Dolichos	2.	Monadelphous
C.	Ceiba	3.	Syngenesious
D.	Cucurbita	4.	Polyadelphous
		5.	Diadelphous

The correct match is:

	A	B	C	D
(a)	4	5	2	1
(b)	3	5	1	4
(c)	5	3	4	2
(d)	3	5	4	1

AP EAMCET-2005

Ans. (d) : In Tridax the androecium is polyadelphous (all anther remains free) in Dolichos, the androecium is Diadelphous i.e. two separate bundles of united filaments (anther are free) are formed. In ceiba, filament of all segment becomes fused and form a group but anther remains free. This situation is called mono-adelphous. In Cucurbita anther and filament both are fused throughout the whole length. This situation is known as **Synandrous**.

a) Tridax– Belongs to the family Asteraceae, it shows the syngenesious condition of the androecium, where in the anthers are fused and the filaments are free.

b) Dolichos– belongs to the family Fabaceae, it shows diadelphous androecium because filaments are united to form two bundles (9+2).

@apna_pdf

c) Ceiba– Belongs to the family Malvaceae, it shows polyadelphous condition because the united filaments form many bundles.

d) Cucurbita– Belongs to the family Cucurbitaceae, the androecium is synandrous because the stamens are united in their whole length as 2 + 2 + 1 pattern.

1031. Which one of the following is being tried in India as a biofuel substitute for fossil fuels?

(a) Musa (b) Aegilops
(c) Jatropha (d) Azadirachta

AIPMT-2008

Ans. (c) : Biofuels are the fuels extracted from the plants (biological sources) to be used in the replacement of fossil fuels to meet future need. Jatropha is used as a petro-plant due to its efficiency as fuel and easy availability and less pollution-causing properties.

Jatropha plant belongs to Euphorbiaceae family. The seeds of Jatropha contain an inedible oil which can be converted to biodiesel. The seed cake (residue left after extraction of oil from seeds) can be used as fertilizer or food for cattle. The biodiesel of Jatropha oil emits 80% less carbon dioxide on burning than other fuels.

1032. The fruit is chambered, developed from inferior ovary and has seeds with succulent testa in :

(a) Guava (b) Cucumber
(c) Pomegranate (d) Orange

AIPMT-2008

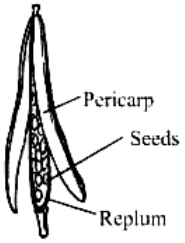
Ans. (c) : Pomegranate is the plant of family Lythraceae. The Pomegranate fruit is a berry which develops from an inferior ovary. Each seed has a surrounding water-laden pulp known as the edible sarcotesta that forms from the seed coat. The seeds have no arils (exarillate). **Aril:-** Accessory covering of certain seeds that commonly develops from the seed stalk **.** It is often a bright coloured fleshy envelope **e.g.** Litchi, Pomegranate.

1033. The Replum is present in the ovary of flower of:

(a) Sunflower (b) Pea
(c) Lemon (d) Mustard

AIPMT-2008

Ans. (d) : A false septum called replum develops between the two parietal placentae in mustard and other members of family Brassicacae. Mustard fruit is called siliqua. It develops from a Bicarpellary, Syncarpous, superior ovary which is unilocular but becomes bilocular due to Replum. It separates 2 valves of the fruit.



Siliqua of Mustard

1034. Most of the economically important fibre yielding plants belong to family

(a) Malvaceae (b) Solanaceae
(c) Cruciferae (d) Poaceae

JIPMER-2009

Ans. (a) : Most economically important fiber yielding plants belong to family malvaceae. It includes cotton, ladies finger etc. It is the most important fiber plant which supplies more than 70% of the world consumption of fibers.

1035. Plants like *Aegle marmelos, Ocimum sanctum* and *Ficus religeosa* are a group of plants designated as

(a) Traditional food crops
(b) Sacred species of plants
(c) Medicinal plant species
(d) Lesser known food plants

Karnataka CET-2008

Ans. (b) : Plants like *Aegle marmelos*, *Ocimum sanctum* and *Ficus religeosa* are a group of plants designated as sacred species of plants.

1036. An alkaloid called 'Reserpine' is extracted from

(a) Leaves of Sarpagandha
(b) Roots of Ashwagandha
(c) Leaves of Ashwagandha
(d) Roots of Sarpagandha

Karnataka CET-2008

Ans. (d) : An alkaloid called 'Reserpine' is extracted from roots of Sarpagandha. Reserpine is used to treat high blood pressure. It also used to treat severe agitation in patients with mental disorders.

1037. The fruit of Solanaceae is

(a) Berry or capsule (b) Pome
(c) Legume or pod (d) Drupe

UP CPMT-2005

Ans. (a): The fruits of the great majority of the Solanaceae are **berries or capsules and less often drupe**.

- A fruit consisting a fleshy enlarged receptacle and a tough central core containing the seeds e.g. an apple pear etc.
- Legume is also called pod fruit of plants in the pea family (Fabacea).
- A Drupe is a fruit with a hard stony covering enclosing the seed e.g. Peach or Olive.

1038. Rauwolfia serpentina is used in

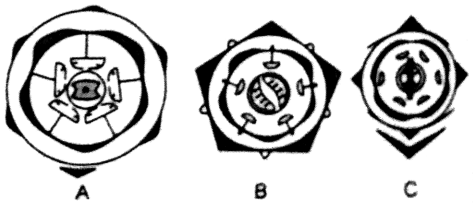
(a) Curing high blood pressure
(b) Kidney failure
(c) Eye defect
(d) Diabetes

JIPMER-2014

Ans. (a) : *Rauwolfia serpentina* is used for hypertension. The plant was used by many physicians throughout India in the 1940s and then was used throughout the world in the 1950s, including in the United States and Canada.

@apna_pdf

1039. Three floral diagrams are given here. Their respective families are assigned in the answer key. Find out the families to which these diagrams belong to



(A) ♀ $K_{pappus}C_{(5)}A_5G_{\underline{(2)}}$

(B) ♀ $K_{(5)}C_{(5)}A_5\underline{G}_{(2)}$

(C) ♀ $K_{2+2}C_4A_{2+4}G_{(2)}$

(a) A-Liliaceae, B-Asteraceae, C-Solanaceae
(b) A-Asteraceae, B-Solanaceae, C-Brassicaceae
(c) A- Brassicaceae, B-Solanaceae, C-Asteraceae
(d) A-Poaceae, B-Solanaceae, C-Asteraceae

JIPMER-2014

Ans. (b) : Floral diagram 'A' belongs to Asteraceae family. It is commonly known as Daisy or Sunflower family. Flowers are tubular or ligulate, bisexual or unisexual, usually dithecous, filament free with united anthers.
Floral diagram 'B' belong to Solanaceae family. It is commonly known as nightshade or potato family. It is one of human kind's most utilized and important family. Floral diagram 'C' belongs to Brassicaceae. It is commonly known as Crucifers or Cabbage family. These are generally herbs, annuals, biennials, or shrubs.

1040. Assertion (A): Dictyostele is present in rhizome of *Pteris vittata*.
Reason (R): Meristeles are scattered in the rhizome of *Pteris vittata*.
The correct answer is
(a) Both (A) and (R) is true and (R) is not the correct explanation of (A)
(b) (A) is true, but (R) is false
(c) (A) is false, but (R) is true
(d) Both (A) and (R) are true, and (R) is the correct explanation of (A) .

AP EAMCET-2013

Ans. (d): In the rhizome of *Pteris vittata* two types of stele present Dictyostele and Meristele. Meristele present in rhizome in scattered form.

1041. Match the following lists

	List I		List II
(A)	Bicarpellary unilocular	(i)	Hyoscyamus
(B)	Bicarpellary bilocular	(ii)	Ulex
(C)	Multicarpellary multilocular	(iii)	Scilla
(D)	Monocarpellary unilocular	(iv)	Citrus
		(v)	Capsicum

The correct match is

	A	B	C	D
(a)	(iii)	(v)	(iv)	(i)
(b)	(iv)	(i)	(iii)	(v)
(c)	(v)	(i)	(iv)	(ii)
(d)	(v)	(iii)	(i)	(ii)

AP EAMCET-2013

Ans. (a) : • **Scilla** has bicarpellary gynoecium with the unilocular ovary having two ovules.
• In **Capsicum** the gynoecium is bicarpellary with bilocular ovary.
• The gynoecium of **Citrus** is multicarpellary with multilocular ovary.
• **Hyoscymus** shows monocarpellary gynoecium with unilocular ovary.

1042. Triple fusion was discovered in this plant possessing naked bulb, fleshy leaf bases and loculicidal capsule.
(a) Lilium (b) Trillium
(c) Aloe (d) Allium

AP EAMCET-2013

Ans. (a) : Lilium is herbaceous plants having scaly bulbs, whorled or scattered leaves, perianth of six segments, versatile anthers,
(b) **Trillium** - Red Trillium has long been used to **relive respiratory distess**, specifically because it acts as expectorant, helping to remove phlegm or mucus from the respiratory fracts. This can help to speed up the healing process of colds and also protect the immune system against the pathogens that often thrive in mucus.
(c) **Aloe** – Aloevera is a succulent plant species. Aloe is widely distributed, and is considered an invasive species in many would regions.
(d) **Allium** – Allium is a **genus of monocotyledonous Flowering plants** that included hundreds of species, including the cultivated Onion, Garlic, Scallions, Shallot, Leek, and Chives.

1043. Identify the correct combination of characters found in Cucurbita.
(a) Free central placentation, synandry, divergent palmately reticulate venation
(b) Mesogamy, fusion of epicarp and thalamus to form rind of the fruit, seed germination epigeal
(c) Axile placentation extrafloral nectaries continuous, collenchymatous hypodermal ring in stem
(d) Bicarpellary gynoecium, compound sieve plate, unilocular ovary

AP EAMCET-2013

Ans. (b) : In **Cucurbita**, Pollen tube enters the ovule through the integuments. In Cucurbit (mesogamy), the epicarp and thalamus form the outer ring of the fruit Also, seed germination is epigeal.

1044. Match the following lists.

	List I	List II
(A)	Apices of underground branches store food material	(i) Mentha
(B)	Underground branches grow obliquely upward from the axillary buds of nodes of the stem below the soil	(ii) Hydrocotyle
(C)	Aerial branches grow obliquely downwards and produce adventitious root after touching the soil	(iii) Agave

@apna_pdf

(D) Weak stemmed plants have a cluster of leaves and root at every node — (iv) Stachys

(v) Jasminum

The correct match is

	A	B	C	D
(a)	(ii)	(v)	(i)	(iii)
(b)	(iii)	(iv)	(ii)	(i)
(c)	(iv)	(v)	(iii)	(ii)
(d)	(iv)	(i)	(v)	(ii)

AP EAMCET-2013

Ans. (d) :
(i) **Mentha**-Undergrond branches grow obliquely upward from the axillary buds of nodes of the stem below the soil.
(ii) **Hydrocotyle**-Weak stemmed plants have a duster of leafs and roots at every node
(iii) **Agave-** Agave is a genus of monocots native to the hot and arid regions of the Americas, Plants in the genus may be considered perennial because they require too many years to mature and flower.
(iv) **Stachys**- Apices of underground branches store food
(v) **Jasminum**-Aerial branches grow obliquely down wards and produce adventitious roots after touching the soil.

1045. Tetradynamous condition of androecium is characteristic feature of family
(a) Solanaceae (b) Brassicaceae
(c) Compositae (d) Malvaceae

UP CPMT-2014

Ans. (b): Tetradynamous condition is unique feature of family Brassicaceae. In this condition the stamens are arranged in two whorls, the outer whorl has to short stamens while the inner whorl has four long stamens.

1046. Respiratory roots, positively aerotropic structure in mangroves are found in plant/plants
(a) Sonneratia (b) Aviccinia
(c) Rhizophora (d) All of the above

UP CPMT-2014

Ans. (d): Respiratory roots (pneumatophores) are characteristics feature of Mangroves marshy plants halophytes, Sonneratia, Aviccinia and Rhizophora all are mangroves vegetation.

1047. The fruit found in plants of family-Poaceae
(a) Cypsela (b) Caryopsis
(c) Pod or legume (d) Siliqua

UP CPMT-2014

Ans. (b): Poaceae or grass family is also known as Graminae. fruit of this family is caryopsis.
• This fruit is one chambered and one seeded fruit and develop from a superior monocarpellary ovary.
Hence, the pericarp remain fused with seed coat.
• **Cypsela –** Cypsela is a characteristic fruit of the family Asteraceae. It is a small simple seeded, dry fruit and it develops from the bicarpellary.
• **Legume or pod** – Legume refers to any plant from the Fabaceae family that would include its leaves, stems and pods and mostly dehiscent type of fruit.
• **Siliqua** – Siliqua fruit is characteristic of the family Brassicaceae. Siliqua is a type of fruit (seed capsule) having two fused carpel with the length being more than three times the width.

1048. Ruminate endosperm is found in the seeds of family
(a) Compositae (b) Cruciferae
(c) Euphorbiaceae (d) Annonaceae

UP CPMT-2011

Ans. (d): Mature endosperm with any degree of irregularity and unevenness in its surface contour is called ruminate endosperm. It is known to occur in about 32 families of angiosperm. In family-Annonaceae ruminate endosperm is found.
• The members of Asteraceae produce a type of fruit called an achene which is dry and single-seeded and does not open at maturity.
• The Euphorbiaceae the spurge family are a large family of flowering plant.

1049. In the members of family Malvaceae, anthers are described as
(a) Diadelphous and dithecous
(b) Diadelphous and monothecous
(c) Monoadelphous and dithecous
(d) Monoadelphous and monothecous

Karnataka CET-2006

Ans. (d) : The androecium of the family malvaceae consists of indefinite stamens. The stamens are monoadelphous i.e. united into one bundle by filaments and monothecous i.e. single called anther. The anther dehiscent transversely.

1050. Study the following lists

List I		**List II**
(A) Spongy aril	**1.**	**Jussiaea**
(B) Multiple epidermis	**2.**	**Pistia**
(C) Respiratory roots	**3.**	**Nerium**
(D) Root pockets	**4.**	**Sagittaria**
	5.	**Nymphaea**

The correct match is

	A	B	C	D
(a)	1	3	2	5
(b)	2	1	4	3
(c)	4	2	3	1
(d)	5	3	1	2

AP EAMCET-2009

Ans. (d) : • Spongy aril is found in Nymphaea.
• Multiple epidermis is found in xerophytic plants like Nerium.
• Root floats or floating roots are found in Jussiaea and helping gaseous exchange from atmosphere (i.e. Respiratory roots).
• In Pistia, root floats are helpful in respiration and balancing and bear root pocket.

1051. A plant with actinomorphic and hypogynous flowers, heterochlamydeous perianth, dorsifixed and extrorse anthers dehiscing transversely belongs to
(a) Coronariae (b) Bicarpellatae
(c) Thalamiflorae (d) Calyciflorae

AP EAMCET-2009

Ans. (c) : Ranunculaceae flower are hypogynous. polycarpellary and dorsifixed anthers, apocarpous, Flower is pedicellate, ebracteate and hermaphrodite, actinomorphic flowers, extrose anther exhibit transverse dehiscence.

@apna_pdf

1052. Study the following table

(i)Modified aerial stem	**Unisexual flowers develop acropetally**	**Chalazal entry of pollen tube**
(ii)Flowers achlamydeous	**Pedicels of all the flowers are of same length**	**Presence of false whorl**
(iii) Cohesion of bracts forming a cup	**Centrifugal opening of flowers**	**Male flowers many**
(iv) Flower formation on one side in a spiral manner	**Presence of Rachilla**	**Terminal part of the peduncle is flowerless**

Select the correct pair of answers in which the former represents the set of characters present in Poinsettia and the latter in the pair represents the set of characters present in Casuarina.

(a) (ii), (iii) (b) (i), (ii)
(c) (iv), (iii) (d) (iii), (i)

AP EAMCET-2009

Ans. (d) : In Poinsettia and Euphorbia inflorescence is **cyathium**, in which involucre fuse to form a cup surrounding a large achlamydeous, pedicellate tricarpellary, syncarpus female flower. Numerous centrifugally arranged male flowers surround the single female flower.

• In Casuarina, cylindrical phylloclades are found which are modified aerial stems, flowers are unisexual which develop acropetally and pollen tube enters the ovule through chalazal tissues, i.e. chalazogamy.

1053. Quinine used for treatment of malarial fever extracted from

(a) Atropa belladona
(b) Cinchona officinalis
(c) Aconitum napellus
(d) Rauwolffia serpentina

UP CPMT-2006

Ans. (b) : Quinine is obtained from the bark of *Cinchona officinalis* (family Rubiaceae). The bark of this plant contain about 30 alkaloids, used for treatment of malarial fever.

***Atropa belladonna*-** Belladonna has been used in herbal medicine for centuries as a pain reliever, muscle relaxer, and anti-inflammatory, and to treat menstrual cycle.

***Aconitum napellus* -** If given at the beginning of an illness, *Aconitum napellus* can often stop an illness from progressing. This medicine is used to treat the initial stages of crop, urinary tract infection, scarlatiniform viral exanthemas, otitis media and influenza, among other conditions.

***Rauwolfia sarpentina* -** *Rauwolfia sarpentina* is a safe and effective treatment for hypertension.

1054. Carthamus belongs to family

(a) compositae (b) gramineae
(c) liliaceae (d) solanaceae

UP CPMT-2006

Ans. (a): *Carthamus tinctorius* (kusum) belongs to family Compositae. Its flower is use as due for dying food and cloth. The seed oil used for making soaps, varnishes, paints and burning purpose. Refined edible oil is also produced by hydrogenation and bleaching.

1055. An example for holandric inheritance is:

(a) epidermolysis (b) Turner's syndrome
(c) haemophilia (d) webbed toes

AP EAMCET-2002
JCECE-2002

Ans. (d) : Holandric inheritance is the inheritance of genes present the y - chromosome. Hypertrichasis of the ears, webbed toes ancl porcupine man are examples of y - linked inheritance.

1056. Barr body is present in

(a) sperm
(b) ovum
(c) somatic cell of female
(d) somatic cell of male

AFMC-2010

Ans. (c) : Bar body is a structure consisting of condersed x - chromosome that is found in non dividing nuclei of female mammals, is, somatic cells of female.

1057. Match the terms in Column I with their description in Column II and choose the correct option

Column I		Column II	
(A)	**Dominance**	**(i)**	**Many genes govern a single character**
(B)	**Codominance**	**(ii)**	**In a heterozygous organism only one allele expresses itself**
(C)	**Pleiotropy**	**(iii)**	**a heterozygous organism both alleles express themselves fully**
(D)	**Polygenic inheritance**	**(iv)**	**A single gene influences many characters**

	(A)	(B)	(C)	(D)
(a)	(iv)	(iii)	(i)	(ii)
(b)	(ii)	(i)	(iv)	(iii)
(c)	(ii)	(iii)	(iv)	(i)
(d)	(iv)	(i)	(ii)	(iii)

NEET-2016 Phase-I

Ans. (c) : The correct option is (c) 1-ii, 2-iii, 3-iv, 4-i.
Dominance- In a heterozyous organism only one allele expresses itself.
Codominance- In a heterozygous organism both alleles express themselves fully.
Pleiotropy- A single gene influences many characters.
Polygenic Inheritance- Many genes govern a single characters.
In heterozygous only one allele is express.

1058. Test cross in plants or in Drosophila involves crossing

(a) between two genotypes with dominant trait
(b) between two genotypes with recessive trait
(c) between two F_1 hybrids
(d) the F_1 hybrid with a double recessive genotype

AIPMT (Mains)-2011

Ans. (d) : When we study about 'Mendelian factor' in Drosophilla then we found a test cross is a experimental cross of an individual organism from parent F_1-generation dominant homozygous to recessive genotype and phenotype contrasting characteristic feature.

@apna_pdf

06 ANATOMY OF FLOWERING PLANTS

A. Tissue

1. Which of the following statements are incorrect regarding internal organization of plant tissues?

A. Phloem parenchyma is absent in dicotyledonous stem
B. Monocot roots do not undergo secondary growth
C. Hypodermis is sclerenchymatous in monocotyledonous stem
D. Lysigenous cavities are found in vascular bundles of dicotyledonous stem

(a) AB (b) AC
(c) BC (d) AD

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : Phloem parenchyma is absent in monocot stem. In dicot stem phloem parenchyma is present.
• Lysigenous cavity is absent in vascular bundle of dicot stem. Lysigenous are present in monocot stem like zea maize and other monocots.

2. The hypodermis tissues in dicot and monocot stems respectively

(a) Collenchyma and Sclerenchyma.
(b) Sclerenchyma and Collenchyma.
(c) Sclerenchyma in both.
(d) Collenchyma in both.

AP EAPCET-22.05.2023, Shift-II

Ans. (a) : Hypodermis is collenchymatous (green) in dicot stem and sclerenchymatous (non green) in monocot stem.

3. Correct sequence of the development process in a plant cell

(a) Meristematic cell → Expansion → Differentiation → Maturation
(b) Meristematic cell → Cell division → Plasmatic growth → Maturation
(c) Meristematic cell → Maturation → Elongation → senescence
(d) Mature cell → Cell division → Meristematic cell → Differentiation

AP EAPCET-23.05.2023, Shift-I

Ans. (a) : The developmental process in plant cell starts from meristematic activity then divided cell growth and expansion and show differentiation and then it gets matured.

4. Match List-I with List-II.

List-I		List-II	
(A)	**Cells with active cell division capacity**	**(i)**	**Vascular tissues**
(B)	**Tissue having all cells similar in structure and function**	**(ii)**	**Meristematic tissue**
(C)	**Tissue having different types of cells**	**(iii)**	**Sclereids**
(D)	**Dead cells with highly thickened walls and narrow lumen**	**(iv)**	**Simple tissue**

Select the correct answer from the options given below.

	(A)	(B)	(C)	(D)
(a)	(iii)	(ii)	(iv)	(i)
(b)	(ii)	(iv)	(i)	(iii)
(c)	(iv)	(iii)	(ii)	(i)
(d)	(i)	(ii)	(iii)	(iv)

NEET-2021

Ans. (b) :

(A)	Cells with active cell division capacity	(ii)	Meristematic tissue
(B)	Tissue having all cells similar in structure and function	(iv)	sample tissue
(C)	Tissue having different types of cells	(i)	vascular tissues
(D)	Dead cell with highly thickened walls and narrow lumen	(iii)	sclereids

5. Irregularly arranged vascular bundles within the ground tissue are called

(a) actinostele (b) radial stele
(c) atactostele (d) plectostele

Tripura JEE-2019

Ans. (c) : Irregularly arranged vascular bundles within the ground tissue are called. 'Atactostele'. It consits of vascular bundles scattered in ground tissue. It is found in monocots. Atactostele occurs in the stem of monocots but eustele occurs in the stem of dicots. It consists a sclerenchymatous bundle sheath and only two meta xylem elements are present per vascular bundle.

6. Structurally the amphicribal vascular bundles resemble closely to

(a) dictyosteles (b) solanosteles
(c) siphonosteles (d) protostele

CMC Vellore-2013

@apna_pdf

Ans. (d) : Structurally the amphicribal vascular bundles resemble closely to protostele. Amphicribal vascular bundle is a central strand of xylem in a bundle and is surrounded by phloem. It is structurally resemble close to protostele.

7. Which one of the following is a secretory tissue ?

(a) Sclerenchyma (b) Companion cells
(c) Hydathode (d) Sclereids

BVP-2006

Ans. (c) : Secretory tissues take place in most vascular plants. Some of these tissues like hydathodes , salt glands and nectarines, secrete unmodified or only slightly modified materials that is supplied directly or indirectly by the vascular tissues.

Hydathodes are secretory structures which are a modification of tissues of leaves, present on tips and margins that discharge water from the interior of the leaf to the surface in a process known as guttation.

8. Transfusion tissue is meant for translocation of

(a) Organic solutes (b) Sap
(c) Food materials (d) All of these

CMC Vellore-2011

Ans. (a) : Transfusion tissue is meant for translocation of organic solutes. The primary function of transfusion is to move substances between the mesophyll and the vascular bundles which performs the function of lateral veins.

9. Chlorenchyma is known to develop in the

(a) Spore capsule of a moss
(b) Pollen tube of pinus
(c) Cytoplasm of chlorella
(d) Mycellium of a green mould such a Aspergillus

MGIMS Wardha-2010

Ans. (a) : Chlorenchyma is known to develop in spore capsule of a mass. Parenchyma cells in leaves which contain chloroplasts are termed as chlorenchyma cell. They help the leaves to produce food by photosynthesis and storage of the food produced. These chloroplast bearing cells have the capacity to prepare food through photosynthesis.

10. Angular collenchyma occurs in

(a) Salvia (b) Helianthus
(c) Althaea (d) Cucurbita

SJIPMER-2013

Ans. (d) : Angular collenchyma is found in cucurbita'. Angular collenchyma is a type of collenchyma in which the material that causes thickening is deposited at angles or corners of the cell. Pumpkin and melon are examples of fruits that belong to this genus.

11. Velamen is found in :

(a) Vanda (b) Rosa
(c) Viscum (d) Santahim

Manipal-2004

Ans. (a) : Velamen is found in 'Vanda'. Velamen is a spongy, multiple epidermis that covers the roots of some epiphytic or semi epiphytic plants, such as orchids or Vanda. Vanda is a genus in the orchid family orchidaceae. It is tissue that is found in the aerial roots of some orchids/Vanda.

12. Phytotron is :

(a) a controlled condition chamber for tissue
(b) leaf culture process
(c) special culture of plants
(d) root culture process

MGIMS Wardha-2005

Ans. (a) : Phytotron is a controlled condition chamber for tissue. It is a device, or chamber in which plants can be grown under a controlled conditions.

Hence, the (a) option is a correct answer,

13. How many tissue systems are suggested by Sachs:

(a) two (b) three
(c) four (d) five

Uttarakhand-2005

Ans. (b) : By 'Sachs' the three tissue systems are suggested. Julius von Sachs classifies the tissue system in plants. on the basis of the structure and location. There are three types of tissue system found in plants-epidermal tissue system, ground tissue system and Vascular or conducting tissue system. In 1975, it was proposed by Sachs.

14. Quiescent centre theory was proposed by :

(a) Nagelli (b) Schmidt
(c) Hanstein (d) Clowes

Haryana PMT-2004
Manipal-2003

Ans. (d) : Quiescent centre theory was proposed by 'Clowes'. The quiescent centre in the root apical meristem is ubiquitous in vascular plants and positioned between the active meristematic region and root cap. It is sometimes also referred to as the cytogenetic centre or constructional center or ontogenetic centre. It may be absent in seedless vascular plants.

15. The branch that deals with the study of trees is:

(a) Pomology (b) Anthology
(c) Dendrology (d) Palynology

Haryana PMT-2003

Ans. (c) : The branch that deals with the study of trees of called 'Dendrology' Dendrology or xylology is the science and study of woody plants, specifically their taxonomic classifications. Carolous Linnaeus is known as father of dendrology. Trees and plants are identified by many characteristic including bark 'flowers' fruits and seeds, buds etc.

16. This is a specialized tissue found in the mesophyll of Cycas and Pinus leaves

(a) Spongy tissue (b) Palisade tissue
(c) Conjunctive tissue (d) Transfusion tissue

J&K CET-2007

Ans. (d) : In cycas and Pinus leaves transfusion tissue is found in the mesophyll of both. Transfusion tissue is the substitute of lateral veins as it helps in the conduction of water. This tissue is found around. The vascular bundles of gymnosperms leaves these are helpful for conduction of water in the leaflets of cycas and Pinus.

@apna_pdf

B. Meristemetic Tissue

17. Virus free plants are obtained in 'Invitro' through

(a) Roots (b) Shoots
(c) Meristems (d) Ovules

AP EAPCET-12.07.2022 Shift-I

Ans. (c) : The plant is infected with a virus, the meristem is free from virus. Hence, tissues from apical and axillary meristem can be used to obtain virus-free plants in in-vitro plant tissue culture.

18. Axillary buds which forms branches or flowers are present in

(a) Lateral meristem
(b) Apical meristem
(c) Cylindrical meristem
(d) Intercalary meristem

AP EAMCET-25.09.2020 Shift-II

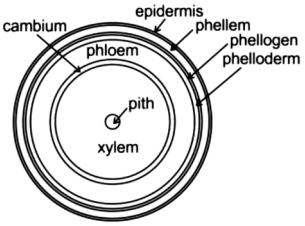
Ans. (b) : Axillary buds which forms branches or flowers are present in 'Apical meristem'. Apical meristem refers to the meristem that occurs at the tips of roots, stems and branches, which bring about the primary growth of the plants.
Thus, Axillary buds and terminal bud both are derived from the activity of apical meristem.

19. Which of the following statements about cork cambium is incorrect?

(a) It is a couple of layers thick
(b) It forms secondary cortex on its outerside
(c) It forms a part of periderm
(d) It is responsible for the formation of lenticels

NEET-2020 Phase-II

Ans. (b) : Cork cambium is a meristematic tissue involved in secondary growth. It is also called phellogen. It develops in the cortex region. It is few layers thick and it cut off cells into outer layer and inner layer the former differentiates into cork (phellem) while latter differentiate into secondary cortex (phelloderm). All these three layers phellogen, phellem and phelloderm are collectively called as periderm. In woody trees, the phellogen cut off closely arranged parenchymatous cells, rupturing the epidermal cell to form lenticles. Pericycle also becomes meristematic to form cork cambium.



20. Regeneration of damaged growing grass following grazing is largely due to :

(a) Secondary meristem
(b) Lateral meristem
(c) Apical meristem
(d) Intercalary meristem

NEET (Odisha)-2019

Ans. (d) : Regeneration of damaged growing grass grazing is largely because Intercalary meristems. These are found in grasses, where they help to regenerate the parts removed by the grazing herbivores. As apical meristems and intercalary meristems, both constitute primary meristems because they appear early in life and contribute to the formation of the primary plant body.

21. Assertion (A): Grasses get regenerated even after grazed by herbivores
Reason (R): In grasses meristems are present in between mature tissues,
Options:

(a) (A) and (R) are true and (R) is the correct explanation of (A).
(b) (A) and (R) are true but (R) is not the correct explanation of (A).
(c) (A) is true but (R) is false.
(d) (A) is false but (R) is true.

AP EAMCET-25.04.2018 Shift-II

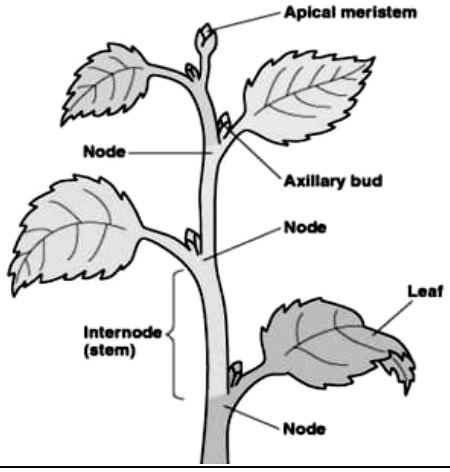
Ans. (a): The grass stem regenerates after grazing due to intercalary meristem because this helps in regeneration of stem in grasses removed by grazing herbivores.

22. Axillary bud and terminal bud are derived from the activity of : -

(a) Lateral meristem
(b) Intercalary meristem
(c) Apical meristem
(d) Parenchyma

Rajasthan PMT-2007
AIPMT-2002

Ans. (c) : Meristem is the group of actively dividing cells that give rise to the side to the new cells after division.
Apical meristems are situated at the tip of root and shoot of the plants. They take place initial growth. Plants elongate and increase in light as a result of division in the meristem.



23. Maximum amount of growth in root occurs

(a) in the presence of light
(b) at its apex
(c) behind the apex
(d) in the presence of soil

Uttarakhand PMT-2011

@apna_pdf

Ans. (c) : The root apical meristem or root apex, is a small region at the tip of a root in which all cells are capable of repeated division and from which all primary root tissue are derived. Apex portion root is made up of protective tissue and root cap and region of cell division it situated below the tap root cap so maximum growth in root takes place behind the apex not in tip.

24. Meristem, which produces vascular bundles, is

(a) procambium
(b) lateral meristem
(c) secondary meristem
(d) mass meristem

Uttarakhand PMT-2011

Ans. (a) : Meristem, which produces vascular bundles, is procambium. The procambium can be defined as a type of meristematic tissue present in the plant. True combium provides the plants with primary tissues of the vascular bundle. It generates new vascular tissues in the plant.

25. Dermatogen, periblem and plerome are

(a) permanent tissues
(b) meristematic tissues
(c) intercalary tissues
(d) secondary tissue

CMC Vellore-2013

Ans. (b) : According to scientist, "Johannes Von Hanstein," tissues of the root is divided into three major parts. (1) vascular cylinder, (2) cortex (3) epidermis. Which is derived from three groups of meristematic cells. Meristematic tissue consists of the cells which have the ability to divide and redivide to form new cells. Dermatogen, periblem, and plerome are meristematic tissues.

- Dermatogen (outermost layer) gives rise to the epidermis.
- Periblem (middle layer) that gives rise to hypodermis, cortex, and endodermis.
- Plerome (innermost layer) that gives rise to vascular tissue including pith.

26. Which is true for meristematic tissue?

(a) Their cells have dense cytoplasm and prominent nuclei
(b) Their cells are dead with large inter cellular spaces
(c) These are usually modified for storage
(d) Their cells are most primitive, living and without nuclei

BVP-2005

Ans. (a) : Meristematic tissues are responsible for overall growth and repair of the plants. Their cells have a thin cell wall, prominent nucleus, abundant cytoplasm, and are tightly arranged without vacuoles. These cells are continuously dividing resulting in overall growth and repair. Hence, these cells have dense cytoplasm and a prominent nucleus for controlling their activities.

27. Decapitation of plant leads to the activation of axillary buds due to

(a) increase in cytokinins
(b) more light availability
(c) auxin translocation
(d) all of these

AIIMS-1995

Ans. (c) : At the tip of stem, maximum content of auxin are found. It is responsible for apical dominance (suppression of lateral buds). Decapitation results in translocation of auxins towards lower side. Therefore, lateral buds (axillary buds) get activated.

28. Cambium of root is an example of:

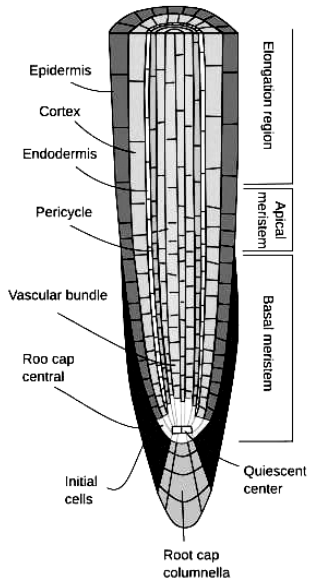
(a) Apical meristem
(b) Intercalary meristem
(c) Primary meristem
(d) Secondary meristem

AIIMS-2000

Ans. (d) : There are two tissues that are responsible for the secondary growth in plants-vascular cambium and cork cambium. In roots, cambium is derived from secondary meristem.

Vascular cambium and cork cambium are secondary meristems that are formed in stems and roots after the tissues of primary plant body have differentiated. Vascular cambium produces secondary xylem and secondary phloem later an leads to wood formation in plants.

Cork cambium which give rise to the periderm which replace the epidermis.



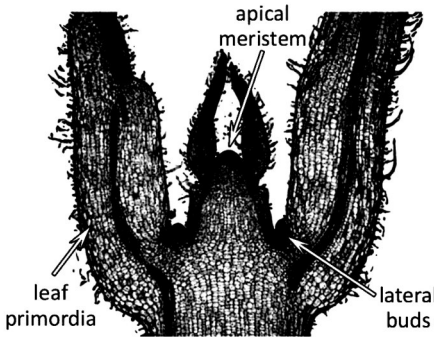
29. The apical meristem of the root is present

(a) Only in radicals
(b) Only in tap roots
(c) Only in adventitious roots
(d) In all the roots

AIPMT-2003

Ans. (d): Root apical meristem present in all roots. RAM provides the meristematic cells for the future root growth while the shoot apical meristem (SAM) gives rise to organs like the leaves and flowers.

@apna_pdf



30. Best material for the study of mitosis in laboratory is: -
(a) Anther (b) Root tip
(c) Leaf tip (d) Ovary

AIPMT-2002

Ans. (b) : Best material for the study of mitosis in laboratory is root tip.
Root tip have active meristematic zone where cells divide mitotically leading increase in length of the root.
Example:- *Allium cepa* root tip.

31. Which of the following plant cells will show totipotency?
(a) Sieve tubes (b) Xylem vessels
(c) Meristem (d) Cork cells

JCECE-2014
AFMC-2000
AIPMT-1993

Ans. (c) : Totipotency is the ability in which cells can get specialized into any type of cells. Meristems shows the totipotency because xylem vessels and cork cell are dead while sieve tube cells do not possess nuclei. The primary meristem present from the beginning and throughout the life.

32. Mowing grass lawn facilitates better maintenance because
(a) wounding stimulates regeneration
(b) removal of apical dominance and stimulation of intercalary meristem
(c) removal of apical dominance
(d) removal of apical dominance and promotion of lateral meristem.

AIPMT-1989

Ans. (b) : Apical dominance occur in the presence of auxin and it is a common observation in vascular plants. If apical meristem is intact and growing, the growth of lateral tips is suppressed. According to Thimann and skoog the auxin, synthesized in apical meristem, is translocated downwords and inhibits the growth of lateral tips. That is why moving grass lawns facilitate better maintenance because of removal of apical dominance and stimulation of intercalary meristem.

33. The meristem, which develops into a primary vascular tissue is
(a) protonema (b) promeristem
(c) ground meristem (d) procambium

CG PMT-2005

Ans. (d) : Procambium – It occurs below the protoderm and gives rise primary xylem, primary phloem and intrafascicular cambium.

34. Lateral root orginates from:
(a) endodermis (b) pericycle
(c) cortex (d) phloem

DUMET-2003

Ans. (b) : The tap root develops from the redicle part of the seed. The direct prolongation of the radicle form the primary root, from which aries **lateral root** of different order as – primary, secondry and tertiary roots.
Lateral roots are endogenous in origin i.e. – **aries from the pericyle.**

35. Meristematic cells have:
(a) thick cell wall and large intercellular spaces
(b) thick cell wall and no intercellular spaces
(c) thin cell wall and large intercellular spaces
(d) thin cell wall and no intercellular spaces

Manipal-2005

Ans. (d) : Meristematic cells have thin cell wall without intercellular spaces as they keep actively dividing. Meristematic cells are dense cytoplasm, small vacuoles and large nucleus. Meristematic cell walls are thin and made up of primary cell wall containing cellulose.

36. Quiescent centre is a :
(a) weak zone (b) active zone
(c) inactive zone (d) strong base

Manipal-2005

Ans. (c) : Quiscent center concept – This concept was given by **Clowes** and discovered in *Zea maize* plant.
Present in the root. It is cap like or hemicircular group of cells between dermatogens and calyptrogen or between, active meristem and root cap **cells are inactive or less active** have low amount of DNA, RNA and protein, light cytoplasm and small nuclei, but may be made active when active tissue damage thus act as reservoir and produce active initial.

37. The histogens are classified on the basis of :
(a) cells they contain
(b) cells they give rise to future tissue
(c) meristematic activity
(d) cell division

Manipal-2005

Ans. (b) : Root apical meristem consist of three cell initiating region called histogen. Which classify into three parts. Dermatogen which form epidermis, periblem form cortex and plerome forms vascular bundle.

38. Viral infection is usually absent in
(a) phloem cells (b) xylem cells
(c) pith cells (d) apical meristem

VMMC-2009

Ans. (d) : Generally, plant shoot apical meristems are virus free. This is because the spread of virus in the plant tissue does not keep up (is slow) with the fast meristem growth if it is actively producing new leaves/flowers.
Apical meristem located at the tip of shoot and root. It is primary meristem responsible for primary growth i.e. Growth in length.

@apna_pdf

39. The meristem that is parallel to the longitudinal axis of the plant is
(a) procambium
(b) intercalary meristem
(c) phellogen
(d) apical meristem

J&K CET-2010

Ans. (c) : Phellogen is also famous as cork cambium which is a lateral meristem. It increases the girth of the plant and parallel to the longitudinal axis of the plant which is responsible for the development of the periderm. There are cells that grow inwards from there called phelloderm whereas the cells develop outward are known as phellem.
Phellem is composed of dead cells and protective in function.

40. Who proposed the histogen theory?
(a) Schmidt (b) Hanstein
(c) Nageli (d) Mankey

Rajasthan PMT-1995

Ans. (b) : The Histogen theory was proposed by Hanstein and supported by Strasburger.
According to this theory histogen divided into three layer.
Dermatogen – It is outermost single layered cells divide anticlinally which gives rise Epidermis in Shoot apex and Epiblema in root apex.
Periblema – Occurs between the dermatogens and plerome, multilayered. It gives. Hypodermis, general cortex and endodermis of shoot apex and root apex.
Plerome – Occurs in the center and gives rise stele e.g. Pericycle, primary vascular bundle, pith and pith rays.

41. Growth of stem in diameter is due to
(a) secondary growth
(b) lateral meristem
(c) apical meristem
(d) intercalary meristem

MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (b) : A lateral meristem is a meristem that runs parallel to the sides of an organ. The radial section of the stem or root has a lateral meristem. The lateral meristem is responsible for the plants thickness. The increase in diameter of a plant's stem and root is caused by cork cambium and vascular cambium. They can be found in dicot plants. These are the lateral meristems, which are in charge of the plant's secondary growth

42. The quiescent centre in root meristem serves as a
(a) site for storage of food, which is utilised during maturation
(b) reservoir of growth hormones
(c) reserve for replenishment of damaged cells of the meristem
(d) region for absorption of water

JIPMER-2011

Ans. (c) : Quiescent centre have low rate of cell division. So, it replenishes the damaged cells. It is found an the tip of growing roots.

43. Quiescent centre is present in:
(a) shoot apex (b) root apex
(c) both a and b (d) meristematic tissue

Rajasthan PMT-2005

Ans. (b) : The quiescent center is present in the root apex. It is cap like or hemicircular group of cells between dermatogens and calyptrogen or between, active meristem and root cap **cells are inactive or less active** have low amount of DNA, RNA and protein, light cytoplasm and small nuclei, but may be made active, when active tissues damaged thus act as reservoir and produce active initial.

44. Wound healing is due to
(a) ventral meristem
(b) secondary meristem
(c) primary meristem
(d) All of these

JIPMER-2013

Ans. (b) : Secondary meristem is a type of meristematic tissue which is responsible for the secondary growth in plants and produce growth in thickness. Healing of wounds in plants take place by the activity of secondary meristem.

45. Portion of apical meristem that gives rise to xylem tissue is called
(a) Protoxylem (b) Procambium
(c) Metaxylem (d) Tracheid

WB JEE-2012

Ans. (b) : Portion of apical meristem that gives rise to xylem tissue is called 'procambium'. The procambium gives rise to vascular tissues, including the primary xylem and primary phloem.

46. Which of the following is the region of cell division?
(a) Root cap
(b) meristematic region
(c) Root hair zone
(d) None of these

Rajasthan PMT-2004

Ans. (b) : Meristematic cells are responsible for the root and shoot growth of plants These cells have the ability of divide and increase in number and increase the length as well as the girth of the stem and root. Meristematic tissues are cells or group of cells that have the ability to divide. The cells present in these tissues constantly divide to produce new cells.

47. Meristematic cells are
(a) thin-walled, less protoplasmic, isodiametric and nucleated
(b) thin-walled, densely protoplasmic, isodiametric and nucleated
(c) thick-walled, less protoplasmic, isodiametric and nucleated
(d) thick-walled, densely protoplasmic, isodiametric and non-nucleated

BVP-2010

@apna_pdf

Ans. (b) : Meristematic cells are thin walled, densely protoplasmic, isodiametric and nucleated. These cells are undifferentiated or incompletely differentiated. They have a dense cytoplasm with a prominent nucleus. They are compactly arranged cells with no intercellular spaces.

48. Girth development is due to

(a) intercalary meristem
(b) lateral meristem
(c) apical meristem
(d) plate meristem

UP CPMT-2010
AIPMT-1988

Ans. (b) : Girth development is due to lateral meristem tissue Lateral meristem (cambium) is situated at the bark and it is responsible for the increase in the girth of the stem or root. The lateral meristem includes cambium which is responsible for the secondary growth of the plant Hence, the girth of the stem increases due to the lateral meristem tissues. Lateral meristem are found in woody plants.

49. Meristematic tissue are

(a) premature having ability of division
(b) mature does not have ability of division
(c) premature not having ability of division
(d) complex differentiating in xylem, phloem and cambium

DUMET-2005
UP CPMT-2003

Ans. (a) : Meristematic tissue are premature having ability of division. These tissues contain living cells with varied shapes. They possess a large nucleus divided by the vacuole. The cell have no intercellular space. This tissues heal the wounds of an injured plant. They possess a single large and prominent nucleus. The meristematic tissue has the quality of self renewal.

50. Which type of meristems allow the fallen stem of cereals/grasses to become erect?

(a) Apical meristem
(b) Lateral meristem
(c) Intercalary meristem
(d) Secondary meristem

MGIMS Wardha-2007

Ans. (c) : 'Intercalary meristem' allow the fallen stem of cereals/grasses to become erect. Intercalary meristem helps in elongation of plant organs and also allow fallen stem of cereals to become erect. This meristem maintains the growth in the internodal region when the cereal stem is lodged, its growth re-occurs due to the meristematic activity of the intercalary meristem.

51. To promote the growth of lateral branches of a plant:

(a) axillary buds are removed
(b) apical bud is removed
(c) auxin is applied to the apical bud
(d) auxin is applied to the decapitated shoot tip

Karnataka CET-2002

Ans. (b) : To promote the growth of lateral branches of a plant- apical bud is removed. During the apical bud of removing, the IAA concentration lowers and allows the lateral buds to grow. It produces new shoots, which compete to become the lead growth. It results in the growth of lateral branches.

52. Viral infection is usually absent in

(a) Phloem cells (b) Xylem cells
(c) Pith cells (d) Apical meristem

BHU PMT (Screening)-2009
Uttarakhand PMT-2009

Ans. (d) : Viral infection is usually absent in 'Apical meristem', Apical meristems are virus free. This is because the spread of virus in the plant tissue does not keep up with the fast meristem growth. If it is actively producing new leaves/flowers. Meristem cells divide at a faster rate than the permanent tissues like pith, phloem and xylem, viruses are unable to divide in them.

53. The length of different internodes in a culm of sugarcane is variable because of

(a) shoot apical meristem
(b) position of axillary buds
(c) size of leaf lamina at the node below each internode
(d) intercalary meristem

Rajasthan PMT-2010

Ans. (d) : The length of different internodes in a culm of sugarcane is variable because of the intercalary meristem. These meristems are present involved in the increases of the internodal length.

54. Cork cambium and cambium are the example of :

(a) lateral meristem (b) primary meristem
(c) intercalary meristem (d) apical meristem

Rajasthan PMT-1998

Ans. (a) : Cork cambium and cambium are the example of lateral meristem. Vascular cambium is the type of cambium that is related to the conduction of water and nutrients. The cork cambium is the type of cambium that is related to the formation of the wood in the plants. The lateral meristem is responsible for the increase in the diameter of the plant or the secondary growth. It is of types like vascular cambium, interfascicular cambium, and cork cambium.
Thus, we can conclude that the vascular cambium and cork cambium are example of the lateral meristem.

55. The outermost primary meristem gives rise to:

(a) epidermis (b) procambium
(c) ground meristem (d) All of the above

UP CPMT-2001

Ans. (a) : The outermost primary meristem give rise to 'epidermis'. The outer most layer of cells is the protoderm which forms a single sheet of meristematic cells that give rise to the epidermis. The protoderm gives rise to epidermal tissue system, ground meristem forms cortex or ground tissue system and procambium forms vascular tissue system.

@apna_pdf

56. The stem of grasses and related plants elongate by the activity of :
(a) Lateral meristem
(b) Apical Meristem
(c) Both apical and intercalary meristem
(d) Intercalary meristem

Karnataka CET-2003

Ans. (c) : The stem of grasses and related plants elongate by the activity of both apical and intercalary meristem. Both apical and intercalary meristems are referred to as primary meristems since they develop early in a plant's life and contribute to the building of the main plant body. Apical meristem is a primary meristem. It can also be referred to as the growing tips of the plant. An intercalary meristem is present at the end of plant. The intercalary meristem along with the apical meristem is responsible for the growth of the plant along its length.

57. The tissue of highest respiratory activity is
(a) Meristem (b) Ground tissue
(c) Phloem (d) Mechanical tissue

CG PMT-2007

Ans. (a) : The tissue with highest respiratory activity is 'Meristem'. The respiration rate is higher always in younger and actively growing meristematic tissues in comparison with the mature and older parts of the plant. Meristems are actively dividing tissues in a plant body. Also high respiration rate in these tissues provides important intermediates for biosynthesis of macromolecules.
Hence, Meristems has highest respiratory rate.

58. Inter fascicular cambium is found:
(a) between pith and vascular bundle
(b) between two vascular bundles
(c) In the vascular bundle
(d) Outside the bundle

Haryana PMT-2005

Ans. (b) : Inter fascicular cambium is found between the two vascular bundles. The cells present between the primary xylem and primary phloem are called interafascicular cambium. The meristematic tissue which develops between the two vascular bundles is called interfascicular cambium. It is responsible for the formation of secondary meristems.

59. Intercalary meristem results in
(a) secondary growth
(b) primary growth
(c) apical growth
(d) secondary thickening

Haryana PMT-2007

Ans. (b) : Intercalary meristem results in primary growth. This meristems are found at the bases of young leaves and internodes. They are involved in the primary growth of the plants as they continuously divide which causes the elongation of the plant stems or leaves. Primary growths are controlled by the root apical meristems or shoot apical meristems while secondary growth is controlled by the lateral meristems, called the vascular cambium and the cork cambium.

60. The tunica-corpus theory was proposed by
(a) Hofmeister (b) Nageli
(c) Strasburger (d) Schmidt

CG PMT-2009, 2006
Rajasthan PMT-2001
Haryana PMT-2009

Ans. (d) : The tunica – corpus theory was proposed by 'schmidt'. This theory is relevant only to shoot apex. According to this theory, the apical region of the shoot consist of two zones: tunica – It is the outer enveloping layer, made up of small cells that give rise to the epidermis and outer cortex. Corpus – It is the mass of cell forming the inner core. It produces the inner cortex, procambium and pith.

61. An auxotroph is:
(a) a plant that responds by bending towards sun
(b) an organism that depends on another organism for meeting its nutritional requirements
(c) a mutant which has lost its ability to synthesize one or more essential compounds
(d) a plant that is able to synthesize its own carbohydrate.

Haryana PMT-2004

Ans. (c) : An auxotroph is a microorganism that is unable to synthesize one or more essential growth factors, and it will not grow in fermentation media lacking them. It is a mutant which has lost its ability to synthesize one or more essential compounds.

62. Which is true for meristematic tissue?
(a) Their cells have dense cytoplasm and prominent nuclei
(b) Their cells are dead with large intercellular spaces
(c) These are usually modified for storage
(d) Their cells are most primitive, living and without nuclei

Haryana PMT-2004
Manipal-2003

Ans. (a) : Meristem growth in plants is largely restricted to specialised regions of active cell division called meristem. Meristematic cells have a prominent nucleus and a dense cytoplasm but it lack of a vacuole. This is so because meristematic cells have an ability to divide and form new cell. It have thin cellulose wall, no vacuole, dense cytoplasm, prominent nuclei.

63. Interfascicular cambium is
(a) apical meristem (b) secondary meristem
(c) primary meristem (d) abnormal meristem

Manipal-2013

Ans. (b) : Interfascicular cambium is a 'Secondary meristems. It along with the interfascicular cambium present between primary xylem and primary phloem forms a continuous rings of vascular cambium. It develops from the parenchymatous cells of medullary rays. Interfascicular cambium originates from parenchymatous cell through differentiation of the fascicular cambium.

@apna_pdf

64. Fascicular, interfascicular and extra stelar cambium together constitute
(a) lateral meristems
(b) apical meristems
(c) intercalary merisetems
(d) ground meristemes.

AMU-1997

Ans. (a) : Fascicular, interfascicular and extra stelar cambium together constitute with 'lateral meristem'. Fascicular cambium, inter-fascicular cambium and extra-stelar (cork cambium) are examples of the secondary meristem. They are found in the mature regions of roots and shoots. They responsible for lateral growth of plants.

65. Lateral meristem is responsible for which of the following
(a) Growth in length
(b) Growth in thickness
(c) Growth in parenchyma
(d) Growth in cortex

CG PMT-2006

Ans. (b) : Lateral meristem is responsible for the growth in thickness of the plants. It is located in the stems and roots on the lateral side. Lateral meristem are referred to as the vascular cambium and cork cambium. It is also called a secondary meristem. Meristems are responsible for wound healing because they regenerate from other cells in wounded tissue.

66. Plant length is increased by
(a) Apical meristem (b) Lateral meristem
(c) Dermatogen (d) Periblem

MGIMS Wardha-2009
Haryana PMT-2009
CG PMT-2009

Ans. (a) : Plant length is increased by 'Apical meristem'. Apical meristematic tissue is a meristematic tissue located at the top of the root, stem and their branches, causing the growth of the plants organs in length. Apical meristem give rise to the primary plant body and are responsible for the extension of the root and shoots.
Hence, Apical meristem is responsible for increase in length of the plant.

67. Examples for lateral meristems are
(a) phellogen and procambium
(b) fascicular cambium and procambium
(c) procambium and dermatogen
(d) fascicular cambium and cork cambium

JCECE-2012
Manipal-2009

Ans. (d) : Examples of lateral meristems are 'fascicular cambium and cork cambium'. It is present along the longitudinal axis of stem and root. They help in increasing the thickness or girth of the stem and root. The vascular cambium (Fascicular) and cork cambium are examples of lateral meristem. These are the responsible for producing the secondary tissues.

68. Grass stem elongates after initial growth due to:
(a) lateral meristem
(b) secondary meristem
(c) intercalary meristem
(d) apical meristem

Uttarakhand PMT-2010
AP EAMCET-2002
AMU-1996

Ans. (c) : Grass stem elongates after initial growth due to 'intercalary meristem'. Meristem which occurs in between the mature tissues is called intercalary meristems present in grasses to replace the lost cells in the stem and elongate the stem. It is the meristem present at the base of the internodes of stem or leaf. It is found only in monocots.

69. Fusiform initial forms
(a) vascular rays (b) ray parenchyma
(c) tracheary elements (d) primary phloem

Haryana PMT-2008

Ans. (c) : Fusiform initial forms tracheary elements. Tracheary elements help in the conduction of water and responsible for distribution of raw sap throughout the plant body.

70. Meristem consists of:
(a) undivided cells
(b) cells in continuous state of cells division
(c) dead cells
(d) cells which divide rarely

Haryana PMT-2003

Ans. (b) : Meristem consist of cells in continuous state of cells division. It have a great potential for division. Meristems generally divided continuously and form a cluster of cells that further undergoes maturation to produce specialized cells. Meristematic tissues are responsible for plant growth these tissues constantly divide to produce new cells.

71. Vertically elongated cells in the lateral meristem producing axial system in the secondary xylem and phloem are known as
I. Fusiform initials
II. Combium cells
III. Phellogen cells
(a) Only I (b) I and II
(c) II and III (d) I, II and III

VMMC-2015

Ans. (a) : Vertically elongated cells in the lateral meristem producing axial system in the secondary xylem and phloem are known as 'fusiform initials'. They are elongated cells, which results in the production of cells that form the vertical system of secondary phloem and xylem, tracheary elements, sieve cells, fibres and the associated companion cells. Fusiform initials cell give rise to secondary xylem and phloem.

72. The secondary meristem initiates
(a) Basal growth (b) Transverse growth
(c) Radial growth (d) Vertical growth

J&K CET-2007

Ans. (c) : The secondary meristem initiates the 'radial growth'. Secondary meristem are responsible for the radial or secondary growth of plants. They also increases the thickness of plant body. Radial growth is a secondary growth which increases the girth or radius of a plant.

@apna_pdf

73. Quiescent centre is found in root apex and acts as

(a) permanent source of active initiates
(b) reservoir of resistant cells
(c) reservoir of passive cells to form new root apex if root apex is damaged/killed
(d) All of the above

BVP-2012

Ans. (d) : Quiescent centre is found in root apex and acts as permanent source of active initiates. It acts as a reservoir of cells which constitute a permanent sources of active initials. Cells of inactive region of quiescent centre become active when the previously active gets damaged.

74. Primary growth is caused by :

(a) apical meristem (b) lateral meristem
(c) dermatogen (d) plerome

BCECE-2002

Ans. (a) : Primary growth is caused by apical meristem. This growth is initiated by the apical meristem and it helps the plant to grow upward. Apical meristem is present at the growing tips of roots and shoots and produce primay tissues.

75. Vascular cambium never develops in the stem of

(a) banana (b) guava
(c) mango (d) sunflower

AMU-2001

Ans. (a) : Vascular cambium never develops in the stem of banana'. Banana is a monocotyledonous plant. It has a single cotyledon present in the seed. The vascular cambium is absent in monocots (banana). Monocots never shows secondary growth.

76. Intercalary meristem is a derivative of

(a) Primary meristem (b) Secondary meristem
(c) Lateral meristem (d) Promeristem

Karnataka CET-2008

Ans. (a) : Intercalary meristem is a derivative of primary meristem. Intercalary meristems are present in grasses and regenerate parts removed by the grazing herbivores. The intercalary meristem helps in increasing the length of the internode. It is usually seen in monocot plants.

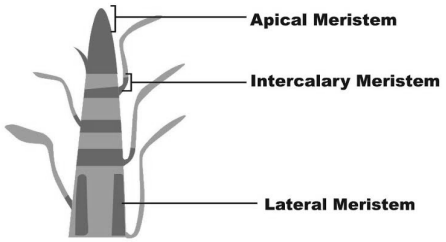
77. Which one of the following is not a lateral meristem ?

(a) Vascular cambium
(b) Interfascicular cambium
(c) Phellogen
(d) Intercalary meristem

AIPMT (Screening)-2010

Ans. (d) : Fascicular vascular cambium, interfascicular cambium and cork-cambium (phellogen) are examples of secondary or lateral meristem. These are responsible for producing the secondary tissues.

Apical and intercalary meristems are primary meristems. They are located at the base of internodes and promotes lengthening of stem and increase height of plant.



Vascular cambium- when the cells of cambium present between two vascular bundles.
Intrafascicular cambium- when the cells of cambium present between primary xylem and primary phloem.
Phellogen- Phellogen is a couple of layers thick.

78. If the apical bud has been removed then we observe:

(a) More lateral branches
(b) More axillary buds
(c) Plant growth stops
(d) Flowering stops

AIPMT-2000

Ans. (a) : When the apical bud is removed from the plant, the auxin hormone gets automatically removed and due to which the lateral buds grow very fast.

Apical dominance is the phenomenon which presence of apical bud does not allow the nearby lateral buds to grow.

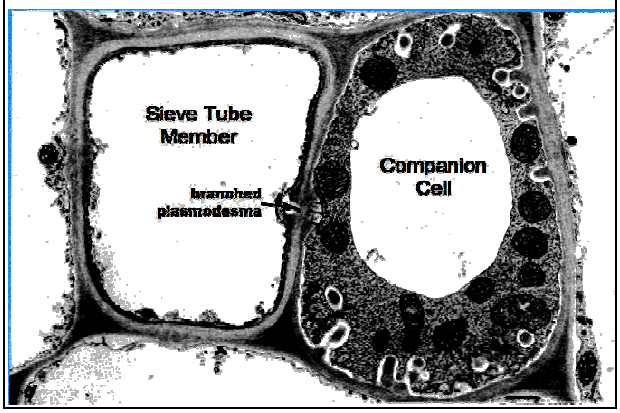
• Gibberellin is the hormone that breaks seed/bud dormancy. The tubers of potato reproduce vegetatively to give rise to new plants. So the dormancy of these tubers can be overcome by applying gibberellins.

79. Function of companion cells is

(a) Loading of sucrose into sieve elements
(b) Providing energy to sieve elements for active transport
(c) Providing water to phloem
(d) Loading of sucrose into sieve elements by passive transport

AIPMT (Mains)-2011

Ans. (a) : Function of companion cell is to load sugar and amino acids into sieve elements. These cells use transmembrane proteins to take up these molecules by active transport. The companium cells help in maintaining the pressure gradient in the sieve tubes.

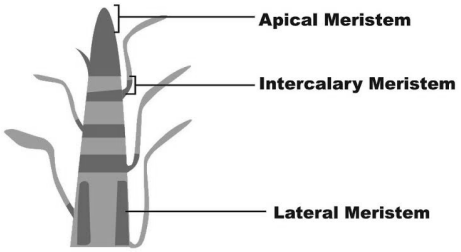


@apna_pdf

80. Meristematic tissue responsible for increase in girth of tree trunk is
(a) Apical meristem
(b) Intercalary meristem
(c) Lateral meristem
(d) Phellogen

NEET (Karnataka)-2013

Ans. (c) : Lateral meristem are the meristematic cells which are present along the lateral sides of stem and roots. They divide only in radial direction. Fascicular vascular cambium, inter-fascicular cambium and cork cambium (Phellogen) are example of this type of meristem. The meristems are responsible for increase in girth of stem and root.



81. In land plants, the guard cells differ from other epidermal cells in having :
(a) Chloroplasts
(b) Cytoskeleton
(c) Mitochondria
(d) Endoplasmic reticulum

AIPMT (Screening)-2011

Ans. (a) : The guard cells differ from other epidermal cells because guard cells contain chloroplast, whereas epidermal cells usually do not present. So they can manufacture food by photosynthesis

- The shape of guard cells are bean shaped in surface view, while the epidermal cells are irregular in shaped.

82. An important step in the manufacture of pulp for paper industry from the woody tissues of plants is the –
(a) Removal of water from the wood by prolonged heating at approximately 50º
(b) Treatment of wood with chemicals that break down cellulose
(c) Removal of oils present in the wood by treatment with suitable chemicals
(d) Preparation of pure cellulose by removing lignin

AIPMT-2005

Ans. (d) : An important step in the manufacturing of pulp for paper industry form the woody tissue of plants is the preparation of pure cellulose by removing lignin.

- Wood mainly consist by secondary xylem (sclerenchymatous cell) lignin. These cells provide strength to wood tissues. Preparation of pure cellulose for manufacture of pulp for paper industry from woody tissues of plants required removal of lignin from these woods.

83. Vascular cambium of stem is:
(a) partly primary and partly secondary meristem
(b) primary meristem
(c) secondary meristem
(d) intercalary meristem

J&K CET-2004

Ans. (a) : Vascular cambium divides the xylem to inner side phloem to outer side. It is also known as fascicular cambium. eg. secondary meristem.

C. Permanent (Simple and Complex) Tissue

84. P-proteins are associated with
(a) sieve tube elements
(b) xylem parenchyma
(c) trichomes
(d) tracheids and vessels

UP CPMT-2009
Punjab MET-2009
Rajasthan PMT-2009
MGIMS Wardha-2005

Ans. (a) : P– proteins are associated with sieve tube elements'. It is also known as phloem protein. P–protein aggregates at the sieve plate when the sieve element is disrupted, preventing the passage of phloem exudates the function of P-protein is sealing mechanism on wounding along with calluse and it is also related with conduction of food.

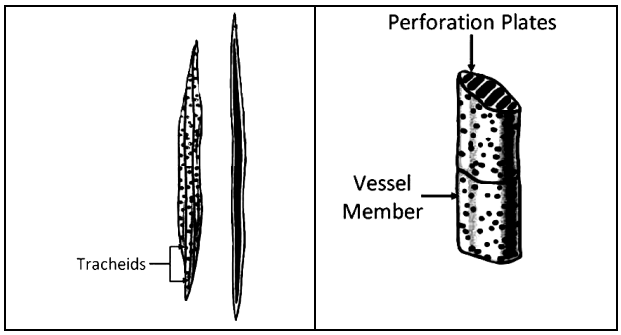
85. Which of the following is true?
(a) Vessels are unicellular and with narrow lumen
(b) Vessels are multicellular and with wide lumen
(c) Tracheids are unicellular and with wide lumen
(d) Tracheids are multicellular and with narrow lumen

AIIMS-2015
DUMET-2009
Rajasthan PMT-2007
AIPMT-2002

Ans. (b) : Tracheids are narrow lumen and unicellular, while vessels are wide lumen and multicellular.

Tracheids	Vessels
• It is a part of xylem, elongated narrow tube-like dead and empty cells with hard thick and lignified walls with large cell cavity. It is found alone in the wood of ferns like gymnosperm such as pines.	It is cylindrical tubular structure, formed of a row of cells placed end to end. • Vessels are only found in only Angiosperms such as mango tree.

@apna_pdf



86. Complex tissue includes:

(a) collenchymas (b) apical meristems
(c) conducting tissue (d) idioblast

HP CET-2011
BCECE-2006
VMMC-2005
AMU-2004

Ans. (c) : Complex tissue includes 'conducting tissue'. The complex tissues are made of more than one type of cells and these work together as a unit. Xylem and phloem constitute the complex tissues in plants.
Xylem functions as a conducting tissue for water and minerals from roots to the stem and leaves.

87. Which of the following tissues consist of living cells?

(a) Vessels (b) Tracheids
(c) Companion cell (d) Sclerenchyma

Uttarakhand PMT-2009
BVP-2009
VMMC-2009
BHU PMT (Screening)-2009

Ans. (c) : Companion cells consists of living cell. The companion cells are specialized parenchymatous cells in the phloem tissues of the angiosperm. They are nucleated living cells with several ribosomes, plastids and mitochondria, phloem parenchyma and companion cells are element of phloem and both living cells.

88. Which combination of tissues acts together to provide the support to the hypocotyl of a seedling?

(a) Epidermis and collenchyma
(b) Xylem and parenchyma
(c) Epidermis and parenchyma
(d) Xylem and phloem fibres

HP CET-2011
VMMC-2005
AMU-2004
BVP-2003

Ans. (a) : Epidermis and collenchyma tissues acts together to provide the support to the hypocotyls of a seedling. The hypocotyl is the part of a plants embryo or seedling that lies between the radical and the cotyledons. The mechanical strength in hypocotyls of seedling is provided by epidermis and collenchyma tissues.

89. Xylem development is poor in

(a) Xerophytes (b) Halophytes
(c) Hydrophytes (d) Mesophytes

AP EAPCET-12.07.2022 Shift-I

Ans. (c) : Hydrophytes are the plants that are submerged in water. These plants have poorly developed xylem because the whole plant body absorbs water and nutrients from the external aquatic environment by and thus, they do not require well-developed water-conducting tissues

90. Statement 1 : Well aerating tissue aerenchyma is the most important anatomical feature of all hydrophytes.
Statement 2 : Hydrophytes live in well aerated environment

(a) Statement 1 is true, statement 2 is false.
(b) Statement 1 and statement 2 are true.
(c) Statement 1 and statement 2 are false.
(d) Statement 1 is false, statement 2 is true.

AP EAMCET-12.07.2022 Shift-II

Ans. (a) : Aerenchyma is majorly found in aquatic and wetland plants. Aerenchyma is a modified parenchyma where the cells are arranged with regular air chambers in between to facilitate diffusion of gases in and out.
Aerenchyma helps in buoyancy and respiration. It is characteristically found in aquatic floating plants. It is located in stems, hypocotyls, taproots, adventitious roots and root nodules under flooded conditions.

91. Select the correct combination?

(i) Fruit wall of nuts
(ii) Pulp of fruit like guava and pear
(iii) Seed coat of legumes
(iv) Micropyle of pea

(a) All except (i) (b) All except (ii)
(c) All except (iii) (d) All except (iv)

AP EAMCET-03.09.2021 Shift-I

Ans. (d) : Sclerids are spherical, oval, highly thickened dead cells, with very narrow cavities.

Sclereids are found in fruit wall of nuts, the pulp of fruits like guava, pear, and sapota and seed coats of legumes.

92. Which of the following statement is correct?

(a) The collenchyma occurs in layers below the epidermis in monocotyledonous plants
(b) Sclerenchyma cells are usually dead and without protoplasts
(c) Xylem parenchyma cells are living and thin walled and their cell walls are made up of lignin
(d) The companion cells are specialized sclerenchymatous cells

AP EAMCET-03.09.2021 Shift-I

Ans. (b) : The collenchyma occurs in layers below the epidermis in dicotyledonous plants and is absent in monocot plants.

- Sclerenchyma cells are usually dead. They become dead and lose their protoplasm after attaining maturity.
- Xylem parenchyma cells are living and thin walled and their cell walls are made up of cellulose and pectin.
- The companion cells are specialised parenchymatous cells.

@apna_pdf

93. Phloem parenchyma is absent in ————

(a) Dicot stem
(b) Dicot leaf
(c) Monocot stem
(d) Dicot root

AP EAMCET-03.09.2021 Shift-I

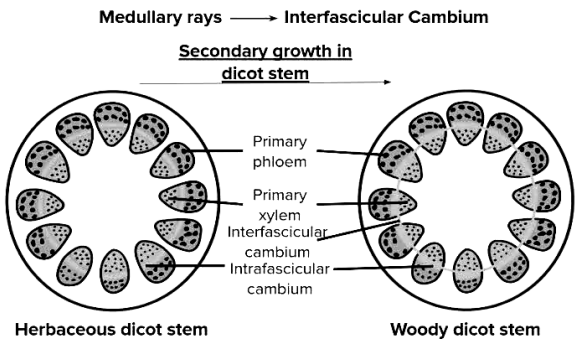
Ans. (c) : Phloem parenchyma is a part of phloem complex tissue. It is living and parenchymatous cells. It perform the function of transporting of organic food in plant. It is absent in the plant where no secondary growth occurs. So, it is absent in monocot stem because in monocot stem no secondary growth occur.

94. Select the correct pair.

(a)	**Loose parenchyma cells rupturing the epidermis and forming a lens shaped opening in bark**	**-**	**Spongy parenchyma**
(b)	**Large colorless empty cells in the epidermis of grass leaves**	**-**	**Subsidiary cells**
(c)	**In dicot leaves, vascular bundles are surrounded by large thick-walled cells**	**-**	**Conjunctive tissue**
(d)	**Cells of medullary rays that form part of cambial ring**	**-**	**Interfascicular cambium**

NEET-2021

Ans. (d) : When the cells of medullary rays differentiated. They give rise to the new cambium called **interfascicular cambium.**



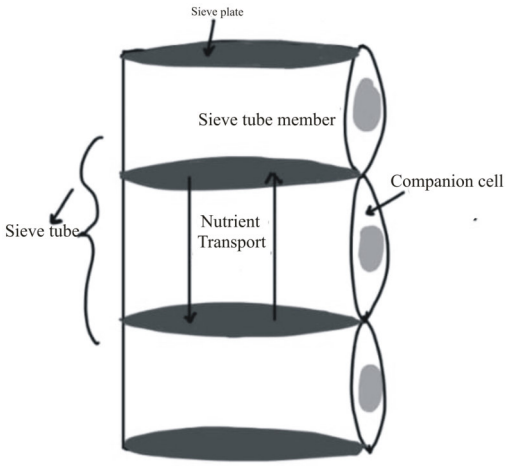
- Complementary cells are loose parenchyma cells rupturing the epidermis and forming a lens shaped opening in bark.
- Large colorless empty cells in the epidermis of grass leaves are called **bulliform cells.**
- In dicot leaves vascular bundles are surrounded by large thick walled cells called **sheath cells**.

95. Which of the following is an incorrect statement?

(a) Nuclear pores act as passages for proteins and RNA molecules in both directions between nucleus and cytoplasm
(b) Mature sieve tube elements possess a conspicuous nucleus and usual cytoplasmic organelles
(c) Microbodies are present both in plant and animal cells
(d) The perinuclear space forms a barrier between the materials present inside the nucleus and that of the cytoplasm

NEET-2021

Ans. (b) : Mature sieve tube elements do not have nucleus but have cytoplasm. (Anucleated living cells).



96. Which of the following plant tissue cannot be used as explant in tissue culture?

(a) Meristem (b) Parenchyma
(c) Sclerenchyma (d) Collenchyma

Karnataka CET-2020

Ans. (c) : Sclerenchyma tissues cannot be used as explants in tissue culture because sclerenchymatous tissue have lignified sencondary wall and dead in nature. Meristem, parenchyma and collenchymas are living cells.

97. Which is the living mechanical tissue in plants?

(a) Parenchyma (b) Sclerenchyma
(c) Collenchyma (d) Xylem

TS EAMCET-28.09.2020 Shift-I

Ans. (c) : Collenchyma is the living mechanical tissue in plants.

- parenchyma consist of living cell but they help in storage.
- Sclerenchymatous cell provide mechanical support but they are dead cell.

98. Pectinisation is seen in

(a) Parenchyma (b) Collenchyma
(c) Sclerenchyma (d) Chlorenchyma

AP EAMCET-24.09.2020 Shift-II

@apna_pdf

Ans. (b) : Collenchyma tissue is composed by elongated living cells of uneven primary thick walls, which posses hemicellulose, cellulose and pectic materials.

- It provides support, structure, mechanical strength, and flexibility to the petiole, leaf veins and stem of young plants, allowing for easy bending without breakage.
- Parenchyma is a simple living tissue and the cell wall is made up of cellulose.
- Sclerenchyma is a simple dead tissue. The cell wall is made up of cellulose and lignin.

99. Match the following

(i)	**Chlorenchyma**	**(p)**	**Nymphaea**
(ii)	**Aerenchyma**	**(q)**	**Canna**
(iii)	**Storage Parenchyma**	**(r)**	**All green parts**
(iv)	**Stellate parenchyma**	**(s)**	**Potato**

(i) (ii) (iii) (iv)
(a) s, p, q, r
(b) p, q, r, s
(c) s, r, q, p
(d) r, p, s, q

SRM JEEE-2019

Ans. (d) :
(i) Chlorenchyma — All green parts
(ii) Aerenchyma — Nymphaea
(iii) Storage parenchyma — Potato
(iv) Stellate parenchyma — Canna

100. The tissue generally present in all organs of plant is_____
(a) Parenchyma (b) Chlorenchyma
(c) Collenchyma (d) Sclerenchyma

SRM JEEE-2019

Ans. (a) : The tissue generally present in all organs of plant is parenchyma. It is a type of simple permanent tissue that makes a major part of ground tissues in plants, where other tissues like vascular tissues are embedded. They are non-vascular and composed of simple, living and undifferentiated cells, which are modified to perform various functions.

They are of two types — (i) Phloem parenchyma
(ii) Xylem parenchyma.

101. Match the following

(A) **(i) Sclereid**

(B) **(ii) Tracheid**

(C) **(iii) Fibre**

(D) **(iv) Vessel**

(v) Colenchyma

The correct answer is

	A	B	C	D
(a)	(ii)	(i)	(iii)	(iv)
(b)	(iii)	(i)	(ii)	(iv)
(c)	(ii)	(iv)	(i)	(iii)
(d)	(v)	(ii)	(iv)	(iii)

TS EAMCET-02.05.2018 Shift-II

Ans. (b) :
(A) → Fibre
(B) → Sclereid
(C) → Tracheid
(D) → Vessel

- Sclereids are a fundamental cell type that widely exist in higher plants and are generally thought to have a mechanical function.
- A tracheid is a long and tapered lignified cell in the xylem of vascular plants.
- A vessel is a very large central cavity element or vessel member (also called xylem vessel) is one of the cell types found in xylem which is water conducting tissue of plants.

102. Pick the incorrect statement with respect to xylem parenchyma
(a) The cell wall is thin and made up of cellulose
(b) The cells store food reserves
(c) The cells assist in conduction of water
(d) The cells are dead at maturity

SRM JEEE -2017

@apna_pdf

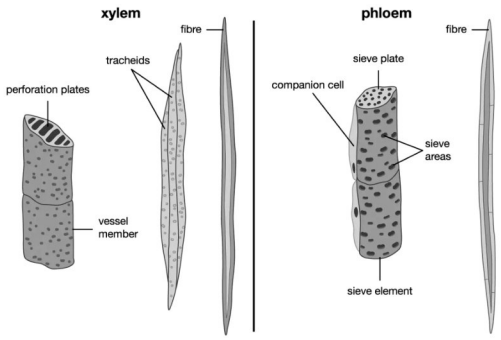
Ans. (d) : Xylem is a complex tissue. It consists of vessels, tracheids, xylem fibres and xylem parenchyma. Except for xylem parenchyma, all other components of xylem tissue are dead. Xylem parenchyma contains parenchymatous cell having a fully functional nucleus and are capable of performing various life processes.

103. Vessels are found in : -

(a) All angiosperms and some gymnosperm
(b) Most of the angiosperm and few gymnosperms
(c) All angiosperms, all gymnosperms and some pteridophyta
(d) All pteridophyta

AIPMT-2002

Ans. (a) : Vessels are the characteristic feature of angiosperm.
Vessels are absent in gymnosperm except Gnetales member.



104. The movement of water and minerals in xylem and the movement of phloem sap in phloem is respectively.

(a) Unidirectional, bidirectional
(b) Bidirectional, bidirectional
(c) Bidirectional, unidirectional
(d) Unidirectional, unidirectional

GUJCET-2016

Ans. (a) : The movement of water and minerals in xylem is always unidirectional i.e. upwards while movement of phloem sap in phloem is bidirectional i.e. upward and down wards because source-sink relationship variable.

105. Nucleus is absent in which of the following?

(a) Xylem parenchyma
(b) Phloem parenchyma
(c) Sieve tube cells
(d) Companion cells

Assam CEE-2014

Ans. (c) : Sieve tube is an elongated living cell of the phloem which is responsible for the transportation of food (mostly sugar). At maturity, the nucleus of the sieve tube gets fragmented and disappears along with the cellular organelles.

106. The main function of phloem is translocation of:

(a) food (b) water
(c) mineral (d) air

BHU PMT (Mains)-2010

Ans. (a) : Phloem is responsible for the transport of food from the leaves to all the parts of the plant. Phloem tissue transports and distributes the sucrose and nutrients produced by plants during photosynthesis. Phloem is in charge of transporting food and nutrients from the leaves to all the plant's part

107. Who proposed the Cohesion theory of ascent of sap?

(a) Strasburger (b) Godlewski
(c) Western (d) Dixon and Jolley

BVP-2003

Ans. (d) : Dixon and Jolley was proposed the cohesion theory of ascent of sap. The flow of water and dissolved mineral salts called ascent of sap. According to cohesion theory ascent of sap is due to the transportation pull or tension, water cohesion and hydration of cell walls.
Negative pressure or tension due to transpiration is conveyed to the root by a constant column of water within the xylem. Breaking the water column is avoided by cohesion between neighboring water molecules and adhesion between water molecules and cell walls.

108. Which tissue is involved in conduction of water:

(a) Xylem (b) Phloem
(c) both a and b (d) Parenchyma

BVP-2001

Ans. (a) : Xylem is one of the complex permanent tissue present in plants. It is composed of xylem parenchyma, vessels, tracheids, and xylem fibers. They help in the conduction of water in the plant. Xylem is called water-conducting tissue because, it is mainly involved in the conduction of water from roots to the aerial parts of the plant. It also helps in compensating for the loss of water due to transpiration and photosynthesis. Because of its major involvement in the transportation of water, it is known as a water-conducting tissue.

109. As tree grow older, which of the following will increase more rapidly in thickness?

(a) Heart wood (b) Sap wood
(c) Xylem (d) Phloem

BVP-2001

Ans. (a) : In old trees, the grater part or secondary xylem is dark brown due to deposition of organic compounds like tannins, resins, oils, gums, aromatic substance and essential oils in the central or innermost layers of the stem. These substance make it hard, durable and resistant to the attacks of micro-organism and insects. This region comprises dead elements with highly lignified walls and is called heart wood. Heartwood is also known as duramen.

110. Leptome is used for:

(a) Phloem (b) Xylem
(c) Fibres (d) Parenchyma

BHU PMT (Mains)-2006

@apna_pdf

Ans. (a) : Phloem is also known as leptome. Main function of phloem is transport of food material, organic materials and amino acids.

- Xylem is a transport tissue in vascular plants that transports water from roots to stems, leaves and other part of plant.
- The fibres are thick-walled, elongated and pointed cells, generally occurring in groups, in various parts of the plant.
- Parenchyma is the functional tissues in plants and animals. In plants, they refer to a specific type of ground tissue having thin cell walls and the ability to grow and divide. They make up most of the cells within leaves, flowers, and fruits.

111. Read the following statements A and B.

A: Many organs of aquatic plants float in water.

B: Large air gaps are present in the collenchymas tissues of lotus leaf.

Select the correct answer.

(a) Statement A is correct and B is wrong.
(b) Statement B is correct and A is wrong.
(c) Statements A and B both are correct.
(d) Statements A and B both are wrong.

Karnataka CET-2011

Ans. (a) : Many organs of aquatic plant float in water because of consists of network of parenchyma cell which enclose very large air cavities. These air cavities store gases and make the aquatic plant light and buoyant.

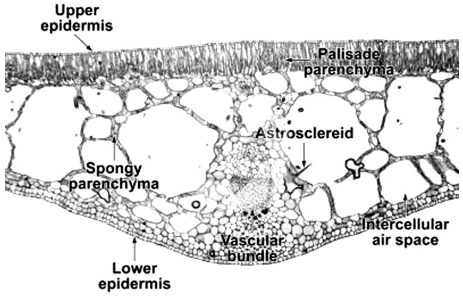
- As air gap are present in the collenchyma tissue of lotus leaf because collenchyma is a simple tissue with pectocellulose thickening in its wall.

112. The branched sclereids present in hydrophytes are:

(a) Osteosclereids (b) Trichosclereids
(c) Macrosclereids (d) Astrosclereids

AIIMS-2009

Ans. (d) : Astrosclerids are star shaped. It has branched i.e arm. Many hydrophytes like nymphaea, astrosclerids are found.



113. Collenchyma occurs in the stem and petioles of

(a) xerophytes (b) monocots
(c) dicot herbs (d) hybrophytes.

AIPMT-1990

Ans. (c) : Collenchyma occurs in the stem and petioles of dicot herbs. It is found either as a homogeneous or in patches. It consist of cell which are much thickened at the corners due to a deposition of cellulose, is found in epidermis of dicot stem and petioles and abundant in climbing stems.

114. Cork cambium and vascular cambium are

(a) parts of secondary xylem and phloem
(b) parts of pericycle
(c) lateral meristem
(d) apical meristem.

AIPMT-1990

Ans. (c) : Vascular cambium and cork cambium are the two lateral meristems. Lateral meristems are located in the stem and roots on the lateral side. It increases thickness of the plants.

115. Sieve tubes are suited for translocation of food because they possess

(a) bordered lumen and
(b) no end walls
(c) broader lumen and perforated cross walls
(d) no protoplasm.

AIPMT-1989

Ans. (c) : Sieve tube are suited for translocation of food because they possess broader lumen and perforated cross walls sieve tubes are elongated tubular conducting channels of phloem. The wall possess many small pores and have thin cellulosic wall.

116. Death of protoplasm is a pre-requisite for a vital function like.

(a) transport of sap (b) transport of food
(c) absorption of water (d) gaseous exchange

AIPMT-1989

Ans. (a) : Death of protoplasm is a pre-requisite for a vital function like transport of sap. Xylem is a dead tissue and do not have protoplasm, xylem perform the function of transport of water or sap inside the plant from roots to leaves. Certain cells get lignified deposition and leading to death of protoplasm such as xylem cell.

117. Bordered pits are found in

(a) sieve cells (b) vessel wall
(c) companion cells (d) sieve tube wall

AIPMT-1993

Ans. (b) : Borded pits are found in vessel wall.
Pits are the depressions or cavity formed in the cell wall that are found in the thick walled schlerenchyma, parenchyma cells and the tracheary elements, i.e. vessels and tracheids.

118. An organised and differentiated cellular structure having cytoplasm but no nucleus is

(a) vessels (b) xylem parenchyma
(c) sieve tubes (d) tracheids.

AIPMT-1991

(c) : An organized and differentiated cellular structure having cytoplasm but no nucleus is sieve tubes.
A mature sieve elements possesses a peripheral cytoplasm and large vacuole but lacks a nucleus. The functions of sieve tubes are controlled by the nucleus of companion cells.

119. Which of the following is not true about 'sclereids'?

(a) These are groups of living cells.
(b) These are found in nut shells, guava pulp, pear.

@apna_pdf

(c) These are also celled stone cells.
(d) These are form of sclerenchyma with fibres.

AIPMT-1996

Ans. (a) : Sclereids are a type of sclerenchyma cells. They are spherical, oval or cylindrical highly thickened dead cells (non living) with very narrow cavities (lumen). These are commonly found in the fruit walls and nuts, pulp of fruits like guava, pear and sapota, seed coats of legumes and leaves of tea. Sclerenchyma provides mechanical supports to organs.

120. Removal of apical bud results in
(a) formation of new apical bud
(b) elongation of main special bud
(c) death of plant
(d) formation of lateral branching

AIPMT-1993

Ans. (d) : Removal of apical bud results in formation of lateral branching because the apical bud produces a hormone called Auxin which inhibits the growth of the lateral buds. Apical bud is removed resulting in the removal of apical dominance is broadly used in tea plantation.

121. Aerenchyma is found in :
(a) parenchyma (b) xylem
(c) phloem (d) sclerenchyma

Punjab MET-2006
CG PMT -2004

Ans. (a) : The most common type of simple permanent tissue present in all the plants which are isodiametric i.e., expanded equally and vary greatly in morphology along with physiology is known as parenchyma. In aquatic plants, large air cavities are present in parenchyma to give support to them to float on water. Such a parenchyma type is called as aerenchyma.

122. Stelar tissues like xylem and phloem, etc, arise from which of the following
(a) protpderm (b) cambium
(c) procambium (d) lateral meristem

BCECE-2015

Ans. (c) : Steler tissues like xylem and phloem, etc arise from procambium. The procambium is a meristematic tissue concerned with providing the primary tissue of the vascular system.

123. Which of the following cells is not totipotent?
(a) Pith cell (b) Epidermal cell
(c) Sieve cell (d) Pollen grain

JIPMER-2002

Ans. (c) : Sieve cell is not totipotent because sieve cell have a large central vacuole with thin peripheral protoplasm.

• Totipotent cell have the ability of regeneration.

• **Sieve cell** : - Sieve cells are long, conducting cells with narrow diameter that do with albuminous cells that helps in the transportation of organic materials. Sieves cells are single cells. The sieves pores are present on both lateral and walls.

124. Hard, lignified, thick walled, long and pointed cells in a plant are
(a) parenchyma (b) sclerenchyma
(c) collenchyma (d) sclereids

CG PMT-2005

Ans. (b) : Hard, lignified, thick walled, long and pointed cells in a plant are sclerenchyma. These cells are also specialised cells. The wall is made up of lignin which makes it waterproof cells are consists of rigid and thick cell walls. At maturity consists of dead cells.

125. Identify from the following a plant tissue in which lignin does not occur in the cellwalls
(a) Sclerenchyma fibers (b) Collenchyma
(c) Xylem tracheae (d) Sclereids

Karnataka CET-2005

Ans. (b) : Lignin does not occurs in the cell wall of collenchyma. Collenchyma cell are living cells and have cellulosic cell walls and helps the plant to keep their shape. Lignin, complex oxygen–containing organic polymer, with cellulose forms the chief constituent of wood. Lignin is second most abundant organic material on earth.

126. Tyloses are the structures found in xylem vessels:
(a) help in efficient flow of water
(b) help in efficient flow of nutrients
(c) function is neutral
(d) all the time hinders the flow of water

Karnataka CET-2000

Ans. (d) : Tyloses are the balloon like structure which are developed by the adjacent xylem parenchyma and ray parenchyma cells and block the lumen of vessels.

• Tyloses are commonly found in many angiospermic families normally they develop into heart wood to give extra mechanical support.

127. Aerenchyma is present in which of the following plants ? (1) Neptunia (2) potamogeton (3) Bryophyllum (4) Vallisneria
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2007

Ans. (c) : Aerenchyma is present in potamogeton and vallisneria. Aerenchyma helps in buoyancy. It is well developed in hydrophytes. Aerenchyma is a modified parenchyma, tissue containing air chambers between cells.

These cells facilitate the diffusion of gasses between the plants and its surroundings and provide buoyancy to aquatic plants.

128. Latex vessels are found in (1) Calotropis (2) Hevea (3) Oleander (4) Papaya
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2007

Ans. (c) : Latex vessels are found in Hevea and Papaya. In Hevea, latex vessels take place secondary phloem and papaya latex vessels take place in both secondary phloem and secondary xylem.

129. In the sieve elements, which one of the following is the most likely function of P-proteins?

@apna_pdf

(a) Deposition of callose on sieve plates
(b) Providing energy for active translocation
(c) Autolytic enzymes
(d) Sealing off mechanism on wounding

JIPMER-2011

Ans. (d) : The balloon shaped intrusions appear in the xylem vessels of heart wood or duramen are called Tyloses. These are formed by the intrusions of ray parenchyma through pits present in the cell wall of vessels. In this cell walls are lignified. They block the xylem vessels. Due to the presence of tyloses, Pathogenic organisms cannot infect the heart wood due to the presence of tyloses. The main function of P-Protein is sealing mechanism on wounding.

130. Sieve tube is :
(a) without nucleus (b) multinucleate
(c) uninucleate (d) none of these

Rajasthan PMT-1999

Ans. (a) : Sieve tubes are considered living cells without a nucleus because the nucleus of companion cells controls their functional activities. Companion cells which unite with sieve tubes to form the sieve element-companion cell complex are related to sieve - tube members.

Note - The cell nucleus is a prominent structure that is responsible for undertaking several processes such as transcription and replication. The nucleus is considered as the controlling center of the cells . It's present mostly in all eukaryotic except a few. In plant cells , the nucleus is absent in the sieve tubes. Sieve tubes cells are conducting cells of the phloem and do not contain nucleus and ribosome.

131. The plant tissue having aquatic adaptation is
(a) collenchyma (b) sclerenchyma
(c) aerenchyma (d) parenchyma

UP CPMT-2012

Ans. (c) : The adaptations can be easily observed in the anatomy of the hydrophytes. Aerenchyma is specialized parenchyma cells which are air -filled. They provide buoyancy to the aquatic plants.

In the cross-section of aquatic plants aerenchyma appears like a cavity. Each cavity is separated from one another using chlorenchymatous cells.

Some characteristics of parenchyma are as follows.

The arenchyma is filled with respiratory gases like carbon dioxide, oxygen. The air chambers have the presence of cross septa called as the diaphragm which provides better aeration and is important in plant floating.

132. Collenchyma is
(a) living and contains protoplasm
(b) dead and hollow
(c) dead and filled with reserve food
(d) living and contains no reserve food

JCECE-2008

Ans. (a) : Collenchyma is living and contains protoplasm. It is a supporting tissue composed of more or less elongated living cells with unevenly thickened, nonlignified primary walls. collenchyma tissue are found below the epidermis of stem and around veins of leaves in plants.

133. The chief function of sieve tube element is:
(a) to conduct minerals
(b) to help the plant in forming wood
(c) to transport water from roots to leaves
(d) to translocate the organic material from source to sink

Manipal-2006

Ans. (d) : The chief function of sieve tube element is to translocate the organic material form source to sink. Material from source to sink sieve tubes are a component of the phloem in plants. They function as the vessel that transport organic food and other material across the plant. It transport of carbohydrates, primarily sucrose, in the plant.

134. Tyloses thickenings are seen in
(a) ray parenchyma and xylem cells
(b) sclerenchyma
(c) ray parenchyma only
(d) collenchyma

BHU PMT-2004
UP CPMT-2001
Punjab MET-1999

Ans. (a) : Tyloses thickenings are seen in ray parenchyma and xylem cells.' Tyloses are balloon – like swellings or projections that fill the vessels. Tyloses are spheroidal protoplasmic bulges that are generally formed when the adjacent parenchyma cells, axial parenchyma or raycells, protrude into the dead axial conducting cells.

135. Lignification is associated with:
(a) xylem (b) phloem
(c) parenchyma (d) chlorenchyma

Punjab MET-2006
Rajasthan PMT-2004

Ans. (a) : Lignification is associated with 'xylem' it is a cell wall fortifying process which occurs in xylem tissue in a scheduled manner during tissue differentiation. It is a complex process. It's main function is to strength in the plant vascular body.

136. Oval, spherical or polygonal cells, thickening at the corners due to the deposition of cellulose, hemicellulose and pectin, often containing chloroplasts and having or not having intercellular spaces are called
(a) parenchyma (b) chlorenchyma
(c) sclerenchyma (d) collenchyma

AMU-2015

Ans. (d) : Oval, spherical or polygonal cells, thickening at the corners due to the deposition of cellulose, hemicelluloses and pectin often containing chloroplasts and having or not having intercellular spaces are called 'Collenchymatous cells.

The cells of collenchymas tissue may also usually be oval, round or virtually usually polygonal and often type of basically comprise chloroplasts in a genuinely most important way in an especially huge way. It consists of cells which are much thickened at the corners due to the deposition of cellulose, pectin and the hemicellulose. Intercellular spaces are absent in collenchyma tissue.

@apna_pdf

137. Vessels and companion cells are characteristics of :
(a) angiosperm (b) gymnosperm
(c) pteridophyta (d) fern

BCECE-2005

Ans. (a) : Vessels and companion cells are characteristics of 'angiosperm'. It is one of the important features of flowering plants and around the plant it carries water. Water transport is maintained by the xylem part of angiosperms and transport of food is maintained by the phloem part. Companion cells are the integral component of the phloem in the angiosperms. It is closely associated with the development and function of a sieve-tube element.
Hence, vessels and companion cells are the characteristic features of angiosperms and absent in gymnosperms, pteridophytes, and bryophytes.

138. Which of the following cell is enucleate at maturity?
(a) Sieve tube (b) Xylem
(c) Tracheids (d) Fibre

BHU PMT-2002
AIIMS-2000

Ans. (a) : 'Sieve tube' cell is enucleate at maturity. A matured sieve cell or sieve tube element lack of nucleus Thus, these are enucleated living cells.

139. Porous wood contains
(a) vessels (b) tracheids
(c) fibres (d) parenchyma

BVP-2010

Ans. (a) : Porous wood contains the 'vessels'. The wood produced by angiosperms is called hard wood. It is composed mainly of vessels and is also called 'porous wood.

140. Which of the following statements is correct?
(a) Xylem is made of all living cells
(b) Xylem is made of living and non-living cells
(c) Xylem is made of non-living cells
(d) Xylem does not contain cells

BVP-2010
BHU PMT(Mains)-2005

Ans. (b) : Xylem is made of living and nonliving cells. It is a plant tissue that is complex and it is responsible for water transport and nutrients to the plant Xylem–type vessel cells can be either alive or dead. According to botanists, the elements of xylem tissue are dead except for the living parenchyma.

141. Vessels and companion cells are absent in :
(a) gymnosperm and pteridophyta
(b) pteridophyta and monocot
(c) dicot and angiosperms
(d) none of the above

Rajasthan PMT-1996

Ans. (a) : Vessels and companion cells are absent in 'gymnosperm and pteridophyta'. Gymnosperms do not have vessels and companion cells. Xylem in gymnosperms consists of tracheids instead of vessels. Gymnosperms and lower plants such as Pteridophytes, mosses and ferns lack sieve tubes and companion cells. Pteridophytes are vascular plants but they differ from angiosperms in that they lack Xylem vessels and phloem companion cells. Gymnosperms cells for food conduction.

142. Which of the following tissue is complex?
(a) Sclereids (b) Xylem
(c) Collenchyma (d) Sclerenchyma

UP CPMT-2010

Ans. (b) : Xylem and phloem are known as complex tissues as they both are made up of more than one type of cells. These cells work in a coordinated manner, as a unit, to perform the various functions. Xylem helps in conducting of water and minerals. Xylem are composed of tracheids, xylem parenchyma, vessels and xylem fibres.

143. Which of the following is removed in girdling experiment?
(a) Bark only
(b) Bark with phloem
(c) Phloem only
(d) Completely vascular tissue

UP CPMT-2010

Ans. (b) : 'Bark with phloem' is removed in girdling experiment. This experiment is used to identify the tissue through which the food is transported. In this experiment bark (Phloem) is removed from the wood by a process known as girdling. When a ring of bark is removed from a woody plant, the woody xylem part remains intact, which causes the water and the nutrients to reach the leaves.

144. Phloem conducts food by
(a) perforated sieve plates
(b) bast fibres
(c) xylem parenchyma
(d) xylem fibres

UP CPMT-2003

Ans. (a) : Phloem conduct food by perforated sieve plates. Sieve plates are connecting and transport tissue in plant. Sieve plate allows the food to pass through the phloem tubes. The tiny pores present on these tubes help in the transport and absorption of food particles. These have long and elongated structures that connect the roots and all other parts of plants.

145. The nature of cell occurring in medulla is
(a) Suberised (b) Liquefied
(c) Collenchymatous (d) Parenchymatous

VMMC-2013

Ans. (d) : The nature of cell occurring in medulla is 'parenchymatous', It is made up of parenchymatous cells, medulla is a ground tissue present at the central region of stele. It consist of parenchymatous cells, medulla is also called Pith. Pith stores water and food materials.

146. The function of a vessel is
(a) conduction of food
(b) conduction of water and minerals
(c) conduction of hormones
(d) All of the above

Manipal-2012, 2000
Punjab MET-2004

@apna_pdf

Ans. (b) : The function of vessel (present in xylem) is conduction of water and minerals. In plants, the same set of pipe–like vessels transport water, mineral salts and food. It is present only in angiosperms. Vessels are longitudinal channels composed of perforated cells.

147. Phloem contains (1) dead matter in it know as bast (2) long and narrow sclerenchymatous fibres (3) companion cell, which are living, thin-walled, narrow. (4) cells which are long and tubular with lignified cell wall

(a) 1,2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2011

Ans. (d) : From the above Statement is (d) option a correct answer. Phloem contains dead matter in it which is known as bast. It contains companion cells, which are living, thin- walled, narrow. Phloem fibres also called as 'bast fibres' are the only dead cells present in the phloem. Phloem parenchyma and companion cells are elements of phloem and both are living cells and thin walled.
Hence, statement 1 and 3 are correct.

148. The inter xylary phloem is found in

(a) Salvia stem (b) Cucurbita stem
(c) Calotropis stem (d) None of the above

BHU PMT (Mains)-2011

Ans. (c) : The interxylary phloem is found in 'Calotropis stem'. Interxylary phloem is the presence of phloem strands embedded within the secondary xylem and produced by the activity of a single cambium, calotropis stem said to be interxylary due to its presence inside xylem.

149. The plant tissue having aquatic adaptation is

(a) collenchyma (b) sclerenchyma
(c) aerenchyma (d) parenchyma

UP CPMT-2012

Ans. (c) : The plant tissue having aquatic adaptation is 'aerenchyma'. Aerenchyma is a special spongy tissue with large intercellular air spaces that is found in aquatic plants. These air spaces are help in gaseous exchange. These are makes the plant light, hence, the plants can float very easily in water.

150. Which of the following maintains continuity between the water and lipid phases inside and outside the cells?

(a) Cell wall
(b) Lecithin
(c) Cell vacuole
(d) Cell membrane of woody plants

Uttarakhand PMT-2004

Ans. (b) : 'Lecithin' maintains continuity between the water and lipid phases inside and outside of the cells. The major phospholipids is made up of phosphotidyl-cholines, also called lecithin. It maintains the continuity between the water and lipid phases.

151. Damaged sieve tubes are sealed by deposition of

(a) Pectin (b) Callus
(c) Suberin (d) Lignin

BHU PMT (Screening)-2007

Ans. (b) : Damaged sieve tubes are sealed by deposition of 'callus'. Callus is formed by a carbohydrate called callose. When callus is formed the pores are blocked and so the transport of food material is retarded. At the advance of spring this substance dissolve and the pores open again. Callose is deposited into the tangled mass in the sieve pores of damaged sieve tubes, which serves to seal off the damaged sieve elements.

152. The jute fibres anatomically are

(a) Bast fibres (b) Cortical fibres
(c) Xylem fibres (d) Pith fibres

BHU PMT (Screening)-2007

Ans. (a) : The jute fibres anatomically are ' Bast fibres', It is a ligno-cellulosic fibre that is partially a textile fiber and partially wood. It falls in to the bast fibre category. This fibre is collected from bats or skin of the plant. It is also known as golden fibre mainly because of its colour.

153. In the sieve elements, which one of the following is the most likely function of P-proteins?

(a) Deposition of callose on sieve plates
(b) Providing energy for active translocation
(c) Autolyric enzymes
(d) Sealing off mechanism on wounding

Rajasthan PMT-2010

Ans. (d) : In the sieve elements, sealing off mechanism on wounding is the most likely function of P-proteins. P-protein is also called phloem protein. This protein can be traced to the phloem. The most important function of P-protein is the sealing mechanism on wounding P-proteins are usually found in phloem of dicot plants.

154. Wilting of plant is due to

(a) blockage of phloem
(b) blockage of xylem
(c) when some roots and phloem are removed
(d) tracheid is blocked

BCECE-2010
WB JEE-2007

@apna_pdf

Ans. (b) : Wilting of plant is due to the 'blockage of xylem'. The collapse of leaves due to loss of water is called 'wilting'. It may be caused due to excessive transpiration, blocking of xylem elements or some diseases, when roots are unable to supply sufficient moisture to the stems and leaves plants to wilt.

155. When sunflower leaf is exposed to sunlight, the solar radiations first pass through its upper epidermis and then through

(a) spongy parenchyma
(b) lower epidermis
(c) vascular bundles
(d) palisade parenchyma

AMU-2011

Ans. (d) : When sunflower leaf is exposed to sunlight, the solar radiations first pass through its upper epidermis and then through palisade parenchyma. In a dicot leaf-symmetry is dorsiventral, stomata are more on lower surface, bundle sheath is made up of parenchyma, they have the palisade parenchyma on adaxial side and spongy parenchyma on abaxial side, sunflower is a dicot.

156. One of the following is not true for hydrophytes.

(a) Vessels are usually absent
(b) Tracheids are absent
(c) Cuticle is poorly developed
(d) Air chambers are well developed

AMU-2010

Ans. (b) : Tracheids are absent is not true for the hydrophytes. In hydrophytes cuticle is poorly developed. It have special air chambers called 'aerenchyma'. Tracheids are developed but the vessels are completely absent in hydrophytes.

157. Medullary rays are made up of

(a) parenchymatous cells
(b) sclerenchymatous cells
(c) tracheids
(d) fibres

AMU-2010

Ans. (a) : Medullary rays are made up of 'parenchymatous cell. Medullary rays are also known as vascular rays or pith rays. These rays are parenchymatous cells which allow the radial transport of sap and essential in the process of tylosis. Medullary rays store and transport food material.

158. Growth rings are formed due to activity of :

(a) extrastelar cambium (b) intrastelar cambium
(c) interstelar cambium (d) both 'a' and 'c'

MGIMS Wardha-2004

Ans. (b) : Growth rings are formed due to the activity of intrastelar cambium. These rings are found in trees. The growth occurs in the cambium which creates new tissue and increases the growth of the tree. Cambium is responsible for the annual or growth ring. Intrastelar cambium is present between xylem and phloem in dicot stem and roots. The vascular cambium is present within the stele, therefore it is also termed as intra-stellar cambium (vascular cambium) is responsible for increasing the diameter of stems and roots and for producing woody tissue.

159. Cotton fibres which are obtained from Gossypium are:

(a) surface fibre (b) soft fibre
(c) hard fibre (d) bast fibre

VMMC-2006

Ans. (a) : Cotton fibres are surface fibre which are obtained from Gossypium, extracted from the covering of seed. They grow from the surface of seeds, leaves or fruits. The surface fibre is made of pure cellulose.

160. The layer of parenchyma surrounding a vascular bundle is known as:

(a) bundle sheath
(b) bundle shield
(c) bundle parenchyma
(d) bundle fibre

VMMC-2006

Ans. (a) : The layer of parenchyma surrounding a vascular bundle is known as ' bundle sheath'. The bundle sheath cells are a layer of cells found in plant leaves and stem. These cells form a sheath around the vascular bundles. These are consist of chloroplasts and are key sites of the Calvin cycle. In dicots the bundle sheath parenchyma also called border parenchyma.

161. Collenchyma differs from sclerenchyma

(a) retaining protoplasm at maturity
(b) having thick walls
(c) having wide lumen
(d) being meristematic

CG PMT-2007

Ans. (a) : Collenchyma differs from sclerenchyma due to the retaining protoplasm at maturity collenchyma cells contain protoplasm and do not have any intercellular spaces. Sclerenchyma is made up of dead cells with thick walls. Sclerenchyma cells do not have protoplasm, these cells are lignified and strong secondary cell wall and are usually dead at maturity.

162. Which of the following is related with transfer of food material?

(a) Xylem (b) Collenchyma
(c) Phloem (d) Parenchyma

Uttarakhand-2005

@apna_pdf

Ans. (c) : 'Phloem' is related with transfer of food material. The main functions of these tissues (Phloem) are transports of food material and mechanical support to the plants phloem is a complex permanent tissue present in higher vascular plants.

163. Which of the following is enucleate at maturity?
(a) Cortical cell (b) Cambial cell
(c) Meristematic cell (d) Sieve tube cell

Uttarakhand-2005

Ans. (d) : 'Sieve tube cell,' is enucleated at maturity. A mature sieve cell or sieve tube element lack nucleus thus these are enucleated living cells. Sieve tubes are considered living cells without a nucleus because the nucleus of companion cells controls their functional activities. The main function of sieve tube the transport of carbohydrates primarily sucrose, in the plant.

164. Compound sieve plates are found in:
(a) Cucurbita (b) Vitis
(c) Magnolia (d) Corchorus

AP EAMCET-2003

Ans. (b) : Compound sieve plates are found in 'vitis', A compound sieve plate has more than one area. When a sieve plates consist of more than one region of pores it is known as a compound sieve tube like in vitis. In compound sieve plates are pores in the plant cell walls that facilitate transport of material.

165. Companion cells in plans are associated with :
(a) vessels (b) sperms
(c) sieve elements (d) guard cells

Haryana PMT-2004

Ans. (c) : Companion cells in plants are associated with 'sieve elements'. Each companion cell is usually closely associated with the sieve element. These cells are present in the phloem tissue of the flowering plant. The companion cells are specialized parenchymatous cells, which are closely associated with sieve tube elements.

166. The waxy substance associated with cell wall of cork cells is :
(a) suberin (b) cutin
(c) hemicelluloses (d) lignin

Haryana PMT-2004

Ans. (a) : The waxy substance associated with cell wall of cork cell is 'Suberin'.
Suberin is highly hydrophobic and its main function is to prevent water from penetrating the tissue.

167. A tissue whose living cells form the mechanical tissue of actively growing organs and whose cell walls show cellulosic unlignified thickenings often at the corners of its cells is called:
(a) Parenchyma (b) chlorenchyma
(c) collenchyma (d) sclerenchyma

WB JEE-2014
JIPMER-2000

Ans. (c) : A tissue whose living cells form the mechanical tissue of activity growing organs and whose cell walls shows cellulosic unlignified thickenings often at the corners of its cells is called 'collenchyma'.
Term Collenchyma coined by **Schleiden.** It is a living mechanical tissue.

168. Excessive aerenchyma is characteristic of :
(a) heliophytes (b) mesophytes
(c) xerophytes (d) hydrophytes

JIPMER-2001

Ans. (d) : Excessive Aerenchyma is characteristic of 'hydrophytes' in aquatic plants (hydrophytes) have large air cavities present in Aerenchyma to give support them to float on water. Hydrophytes possess special air storage parenchyma tissue, called as Aerenchyma.
For example:- *Hydrilla, Ceratophyllum, Lotus, Echhornia* etc.

169. The stalk of a plant leaf is derived from which one of the following types of plant tissue?
(a) Sclerenchyma (b) Parenchyma
(c) Chlorenchyma (d) Collenchyma

KVPY SA-2014

Ans. (d) : The stalk of a plant leaf is derived from 'collenchyma', type of plants tissue. The collenchyma occurs in layers below the epidermis in dicotyledonous plants. It consists of cells which are much thickened at the corners due to a deposition of cellulose, hemicelluloses and pectin. These cells assimilate food when they contain chloroplasts.

170. Collenchyma resembles parenchyma in being
(a) potentially meristematic
(b) partially cutinised
(c) provided with air spaces
(d) devoid of chloroplasts

AMU-1997

Ans. (d) : Collenchyma resembles parenchyma is being devoid of chloroplasts. Parenchyma cells containing chloroplasts which is called chlorenchyma. Collenchyma cell may or may not contain a few chloroplasts.
Hence, collenchyma is a correct answer.

171. The nature of sieve elements in the phloem are
(a) dead
(b) enucleate
(c) thick-walled
(d) living but non-functional.

AMU-1997

Ans. (b) : A mature sieve element possesses a peripheral cytoplasm and a large vacuole but lacks a nucleus. The functions of sieve tubes are controlled by the nucleus of companion cells.

@apna_pdf

172. Radial conduction of water takes place by
(a) vessels
(b) vessels and tracheids
(c) phloem
(d) ray parenchymatous cells

AMU-2012

Ans. (d) : Radial conduction of water takes place by 'ray parenchymatous cells'. Transport of nutrients and water radially between the xylem and phloem by ray parenchyma cell. Radial conduction refers to the conduction of water in the horizontal direction through the xylem.
Hence, radial conduction takes place by the ray parencymatous cells of xylem.

173. Wood is the common name of
(a) phloem (b) vascular bundles
(c) cambium (d) secondary xylem

CG PMT-2006

Ans. (d) : Wood is the common name of 'secondary xylem. The inner non-functional secondary xylem is called Heart wood and the outer functional secondary xylem is known as Sapwood. Wood is the secondary xylem produced by coniferous gymnosperms and by dicotyledonous angiosperms. Wood conducts water from the roots to the leaves and it also supports the branches and crown of trees and shrubs.

174. Which of the following would be insignificant amount in xylem sap?
(a) Sugar (b) Nitrates
(c) Phosphates (d) Water

Manipal-2009
Karnataka CET-2009

Ans. (a) : 'Sugar', would be insignificant amount in xylem sap. Xylem is a vascular tissue which has the role of the conduction of water and minerals form the roots to the shoots in the plants. It is found in roots, stems and leaves of the plants.
Phloem is the tissue of the plant which transports the soluble organic substances to the various parts of the plant.
Sugar is carried by the phloem form the leaves to the other parts. Phloem tissue is involved in transport of sugar.

175. Which of the following tissue helps in the flow of water in vascular plant ?
(a) Xylem (b) Phloem
(c) Cambium (d) Sieve tube cell

DUMET-2001

Ans. (a) : 'Xylem', tissue helps in the flow of water in vascular plant. Xylem is a vascular tissue that transports water and dissolved minerals from roots to stems and leaves. It also transports the nutrients.
Xylem tissue consists of a variety of specialized, water-conducting cells known as treachery elements.

176. Simple tissue with mechanical and physiological functions in a young dicotyledonous plant is:
(a) parenchyma (b) collenchyma
(c) sclerenchyma (d) meristematic tissue

AP EAMCET-2002
JIPMER-1996

Ans. (b) : 'Collenchyma', is a simple tissue with mechanical and physiological functions in a young dicotyledonous plants. This tissue is composed by elongated living cells of uneven primary thick walls, which possess cellulose, hemicelluloses, and pectic materials. It provides support structure, mechanical strength and flexibility to the petiole, leaf veins and stem of young plants, allowing for easy bending without breakage.

177. The crunchy and granular feeling when we chew pear fruit is due to
(a) parenchyma (b) collenchyma
(c) chlorenchyma (d) sclerenchyma

CMC Ludhiana-2014

Ans. (d) : The crunchy and granular feeling when chew pear fruit is due to the ' sclerenchyma' tissue. The sclerenchyma cells are of two types-fibres and sclereids. The sclereids give a crunchy feeling to the pear because it provides support and hardens the tissue. Sclereid cells are also called "stone cells".

178. The nature of cells occurring in medulla is:
(a) parenchymatous (b) liquified
(c) suburised (d) collcnchymatous

AP EAMCET-1997

Ans. (a) : The nature of cells occurring medulla is 'parenchymatous', Medulla is also called pith. It is a ground tissue present at the central region of stele. Medulla is made up of parenchymatous cells.

179. Cell wall of xylem is rich in
(a) Starch (b) lignin
(c) lipid (d) protein

CG PMT-2010

Ans. (b) : Cell wall of xylem is rich in 'lignin'. Lignin and cellulose are found in the rigid cells. It helps in the transportation of water in stems. Presence of lignin is make up the wood of woody plants in Xylem cells.

180. Anatomically jute fibres are
(a) Xylem fibres
(b) Phloem fibres
(c) Sclerenchyma fibres
(d) Cortical fibres

CG PMT-2010

Ans. (b) : Anatomically jute fibres are 'Phloem fibres', are known as sclerenchymatous fibres, as they are made up of sclerenchyma cells. These fibres are mainly found in the phloem, so they are also called the 'phloem fibres'. It falls into the bast fibre category,

@apna_pdf

181. The sclerenchymatous part of pericycle which gives mechanical support is called:

(a) hard bast (b) bast fibres
(c) sclereids (d) wood fibres

AP EAMCET-2000

Ans. (b) : The sclerenchymatous part of pericycle which gives mechanical support is called 'bast fibres', bast fibres are called phloem fibres, they are sclerenchymatous dead cells that provide mechanical strength to the plants.

182. An old trunk of shisham (*Dalbergia sisso*) tree would possess maximum amount of

(a) Primary xylem (b) Secondary xylem
(c) Primary phloem (d) Secondary cortex

Rajasthan PMT-2011

Ans. (b) : Maximum amount of secondary xylem is present in an old trunk of shisham. It is formed from the secondary growth of the plants. Secondary growth increases the diameter of the stem in plants. In *Dalbergia sissoo*, a vascular cambium is found, its function is to produce wood cells and bark cells, vascular cambium produces a large amount of secondary xylem towards its inner side.

183. Tracheids differs from vessels in having:

(a) Thick wall
(b) Bordered pits
(c) Discontinuous Intercalary wall
(d) Spiral thickening

Rajasthan PMT-2000
Rajasthan PMT-2006

Ans. (b) : Tracheid differs from vessels in having 'bordered pits'. Tracheids are made up of single cells, whereas vessels are made up of a group of cells. Tracheids are found in all vascular plant but vessels are only seen in angiosperms, tracheids are found less large pits while vessels are found large small pits. Bordered pits are structures found in the conductive tissues of many plants. The tracheids, which transport liquids, are dead cells.

184. The difference in phloem of gymnosperms and angiosperms is due to:

(a) Parenchyma (b) Sieve cell
(c) Companion cell (d) Fibres

Rajasthan PMT-2006,2002

Ans. (c) : The difference in phloem of gymnosperms and angiosperms is due to the 'companion cell', phloem in gymnosperms lack both sieve tubes and corresponding cells. Companion cells are attached to the sieve tubes and regulate, their activity phloem in gymnosperms doesn't have either, instead, they have sieve cells and albuminous cells for the conduction of food.

Hence, the difference in phloem of both is due to the 'companion cell'.

185. As compared to sclerenchyma, parenchyma does not function in:

(a) gas exchange
(b) nutrient transport
(c) mechanical support
(d) support and gas exchange

AP EAMCET-1999

Ans. (c) : As compared to sclerenchyma, parenchyma does not function in 'mechanical support', parenchyma has loosely packed cells that contain intercellular spaces. They store and assimilate food, they serve as a food storage tissue. Parenchyma is a permanent tissue helps in storing food in plants. Sclerenchyma provides mechanical strength. These cells are usually found associated with other cells types and give them mechanical support. Sclerenchyma is an example of a simple permanent but dead mechanical tissue. It has a cell wall that is made up of cellulose and lignin. It provides mechanical support to the plants.

186. The stele, in the root of the following is tetrarch:

(a) Nicotiana (b) Helianthus
(c) Gossypium (d) Trapa

AP EAMCET-1999

Ans. (c) : The stele, in the root of '*Gossypium*' is tetrarch, based on the number of xylem strands present in the stele, it can be different types in vascular tissue or the stele consists of three tissues, the pericycle, the xylem and also the phloem. In 'Gossypium' the tetrarch stele is found. Tetrarch stele is a stele which contain the 4 xylem strands.

187. Wilting of plant is because

(a) xylem is blocked
(b) phloem is blocked
(c) epidermis few roots are removed
(d) pith is removed

VMMC-2007
BHU PMT (Screening)-2006
UPCPMT-2002

Ans. (a) : If the Xylem is blocked, the plant will undergo wilting due to the lack of proper transport of water. The main function of the Xylem is to transport water unidirectionally from roots to tips of the plant. This will lead to loss of rigidity of cells and lead to wilting.

188. Assertion: Libriform fibres are true fibres.
Reason: Libriform fibre develop from non-functional tracheids by reduction

(a) Both Assertion and Reason are true and Reason is the explanation of Assertion
(b) Both Assertion and Reason are true but Reason is not the correct explanation of Assertion

@apna_pdf

(c) Assertion is true but Reason is false
(d) Assertion is false but Reason is true

Manipal-2010

Ans. (c) : Among the following statements the assertion (A) is true but the reason (R) is false. A fibre with very thick walls and reduced simple pits are termed as 'libriform fibres', these fibres are present in phloem. Libriform fibres occur in woody dicotyledons. Libriform fibre is not developped from non-functional tracheids by reduction,

189. The longest plant cell is :

(a) fibre (b) vessel
(c) tracheid (d) sieve tube

Rajasthan PMT-2000

Ans. (a) : The longest plant cell is fibre. Fibres are greatly elongated cells whose long, tapering ends interlock, which provides maximum support to a plant fibres are the longest plant cells with the length up to 21.65 inches long. It is elongated by intercalary growth and intrusive tip growth.

190. Bast fibres obtains from which part of the stem?

(a) Cork (b) Cortex
(c) Xylem (d) Phloem

Rajasthan PMT-2000

Ans. (d) : Bast fibres are obtains from 'phloem' part of the stem. Bast fibres also called 'phloem fibres'. It is a type of plant fiber that can be collected from the phloem or bast surrounding to the stem of mainly dicotyledonous plants. They are sclerenchymatous dead cells that provide mechanical strength to plants.

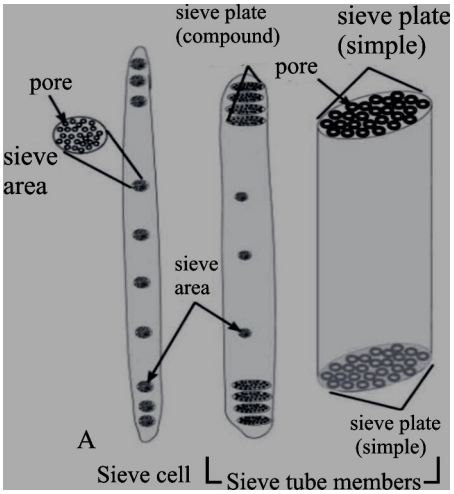
191. Which of the following is anucleated living plant cell?

(a) Sieve tube (b) Vessel
(c) Tracheid (d) All of these

AMU-2002

Ans. (a) : 'Sieve tube' is anucleated living plant cell. Sieve elements are the phloem conducting elements. The sieve elements are stacked on top of each other to form vertical sieve tubes.

The nucleus is absent in mature sieve tubes. Sieve tube elements also known as sieve tube members in plant anatomy. Sieve tubes are considered as living cells without a nucleus because the nucleus of companion cells controls their functional activities.



192. Compare the statement A and B

Statement A : Sclerenchyma cells do not have plasmodesmata

Statement B : The cell walls of some permanent tissues are heavily lignified.

Select the correct description :

(a) Both the statements A and B are wrong
(b) Statement A is correct and B is wrong
(c) Statement A is wrong and B is correct
(d) Both the statements A and B are correct

Karnataka CET-2010

Ans. (d): Sclerenchyma cells do not have plasmodesmata because they are thick and dead cells. So, there is no need for plasmodesmata in dead cells as cell to cell communication does not take place in dead cells. Parenchyma, collenchyma and sclerenchyma are types of permament tissues in which sclerenchyma is heavily lignified.

193. Study the following table:

S. No.	Tissue	Structural feature	Function
1.	Collenchyma	Cell walls with high water content	Photosynthesis in young stems
2.	Parenchyma	Suberised cell walls	Storage of food
3.	Sclerenchyma	Lignified cell walls	Strength
4.	Digestive glands	Dense cytoplasm	Breaking the substrate without water

The correct combination is:

(a) 1 and 2 (b) 2 and 3
(c) 1 and 4 (d) 1 and 3

AP EAMCET-2005
VMMC-2010

Ans. (d) : Collenchyma is a living tissue consist of a non-lignified cellulosic thick walled cell. Each cell contain an average of about 60-70% of water. The primary function of **Collenchyma** is to provide support but in young stem due to presence of chlorophyll it also take part in photosynthesis.

Sclerenchyma tissue consists of a lignified thick walled cell. It provides mechanical support to the plant.

Parenchyma typically composed of living cells that are thin walled, variable in morphology and physiology that concerned vegetative activities of plant like photosynthesis, assimilation, respiration, storage, secretion and excretion.

@apna_pdf

Digestive glands secrete digestive juices, which contain enzyme for digestion of food. The digestive system also contains associated glands such as pancreas, liver etc. which release their secretions in the elementary canal to facilitate digestion.

Schlerenchyma cells are specialized plant cells that exist to provide strength and support. Their cell wall consists of cellulose, lignin and hemi cellulose.

194. P- proteins belong to

(a) xylem parenchyma
(b) trichomes
(c) sieve tube elements
(d) tracheids and vessels

UP CPMT-2005

Ans. (c) : Sieve tube element contains special type of protein P- proteins in which P stand for phloem. Most likely function of P- protein is sealing mechanism on wounding along with callose and it is also related with conduction of food.

• Xylem parenchyma, tracheids and vessels are the part of xylem.

Trichomes are fine outgrowths or appendages on plants, algae, lichens, and certain Protists.

195. Transport of food material in higher plants takes place through

(a) Sieve elements
(b) Companion cells
(c) Transfusion cells
(d) Tracheids

AIPMT (Mains)-2010

Ans. (a) : Transport of food material in higher plants takes place through sieve elements. They are specialized cells that are important for the function of phloem which is highly organized tissue that transports organic compounds made during photosynthesis.

- The phloem also conducts some other substances such as amino acids. The conducting cells of the phloem are cylindrical cells called **sieve tubes**, which have sieve like partitions at both ends.
- These partitions are known as **sieve plates**.

196. Which of the following tissues consist of living cells?

(a) Vessels (b) Tracheids
(c) Companion cell (d) Sclerenchyma

JIPMER-2012

Ans. (c) : Companion cells are present between sieve tubes in the phloem of angiosperm. These are the living cells with large nucleus that controls the activity of non-nucleated sieve tubes.

Companion cells function to load and unload sugars into the cavity of sieve tube members.

197. Vascular tissues in flowering plants develop from

(a) phellogen (b) plerome
(c) periblem (d) dermatogen

JIPMER-2012

Ans. (b) : Plerome is the central histogen which forms stele or part of stem and root inner to endodermis. Part of plerome the forms vascular tissues is called procambium.

Plerome represent the inner region of the apical meristem. It consists of thin-walled cells that serve as precursors for stele including the pith.

198. Companion cells are closely associated with:

(a) Trichomes
(b) Guard cells
(c) Sieve elements
(d) Vessel elements

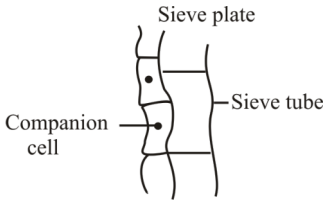
AIPMT (Screening)-2012

Ans. (c) : Companion cells are thin walled elongated cell which is associated with sieve tube.

They are associated with sieve elements through plasmodesmata and they together help in the transport mechanism in plants.

Companion cells are present only in angiosperm.

Pteridophytes and gymnosperms do not have companion cell.



199. Closely and compactly arranged fundamental tissue is not found in

(a) Prothallus of *Pteris*
(b) Medulla of dicot stem
(c) Columella of *Funaria*
(d) Adaxial Mesophyll of *Nerium*

AP EAMCET-2010

Ans. (b) : Pith (Medulla) of dicot stem occupies the large central part of the dicot stem. It comprises thin walled parenchyma cell with inter cellular air space.

Prothallus of *Pteris* – Prothallus of *pteris* is a single layered cellular structure having rhizomes at its ventral surface of the thalloid body.

Columella of *Funaria* – Columella is the middle region consisting of parenchyma cell. It is found within the sporangium it act as a conducting tissue.

Adaxial Mesophyll of *Nerium* – Both the adaxial and abaxial epidermis in *nerium* are multiseriate, being composed of up to three layers of compactly arranged cell with heavily cutinized outer walls.

@apna_pdf

D. Epidermal, Ground, Vascular Tissue System

200. Sunken stomata are found in

(a) Nerium (b) Hydrilla
(c) mango (d) none of these

Manipal-2008
BVP-2008
Punjab MET-2008,2006
Uttarakhand PMT-2007
JCECE-2003
Rajasthan PMT-2002
J&K CET-2006

Ans. (a) : Suken stomata is a stomata in a small pit which protects the escaping water vapour from air currents decreasing water loss from the leaf.

- Sunken stomata are commonly found in leaves of Nerium this is an adaptation of the leaves to reduce excessive transpiration.
- Each stomata remains surrounded by two semilunar guard cells. The guard cells are living and contain chloroplasts they regulate opening and closing of stomata.

201. Vascular bundles, in which phloem is found on both sides of xylem are called

(a) collateral (b) bicollateral
(c) radial (d) amphicribral

HP CET-2011
JCECE-2008
Punjab MET-2007
BCECE-2006
VMMC-2005
AMU-2004
J&KET-2011,2003
BVP-2003
Rajasthan PMT -2001

Ans. (b) : Bicolateral vascular bundle have xylem and phloem present on the same radius and phloem is found in both the side of xylem. In vascular bundle plants are made up of conducting tissue of the xylem and the phloem. In collateral vascular bundle xylem and phloem are present on the same radius. The phloem is present on the outer side of xylem.

202. The cells without nuclei are present in :

(a) vascular cambium
(b) root hair
(c) companion cell
(d) members of sieve tube

Punjab MET-2006
J&K CET-2006
JCECE-2003
Rajasthan PMT-2002

Ans. (d) : The cell without nuclei are present in member of sieve tube elements are important component of phloem. They are devoid of a nucleus at maturity. This is normally associated with one or more nucleated companion cells to which they are connected by plasmodesmata.

203. Which is a useful product of epidermal origin?

(a) Saffron (b) Cotton fibres
(c) Clove (d) Jute

JIPMER-2012
Uttarakhand PMT-2009
BVP-2009
VMMC-2009

Ans. (b) : Cotton fibres is chiefly composed of epidermal hairs of seeds and present on the surface of seeds of Gossypium species. These are made up cellulose only and may be of two type i.e extractable and non extractable fluffy fuzz. Cotton fibres are mainly used for textiles celluloid, rayon and paper pulp.

204. When the vascular cambium is present between the xylem and phloem, then the vascular bundle is called,

(a) Closed (b) Exarch
(c) Open (d) Endarch

Karnataka CET-20.05.2023

Ans. (c) : In gymnosperms and dicot stems a strip of vascular cambium occurs between phloem and xylem of each vascular bundles. It is called intrafascicular cambium. This strip of vascular cambium later produces secondary tissues. Such vascular bundles are described as open vascular bundle.

205. Sunken stomata are in the leaves of

(a) Hydrilla (b) Nerium
(c) Typha (d) Salvinia

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : Sunken stomata are found in xerophytes. That they plant grow on desert condition Ex:- Nerium

- Sunken stomata prevent the water loss through respiration.
- Hydrilla is hydrophylic plant.
- Typha is a monocotyledonous flowering plant. It can be used as a source of starch to produce ethanol.
- Salvinia is a aquatic pteridophytes.

206. Which of the following characters are found in Hydrilla stem

(I) Aerenchyma
(II) Sunken stomata
(III) Palisade tissue
(IV) Xylem cavity

Correct answer is

(a) I and II (b) I and IV
(c) III and IV (d) IV only

TS EAMCET 10.05.2023 Shift-I

Ans. (b) : Aerenchyma isa modified parenchymatous tissue containing air chambers between cells. It provide buoyancy to aquatic plants like hydrilla.

207. Select the incorrect statements related to anatomical characters from the following

(I) Endodermis is a part of the stele
(II) Endodermis with casparian strips are found in the dicot stem
(III) Bulliform cells are found in the upper epidermis of the isobilateral leaf.
(IV) Vascular bundles are open in monocot stems.

@apna_pdf

(a) I, II, IV (b) I, II, III
(c) II, IV (d) III, IV

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : • The endodermis is the innermost layer of the cartex and is not a component of stele.
• Casperian strips are present in dicot roots.
• Open vascular bundles are present only in dicotyledonous plants.

208. Match the arrangement of vascular tissues with the type of steles below.

	List-I		List-II
A.	Stele with medulla surrounded by xylem and phloem	I.	Protostele
B.	Dissected Medullated Stele with overlapping leaf gaps	II.	Siphonostele
C.	Medullated stele with non overlapping leaf gaps	III.	Solenostele
D.	Non-medullated stele with xylem surrounded by phloem	IV.	Dictyostele

(a) a-III, b-IV, c-II, d-I
(b) a-III, b-II, c-I, d-IV
(c) a-II, b-IV, c-I, d-III
(d) a-II, b-IV, c-III d-I

TS EAMCET-11.05.2023, Shift-II

Ans. (d) :

A.	Stele with medulla surrounded by xylem and phloem	II.	Siphonostele
B.	Dissected Medullated Stele with overlapping leaf gaps	IV.	Dictyostele
C.	Medullated stele with non overlapping leaf gaps	III.	Solenostele
D.	Non-medullated stele with xylem surrounded by phloem	I.	Protostele

209. Xylem development is poor in
(a) Xerophytes (b) Halophytes
(c) Hydrophytes (d) Mesophytes

AP EAPCET-12.07.2022 Shift-I

Ans. (c) : Xylem of hydrophytes is poorly developed. Vessels in the hydrophytes are completely are completely absent but traches are well developed.
• In aquatic plants, water can be taken in through the leaves, stems and roots through osmosis, making the vascular system less needed.

210. Match the following?

Vascular bundles	Arrangement	Plants
(a) Open	(i) Different radial	(p) Leaves
(b) Closed	(ii) Same radial	(q) Dicots
(c) Radial	(iii) Cambium present	(r) Monocots
(d) Conjoint	(iv) Cambium absent	(s) Root

(a) (a–iv–p), (b–ii–r), (c–iii–q), (d–i–s)
(b) (a–iii–q), (b–iv–r), (c–i–s), (d–ii–p)
(c) (a–i–p), (b–ii–q), (c–iii–r), (d–iv–s)
(d) (a–ii–r), (b–i–p), (c–iv–s), (d–iii–q)

AP EAMCET-03.09.2021 Shift-I

Ans. (b) : Monocot stem → collateral, conjoint, closed, endarch cambium.
Monocot root → radial vascular bundles.
Dicot stem → collateral, conjoint, open and endarch.
Dicot root → radial vascular bundle.

211. Identify the incorrect statements among the following.
(A) Epidermal cells are parenchymatous and have small amount of cytoplasm
(B) Gymnosperms have vessels in their xylem
(C) In bicollateral vascular bundle, phloem is present on either side of cortex
(D) Root endodermal cells have deposition of water impermeable, suberin as casparain strips
(a) A, B
(b) B, C
(c) C, D
(d) A, C

TS EAMCET-10.08.2021 Shift-I

Ans. (b) : Gymnosperms lack vessel in their xylem.
• In bicollateral vascular bundles, phloem patches remain on both sides of the xylem.

212. Which one of the following is not a type of protostele ?
(a) Haplostele (b) Actinostele
(c) Plectostele (d) Atactostele

Tripura JEE-2021

Ans. (d) : Atactostele is not a type of protostele. Atactostele refers to a type of eustele found in monocots, in which the vascular tissue in the stem exists as scattered bundles.

213. Bicollateral bundles means:
(a) they have phloem both on outer and inner side of xylem
(b) they have xylem both on outer and inner side of phloem
(c) both (a) and (b)
(d) none of the above

Rajasthan PMT-1997
AP EAMCET-05.10.2021 Shift-I

Ans. (a) : Bicollateral vascular bundles means they have xylem both on outer and inner side of phloem. This, all of them lie within the same radius. Apart from phloem, vascular cambium is also present on both sides of the xylem.

214. Velamen is found in _____
(a) Roots of screwpine
(b) Aerial and terrestrial roots of orchids
(c) Leaves of Ficus elastica
(d) Aerial roots of orchids

AP EAPCET-07.09.2021 Shift-I

@apna_pdf

Ans. (d) : Epiphyte is an organism that grows on the surface of the plant but does not derive nutrition or moisture from them. Majority of orchids are epiphytes. All epiphytic orchids and Vanda (a genus in the Orchid family) have a spongy tissue called velamen which is made up of multiple epidermis that covers the roots. Their roots are aerial and can perform photosynthesis by absorbing moisture and carbon dioxide from the air. Epiphytes are not parasites as epiphyte does not absorb nutrients from the host plant, unlike parasites.

215. Large, empty colourless cells of the adaxial epidermis along the veins of grass leaves are

(a) Bulliform cells
(b) Lenticels
(c) Guard cells
(d) Bundle sheath cells

NEET-2020 Phase-II

Ans. (a) : During times of stress, bulliform cells assist in the rolling of leaves to avoid water through transpiration.

- Bulli form cells or motor cells are large, bubble shaped epidermal cell that occur in group on the upper surface of the leaves of many monocots. These cells are present on the upper (adaxial) surface of the leaf.

216. Dumb-bell shaped guard cells are found in

(a) Vinca (b) Beetle
(c) Pea (d) Grass

AP EAMCET-24.09.2020 Shift-II

Ans. (d) : Dumb-bell shaped guard cells are found in Grasses. Grasses are monocotyledons and are classified as either Gramineae or Poaceae. Cereals including wheat, rice, corn, barley, millets etc.

217. Which one of the following codons will NOT pair with anticodon of t-RNA ?

(a) AUU (b) UAG
(c) UUU (d) CUC

MHT CET-06.10.2020 Shift-I

Ans. (b) : UAG UAA UGA stops condons in genetic code. They are also called non sense or termination codon as they do not code for any amino acid.

218. Xylem translocate

(a) Water and mineral salts only
(b) Water, mineral salts and some organic nitrogen only
(c) Water, mineral salts, some organic nitrogen and hormones
(d) Water only

NEET-2019

Ans. (c) : Xylem is transport water and minerals, it also translocates organic nitrogen and some hormones in a plant.

- Xylem parenchyma is irregular shape and main function storage of food.
- Vessel is a non-living, thick walled and it play vital role in translate of H_2O.

219. Phloem in gymnosperms lacks:

(a) Sieve tubes only
(b) Companion cells only
(c) Both sieve tubes and companion cells
(d) Albuminous cells and sieve cells

NEET-2019

Ans. (c): The sieve element is a sieve cell in gymnosperms and other primitive vascular plants, while the associated cell is referred to as in albuminous cells.
The sieve tube and the associated cells are absent from the phloem of gymnosperm, instead, they have sieve cells for the conduction of dietary material.

220. _____is composed of single layer of barrel shaped parenchymatous cells and forms a complete ring around the stele.

(a) Endodermis (b) Rhizodermis
(c) Epidermis (d) Epiblema

SRM JEEE-2018

Ans. (a) : Endodermis is composed of single layer of barrel shaped parenchymatous cells and forms a complete ring around the stele.

221. In which type of vascular bundles are Xylem and Phloem present at the same radius?

(a) Radial (b) Closed
(c) Conjoint (d) Exarch

Karnataka CET-2018

Ans. (c) : Vascular bundle with phloem and xylem present on the same radius is called conjoint. Xylem and phloem are collectively known as vascular bundles. Xylem transport water and minerals from the roots to the entire plant body while phloem has the responsibility to transport the organic food inside the body of the plant.

222. The vascular cambium normally gives rise to

(a) Phelloderm (b) Primary phloem
(c) Secondary xylem (d) Periderm

NEET-2017

Ans. (c) : Vascular cambium gives rise to secondary xylem and secondary phloem during secondary growth.

- Vascular cambium is a layer of meristmatic tissue which is present between the primary xylem and primary phloem.
- Phelloderm is formed by cork cambium.

223. Which of the following is made up of dead cells?

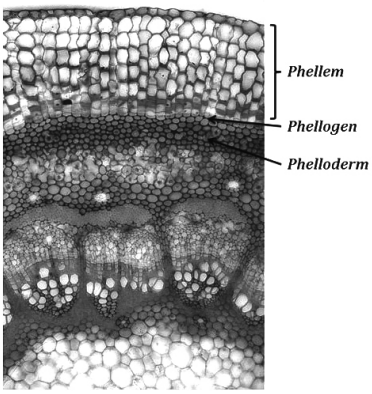
(a) Xylem parenchyma (b) Collenchyma
(c) Phellem (d) Phloem

NEET-2017

Ans. (c) : Phellem or cork is a tissue formed on the outer side of the cork cambium. It is composed of dead cells and is impermeable to water due to suberization.

- **Xylem parenchyma** is the only xylary element which consists of living cells.
- **Collenchyma** are living cell having thick deposits of cellulose in their cell walls.
- Phloem are living components of vascular bundles.
- However in xylary elements, tracheids, vessels and fibers are non-living components while parenchyma are living.
- Phloem consists of living components like companion cells, sieve tube cells and parenchyma cells but phloem fibers or bast fibers are dead elements.

@apna_pdf



Formation of Periderm

224. Multiple epidermis on dorsal and ventral side of the leaf is found in

(a) Zea mays (b) Triticum aestivum
(c) Mangifera indica (d) Nerium oleander

CG PMT-2007

Ans. (d) : In nerium leaf multi layered numerous small opening called stomata are found in the epidermal layer of the leaves stomata are found in most abundance in the lower epidermis of the dorsiventral leaf they are sometimes together absent.

225. A vascular bundles without pith is

(a) Protostele (b) Siphonostele
(c) Solenostele (d) None of these

BCECE-2008

Ans. (a) : A vascular bundle is without pith is called protostele, which consists of xylem and surrounded by phloem and pericycle. Protostele is most primitive stele it consists of a solid core of xylem surrounded by the phloem and the pericycle. Protostele is a type of stele, in which the vascular tissue in the stem forms a solid core, with no central pith.

226. A few drops of sap were collected by cutting across a plant stem by a suitable method. The sap was tested chemically. Which one of the following test results indicates that it is phloem sap?

(a) Acidic
(b) Alkaline
(c) Low refractive index
(d) The absence of sugar

NEET-2016 Phase-II

Ans. (b) : The phloem sap is alkaline in nature with pH ranging from 7.3 – 8.5 and contains high levels of K^+ and Mg^{2+}. Hence the chemical test for alkalinity will help to identify that the exudated sap is phloem sap, as protons are pumped from companion cells to the neighbouring cells for the translocation of the sugars.

227. Meristematic tissue in vascular bundle is

(a) phellem
(b) procambium
(c) interfascicular cambium
(d) fascicular cambium

JIPMER-2008

Ans. (d) : The cambium present between the xylem and phloem of the vascular bundle is called vascular fascicular cambium. The vascular cambium is the main growth tissue in the stems and roots of many plants, specifically in dicots such buttercups and oak trees, gymnosperms such as pine trees, as well as in certain other vascular plants.

228. Opening and closing of stomata is due to the : -

(a) Hormonal change in guard cells
(b) Change in Turgor pressure of guard cells
(c) Gaseous exchange
(d) Respiration

AIPMT-2002

Ans. (b) : Opening and closing of stomata take place due to turgor pressure that changes in guard cells. As the solute particles enter the guard cells from the epidermal and mesophyll cells, both the osmotic potential and the water potential of the guard cells get lowered and potassium ions (K^+) enter the guard cells. This creates a water potential gradient which makes the water moves towards the guard cell, it creates a hydrostatic pressure in the guard cell and thus becomes turgid and swell in size which causes stomata opening. With a decline in guard cells solutes, water moves out of the guard cells, making them flaccid, this occurs because potassium ions move back out of the guard cell, so stomata closed.

229. Peroxisomes are found in

(a) bundle sheath (b) endosperm
(c) mesophyll cells (d) vascular bundles

Manipal-2010

Ans. (c) : Peroxisomes found in all eukaryotic cells. It is small organelles found in the photosynthetic mesophyll cells in plant. They play vital role in the process of photorespiration. These are also involved in metabolism, development, and responses to stresses. Peroxisomes are the sole site of fatty acid β- oxidation in plant cells.

230. Idioblasts are specialized, non-green large sized

(a) Sclerenchyma cells
(b) Parenchyma cells
(c) Colenchyma cells
(d) Aerenchyma cells

UP CPMT-2013

Ans. (b) : Idioblasts are specialized, non-green large sized parenchyma cells. It is a type of simple permanent tissue that makes a major part of ground tissues in plants, where other tissues such as vascular tissues are embedded.

231. Non-cellular layer that connects inner surface of the epithelial tissue to the connective tissue is

(a) Endodermis
(b) Cuticle
(c) Connective tissue
(d) Basement membrane

UP CPMT-2013

Ans. (d) : Epithelial tissue is separated from the underlying tissue by a non-cellular layer called the basement membrane. The basement membrane is a thin, non-cellular tissue with blood vessels present underneath on which the epithelium sits.

@apna_pdf

232. At maturity the sieve plates become impregnated with

(a) Cellulose (b) Pectin
(c) Suberin (d) Lignin
(e) Callose

BCECE-2012
Kerala PMT-2009

Ans. (e) : Sieve elements are " semi - alive" at maturity. They lose their nucleus and other organelles but other organelles but retain the endoplasmic reticulum, mitochondria and plastids.

233. Periderm is formed by

(a) phellem (b) phelloderm
(c) phellogen (d) All of these

JCECE-2014, 2010

Ans. (d) : The periderm is a protective tissue that is formed during secondary growth in the stems, branches and roots of most dicotyledons and gymnosperms. Periderm composed of phellem, phellogen and phelloderm.

- Phellem are also called suberized cells which develop outside of the plant. They protect plants from the penetration, ingestion by animals, temperature changes, excessive evaporation etc.
- Phellogen is also called cork cambium and it is the meristematic layer that is responsible for the development of periderm.
- The phelloderm are the parenchyma cells, which are derived from the phellogen.

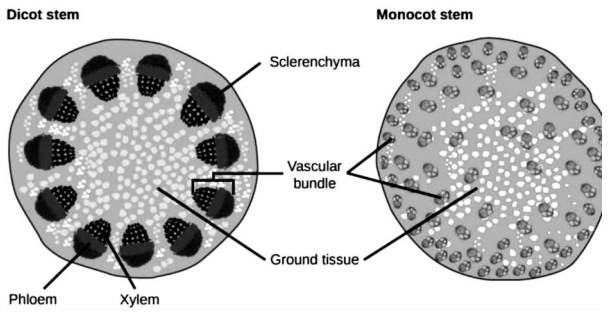
234. Vascular bundles in monocotyledons are considered closed because:

(a) Cambium is absent
(b) There are no vessels with perforations
(c) Xylem is surrounded all around by phloem
(d) A bundle sheath surrounds each bundle

AIPMT-2015

Ans. (a) : Vascular bundles in monocotyledons are considered as closed because cambium is absent in the vascular system and thus they lack secondary growth in the thickness.

• The xylem and phloem are the two vascular tissues found in plants. Xylem is specialized tissue that involves in the water transportation and movement of nutrients from root to tip of the leaves of a plant. The xylem is present in the inner surface and phloem in the outer surface and cambium is not present in monocot plants.



235. Tracheids differ from other tracheary elements in

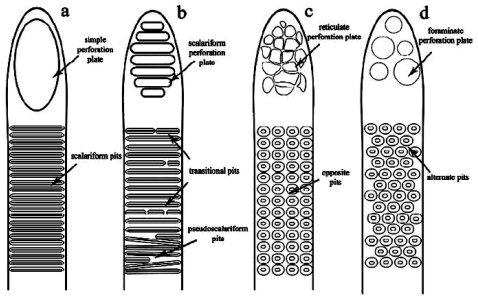
(a) having casparian strips
(b) being imperforate
(c) lacking nucleus
(d) being lignified

AIPMT-2014

Ans. (b) : Tracheids and vessels are two type of Tracheary elements of xylem tissue. The main function of treachery elements is ascent of sap. Tracheids have imperforated cells thus keeps the sap longer in them while vessels are highly perforated. Example-

1. Simple
2. Scalariform
3. Reticulate
4. foraminate.

Vessels have various types of perforations. As there is no perforations in tracheids the cells are less sufficient for transportation while vessels are more sufficient in carrying the sap.

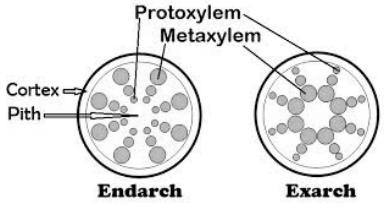


236. You are given a fairly old piece of dicot stem and a dicot root. Which of the following anatomical structures will you use to distinguish between the two?

(a) Secondary xylem (b) Secondary phloem
(c) Protoxylem (d) Cortical cells

AIPMT-2014

Ans. (c) : Protoxylem develops during the primary growth of a plant. In stems the protoxylem lies towards the centre (pith) and the **metaxylem lies towards the periphery**. This type of primary xylem is called **endarch**. In root, the protoxylem lies towards periphery and metaxylem lies towards the centre, such arrangement is called **Exarch**.



237. A common structural feature of vessel elements and sieve tube elements is-

(a) Thick secondary walls
(b) Pores on lateral wall
(c) Presence of P-protein
(d) Enucleate condition

JCECE-2013
AIPMT-2006

@apna_pdf

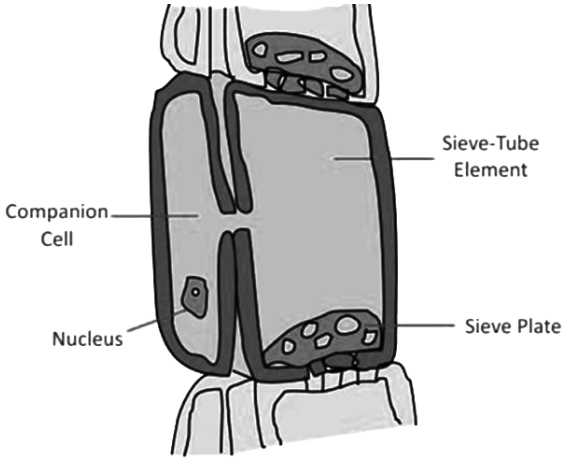
Ans. (d) : Vessels are a part of xylem whereas sieve tube is an element of phloem. The water- conducting xylem vessel elements are dead but sieve tube elements are living cells. They lose their nucleus on maturity and attain the enucleate condition. So, the common structural feature of vessel elements and sieve tube elements is enucleate condition.

238. In the sieve elements, which one of the following is the most likely function of P-proteins ?

(a) Deposition of callose on sieve plates
(b) Providing energy for active translocation
(c) Autolytic enzymes
(d) Sealing mechanism on wounding

AIIMS-2006

Ans. (d) : Phloem protein is another name for P-protien. The most important **function of P-protein is the sealing mechanism on wounding**. They generally play a role during an unfavorable condition where they quickly aggregate at the sieve plate to form a clot when the sieve element is disrupted. It prevents the flow of the phloem sap.

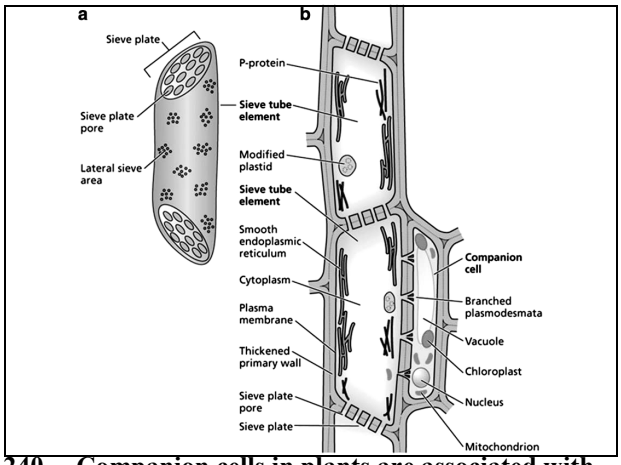


239. Which one of the following statements pertaining to plant structure is correct?

(a) cork lacks stomata, but lenticels carry out transpiration
(b) passage cells help in transfer of food from cortex to phloem
(c) sieve tube elements possess cytoplasm but no nuclei
(d) the shoot apical meristem has a quiescent centre

AIIMS-2005

Ans. (c) : Sieve tube elements are the relative type of phloem cells found is angiosperms. Mature sieve tube elements are deep, tublar and do not contain nucleus in the cells with no secondary wall and terminal sieve plate.

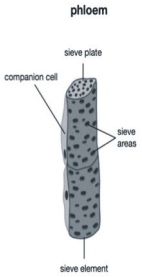


240. Companion cells in plants are associated with

(a) Vessels (b) Sperms
(c) Sieve elements (d) Guard cells.

AIIMS-2004

Ans. (c) : Companion cells are present in the phloem tissue of the flowering plant. This tissue is a special type of parenchyma cells. These cells are closely associated with the sieve tubes elements. They are connected via cytoplasm of companion cells and plasmodesmata.



241. A narrow layer of thin walled cells found between phloem/bark and wood of a dicot is

(a) cork cambium (b) vascular cambium
(c) endodermis (d) pericycle.

AIPMT-1993

Ans. (b) : A narrow layer of thin walled cells found between phloem/bark and wood of a dicot is vascular cambium. Vascular cambium helps in secondary growth in dicot root and stem.

242. A bicollateral vascular bundle is characterised by

(a) phloem being sandwiched between xylem
(b) transverse splitting of vascular bundle
(c) longitudinal splitting of vascular bundle
(d) xylem being sandwiched between phloem.

AIPMT-1992

Ans. (d) : Bicollateral vascular bundle is characterized by the xylem being sandwiched between phloem. Here two patches of phloem found on either side of xylem. These types of bundles occur in cucurbitaceae.

243. Amphivasal or leptocentric vascular bundles are found in

(a) Maize and wheat
(b) Helianthus and Cucurbita
(c) Dracaena and Yucca
(d) Cycas and Dryopteris

JIPMER-2002

@apna_pdf

Ans. (c) : When xylem surrounds the phloem tissue from all sides the vascular bundle is called as 'amphivasal or leptocentric vascular bundle'. Such vascular bundles are seen in monocot plant, like Dracaena and Yucca. Bicollateral vascular bundles are seen in Helianthus and Cucurbita.
Maize and wheat-collateral closed vascular bundles.
Cycas and Dryopteris - Amphicribal vascular bundles.

244. A component of xylem is
(a) sieve tube (b) medullary ray
(c) sclereid (d) tracheid

CG PMT-2005

Ans. (d) : Xylem consists of tracheids, vessels, parenchyma, and fibers. Vessels consist of vessels elements joined together in files by large perforation plates, large gaps in the end walls between successive vessel elements, while tracheids have tapering ends that overlap with adjacent cells, and lack perforation plates.

245. Plasmodesmata is usually observed between
(a) Sieve tubes and Bast fibre
(b) Trachea and Phloem fibres
(c) Xylem parenchyma and xylem fibres
(d) Sieve tubes and companion cells

Karnataka CET-2013

Ans. (d) : Phloem is a complex tissue that helps in the conduction of food from the leaves to other parts of the plant. Sieve tubes and companion cells are integral components of phloem. Sieve tubes have no cell nucleus, ribosomes, or vacuoles. Thus, they depend on companion cells. So, plasmadesmata connection is usually observed between Sieve tubes and companion cells and it help is the translocation of food.

246. Cotton is :
(a) epidermal tissue system
(b) vascular tissue system
(c) meristematic tissue system
(d) ground tissue - system

DUMET-2002
Punjab MET-2011

Ans. (a) : Cotton is obtained from the epidermal tissue system. This system forms the outermost layer or surface of the entire plant body. The cotton is soft, fluffy, unicellular epidermal lint hair or fibers that grow out around the seed of the cotton plant. The cotton fibers are made up of cellulose.

247. Damaged sieve tubes are sealed by deposition of:
(a) pectin (b) callus
(c) suberin (d) lignin

DUMET-2004

Ans. (b) : Damaged sieve tubes are sealed by deposition of callus. Lignin is an organic compound of high carbon content. The impregnation with lignin usually starts in the intercellular lamella and then spreads centripetally through the primary and secondary walls e.g., xylem cells. Pectic substances (protopectin, pectin, pectic acid) constitute the intercellular substance that binds together the wall of individual cells. Suberin occurs in association with cellulose in cork cells of periderm, endodermis and exodermis of many plants.

248. In bicollateral vascular bundle the tissues found from out to inner side will be:
(a) outer phloem, outer cambium, xylem, inner cambium and inner phloem
(b) outer phloem, inner phloem, outer cambium, inner cambium, xylem
(c) all of above
(d) none of the above

Rajasthan PMT-1997

Ans. (a) : Bicollateral vascular bundles have xylem and phloem present on the same radius and phloem is found on both the sides of xylem. Apart from phloem, vascular cambium is also present on both the sides of the xylem.

249. Casparian strip is found in:
(a) vascular bundle
(b) between stem and root
(c) radial and inner wall of endodermis
(d) none of the above

AMU-2011
Rajasthan PMT-1997

Ans. (c) : Casparian strips are the ring-like cell wall modifications found in the root of the endodermis of vascular plants. It acts as a barrier to harmful chemicals like herbicides.
• It is found in the radial and inner wall of endodermis. Endoderm forms the central and innermost layer of cortex in terrestrial plants.

250. The term leptome is used for
(a) xylem (b) phloem
(c) endodermis (d) pericycle

Rajasthan PMT-2003

Ans. (b) : Term Leptome is used for phloem by Haberlandt. It has function similar to phloem is higher plants i.e. conduction of food material.

251. Mature sieve tube lacks :
(a) nucleus
(b) nucleus and chloroplast
(c) nucleolus and ER
(d) all of the above

Rajasthan PMT-2001

Ans. (a) : Sieve tubes are thin, walled living cells made up of sieve tube elements. Its cytoplasm lacks nucleus.
• Sieve tube element develops from a common initial cell along with companion cell (with nucleus).

252. Angiospermic companion cell is associated with :
(a) sieve tube
(b) vessels
(c) tracheids
(d) gymnospermic tracheids

Rajasthan PMT-2001

Ans. (a) : Companion cells are characteristic components of phloem tissue, which are closely associated with the sieve tubes (sieve elements) in the angiosperms. Both are linked ontogenically, as they originate from the same mother cell. The sieve tubes and companion cells maintain close cytoplasmic connections via plasmodesmata.

@apna_pdf

253. Removal of ring wood of tissue outside the vascular cambium from the tree trunk kills it because

(a) water cannot move up
(b) food does not travel down and roots become starved
(c) shoot become starved
(d) annual ring are not produced

BVP-2008
UPCPMT-2002

Ans. (b) : If a ring of tissue outside vascular cambium is cut then secondary phloem is removed sugars cannot travel from aerial photosynthesizing parts of plants to roots which are non photosynthetic. Consequently roots are killed and the plants dies.

254. Pith is absent in

(a) Protostele (b) Eustele
(c) Amphiphloic stele (d) Ectophloic stele

WB JEE-2008

Ans. (a) : Protostele is a type of stele in which the vascular tissue in the stem forms a solid core, with no central pith.

• The stele without pith is protostele, which consists of a solid core of xylem surrounded by the phloem and pericycle. The protostele is most primitive stele.

255. One of the characteristic of sieve tube is

(a) It is a part of phloem
(b) Function is transport of inorganic solutes
(c) It is dead cell
(d) Sieve plate is not present

WB JEE-2008

Ans. (a) : Phloem is composed of sieve tubes, phloem parenchyma, phloem fibres and sclereids. It is a food conducting tissue. Sieve tubes are tubular cells with perforated cells. They are living but do not have a nucleus.

256. In the following pairs, where do you get lignin in both the element?

(a) Tracheid and collenchyma
(b) Sclerenchyma and sieve tube
(c) Sclerenchyma and trachea
(d) Parenchyma and endodermis

WB JEE-2008

Ans. (c) : The walls of sclerenchyma and the walls of xylem cells are lignified. This allows the xylem to withstand pressure changes as water moves through the plant. Sclerenchyma provides mechanical strength to plants. On maturation the cell walls become strong, rigid and impermeable to water due to the thick deposition of lignin.

257. A distinguishing feature of latex cells is that they are

(a) single-celled elements with anastomosing (fusing) branches
(b) single-celled elements with non anastomosing branches
(c) multi-celled elements with anastomosing branches
(d) multi-celled elements with non anastomosing branches

AMU-2014

Ans. (b) : Latex cells also called as non-articulate latex ducts means they do not make joint.

Latex cells are single or independent units with non-anastomosing branches. They originate as minute structures and then, with the growth of the plant, elongate and branch, ramifying in all directions through the tissues of the plant, but without fusing together it forms a network as in calotropis stem. *Nerium odorum, Thevitia nerifatolia*.

258. Amphivasal vascular bundles are found in the stem of:

(a) Beta (b) Cucurbita
(c) Dracaena (d) Boerhaavia

AP EAMCET-1998
JIPMER-1998

Ans. (c) : Amphivasal vascular bundles are found in the stem of Dracaena. A vascular bundle in which xylem encircles the central strand of phloem is known as amphivasal bundle, also called leptocentric bundle. Ex. Dracaena and Yucca.

259. Which of the following have living cytoplasm?

(a) Vessels (b) Tracheids
(c) Sclerenchyma (d) Companion cells

VMMC-2011

Ans. (d) : The companion cells are thin walled elongated specialised parenchymatous cells which are closely associated with sieve tube elements through compound plasmodesmata.

260. Stomata are also called as:

(a) stomates (b) lenticels
(c) hydathods (d) bark

Rajasthan PMT-2004

Ans. (a) : Stomata are structure present in the epidermis of leaves, each stomata regulate the process of transpiration and gaseous exchange.

• Stomata are usually found in plant leaves but they can also be found in some stems.

261. Epidermis and epiblema develops from:

(a) phellogen (b) periderm
(c) protoderm (d) calyptrogen

BHU PMT-2002

Ans. (c) : Epidermis and epiblema develops from protoderm cells are long give rise 1° vascular bundle 1° xylem, 1° phloem Intra fascicular cambium.

• Periderm the cork cells are phellom cork cells are phallogen secondary cortex or phelloderm jointly called the periderm.

262. Endodermis is a part of:

(a) pericycle (b) cortex
(c) epidermis (d) none of these

Rajasthan PMT-1996

Ans. (b) : Endodermis is a part of cortex the ground tissue found beneath the epidermis which surrounds the central cylinder and is delimited from the cylinder by the endodermis is called the cortex.

Pericycle → Pericycle absent in monocot stem and outer most layer of the stele found below the epidermis.

@apna_pdf

263. The cotton thread fibres are
(a) fibres taken out from stem
(b) epidermal hairs of seed
(c) epidermal hairs of fruits
(d) fibres taken out from roots

UP CPMT-2010

Ans. (b) : : Fibre elongated end wall tapering lignified lumen empty.
• Cotton thread fibres obtained from *Gossypium arboreum* and *G. herbaceum* found in seed surface.
• Cotton fibers are natural hollow fibers: They are soft, Cool, Known of breathable fibers and absorbent.

264. Which of the following is a calcium carbonate?
(a) Raffides (b) Druces
(c) Cystolith (d) All of these

AFMC-2000
UP CPMT-2010
BHU PMT (Screening) 2007

Ans. (c) : Calcium corbonate is found in cystolith. The crystals of $CaCO_3$ called the cystolith and cells called lithocyte the crystals of calcium oxalate in the form of needles called Raphides and in the form star and druses.

265. Two cross-sections of stem and root appear simple, when viewed by naked eye. But under microscope the can be differentiated by
(a) exarch condition of root and stem
(b) endarch condition of stem and root
(c) endarch condition of root and exarch condition of stem
(d) endarch condition of stem and exarch condition of root

AMU-2005
Manipal-2004

Ans. (d) : In endarch condition when Protoxylem lies towards the centre and metaxylem towards the pheriphery the condition of xylem is called endarch as stem.
• Exarch→ When protoxylem lies towards pheriphery and metaxylem towards the centre condition is called exarch as root.

266. Protoxylem lacunae occur in
(a) cladodes
(b) underground stems
(c) vascular bundles of grass stem
(d) climbers

BHU PMT (Mains)-2009

Ans. (c) : Protoxylem lacuanae occur in vascular bundles of grass stem. In the protoxylem of monocot vascular bundles some of the protoxylem cells disintegrate and form in to a lysogenous cavity called protoxylem lacunae. It stores water so it is also called water cavity.

267. Periblem forms : (1) endodermis (2) epidermis (3) cortex (4) cuticle
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2005

Ans. (d) : Endodermis:- This is uniseriate layer of cells delimiting the cortex from stole. It consists of barrel shaped cells arranged quite close to each other having no inter cellular spaces amoung them. The cells are endodermis and elongated and arranged parallel to the long axis of the vascular tissue.
Function of endodermis:- There is great controversy about the function of the endodermis storage of starch grain.
Cortex generally is present in dicot stem, ground stem, and monocot stem. Cortex in the root, Extends from hypodermis to the endodermis, multilayered thin walled parenchymatous living cells.

268. Select the correct match from the table.

List I	List II
1. Epidermis	A. Outermost layer of parenchyma covered by a thin cuticle
2. Hypodermis	B. Immediately below the vascular bundles
3. Ground tissue	C. Parenchymatous cells enclosed by the hypodermal layer
4. Vascular bundles	D. Scattered in the hypodermis

(a) 1,2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2011

Ans. (d) : Epidermis:- The epidermis usually consists of single layer of cells which cover outer surface of the plant body.
Hypodermis-: Found below the epidermis few layered in herbaceous dicot stem consist of collenchyma.
Ground tissue:- The ground tissue derived from the ground meristem are plerome and periblem of embryonal layers.
Vascular bundle:- Part of the transport system is vascular plants.

269. For a successful graft, the adhesion between the scion and stock is essential. In your view which of the following is the earliest event towards a good graft?
(a) Production of plasmodesmata in the cells at the interface of scion and stock
(b) Co-ordinated differentiation of vascular tissue between the stock and scion
(c) Regeneration of cortex and epidermis over the union of stock and scion
(d) Production of callus tissue between the cells of scion and stock

JIPMER-1998

@apna_pdf

Ans. (b) : For a successful grafting the adhesion between the scion and stock is essential.Stock is a rooted stem in to which a scion orbed is grafted and the portion of the mixture provides the root.
Scion is living plant component that is detached and grafted to the stalk during the grafting process.

270. A common feature shared by guard cells and mesophyll cells is:
(a) presence of chloroplasts
(b) dumb – bell shaped structure
(c) differentially thick cell wall
(d) uniformly thin cell wall

Karnataka CET-2002

Ans. (a) : The chloroplast present in both, guard cells and mesophyll cells. When environmental conditions change, guard cells can rapidly change shape so that the pores open or close to control leaf gas exchange and water transpiration.
Mesophyll cells are parenchyma cells between the upper and lower epidermis specialized for photosynthesis.

271. Which of the following does not have stomata?
(a) Hydrophytes
(b) Mesophytes
(c) Xerophytes
(d) Submerged hydrophytes

AFMC-2002

Ans. (d) : Submerged plants (e.g. Hydrilla, vallisneria, potamogeton do not have stomata, and they are dependent on epidermal cells to absorb all nutrients and gases that dissolved in water. In hydrophytes exchange of gases takes place directly by the plant body cells.
• Such plants do not need stoma for this purpose. Hence underwater plants do not have stomata.

272. Which combination of tissues acts together to provide the support to the hypocotyl of a seedling?
(a) Epidermis and collenchyma
(b) Xylem and parenchyma
(c) Epidermis and parenchyma
(d) Xylem and phloem fibres

HP CET-2011

Ans. (a) : The hypocotyl refers to the Germinating seeding stem which is normally found underneath the seed leaves but above the roots. The hypocotyl grows in response to light stimulation and gradually develops into the stem. Mechanical strength to hypocotyls of seeding is provided by epidermis and collenchymas tissues.

273. The sclerenchyma of the hypodermis in the Pinus needle helps in:
(a) increasing the absorptive surface of the cell
(b) checking transpiration
(c) mechanical support
(d) photosynthesis

HP CET-2011

Ans. (c) : Sclerenchyma provides mechanical support in the pinus needle as it has thick walls. Sclerenchyma may be fibres or sclereoid. The epidermis is covered on the outside by a thick cuticle, which helps in checking transpiration. The parenchymatous mesophyll consists of thin walled cell which contain numerous chloroplasts and thus photosynthetic in function.

274. The epidermal hairs present on the stem of the plant is called
(a) trichomes (b) root hairs
(c) stomata (d) guard cells

J&K CET-2014

Ans. (a) : The epidermal hairs present on the stem of the plant is called trichomes. The roots hairs are unicellular, elongated of the epidermal cells and helps to absorb water and minerals from the soil on the stem.

275. Lenticels are involved in
(a) Photosynthesis
(b) Food transport
(c) Conduction of water
(d) Transpiration
(e) Gaseous exchange

Kerala PMT-2015

Ans. (e) : Its function as a pore providing a pathway for the direct exchange of gases. Lenticles are involved in gaseous exchange lenticles is porus tissue consisting of cells with large intercellular space in the periderm of the secondary thickened organs and bark of woody stem of flowering plants.

276. Vascular tissues in flowering plants develop from
(a) phellogen (b) plerome
(c) periblem (d) dermatogens

BHU PMT (Screening)-2010
AIPMT-2008

Ans. (b) : Plerome:- Lies in the centre, it give rise stele including pericycle pith or medulla pith rays or medullary rays and vascular bundle. The part of the plerome from which vascular tissues are fashioned is known as procambium.

277. In respect of many grasses, the presence of motor cells in the upper epidermis of leaves is to
(a) increase the surface area of the leaf
(b) store large amounts of water
(c) check transpiration by reducing the surface area of the leaf
(d) bear unicellular trichomes

AMU-2011

Ans. (c) : Bulliform cells or motor cells are large bubble shaped epidermal cells that occur in groups on the upper surface of the leaves of many grasses.
• The upper epidermis typically has only about half the density of stomata that occur on the lower epidermis, so while transpiration does occur across the upper epidermis, not as much occurs as across the lower.

278. Piliferous layer in the root is
(a) epidermis (b) pericycle
(c) cortex (d) endoderics

AMU-2011

@apna_pdf

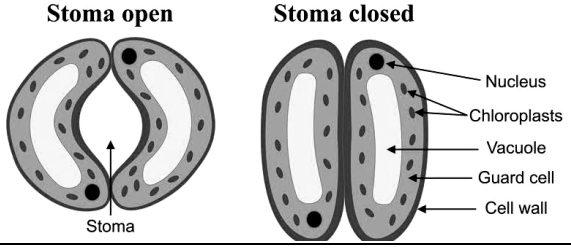
Ans. (a) : Epidermis:- Piliferous layer is the part of the root epidermis, that bears root hairs. It extends over a region about 410 nm behind the root tip. Beyond this the piliferous layer is sloughed to reveal the hypodermis.

279. Stomatal opening or closing is due to

(a) change in the turgidity of guard cells
(b) the inner walls of each guard cells is thick and elastic
(c) cellulose microfibrils of guard cells are oriented radially
(d) All of the above

AMU-2010
JCECE-2006
AIPMT-2002

Ans. (d) : The immediate cause of the opening or closing of stomata is a change in the turgidity of the **guard cells.** The inner wall of each guard cell, towards the pore or **stomatal aperture,** is thick and elastic. When turgidity increases within the two guard cells flanking each stomatal aperture or pore, the thin outer walls bulge out and force the inner walls into a crescent shape. The opening of the stoma is also aided due to the orientation of the microfibrils in the cell walls of the guard cells. Cellulose microfibrils are oriented radically rather than longitudinally making it easier for the stoma to open.



280. Cuticle is

(a) A cellular layer on epidermis, which is visible and found in most organ
(b) A cellular layer on epidermis which is visible or invisible, found in all organs
(c) A cellular layer on epidermis of dead cells
(d) A layer on epidermis which is dead and visible or invisible.

VMMC-2007
UPCPMT-2002
AMU-1998

Ans. (a) : A leaf is covered by on both surface by a single layered epidermis. The outer walls of the epidermis are usually thickened and covered with a waxy substance called citin. The outer surface of the epidermis are frequently covered with a thin or thick cuticle.

281. Northern blotting is used for:

(a) DNA transfer (b) RNA transfer
(c) protein transfer (d) all of these

HP CET-2013

Ans. (b) : A northern blot is a laboratory method used to detect specific RNA molecule among a mixture of RNA Northern blotting can be used to analyze a sample of RNA form a particular issue or cell type in order to measure the RNA expression of particular genes.

282. In soil, water available for plants is:

(a) capillary water
(b) hygrosopic water
(c) gravitational water
(d) chemically bound water

HP CET-2013

Ans. (a) : In soil water available to the plants is capillary water. Capillary water makes up to about 75% of the total water available to plants, it is held in the small pores of the soil. It is readily available to plants for absorption by roots.

283. Which of the following is a part of a epidermal layer?

(a) Guard cell (b) Root hair
(c) Trichomes (d) All of the above

Rajasthan PMT-1998

Ans. (d) : The part of epidermal layer is guard cells, trichomes and root hair. Guard cells surrounded by special modified epidermal cells called subsidiory or accessory cells which protect guard cells.
Trichomes occur on the shoot trichomes either unicellular as *Cannabis Sativa* mostly multicellular which may be unbranched as sunflower.

284. The shapes of stomata in Cynodon dactylon (doob) is :

(a) oval (b) heart shaped
(c) dump-bell shaped (d) none of these

Rajasthan PMT-1998

Ans. (c) : In monocot like doob grass (cynodon dactylon) and maize etc. Guard cells are dumb bell shaped. The guard cells are living and contain chloroplast.

285. The most primitive type of stele is

(a) eustele (b) solentstele
(c) protostele (d) siphonostele

UP CPMT-2001

Ans. (c) : The most protostele is given by jafferey pith is absent. It is following type.
Haplostele:- The central soild pore of xylem is smooth as selaginella crausina.
Actinostele:- That is star shaped surrounded by phloem and pericycle as lycopodium serratum and lycopodium psilotum.

286. In which of the following tissue is the matrix not a product of synthesis of its cells?

(a) Vascular tissue
(b) Osseus tissue
(c) Loose connective tissue
(d) Adipose tissue

Karnataka CET-2003

Ans. (a) : Vascular tissue:- Central column of axis (root and stem) is called stele, which is made of vascular bundle which constitute of vascular tissue system. Loose connective tissue and fibres loosely arranged in a semifluid ground substance that is. e.g. areolar tissue.

287. Ectophloic siphonostele is found in

(a) Adiantum and Cucurbitaceae
(b) Osmunda and Equistem
(c) Marsilea and Botrychium
(d) Dicksonia and Maiden hair fern

AMU-2007

@apna_pdf

Ans. (b): Ectopholic siphanostele is found osmunda and equistem.

288. In a plant organ which is covered by periderm and in which the stomata are absent, some gaseous exchange still takes place through :
(a) aerenchyma (b) trichomes
(c) pneumatophores (d) lenticels

Haryana PMT-2004

Ans. (d) : Lenticles : In place of cork cells complementary cells are thin walled, Parenchymatous loosely arranged have large intercellular spaces, due to increase of number of complementary cells, epidermis ruptured lens core is formed called lenticles exchange of gases occur.

289. The sugarcane plant has :
(a) dumb-bell shaped guard cells
(b) pentamerous flowers
(c) reticulate venation
(d) capsular fruits

Haryana PMT-2004

Ans. (a) : The sugarcane has dumb-bell shaped guard cells in their stomata. Reticulate venation capsular fruits and pentamerous flowers are a characterstic feature of dicotyledonus plant.

290. Stele comprises consists
(a) xylem, phloem and pith
(b) endodermis, xylemand phloem
(c) vascular tissue, pericycle and pith
(d) vascular tissue, endodermis and pith

Manipal-2013

Ans. (c) : According to concept hypothesis of stele proposed by van Tieghem, the stele consists of vascular tissue, ground tissue or pith and a pericycle. The primary body of root and stem are anatomically same i.e. consist of central stele surrounded by cortex. The stele was oriented in first vascular plant (pteridophytes) and it consist of vascular tissue pericycle and pith pericycle surrounds the stele on the outer side.

291. Which one is responsible for opening and closing of stomata?
(a) Rise in pH of guard cell causes hydrolysis of starch
(b) Cytokinins and cAMP are requireds
(c) Absicisic acid promotes closure
(d) All of the above

VMMC-2008
AMU-2008

Ans. (d) : The opening and closing of stomata is regulated by the integration of environmental signals and endogenous hormonal stimuli. When there is the rise in pH it causes hydrolysis of starch into sugar which accumulates in guard cell which result in the opening of cell for this mechanism cytokinins and CAMP are required.

• Abscisic acid is the stress hormone which results in the close stomata.

292. The monocotyledonous seed consists of one large and shield shaped cotyledon known as a/an
(a) Coleoptile (b) Scutellum
(c) Aleurone layer (d) Coleorhiza

J&K CET-2015

Ans. (b) : Monocotyledonaus seed has embryos that bases only one large cotyledon called scutellum. Generally, the scutellum is shaped like a shield. Its located laterally towards the side of the embryo axis like dicotyledons the embryo axis of monocotyledons process a shoot tip called the plumule.

293. Stomata open at night and close during day time in:
(a) succulents (b) xerophytes
(c) hydrophytes (d) mesophytes

WB JEE-2007
JIPMER-1995

Ans. (a) : In succulent plants like Cacti and Bryophyllum stomata are open during the night, and closed during the day time. This is an adaptation of cutting transpirational loss of water. CAM plants are the succulent plant which grow in deserts and are exposed to high temperature of the stomata are open during the night for carbon dioxide uptake but closed during the day to prevent water loss.

294. Consider the following statements
(1) Copper is present in cytochrome oxidase
(2) Pantothenic acid is the precursor of Coenzyme-A
(3) Thiamine pyrophosphate is the prosthetic group in decarboxylases
(4) Zinc is present in RNA and DNA polymerases
(a) 1, 2 and 3 are correct.
(b) 1 and 2 are correct.
(c) 2 and 4 are correct.
(d) 1 and 3 are correct.

BHU PMT (Mains)-2008

Ans. (b) : Copper is present in cytochrome oxidase Pantathenic acid is precursor of Coenzyme-A is the correct option.

295. Cork cambium is also called
(a) phellem (b) phellogen
(c) phelloderm (d) none of these

AMU-1997

Ans. (b) : Cork cambium also called phellogen.
Phellum is also called cork cells.
Phelloderm is also called secondary cortex.

296. The division of an individual vascular cambial cell results in the formation of
(a) two xylem mother cells
(b) two phloem mother cells
(c) one xylem and one phloem mother cell
(d) one xylem or one phloem mother cell and one cambium cell.

AMU-1997

Ans. (c) : Vascular cambial cell results in the formation of one xylem and one phloem mother cell.
Cell division by the cambium produces xylem and phloem. As secondary phloem and xylem tissue accumulates it both increases the girth of the stem and forms wood and bark.

@apna_pdf

297. Old stem of Combretum has
(a) inter and intra xylary phloem
(b) inter and extra xylary phloem
(c) intra and extra xylary phloem
(d) All of above

AMU-2004
BVP-2003

Ans. (b) : The old stem combretum and entada the cambium shows abnormal behavior by cutting phloem on the inner as well as at certain places for a short period and then resumes normal activity.

298. Velamen of orchids are formed from
(a) phelloderm (b) phellogen
(c) dermatogen (d) cortex

CG PMT-2006

Ans. (c) : Velamen of orchid are formed from dermatogens velamen is spongy multiple epidermis that covers the root of some epiphytic or semi epiphytic plants. Such as orchids and clivia species. Velamen are formed from root dermatogens. The velamen of an orchid is the white or grey covering of aerial roots. It is many layers thick and capable of absorbing atmospheric moisture and nutrients.

299. Which of the following plant shows multiple epidermis?
(a) Croion (b) Allium
(c) Nerium (d) Cucurbita

BHU PMT-2004

Ans. (c) : Plant shows multiple epidermis in Nerium. The epidermis is the outer most layer of the primary plant body, it is made up of elongated compactly arranged cells, which form a continuous layer. Epidermis is usually single layered but in some plants like Nerium and ficus epidermis is multilayered.

300. Atactostele vascular bundles are
(a) Scattered in the ground tissue
(b) Three in number
(c) In form of ring around
(d) Broken vascular bundles

MGIMS Wardha-2011

Ans. (a) : Atactostele is a type of Eustele which has vascular tissue in the stem that exist as scattered bundles, eustele consist of vascular bundles in the form of one or two rings, where as an atactostele contains numerous vascular bundles, which are scattered in ground tissue throughout the stem.

301. Sunken stomata are present in
(a) Mesophyte (b) Xerophyte
(c) Epiphytes (d) All of these

MGIMS Wardha-2011
VMMC-2010
WB JEE-2007

Ans. (b) : Sunken stomata are commonly found in xerophytes. They are plants adopted to grow in desert conditions. Hydrophytes are plants that grow in water mesophytes are terrestrial plants which are adopted to niether a particularly dry not particularly wet environment.

302. Stoma opens, when
(a) guard cells swell due to an increase in their water potential
(b) gaurd cells swell by endosmosis due to influx of hydrogen ions (protons)
(c) guard cells swell by endosmosis due to influx of potassium ions
(d) guard cells swell due to a decrease in their water potential

Manipal-2009

Ans. (d) : When there is light, potassium ions are pumped in which results is lowering of the water potential inside to guard cells. During day time stomata open, the osmotic pressure of the Guard cell become high as comparison to subsidiary cell or surrounding cell. When water inters from low osmotic pressure to high osmotic pressure that is water moves from surrounding cell in to the Guard cell, by endosmosis guard cell become turgid stomata opens.

303. Distinguishing character of closed vascular bundles is
(a) absence of cambium
(b) presence of cambium
(c) presence of xylem and phloem
(d) presence of pith

VMMC-2010

Ans. (a) : A closed vascular bundle means that there is an absence of a cambium they are not capable of forming the secondary xylem and tissue. In monocots the xylem is found within the inner side while the phloem is present outside the xylem and phloem is arranged side by side within the same radius.

304. What happens during vascularisation in plants?
(a) Differentiation of procambium followed by primary phloem and then primary xylem
(b) Differentiation of procambium, xylem and phloem simultaneously
(c) Differentiation of procambium followed immediately by the development of secondary xylem and phloem
(d) Differentiation of procambium followed by the development of xylem and phloem

Haryana PMT-2010

Ans. (d) : Vascular plants grow and develop by the activity of organ forming regions, the growing plant. Development of vascular bundles from Pro- cambium is called as vascularisation. Thin walled elongated procambium strands are produced during the early growth and differenation which is turn immediately diffrenciate in to primary xylem and phloem.

305. Read the following statements choose the correct option.
I. Hydrolysis of starch produce malic acid in guard cells of stomata.
II. Malic acid accumulation results into closure guard cells.
III. Breakdown of malic acid from potassium malate.
IV. This opens the stomata.

@apna_pdf

(a) These sequence of events I to IV are formed in CAM plants
(b) These sequence of events are normal mechanism of stomatal apparatus
(c) The events are characteristics of C_3 and C_4 plants
(d) All statements are wrong

VMMC-2015

Ans. (a) : According to this theory starch converted into the phosphoenolpyruvic acid during the day time with the help of enzyme phosphophenolpyruvate and CO_2. phosphoenol pyruvic acid converted in to oxalo acetic acid which converted in to the malic acid. Malic acid dissociate hydroquinone malate inter in to vacuole of guard cell and hydrogen ions outside of the guard cell. Turgor pressure increase guard cell turgid stomata open.

306. The epidermal trichomes helps in
(a) Transpiration and exchange of gases
(b) Protection from desiccation
(c) Protection and reduction of transpiration
(d) exudes water drops their tips

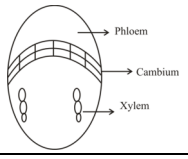
J&K CET-2007

Ans. (c) : The epidermal trichomes help in protection and reduction of transpiration. The epidermal trichome is initiated as a protuberance from an epidermal cell.
• Generally a dense covering of woody trichomes controls the rate of transpiration. They also reduce the heating effect of sunlight.

307. An open collateral bundle is one in which
(a) xylem and phloem are separated by cambium
(b) xylem and phloem lie side by side
(c) cambium occurs on the out side of bundle
(d) cambium does not occur in the bundle

BVP-2014,2012
MGIMS Wardha-2006

Ans. (a) : An open collateral vascular bundle has cambium called fascicular cambium, between xylem and phloem. The bundles can increase in diameter by normal secondary growth with the help of fascicular cambium. So xylem and phloem are separated by cambium.



308. The ground tissue is undifferentiated in:
(a) dicot stem (b) dicot root
(c) monocot stem (d) monocot root

AP EAMCET-2000

Ans. (c) : Ground tissue system:- It consist of thin cell called parenchyma cell having cell defined intercellular spaces among them.
• The tissue extends from below the sclerenchyma (hypodermis) to the center. It is not differentiated in to cortex endodermis pericycle and pith as monocot stem.

309. The extension of pith between the vascular bundles as seen in the transverse section of a young dicot stem is called:
(a) Phloem (b) Medullary ray
(c) Cambium (d) Xylem

AP EAMCET-2000

Ans. (b) : Primary xylem shifted towards the center and primary phloem towards pheriphery and crushed the portion opposite each protoxylem group form pith or medullary ray.

310. Amphivasal vascular bundle possess:
(a) Xylem around phloem
(b) Phloem around xylem
(c) Phloem on both sides of xylem
(d) Phloem towards centre and xylem towards periphery

Rajasthan PMT-2006

Ans. (a) : Amphivasal vascular bundles are a type of vascular bundle found in some plant species. They are characterized by having both xylem and phloem located toward the periphery of the bundle, with the xylem occupying the inner region and the phloem surrounding it.

311. Protoxylem in Selaginella stem is:
(a) endarch (b) mesarch
(c) exarch (d) monarch

AP EAMCET-1999

Ans. (c) : Protoxylem in selaginella stems is a type of primary xylem tissue that develops early in the growth of the plant. Protoxylem refers to the first formed xylem elements or cells in a developing plant organ, such as a stem. In contrast, exarch protoxylem would be positioned towards the periphery or outer region of the stem.

312. Vascular bundles in monocotylendons are considered closed because
(a) xylem is surrounded all around by phloem
(b) there are no vessels with perforations
(c) a bundle sheath surrounds each bundle
(d) there is no secondary growth

JCECE-2015

Ans. (d) : As we know that Vascular bundles in Monocotylendons are considered as closed because cambium is absent due to this, there is no secondary growth in the thickness.

313. A student collected a hydrophyte with swollen and with a single vascular bundle in the root. The plant which he collected was
(a) Jussiaea (b) Trapa
(c) Ceratophyllum (d) Potamogeton

Manipal-2010

Ans. (b) : Hydrophytes grow in water or very wet places. They may be submerged or partly submerged. The vascular bundles in hydrophytes show greatest reduction.

314. The structure which contain vascular bundle and is modification of stem is
(a) bristles (b) thorn
(c) prickle (d) spine

AFMC-2010

Ans. (b) : The structure which contain vascular bundle and is modification of stem is made up of thorm.
• Thorns are derived from shoot, they can be branched and they can have leaves. They arise from a buds. Thorn have vascular bundle inside.

@apna_pdf

315. Identify the correct statement:

(a) The age of the plant can be determined by its height.
(b) Healing of damaged tissue is because of the activity of sclerenchyma cells.
(c) Grafting is difficult in monocot plants as they have scattered vascular bundles.
(d) Because of marked climate variations, plants growing near the sea shore do not produce annual rings.

Karnataka CET-2009

Ans. (c) : Grafting is difficult in monocot stem because ground tissue in monocot stem is not differentiated into cortex and pith also, there is scattered arrangement of vascular bundle.

316. In a vascular bundle, if xylem vessels develop in a centripetal fashion, the xylem is likely to be

(a) Endarch (b) Exarch
(c) Mesarch (d) Centrarch

Karnataka CET-2008

Ans. (b) : In a vascular bundle, if xylem develops in a centripetal fashion, the xylem is likely to be exarch. Exarch xylem is found in both dicot and monocot root systems.

317. Stomatal opening is regulated by

(a) light
(b) temperature
(c) atmospheric humidity
(d) wind

UP CPMT-2005

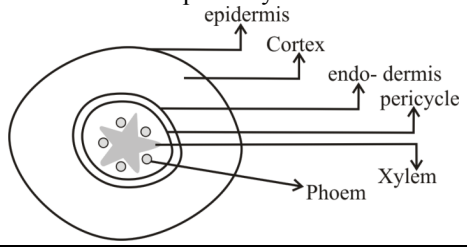
Ans. (a) : Stomatal opeing is primarily regulated by two main factors.
(i) Light intensity
(ii) Concentration of the plant hormone abscisic acid (ABA)

318. Casparian strips are present in

(a) endodermis (b) epidermis
(c) cortex (d) pericycle

UP CPMT-2005

Ans. (a): The casparian strip is named by Robert Caspary. The casparian strip is a water proof tissue. Casparian strips occur in the endodermis. It is a cell wall material that is deposited in the radial and transverse walls of the endodermis of roots. It regulates the water and mineral uptake by the roots.



319. The number of stomata and epidermal cells in 1 mm^2 area of abaxial surface of the leaves of B, C and D plants are given below.

Plant	Number of Stomata	Number of Epidermal cells
A	40	730
B	60	510
C	70	450
D	30	620

Identify the two plants having least stomatal index

(a) B and C (b) A and D
(c) A and C (d) A and B

AP EAMCET-2013

Ans. (b): Stomatal index $= \left(\frac{S}{S+E}\right) \times 100$

Where,
S = No. of stomata per unit area.
E= No. of epidermal cells in the same unit area.
• Stomatal index is the percentage which the number of stomata forms to the total number of epidermal cells, both per unit area of concern. Stomata index can be calculated using the equation.

320. Leptocentric (amphivasal) vascular bundles, (in which the whole phloem is enclosed by xylem) are characteristic feature of

(a) Dracaena and Yucca-Monocot
(b) Dracaena and Cucurbita-Monocot
(c) Ficus and Shorea-Dicot
(d) Xanthium and Acacia-Dicot

UP CPMT-2014

Ans. (a): Leptocentric (amphivasal) vascular bundles is one type of concentric bundles. In that type of bundles xylem tissue surrounds the phloem tissue. It is found in Dracaena, yucca and other monocots and some dicots also. Another type concentric bundle is amphicribal where phloem surrounds xylems and it is found in ferns.

321. Middle lamella is present

(a) inside the secondary wall
(b) inside the primary wall
(c) outside the primary wall
(d) in between secondary and tertiary walls

UP CPMT-2011

Ans. (c): The middle lamella is presents outside the primary wall. Calcium and magnesium pectates form the middle lamella. In a mature plant cell it is the outermost layer of the cell wall. In such case the two adjacent primary wall and the middle lamella perhaps the first layer of the secondary wall of each cell may be called a compound middle lamella.

322. Specialised epidermal cells surrounding the guard cells are called

(a) Lenticels
(b) Complementary cells
(c) Subsidiary cells
(d) Bulliform cells

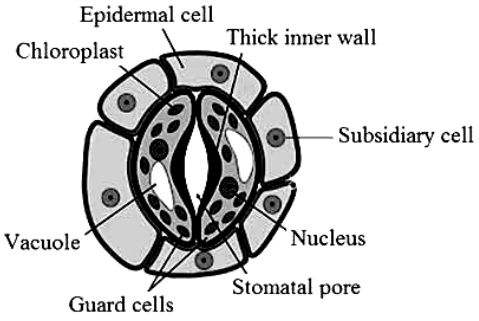
NEET-2016 Phase-I

@apna_pdf

Ans. (c) : Specialized epidermal cells surrounding the guard cells are known as subsidiary or accessory cells. They act as a buffer between guard cells and epidermal cells against guard cells expansion.

Subsidiary cells: As defined subsidiary cells and guard cells, both are the modification and part of epidermal cells in which guard cells have chloroplast which are absent in surrounding subsidiary cells.

STOMA

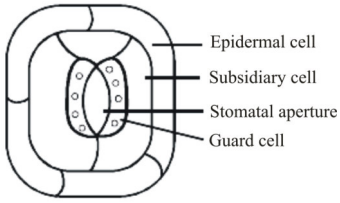


323. Given below is the diagram of a stomatal apparatus. In which of the folloiwng all the four parts Labelled as A, B, C and D are correctly identified

	A	B	C	D
(a)	Epidermal cell	Subsidiary cell	Stomatal aperture	Guard cell
(b)	Subsidiary cell	Epidermal cell	Guard cell	Stomatal aperture
(c)	Guard cell	Stomatal aperture	Subsidiary cell	Epidermal cell
(d)	Epidermal cell	Guard cell	Stomatal aperture	Subsidiary cell

AIPMT (Mains)-2010

Ans. (a) :



The Stomatal apparatus consists of a pair of guard cells with or without surrounding subsidiary cells that serves as a value to open or close a stomatal aperture for gaseous exchange and transpiration. The guard cells are two beans-shaped cells that make up each stoma.

324. Study the following lists

List–I	List–II
(A) Ephemeral	**1. Nerium**
(B) Mucilage	**2. Ziziphus**
(C) Multiple epidermis	**3. Calotropis**
(D) Spine	**4. Tribulus**
	5. Aloe

The correct match is

	A	B	C	D
(a)	2	4	5	1
(b)	5	2	1	4
(c)	4	5	1	2
(d)	4	3	2	1

AP EAMCET-2007

Ans. (c) :

List–I	List–II
(A) Ephemeral	4. Tribulus
(B) Mucilage	5. Aloe
(C) Multiple epidermis	1. Nerium
(D) Spine	2. Ziziphus

325. What happens in plants during vascularisation?

(a) Differentiation of procambium, formation of primary phloem followed by formation of primary xylem

(b) Differentiation of procambium followed by the formation of primary phloem and xylem simultaneously

(c) Formation of procambium, primary phloem and xylem simultaneously

(d) Differentiation of procambium followed by the formation of secondary xylem

AIPMT-2000

Ans. (b) : Vascularization in plants occurs through differentiation of procambium followed by the development of xylem and phloem. All procambial cells appears to differentiate into vascular tissues during primary growth.

326. Closed vascular bundles lack:

(a) Cambium

(b) Pith

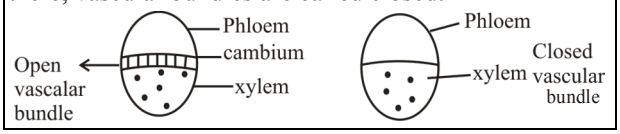
(c) Ground tissue

(d) Conjuctive tissues

AIPMT (Screening)-2012

Ans. (a) :A closed vascular bundle means that there is a absence of cambium they are not capable of forming the secondary xylem and phloem tissue.

- The cambium is a meristematic tissue found in dicot stem and roots.
- When it is present between xylem and phloem, the vascular bundles are called open and when it is absent there, vascular bundles are called closed.



327. Some vascular bundles are described as open because these

(a) are not surrounded by pericycle

(b) are surrounded by pericycle but no endodermis

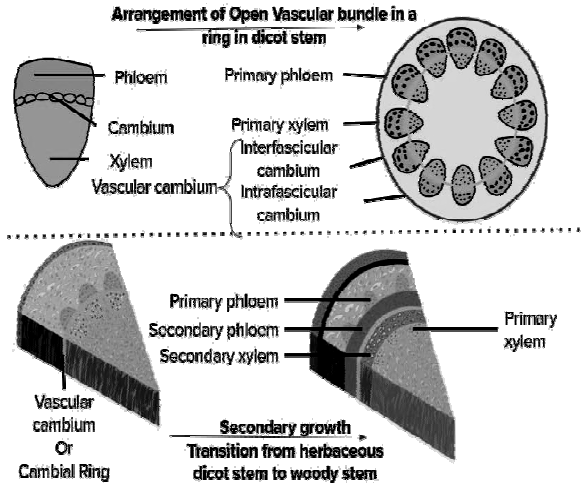
@apna_pdf

(c) are capable of producing secondary xylem and phloem
(d) possess conjunctive tissue between xylem and phloem

AIPMT (Mains)-2011

Ans. (c) : Open vascular bundles refer to the presence of a strip of cambium in between the xylem and phloem of each vascular bundle. Such types of vascular bundles can be seen in dicotyledonous stems and gymnosperms.

• Cambium is a secondary meristem. Its presence makes the vascular bundle 'open' for secondary growth and, hence, the name.



Conjunctive tissue is found in between the xylem and phloem as patches of parenchymatous cells in dicot roots.

• The pericycle is the layer followed by endodermis. It is made up of both thick-walled parenchymatous cells and sclerenchymatous fibres in a dicot stem.

328. Ground tissue includes:
(a) All tissues internal to endodermis
(b) All tissues external to endodermis
(c) All tissues except epidermis and vascular bundles
(d) Epidermis and cortex

AIPMT (Screening)-2011

Ans. (c) : Ground tissue includes all the tissue except vascular and epidermis bundles.

• Ground tissue consists of three simple tissues:
(1) Parenchyma → Thin walled cells and main function storage of food.
(2) Collenchyma → Thick walled cells and main function supports young plant bodys.
(3) Sclerenchyma → It is composed of two types of cells, sclereids and fibres and main function is provide structural support of the plant body.

329. The number of stomata and epidermal cells in 1mm^2 leaf area of lower epidermis of the leaves of X, Y and Z plants are given below. Arrange the plants in decreasing order of their stomatal index.

Plant	Number of stomata	Number of Epidermal cells
X	30	150
Y	60	240
Z	90	400

The correct answer is
(a) X, Y, Z (b) Y, Z, X
(c) Z, Y, X (d) Y, X, Z

AP EAMCET-2009

Ans. (b) :

Stomatal index (SI) = $\frac{S}{S+E} \times 100$

So, the arrangement of plant in decreasing order of their stomatal index is YZX.

Plant	Number of stomata (S)	Number of epidermal cells (E)	SI
X	30	150	16.6
Y	60	240	20.0
Z	90	400	18.3

330. Vascular bundle in which two patchs of phloem are present on both side of xylem?
(a) Collateral
(b) Bicollateral
(c) Concentric
(d) Radial

UP CPMT-2006

Ans. (b): Bicollateral - Vascular bundle which possess both xylem and phloem are called **conjoint vascular bundle**. In bicollateral conjoint vascular bundles phloem are present on both outer and inner side of xylem **e.g. Cucurbita** solanaceae (the potato family).

331. Raphides are crystals of
(a) calcium carbonate
(b) calcium oxalate
(c) magnesium carbonate
(d) magnesium oxalate

UP CPMT-2006

Ans. (b): Calcium oxalate crystal is present in raphides of almost all the plant organ and is particularly common in storage organs, pith and cortical tissue. The shape of the crystals called raphides are found in aroids **e.g. Colocasia**, Amorphophallus impatieus and many aquatic plant **e.g. Pistia, Eichornia**.

332. A bicollateral vascular bundle has the following arrangement of tissues…….
(a) Outer Phloem – Outer Cambium – Middle Xylem – Inner Cambium – Inner Phloem.
(b) Outer Xylem – Outer Cambium – Middle Phloem– Inner Cambium – Inner Xylem.
(c) Outer Phloem – Outer Xylem– Middle Cambium– Inner Xylem– Inner Phloem.
(d) Outer Cambium– Outer Phloem– Middle Xylem – Inner Phloem– Inner Cambium.

Karnataka CET-2004

@apna_pdf

Ans. (a) : Bicollateral - Vascular bundle which possess both xylem and phloem are called **conjoint vascular bundle**. In bicollateral conjoint vascular bundles phloem are present on both outer and inner side of xylem e.g. Cucurbita.

Outer Phloem → Outer Cambium → Middle Xylem → Inner Cambium → Inner Phloem

E. Dicot and Monocot Root

333. Polyarch and tetrarch vascular bundles generally occur in theses

(a) Monocot stem and dicot root.
(b) Dicot stem and monocot stem.
(c) Dicot root and monocot root
(d) Monocot root and dicot root.

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Polyarch vascular bundles are found in monocot roots. The words polyarch' means "many arches" referring to the many xylem strands in each varcular bundle. This is because monocot roots do not have secondary growth. So, they do not need as many xylem strands to transport water and nutrients.

• Tetrarch vascular bundles are found in dicot roots. These are four xylem strands in each vascular bundle.

334. Identify the monocot root characters

I. Polyarch condition
II. Large pith
III. Presence of bundle sheath
IV. Scattered vascular bundles

(a) I and III only
(b) I and II only
(c) II and III only
(d) IV only

TS EAMCET-11.05.2023, Shift-I

Ans. (b) : • Monocot roots have the polyarch condition meaning that they have more than 6 xylem bundles.

• Monocot roots have a central pith made up of parenchyma cells. In monocot roots, the pith is large and spongy. Which helps to store food and water. So, the I and II are character of monocot root.

335. The features are not characteristics of dicotyledonous root

A. Radial vascular bundles.
B. Pith little or absent
C. Vascular bundles 15 – 20
D. Cambium ring do not develop

(a) A, B (b) A, C
(c) C, D (d) B, D

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : <u>Features of dicot root</u>

• Dicot roots have radia vascular bundles, which means that the xylem and phloem are arraged in a circle around the pith.

• The pith is the central region of the root and is made up of soft spongy tissues. In dicot roots the pith is small or absent.

• Dicot roots do not have a combium ring which is a layer of cells that gives rise to secondary growth.

• The features that are not characterstics of dicotyledonous roots are –:

• Vascular bundles 15 – 20 : Dicot roots typlically have 2 – 8 vascular bundles.

• Cambium ring do not develop :

Dicot roots do not have cambium ring . So, the statement (C) & (D) is not the feature of dicotyledomeus noot.

336. The transverse section of a plant part showed polyarch, radial and exarch xylem, with endodermis and pericycle. The plant part is identified as :

(a) Dicot stem (b) Monocot stem
(c) Monocot root (d) Dicot root

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (c) : The monocot root is composed of an endodermis, cortex, endodermis, pericycle xylem, phloem and a pith.

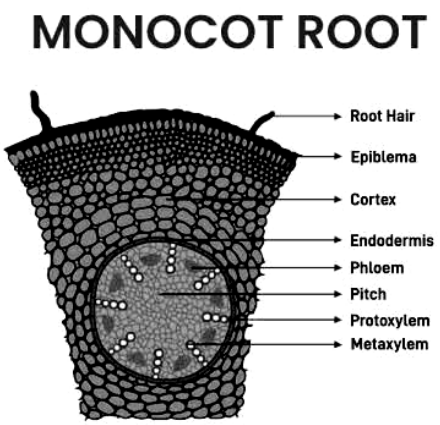
• Monocot root has a pith in the stele it also contain vascular bundles that are composed of both xylem and phloem.

• There are more than four xylem arms called polyarch condition. Monocot roots are usually polyarch.

• Vascular bundle are arranged side by side on different radii and separated by non-conjunctive tissue.

• When protoxylem is outside and metaxylem is inside this arrangement is called exarch.

• Radial vascular bundles are present in roots. Monocot roots have polyarch and exarch condition of xylem.



337. Given below are two statements :

Statement I : Endarch and exarch are the terms often used for describing the position of secondary xylem in the plant body.

Statement II : Exarch condition is the most common feature of the root system.

In the light of the above statements, choose the correct answer from the options given below :

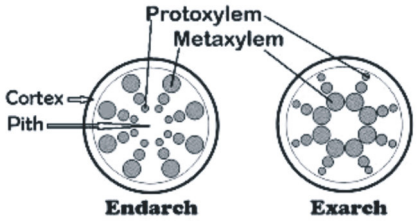
(a) Statement I is incorrect but Statement II is true.
(b) Both Statement I and Statement II are true.
(c) Both Statement I and Statement II are false.
(d) Statement I is correct but Statement II is false.

NEET (UG) 07.05.2023

@apna_pdf

Ans. (a) : The vascular bundle is composed of xylem, phloem and sometimes a layer of cambium.

- Exarch is that arrangement in which the protoxylem is directed towards the periphery and meta xylem towards the center.
- Exarch condition is the characteristic feature of root.
- In endarch condition protoxylem is directed towards the centre and metaxylem towards the periphery Endarch arrangement of vascular bundle is the characteristic feature of stem.



338. What is the role of RNA polymerase III in the process of transcription in Eukaryotes?

(a) Transcription of only snRNAs
(b) Transcription of rRNAs (28S, 18S and 5.8S
(c) Transcription of tRNA, 5 srRNA and snRNA
(d) Transcription of precursor of mRNA

NEET (UG) 07.05.2023

Ans. (c) : In eukaryote cells, RNA polymerase III is a protein that transcribes DNA to synthesize ribosomal 5s rRNA, tRNA and other small RNAs.

- The DNA polymerases are involved mostly in DNA repair and translation DNA synthesis.
- The main function of the third polymerase III is the duplication of the chromosomal DNA.

339. Which one of the following plants does not show plasticity?

(a) Maize (b) Cotton
(c) Coriander (d) Buttercup

NEET-2022

Ans. (a) : The ability of an organism to change its phenotype in response to different environment called plasticity.

- **Maize** is monocot plant (Poaceae) in which hypodermis is sclerenchymatous so maize (zea mays) does not show plasticity.

340. In the dicot root the vascular cambium originates from :

(a) Intrafascicular and interfascicular tissue in a ring
(b) Tissue located below the phloem bundles and a portion of pericycle tissue above protoxylem.
(c) Cortical region
(d) Parenchyma between endodermis and pericycle

NEET (Odisha)-2019

Ans. (b) : In dicot root, the vascular cambium is completely secondary in origin. It originates from. Tissue located below the phloem bundles and a portion of pericycle tissue above protoxylem forming a complete and continuous wavy ring which later become circular.

- The parenchyma cells present between xylem and phloem elements in the vascular bundles constitute 'conjunctive tissue' similarly, the cells of pericycle present against protoxylem divide and form multiple layers of cells, which are joined by cambiam cells derived from conjunctive tissues and together they make a complete cambium ring.

341. Conjunctive tissue is present between (i) and (ii) in (iii)

(a) (i) Pericycle (ii) Endodermis (iii) Dicot root
(b) (i) Xylem (ii) Phloem (iii) Dicot root
(c) (i) Palisade parenchyma (ii) Spongy parenchyma (iii) Dicot leaf
(d) (i) Xylem (ii) Phloem (iii) Dicot stem

Karnataka CET-2018

Ans. (b) : Conjunctive tissue is present between xylem, Phloem and dicot root. Parenchyma cells present in the middle of xylem and phloem which helps in transfer of water and food respectively is called conjunctive tissue.

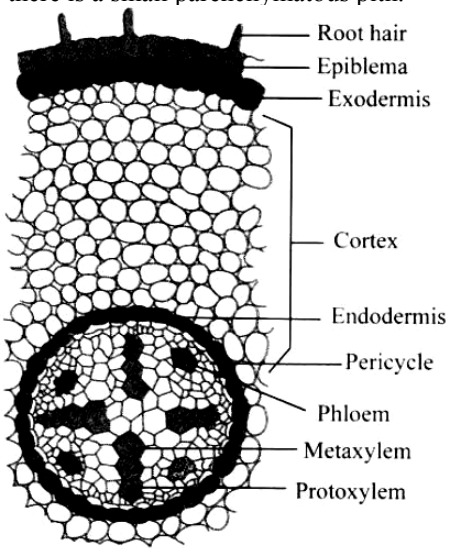
- It does not become meristematic at any formative stage in monocot. In the dicot plants like Boerhavia the conjunctive tissue is condensed in the interfascicular locale and it becomes meristematic and brings to secondary tissue development.

342. Four radial vascular bundle are found in : -

(a) Dicot root (b) Monocot root
(c) Dicot stem (d) Monocot stem

Rajasthan PMT-2007
AIPMT-2002

Ans. (a) : The characteristic features of vascular tissue of the root (dicot) is vascular bundles arranged in radial form, means one xylem and one phloem alternate forms. There are 2 to 6 vascular bundles in the dicot root in center, there is a small parenchymatous pith.



T. S. of Dicot root

@apna_pdf

343. A major characteristic of the monocot root is the presence of:

(a) Scattered vascular bundles
(b) Vasculature without cambium
(c) Cambium sandwiched between phloem and xylem along the radius
(d) Open vascular bundles

AIPMT-2015

Ans. (b) : One of the most prominent characteristics of the monocot root is the absence of cambium, this limits the roots ability to grow sufficiently. The monocot root consists of a distinct pith around which the vascular bundles arrange themselves alternately radially forming a ring. They do not take part in cambium formation and are separated by narrow strips known as the **conjunctive tissue**→ Based on the particulars provided one can conclude that the major characteristic of the monocot root is the presence of vasculature without cambium.

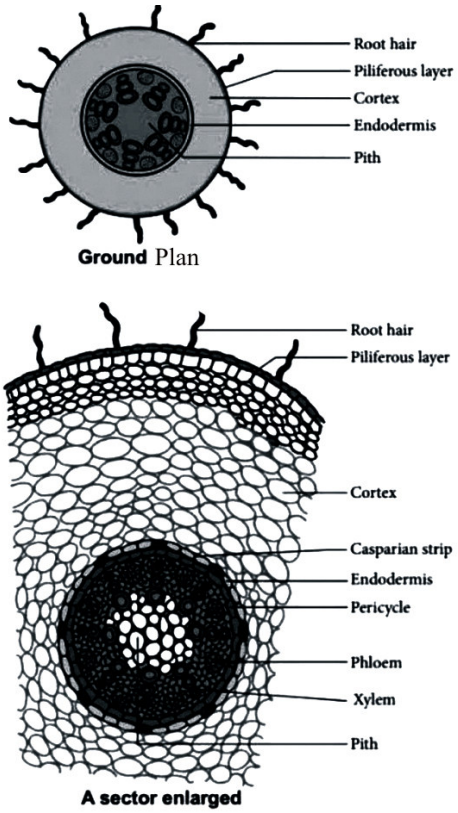


Figure 12.3 Transverse section of Monocot root

344. As compared to a dicot root, a monocot root has

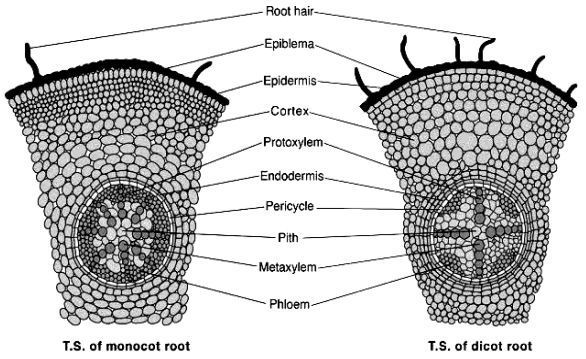
(a) Inconspicuous annual rings
(b) Relatively thicker periderm
(c) More abundant secondary xylem
(d) Many xylem bundles

AIPMT (Mains)-2012

Ans. (d) : In dicot roots, the vascular structure are located in the middle of the roots, the arrangment of xylem and phloem is different in dicots, that it is in monocots the xylem is all located in the middle of dicot root and bundles of phloem are arranged around it by vascular combium.

- In center of monocot root consist of xylem and phloem (vascular strand) and it surrounded by the cortex. Vascular strand is in the form of several alternate and radial xylem and phloem bundles.

Monocot Root vs Dicot Root

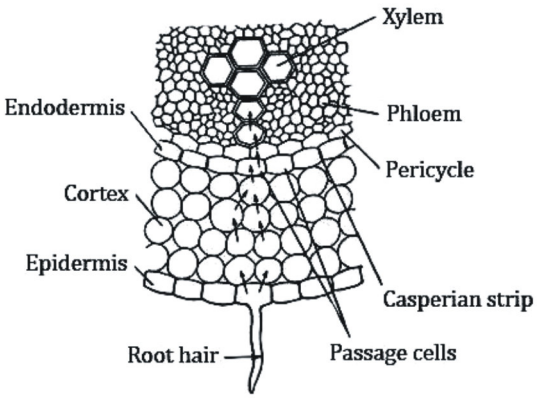


345. Passage cells are found in

(a) Dicot stem (b) Monocot root
(c) Aerial root (d) Monocot stem.

AIIMS-2002

Ans. (b) : Passage cells are endodermal cells of older roots which have retained thin walls and casparian strips rather than becoming suberized and waterproof like the other cells around them, to continue to allow some symplastic flow to the inside. Passage cells function to allow transfer of solutes, such as calcium and magnesium into the steel, in order to eventually reach the transpiration system.



346. Epidermis is specialized for

(a) respiration (b) absorption
(c) protection (d) All of these

Haryana PMT-2011

Ans. (d) : Epidermis is specialized for respiration, absorption and protection also. The plant epidermis is a protective tissue that covers the entire surface of the plant. It regulates the gas exchange in plant cells. The epidermis protects the plant from infection and water loss. It also protects against mechanical injury and parasitic fungus invasion. The epidermis is in charge of absorbing water and essential minerals.

@apna_pdf

347. Triradiate vascular bundles can be traced in
(a) monocot roots (b) dicot root
(c) monocots (d) dicot stem

Haryana PMT-2011

Ans. (b) : Dicot root contains radial vascular bundle. In the center, there is a tiny parenchymatous pith. It's also possible that dicot root don't have it. Vascular bundle are in the dicot roots 2-6 in number.

348. In monocot roots which types of vascular bundles are found?
(a) Collateral, conjoint and closed
(b) Radial with exarch xylem
(c) Bicollateral, conjoint and closed
(d) Radial with endarch xylem

BHU PMT-2003

Ans. (b) : The vascular bundles are radial i.e xylem and phloem strands are equal xylem is exarch. The protoxylem poles are found towards periphery and metaxylem towards some centre, the vessels of protoxylem are narrow and possessing granular and spiral thickness.

349. Aerenchyma provides:
(a) flexibility to plants
(b) mechanical strength to plants
(c) buoyancy to hydrophytic plants
(d) promoting nature of photosynthesis

Manipal-2004

Ans. (c) : In hydrophytes there are large spaces in the parenchyma then called parenchyma helps in buoyancy or floating. Parenchyma may be specialized as water storage tissue in may succulent and xerophytic plant in aloe, agave.

350. Select the characters which are not applicable to the anatomy of dicot roots?
(A) Conjunctive tissue present
(B) Presence of protein compounds in the Casparian strips
(C) Polyarch xylem bundles
(D) Presence of pericycle
(a) A and B (b) B and D
(c) C and D (d) A and D
(e) B and C

Kerala PMT-2015

Ans. (e) : Presence of protein compounds in the casparian strips and polyarch xylem bundles not applicable to the anatomy of dicot roots.
• Presence of pericycle and conjunctive tissue are present in the anatomy of dicot roots.

351. In which of the following three radial vascular bundles are present?
(a) Monocot root (b) Dicot root
(c) Monocot stem (d) Dicot stem

Rajasthan PMT-1998

Ans. (b) : The vascular bundles in dicot roots are radial and 2 to 6 strands of xylem and phloem are present in a ring (Diarch to hexarch condition).

352. Assertion (A) : Epidermis in the dicot root is composed of cutinized cells.
Reason (R) : The exodermis in the root offers protection to the inner parts in the absence of epidermis:
The correct answer is:
(a) Both A and R are true and R is the correct explanation of A
(b) Both A and R are true but R is not the correct explanation of A
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-2004

Ans. (d) : Main function of root is absorption of water It does not bear cutinized cells, the exodermis. In root offers protection to the inner in the absence of epidermis.

353. Casparian strips are characteristic of :
(a) endodermis (b) epidermis
(c) epiblema (d) xylem vessels

Haryana PMT-2004
Manipal-2003

Ans. (a) : The inner most layer of the cortex, called endodermis. It comprises a single layer of barrel shaped cells without any intercellular spaces. The tangential as well as radial wall of the endodermal cell have a deposition of water impermeable waxy material suberin in the form of casparian strips.

Directions: In the following question more than one of the answers given may be correct. Select the correct answer and mark it according to the code:

354. A monocot root is characterized by vascular bundles that are closed as well as
(a) endarch, collateral and tri-to pentarch
(b) exarch, polyarch and radial
(c) endarch, polyarch and radial
(d) collateral, exarch and polyarch

AMU-1997

Ans. (b) : The vascular bundles are radial, the xylem and phloem strands are equal in number and arranged alternately the bundles are more than six (i.e polyarch condition) the xylem is exarch. The proto xylem poles are found towards pheriphery and meta xylem towards centre. The vessels of proto xylem are narrow and possessing annular and spiral thickness where as the vessels of meta xylem broad and possessing reticulate and pitted thickness or their walls.

355. The vascular bundles of dicot roots are
(a) endarch and polyarch
(b) exarch and polyarch
(c) exarch and radial
(d) endarch and collateral

AMU-1997

Ans. (c) : When xylem and phloem lie an different radaie xylem alternate phloem as roots.
When protoxylem lies towards periphery and metaxylem towards the centre condition is called exarch as root.

@apna_pdf

356. When secondary growth in thickness is initiated in a dicot root

(a) pericycle starels outside the primary xylem divide
(b) anticlinal initials between xylem and phloem divide
(c) cambial initials between xylem and phloem divide
(d) parenchyma cells between xylem and phloem become meristematic

VMMC-2015

Ans. (d) : Most of the dicotyledonous roots show secondary in thickness similar to that of dicotyledonous stem. However the monocotyledonous roots do not show any secondary growth. They remain entirely primary throughout their life the secondary tissue developed in the dicotyledonous roots are fundament ally quite similar to that of dicotyledonous stem. But the process initiates in some different manner.

• The dicotyledonous roots posses a limited number of radial vascular bundles with exarch xylem normally the pith is very little or altogether absent.

357. Identify the plant parts whose transverse sections show a clear and prominent pith.

(a) Dicot root and monocot root
(b) Dicot stem and dicot root
(c) Dicot stem and monocot stem
(d) Dicot stem and monocot root

Karnataka CET-2008

Ans. (d) : Dicot stem and monocot roots transverse sections show a clear and prominent pith. Pith is a tissue in the stems of vascular plants. It is made of delicate, springy parenchyma cells. It is made up of thin walled colourless parenchymatous cells with lot of intercellular space.

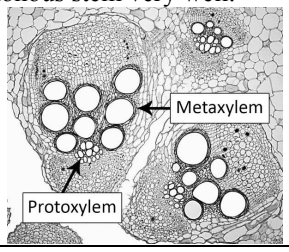
358. Anatomically fairly old dicotyledonous root is distinguished from the dicotyledonous stem by:

(a) Position of protoxylem
(b) absence of secondary xylem
(c) Absence of secondary phloem
(d) Presence of cortex

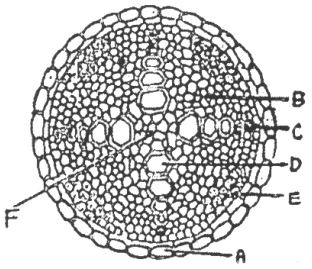
AIPMT-2009

Ans. (a) : Anatomically fairly old dicotyledonous root is distinguished from the dicotyledonous stem by position of cortex. Protoxylem is the first formed xylem developing from procambium and consisting of narrow cells with annular, spiral or scalariform wall thickenings.

Thus, the position of protoxylem and metaxylem can help in distinguishing the fairly old dicotyledonous root from dicotyledonous stem very well.



359. In the diagram of T. S. of Stele of Dicot Root, the different parts have been indicated by alphabets; choose the answer in which these alphabets correctly match with the parts they indicate.



(a) A = Pericycle; B = Conjunctive tissue; C = Metaxylem; D = Protoxylem; E = Phloem; F = Pith.
(b) A = Endodermis; B = Conjunctive tissue; C = Protoxylem; D = Metaxylem; E = Phloem; F = Pith.
(c) A = Endodermis; B = Conjunctive tissue; C = Metaxylem; D = Protoxylem; E = Phloem; F = Pith.
(d) A = Endodermis; B = Pith; C = Protoxylem; D = Metaxylem; E = Phloem; F = Conjunctive tissue.

Karnataka CET-2004

Ans. (b) : All tissue on the inner side of the endo-dermis such as pericycle, vascular bundles and pith constitute the stele image.

360. Fibrous root system is mostly found in:

(a) monocot plants (b) dicot plants
(c) pteridophytes (d) bryophytes

J&K CET-2005

Ans. (a) : Fibrous root system is mostly found in monocot plant. The anatomy of the monocot root is similar to the dicot root. As compared to the dicot root which have xylem bundles, there are usually more than six (Polyarch) xylem bundles in the monocot root. Pith is large and well developed.

F. Dicot and Monocot Stem

361. Lysigenous Cavities are seen in

(a) Monocot roots (b) Dicot roots
(c) Monocot stems (d) Dicot stems

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : Lysiginous cavites are the spaces found by break down of cells inside certain parts of the plant. These space are filled with water air oil.

• Lysogenous cavity are found is hydrophyte in which these are filled with air to provide Buyancy to floating hydro phytes.

• Lysogenious cavity found in monocot stem plant like zea mays.

362. Conjoint, collateral and closed vascular bundles are found in

(a) Monocot root (b) Monocot stem
(c) Dicot root (d) Dicot stem

TS EAMCET 10.05.2023 Shift-I

@apna_pdf

Ans. (b) : Conjoint, collateral and closed vasular bundles are found in monocot stem.
The monocot stem has a sclerenchymatous hypodermis, a large number of scattered vascular bundles, each surrounded by a sclerenchymatous bundle sheath, and a large, conspiecious parenchymatous ground tissue. The phloem parenchyma is absent, and water – containing covities are present within the vascular bundles.

363. This type of cells are not present in phloem of a monocot stem
(a) Phloem parenchyma.
(b) Sieve tubes.
(c) Companion cells.
(d) Phloem fibres.

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : Phloem parenchyma cells are not present in phloem of a monocot stem.
• Phloem parenchyma cells providing the structural support to the plants and do not die at their maturity. These cells are found in dicot leaf, dicot stem and monocot root.
• In monocot stem cortex, endoermis, pericycle, pith and phloem parenchyma is absent.

364. Identify the monocot stem characters
I. Exarch xylem
II. Absence of medullary ray
III. Presence of bundle sheath
IV. Scattered vascular mundles
(a) I & II (b) II, III & IV
(c) II & IV (d) I, III & IV

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : The characteristics of monocot stem are as follows–
1. Presence of Bundle Sheath– The vascular bundle is enclosed by a bundle sheath of parenchyma cells in the cortex region.
2. Scattered Vascular Bundles– In monocot stems, the vascular bundles are conjoint and closed type and are scattered throughout the ground tissue.
3. Absence of Medullary Ray– In monocot stem general cortex, endoderm is, pericycle, medullary rays are absent.

365. Match the following

List-I		List-II	
I.	Well developed large pith	A.	Endodermis
II.	Caparian strips	B.	Monocot stem
III.	Scelerenchymatous bundle sheath	C.	Dicot stem
IV.	Endarch protoxylem	D.	Monocot root

(a) I-B, II-A, III-D, IV-C
(b) I-D, II-A, III-B, IV-C
(c) I-D, II-C, III-A, IV-B
(d) I-C, II-A, III-D, IV-B

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : (I) Well developed large pith is found in monocot root. Monocotyledonous roots do not undergo any secondary growth.
(II) Casparian Strips– In dicot root, casparian strips are the ring-like cell wall modifications found in the root of the endodermis of vascular plant.
(III) Scelerenchymatous bundle sheath– The monocot stem has a scelerenchymatous hypodermis, a large number of scattered vascular bundles, each surrounded by a scelerenchymatous bundle sheath.
(IV) Endarch protoxylem– Endarch protoxylem is found in dicot stem. In this type of vascular bundle, protoxylem is present towards the centre and metaxylem is present towards the periphery.

366. The cavities in the vascular bundles of monocot stem
(a) Lysigenous cavities (b) Metaxylem
(c) Large protoxylem (d) Mucilage canal

AP EAPCET-23.05.2023, Shift-I

Ans. (a) : The cavities in the vascular bundles of monocot stem lysigenous cavities. The lysigenous cavity is the secretory depression formed by the decomposition of cells in a tissue.
Metaxylem– Metaxylem exits at the boundary of the structure. It also supports the conduction of water and minerals towards the apical shoot in plants.

367. Arrangement of vascular bundles and bundle sheath tissue in Monocot stem
(a) Ring and Sclerenchyma
(b) Scattered and Sclerenchyma
(c) Scattered and Parenchyma
(d) Scattered and Collenchyma

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : The arrangement of vascular bundles and bundle sheath tissue in Monocot stem scattered and sclerenchyma. On the other hand, in dicots stem, the vascular bundles are arranged in the form of one or two broken circular rings and they have a definite shape.

368. Identify the common character present in both dicot and monocot stems
(a) Pericycle and Endodermis
(b) Open vascular bundles
(c) Well developed large pith
(d) Conjoint vascular bundles

AP EAPCET-23.05.2023, Shift-I

Ans. (d) : The common character present in both dicot and monocot stems conjoint vascular bundles. In the conjoint type of vascular bundles, the xylem and phloem are arranged together in the same radius of vascular bundles.
Open vascular bundles– An open vascular bundles is characterized by the presence of cambial ring between the xylem and phloem bundles.

369. A student observed transverse sections of 2 plant parts under microscope. In that T.S of 'A' has many vascular bundles arranged in a ring, while T.S of 'B' has many scattered vascular bundles. Identify the materials 'A' and 'B' in the same order.
(a) Monocotyledonous root, Dicotyledonous stem
(b) Monocotyledonous stem, Dicotyledonous root

@apna_pdf

(c) Monocotyledonous stem, Dicotyledonous stem
(d) Dicotyledonous stem, Monocotyledonous stem

TS EAMCET-30.07.2022 Shift-II

Ans. (d) : A student observed transverse sections of 2 plant parts under microscope. In that
- T.S. of dicotyledonous stem has many vascular bundles arranged in a ring around the pith.
- T.S. of monocotyledonous stem has many scattered vascular bundles near the outside edge of the stem.

370. Arrange the following in a centrifugal manner in Primary Dicot Stem

(I) Pericycle **(II) Cambium**
(III) Metaxylem **(IV) Starch Sheath**

(a) IV, I, II, III
(b) IV, II, I, III
(c) III, II, I, IV
(d) III, I, II, IV

AP EAMCET-11.07.2022 Shift-II

Ans. (c) : Arrange the steps of primary dicot stem – Metaxylem > Cambium > Pericycle > Starch sheath

371. The organic food material is translocated through phloem in the stems of following

(a) Dicot stem with conjoint, Collateral, Closed Vascular bundles
(b) Monocots Stems with vascular bundles
(c) Dicot stems with conjoint, collateral, opened vascular bundles
(d) Dicot stem with bicollateral vascular bundles

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Each of the vascular bundles in the dicot stem is collateral conjoined open and endarch. A cambium is present between xylem and phloem.
- In dicot stem each vascular bundle consists of phloem on the outer side, xylem towards the inner side and a strop of cambium in between the two phloem and xylem tissues lie on the same radius.

372. The characters restricted to monocot Stem & Leaf respectively _____

(a) Trichomes and Bulliform cells
(b) Lysigenous cavity and Bulliform cells
(c) Trichomes and Lysigenous cavity
(d) Bulliform cells and Lysigenous cavity

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Monocots stem possess Lysigenous cavity. These cavities help in storage of water, gases and oil in stem. Like stems of monocots, their leaf also passes water storage bodies, that is spread among the leaf epidermal cells called as Bulliform cells.

373. Assertion (A) : The primary and secondary phloem gradually crushed in the secondary growth of dicot stem.
Reason (R) : The secondary xylem is produced more than secondary phloem.
The correct option among the following is :

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-II

Ans. (a) : During the activity of the Cambium ring, the Secondary xylem Continues to form and accumulate due to which the primary and Secondary phloem gets crushed.
- During Secondary growth the amount of Secondary Xylem Produced is more than the Secondary phloem because cambium is more active on inner side.

374. The innermost layer of the cortex is called _____

(a) Epidermis (b) Endodermis
(c) Pericycle (d) Hypodermis

AP EAMCET-25.09.2020 Shift-II

Ans. (b) : Endodermis absent in monocot stem woody dicot stem present herbaceous dicot stem. Endodermis well developed in roots. It is the inner most layer of the cortex and outer most to the stele. Single layered cells barreled shaped in stem endodermal cells have starch grains therefore called starch sheath.

375. The transverse section of a plant shows following anatomical features :

(A) Large number of scattered vascular bundles surrounded by bundle sheath
(B) Large conspicuous parenchymatous ground tissue
(C) Vascular bundles conjoint and closed
(D) Phloem parenchyma absent

Identify the category of plant and its part :

(a) Monocotyledonous root
(b) Dicotyledonous stem
(c) Dicotyledonous root
(d) Monocotyledonous stem

NEET-2020 Phase-I

Ans. (d) : Monocotyledonous stem posses large number of scattered vascular bundles surrounded by bundle sheaths. Large conspicuous parenchymatous ground tissue, vascular bundles are conjoint and closed, phloem parenchyma are absent.
- Pholem parenchyma is absent here, because the vascular bundles are open and lack cambium. No secondary growth occurs.

376. Secondary xylem and phloem in dicot stem are produced by

(a) Apical meristems (b) Vascular cambium
(c) Axillary meristems (d) Phellogen

NEET-2018

Ans. (b) : Secondary vascular tissues i.e. secondary xylem and phloem are formed by the vascular cambium.
- Vascular cambium is produced by two types of meristem. Interfascicular and intrafascicular cambium.
- Intrafascicular cambium is a primary meristem which occurs as strips in vascular bundles.
- It divides to form secondary phloem on outerside and secondary xylem on the inner side.

@apna_pdf

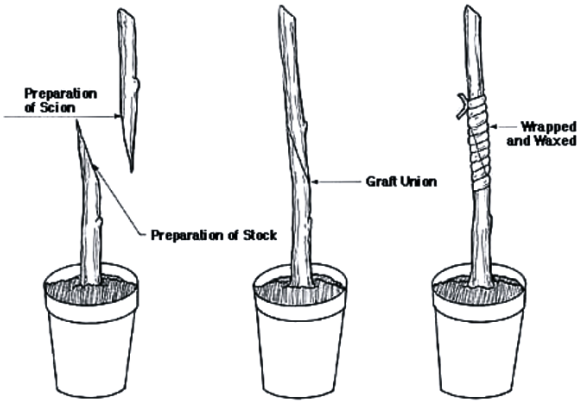
377. Grafting is successful in dicots but not in monocots because the dicots have

(a) Vascular bundles arranged in a ring
(b) Cambium for secondary growth
(c) Vessels with elements arranged end to end
(d) Cork cambium

AIIMS-2006

Ans. (b) : Grafting- Grafting is a type of vegetative reproduction in which a part of plant is inserted into another plant in such a way that their vascular tissue cambium.

- Grafting is successful only in closely related species.
- Main purpose of grafting to obtained desired quality of plants and fruits.
- The cambium possesses that ability to form secondary xylem and phloem.
- It is present in dicots and absent in monocots.
- In case of grafting, it is very important that the plant should form primary and secondary tissue for its survival. Hence, grafting is successful in dicots.



378. Read the different components from (a) to (d) in the list given below and tell the correct order of the components with reference to their arrangement from outer side to inner side in a woody dicot stem

(A) Secondary cortex
(B) Wood
(C) Secondary phloem
(D) Phellem

The correct order is

(a) (D), (C), (A), (B) (b) (C), (D), (B), (A)
(c) (A), (B), (D), (C) (d) (D), (A), (C), (B)

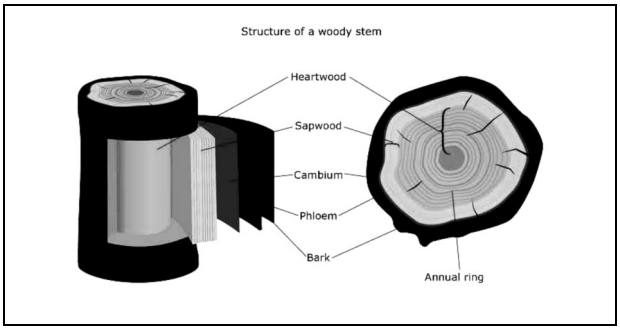
AIPMT (Re-Exam)-2015

Ans. (d) : Sequence of different component from outer side to inner side in woody dicot stem.

Phellem → Secondary cortex → Secondary phloem → wood secondary xylem

outermost — innermost

- In woody dicot stem, phellem (cork) forms the outermost layer followed by phellogen and then secondary phloem forms a narrow circle on the outer side of vascular cambium where as secondary xylem occurs on the inner side of vascular cambium.



379. Maximum numbers of vascular bundles are present in

(a) Monocot stem (b) Monocot root
(c) Dicot stem (d) Dicot root

BCECE-2008
UP CPMT-2006

Ans. (a) : Monocot of stem :- Sclerenchymatous hypodermis is large no. of scattered vascular bundle conjoint and closed.

- The xylem is present in the inner surface and phloem in the outer surface and cambium is not present in monocot plants, hence the vascular bundles in monocot stem are endarch, closed and collateral.

380. Grafting is not possible in monocots because they:

(a) have scattered vascular bundles
(b) are herbaceous
(c) have parallel venation
(d) lack cambium

JIPMER-1995

Ans. (d) : Grafting is not possible in monocots because the lack cambium of tissue, which is present in dicot plants cambium tissue is a meristmatic tissue, which is present in vascular bundle of the dicot plants. The tissue has a regeneration capacity due to which it can form new tissue at time of grafting.

381. Conjoint, collateral and closed vascular bundle is found in :

(a) monocot stem (b) monocot root
(c) dicot stem (d) dicot root

BCECE-2005

Ans. (a) : Conjoint collateral and closed vascular bundle in monocot stem.

Conjoint – The xylem and phloem are arranged together in the same radius of vascular bundle.

Collateral – A vascular bundle in which phloem strand is present outside the xylem strand on the same radius side by side.

- **Closed vascular bundle –** It signifies that cambium is absent.

382. Main function of lenticel is : -

(a) Transpiration
(b) Guttation
(c) Gaseous exchange
(d) Bleeding

AIPMT-2002

@apna_pdf

Ans. (c) : The name lenticel is derived from its (lens-like) lenticular form. They facilitate the gas exchange of oxygen, carbon dioxide and water vapour in plant bodies that produce secondary growth.

- Transpiration takes place mostly through stomata.
- Guttation and bleeding takes place through hydathodes.

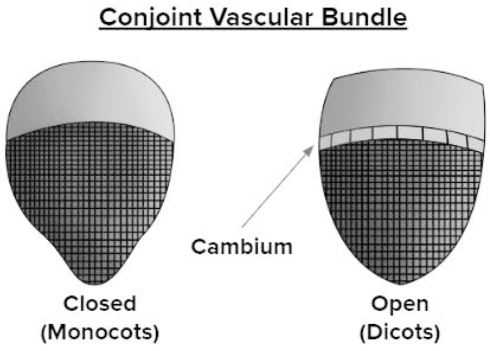
383. Why are vascular bundles closed in monocots?

(a) Xylem and phloem are present
(b) Xylem and phloem occur in separate bundles
(c) Vascular cambium is present between xylem and phloem
(d) Vascular cambium is not present.

AIIMS-2010

Ans. (d) : The xylem and phloem together constitutes vascular bundles.

- In dicotyledonous stems, cambium is present between phloem and xylem is known as open type vascular bundle. Such vascular bundles posses the ability to form secondary xylem and secondary phloem tissues hence are called secondary growth.
- In the monocotyledons the vascular bundle have no cambium present in stem. This type of vascular bundle is called close type and secondary growth is absent.



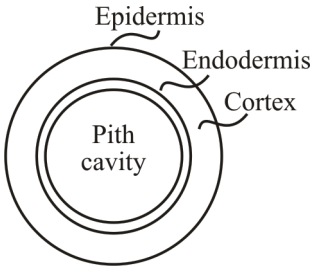
384. Pith cavity occurs in the stem of:

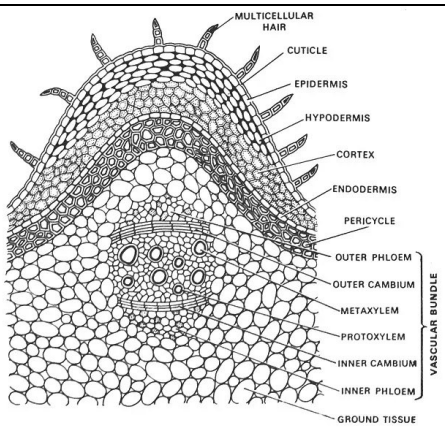
(a) Helianthus (b) Zea mays
(c) Cucurbita (d) Dracaena

AIIMS-2015

Ans. (c) : The central part of stem is a cavity known as pith, in which the vascular bundles are embedded in its outer zone. It is made up of polygonal oval shaped or rounded parenchyma cells which encloses intercellular space.

- The hollow cavity present in the stem is called pith cavity.





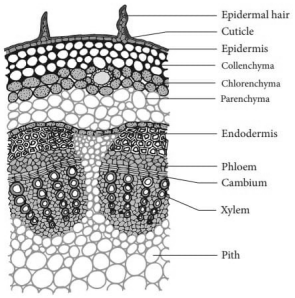
385. From the outside to the inside is:

(a) Phellem – pericycle – endodermis – phloem
(b) Phellem – phloem – endodermis – pericycle
(c) Phellem – endodermis – pericycle – phloem
(d) Pericycle – phellem – endodermis – phloem.

AIIMS-2003

Ans. (c) : The dicotyledonous stem indicates the epidermis which is the ultimate defensive layer. The sequence of tissues from the outside to the inside is phellem-endodermis-pericycle-phloem. Phellem is the cork tissue that replaces the epidermis after secondary growth.

- Endodermis is outer to the pericycle. Xylem and phloem are present and they are interior to pericycle.



386. Pith and cortex do not differentiate in

(a) monocot stem (b) dicot stem
(c) monocot root (d) dicot root.

AIPMT-1988

Ans. (a) : Ground tissue consist of only parenchyma cells that store food. In monocot stem, ground tissue are undifferentiated. Thus endodermis, pericycle cortex and pith are not recognisable.

387. Generally, a monocot stem bears vascular bundles

(a) concentric and closed
(b) concentric and open
(c) conjoint and open
(d) radial and open

BHU PMT-2002

Ans. (a) : When xylem completely surrounds the phloem called concentric vascular bundle. Concentric bundle is always closed.

- When cambium is absent in vascular bundle called the closed vascular bundle as monocot stem.

@apna_pdf

388. Grafting is not possible in monocots because they
(a) lack cambium
(b) have scattered vascular bundles
(c) have parallel venation
(d) are herbaceous

MGIMS Wardha-2007
BVP-2012

Ans. (a) : Monocots cannot be grafted as they lack the cambium tissue. The dicot plants have the cambium tissue which is a meristematic tissue and is present in the vascular bundles of the plant.
• The huge chunk of meristematic tissue that can heal the cut wound in the stem is the cambium, which is made up of lateral meristem.

389. Phloem parenchyma is absent in
(a) Monocot stem (b) Dicot stem
(c) Dicot root (d) Dicot leaf

BHU PMT (Screening)-2007
MGIMS Wardha-2008

Ans. (a) : Phloem parenchyma is absent in most of the monocots stem. The majority of the monocot stem is composed of ground tissue, which primarily consists of parenchyma cells.

390. In dicotyledonous stem, which of the following is the sequence of tissues from the outside?
(a) Pith, phloem, cambium, protoxylem, metaxylem, pericycle, parenchyma, collenchyma, endodermis and epidermis
(b) Pith, cambium, phloem, protoxylem, metaxylem, pericycle, endodermis, parenchyma, collenchyma and epidermis
(c) Pith, phloem, protoxylem, metaxylem, cambium, pericycle, endodermis, parenchyma, collenchyma and epidermis
(d) Pith, protoxylem, metaxylem, cambium, phloem, pericycle, endodermis, parenchyma, collenchyma and epidermis

J&K CET-2014

Ans. (d) : In dicotyledonous stem, the pith, protoxylem, metaxylem, cambium, phloem, pericycle, endodermis, parenchyma and epidermis found in outside.

391. If the dicot stem is stained for starch. The most intense colouration would develop in:
(a) epiblema (b) phloem
(c) endodermis (d) pith

VMMC-2006

Ans. (c) : The inner most layer of the cortex is the endodermis. It consisting of barrel shaped elongated compact cells having no inter cellular spaces. It contain starch grain and thus the endodermis may be termed as starch sheath.

392. In dicot stem secondary growth is due to the activity of:
(a) apical meristem (b) lateral meristem
(c) cork (d) bark

Manipal-2000

Ans. (b) : Lateral meristems are seen at the lateral sides of roots and stem in plant. It consists of two meristems called cork cambium and vascular cambium. In a dicot stem, secondary growth occurs due to lateral meristem.

393. The meristem responsible for extra stellar secondary growth in dicot stem is
(a) inter fascicular cambium
(b) intra fascicular cambium
(c) inter calary meristem
(d) phellogen

AMU-2006

Ans. (d) : Phellogen is defined as the meristematic cell layer responsible for the development of the periderm. The extrastelar regions grow simultaneously. The growth of extrastelar region is initiated by the formation of cork cambium of phellogen.

394. In dicot stem, vascular bundles are
(a) Numerous scattered
(b) Arranged in a ring
(c) Without cambium
(d) Surrounded by bundle sheath

CMC Vellore-2010
AMU-2009

Ans. (b) : The vascular bundles of monocotyledonous stem are like those of dicotyledonous stem in consisting of xylem towards the centre of the stele and phloem towards the periphery. The vascular bundles of monocotyledonous stem do not passes a cambium layer. Which found in dicotyledonous stems. Each bundle remains more or less completely surrounded by a sheath of sclerenchyma cells and bundle sheath.

395. Identify the correct order of the components with reference to their arrangement from outer side to inner side in a woody dicot stem.
I. Secondary cortex
II. Autumn wood
III. Secondary phloem
IV. Phellem
(a) II, III, I, IV (b) III, IV, II, I
(c) IV, I, III, II (d) I, II, IV, III

VMMC-2010
AP EAMCET-2005

Ans. (c) : The Correct order from the outer to inner side of the dicot stem is phellum> secondary cortex> secondary phloem> Autumn wood.
• The dicot woody stem is a result of the secondary growth that originates the lateral meristem. The cells of secondary cortex are parenchymatous cells displaced towards, the outside of the vascular cambium differentiate into secondary phloem.

396. Chronological sequence of cellular layers from the periphery towards the cortex in an old dicot stem is
(a) epidermis, hypodermis, cortex, endodermis
(b) epidermis, phellem, phellogen, phelloderm
(c) epidermis, hypodermis, phellogen, phelloderm
(d) epidermis, phellogen, phellem, endodermis

BVP-2013

@apna_pdf

Ans. (b) : The transverse section of typical young dicotyledonous stem shows that the epidermis is the outer most protective layer of stem covered with a thin layer of cuticle. It may be bear trichomes and few stomata, the cells arranged in multiple layers between epidermis and pericycle constitute of a few layers of collenchymatous cells. Just below the epidermis which provide mechanical strength to young stem. Cortical layers below hypodermis consist of rounded, then walled parenchymatous cells with consipicuous inter cellular spaces the cells of the endodermis are rich in starch grains.

397. Monocot stem lacks

(a) tracheids (b) sieve tube
(c) cambium (d) none of these

AFMC-2010

Ans. (c) : Commonly the vascular bundles of mono cotyledons do not passes cambium and therefore there is no secondary growth, however it occurs in some monocotyledons e.g. Dracaena and yucca.

398. A monocot stem with secondary growth is

(a) Lilium
(b) Cocos
(c) Yucca
(d) Asparagus

UP CPMT-2011

Ans. (c): Monocots do not undergo secondary growth due to lack of cambium in monocotyledons, secondary growth takes place in some monocotyledons such as yucca.

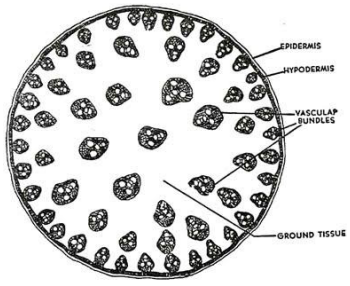
• Secondary growth occurs in most seed plants.

399. In barley stem vascular bundles are -

(a) Closed and radial
(b) Open and scattered
(c) Closed and scattered
(d) Open and in a ring

AIPMT-2009

Ans. (c) : Barley is monocotyledons cereal. Monocot stem has their vascular bundles closed because it lacks vascular cambium and so, no secondary growth is visible in monocot stem.



400. Which one of the following is the correct sequence of tissues present in dicot stem during secondary growth?

(a) Phellogen, cork, primary cortex, secondary cortex
(b) Cork, primary cortex, secondary cortex, phellogen
(c) Primary cortex, secondary cortex, phellogen, cork
(d) Secondary cortex, cork, phellogen, primary cortex

AP EAMCET-2007

Ans. (c) : The correct sequence of tissues present in dicot stem during secondary growth is-
Primary cortex, secondary cortex, phellogen, cork.

401. Water containing cavities in vascular bundles are found in:

(a) Cycas (b) Pinus
(c) Sunflower (d) Maize

AIPMT (Screening)-2012
Rajasthan PMT-2011

Ans. (d) : Water containing cavities in vascular bundles are found in maize. In monocot stem vascular bundles are collateral and conjoint vascular bundles.

• In the vascular bundles, cambium is absent between xylem and phloem. So these are closed vascular bundles.

• In the xylem, protoxylem is towards the centre and metaxylem is towards the periphery. So it is endarch xylem.

• In the protoxylem some of the cells, disintegrate and form into a lysigenous cavity called as protoxylem lacuna eg. maize (lacuna in maize).

G. Dicot and Monocot Leaf

402. Choose the incorrect statement?

(a) Guard cells guards the Stoma
(b) Guard cells are enucleated
(c) Guard cells have uneven cell wall thickening
(d) Guard cell possess chloroplast

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Guard cells, guards the stomata. Guard cells are nucleated. Guard cells have uneven cell wall thickening, unlike other epidermal cells Guard cells possess chloroplasts.

403. Monocot leaves possess

(a) intercalary meristem (b) lateral roots
(c) apical meristem (d) mass meristem

AIPMT-1999

Ans. (a) : Intercalary meristems are derived from apical meristems and separated form the same by permanent cells. They are responsible for localized growth.

404. What is true about a monocot leaf?

(a) Reticulate venation
(b) Absence of bulliform cells epidermis
(c) Mesophyll not differentiated into palisade and spongy tissues
(d) Well differentiated mesophyll

AIPMT-1992, 1990

Ans. (c) : In monocot leaf mesophyll cells are not differentiated into palisade and spongy tissue. But there are well differentiated mesophyll cells in dicot stem. Also in the upper epidermis, there are some large cells found in groups which are called bulliform cells. The venation pattern in monocot is parallel.

@apna_pdf

405. The part of the leaf between the upper epidermis and the lower epidermis is called
(a) mid rib (b) hypodermis
(c) mesophyll (d) palisade

JIPMER-1999

Ans. (c) : The leaf tissue that lies between the upper and lower mesophyll and between the veins is usually composed of thin walled parenchyma, called the mesophyll, the tissue that forms the major part of the inner leaf, usually the cells of the mesophyll are two types are –
(i) Palisade parenchyma or palisade tissue
(ii) Spongy parenchyma or spongy tissue

406. In which of the following manner distribution of stomata occur in dorsiventral leaf?
(a) More in palisade tissue and less in spongy parenchyma
(b) Equal in both palisade and spongy parenchyma
(c) More in spongy parenchyma and less in palisade tissue
(d) Absent in all of these

Rajasthan PMT-1998

Ans. (c) : Palisade tissue may consist of one or more layers these cells are arranged near the upper surface of the leaf. Where they receive sunlight and attracted to perform of photosynthesis sometimes the leaves hang vertically so that both leaf surface are equally illuminated the palisade parenchyma of such leaves depends on the intensity of light.
• The lower portion of the mesophyll in the leaf is known as spongy parenchyma or spongy tissue. The spongy tissue is usually composed of loose irregular in walled cells having big inter cellular spaces (airspaces) among them.

407. What differentiates leaf of dicots from monocots ?
(a) Parallel venation
(b) Differentiation of palisade and spongy parenchyma
(c) Stomata only on upper side
(d) Stomata both on upper and lower sides

BHU PMT (Mains)-2008

Ans. (b) :

Dicot leaf	Monocot leaf
(A) Mesophyll is different fitted in to palisade and spongy parenchyma.	(i) Mesophyll not differentiated and all cells are like spongy parenchyma.
(B) Under the palisade mesophyll, spongy mesophyll is located whereas beneath the upper epidermis leaves, palisade mesophyll cells located.	(ii) Sclerenchymatous cells patches are present above and below the large vascular bundles.

408. The cells which help in rolling and unrolling of leaf lamina in grasses are:
(a) complementary cells
(b) motor cells
(c) passage cells
(d) companion cells

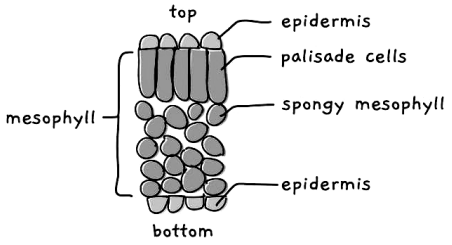
AP EAMCET-2001

Ans. (b) : In grasses certain adaxial epidermal cells along the veins modify themselves in to large empty colorless cells these are called bulliform cells.
• When the bulliform cells in the leaves have absorbed water and are turgid the leaf surface is exposed when they are flaccid due to water stress. The leaves curl in wards to minimize water loss.

409. Palisade parenchyma is absent in leaves of -
(a) Gram (b) Sorghum
(c) Mustard (d) Soybean

AIPMT-2009

Ans. (b) : Monocot mesophyll is not differentiated into palisade and spongy layers. Hence, **sorghum (monocot) does not have palisade parenchyma.** palisade cells occur in dicotyledonous plants and also in the net-veined monocots. They are present in dicots such as gram and soybean.



H. Secondary Growth

410. Duramen is present in
(a) inner region of secondary wood
(b) part of sap wood
(c) outer region of secondary wood
(d) region of pericycle

VMMC-2012
UP CPMT-2012, 2008
BCECE-2010
Uttarakhand PMT-2007

Ans. (a) : Secondary xylem is central axis becomes inert by losing water and storing food content and filled with complex metabolism by products, So this area becomes hard in nature and dark in color, is named as duramen.

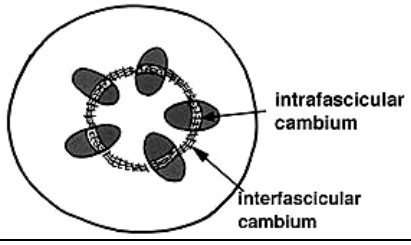
411. Consider the following plant tissues:
(A) Axillary buds
(B) Fascicular vascular cambium
(C) Interfascicular cambium
(D) Cork cambium
(E) Intercalary meristem
Identify the lateral meristems among the above.
(a) (A), (B), (C) and (E) only
(b) (A), (B), (D) and (E) only
(c) (A), (C), and (D) only
(d) (B), (C) and (D) only

RE-NEET (UG)-06.06.2023 (Manipur)

@apna_pdf

Ans. (d) : Fascicular cambium is present between the xylem and phloem of vascular bundle.

- Inter fascicular cambium present between two vascular bundles.
- Fascicular vascular cambium, inter fascicular cambium and cork cambium are example of lateral meristem.
- The meristem which occurs between mature tissue is known as intercalary meristem.
- Cell of shoot apical meristem form the axillary bud.
- Both intercalary meristem and axillary buds are primary meristem.



412. Identify the correct statements :

A. Lenticels are the lens-shaped openings permitting the exchange of gases.

B. Bark formed early in the season is called hard bark.

C. Bark is a technical term that refers to all tissues exterior to vascular cambium.

D. Bark refers to periderm and secondary phloem.

E. Phellogen is single-layered in thickness.

Choose the correct answer from the options given below :

(a) B and C only (b) B, C and E only

(c) A and D only (d) A, B and D only

NEET (UG) 07.05.2023

Ans. (c) : Lenticels is a porous tissue made up of vast intercellular gaps between cells on stem and root.

- Lenticels allow gases to pass between the atmosphere and the organs interior tissues.
- The bark is the outer covering of the stems and the roots of woody plants especially on tree.
- Bark provides significant support and protection.
- Bark which includes everything towards the outside of the plant starting at vascular Cambium is much thicker than most people assume, the inner bark is composed of living tissue which help translocate the sugar to all parts of plants.

413. Given below are two statements : One is tabelled as Assertion A and the otheris labelled as Reason R :

Assertion A : Latewood has fewer xylary elements withnarrow vessels.

Reason R : Cambium is less active in winters.

In the light of the above statements, choose the correct answer from the options given below :

(a) A is false but R is true.

(b) Both A and R are true

(c) Both A and R are true but R is NOT the correctexplanation of A.

(d) A is true but Ris false.

NEET (UG) 07.05.2023

Ans. (b) : Secondary xylem is called wood.

- The late wood trachieds have somewhat reduced borders with oval inner aperture.
- In temperate regions, every year new wood is formed in a limited growing season, with the result definite growth layers develops, which shows two distinct areas within each layer.
- Those wood which is formed in winter season is called the autumn wood or late wood, and which are formed on summer season called early wood or spring wood.
- There is a sharp contrast between the late autumn wood and the early spring wood and this make the successive ring distinct.
- The cambium cells help in the secondary growth of the plant by providing an undifferentiated mass of cells, the cambial activity is seen between the areas of the xylen and phloem.

414. In old trees the greater part of secondary xylem is dark brown and resistant to insect attack due to :

(A) secretion of secondary metabolities and their deposition in the lumen of vessels

(B) deposition of organic compounds like tannins and resins in the central layers of stem

(C) deposition of suberin and aromatic substances in the outer layer of stem

(D) deposition of tannins, gum, resin and aromatic substances in the peripheral layers of stem

(e) presence of parenchyma cells, functionally active xylem elements and essential oils

Choose the correct answer from the options given below-

(a) (B) and (D) Only

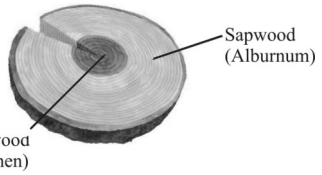
(b) (A) and (B) Only

(c) (C) and (D) Only

(d) (D) and (E) Only

NEET-2022

Ans. (b) : In old trees, the greater part of secondary xylem (wood) is dark brown due to deposition of organic compounds like tannin, resins, oils, gums, aromatic substances and essential oils in the central this type of wood is called **Duramen** or **innermost layers of the stem**, these substance make it hard, durable and resistant to the attacks of micro-organisms and insects. (outer most part of secondary xylem is called **Alburnum**)



@apna_pdf

415. Interfascicular cambium is present between:

(a) Primary xylem and primary phloem
(b) Pericycle and endodermis
(c) Two vascular bundles
(d) Secondary xylem and secondary phloem

NEET (Re-Exam)-04.09.2022

Ans. (c) : Interfascicular cambium is the cambium present between two vascular bundles of the stem. When the stem is young, fascicular cambium is found in patches in a single layer between the xylem and the phloem, when the plant grows up these patches Join together to form a complete ring.

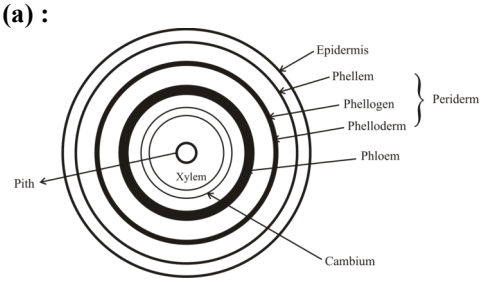
146. Identify the correct statements

(A) Periderm consists of phellem, phellogen, and phelloderm
(B) Permanent tissue having many different types of cells is called complex tissue
(C) In stem, endodermis store starch grains
(D) Heartwood and sapwood produced in a year have same color and density

(a) A, B, C
(b) B, C, D
(c) A, B, D
(d) A, C, D

TS EAMCET-10.08.2021 Shift-I

Ans. (a) :



• Complex permanent tissue having tracheids, vessels, xylem parenchyma and xylem fiber.
• The starch layer is endodermis of dicot stem endodermis, which is rich in starch grains as a food reserve. The periderm consists of three layers, namely the phelloderm, phellogen and phellum.
• Phelloderm and phellogen layer are present in cork cambium, and the phellem layer is present in the cork.
• Heartwood is denser, stronger, and dryer than sapwood. Heartwood has dark color due to the accumulation of many aromatic substances, pigments, and tannis.

417. Match the following lists

	List - I		List - II		List - III
A	Lignified walled dead cells	i	Plants are less active	I	Secondary growth of root
B	During unfavourable seasons	ii	Pericycle above protoxylem	II	Medullary ray
C	Cambium farming narrow band of parenchyma	iii	Does not conduct water	III	Less number of xylem vessels with narrow lumen
D	Cambium forms below phloem	iv	Between secondary xylem and phloem	IV	Heart wood

The correct match is :

Options:

	A	B	C	D
(a)	iii, IV	i, III	ii, II	iv, I
(b)	ii, II	iii, III	iv, I	i, V
(c)	i, IV	ii, III	iv, II	iii, I
(d)	iii, IV	i, III	iv, II	ii, I

TS EAMCET-09.08.2021 Shift-I

Ans. (a & d) : Lignified walled dead cells — Dose not conduct water — Heart wood.
• During unfavorable seasons — plants are less active – – Less number of xylem vessels with narrow lumen.
• Cambium farming narrow band of parenchyma — pericycle above protoxylem — medullary ray
• Cambium form below phloem — Between secondary xylem and phloem —secondary growth of root.

418. Match List-I with List-II.

	List-I		List-II
(A)	Lenticels	(i)	Phellogen
(B)	Cork cambium	(ii)	Suberin deposition
(C)	Secondary cortex	(iii)	Exchange of gases
(D)	Cork	(iv)	Phelloderm

Choose the correct answer from the options given below.

	(A)	(B)	(C)	(D)
(a)	(iv)	(ii)	(i)	(iii)
(b)	(iv)	(i)	(iii)	(ii)
(c)	(iii)	(i)	(iv)	(ii)
(d)	(ii)	(iii)	(iv)	(i)

NEET-2021

Ans. (c) : Lenticels - Exchange of gases.
Cork Cambium - Phellogen.
Secondary Cortex - Phelloderm.
Cork - Suberin deposition.

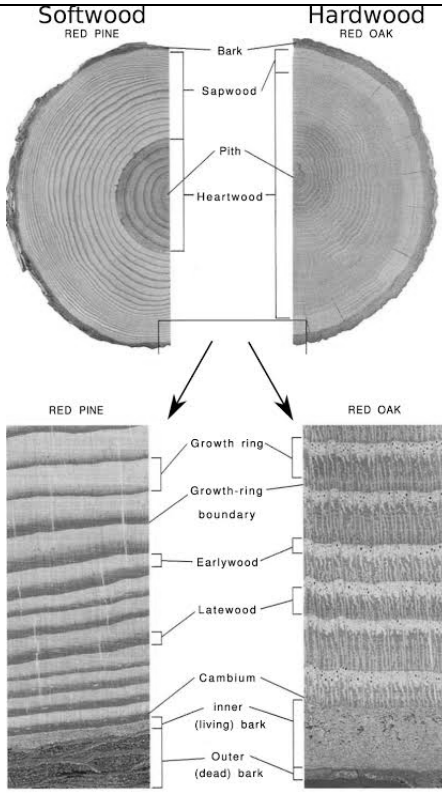
419. Which of the statements given below is not true about formation of Annual Rings in trees?

(a) Differential activity of cambium causes light and dark bands of tissue early and late wood respectively.
(b) Activity of cambium depends upon variation in climate.
(c) Annual rings are not prominent in trees of temperate region.
(d) Annual ring is a combination of spring wood and autumn wood produced in a year

NEET-2019

Ans. (c) : Some plants mainly dicotyledons exhibit an increase in girth this type of mechanism is called secondary growth.
• Annual ring gives an estimate of the age of trees. The cambium ring cut off new sales towards inner and outer sides the activity of cambium is dependent on many psychological and environmental factors.
• In temperate regions climate condition are not uniform throughout the year, however in tropics climatic conditions are uniform throughout the year.

@apna_pdf



420. Vascular cambium produces:
(a) Primary xylem and primary phloem
(b) Primary xylem and secondary phloem
(c) Secondary xylem and secondary phloem
(d) Secondary xylem and primary phloem

TS EAMCET-09.05.2019 Shift-I

Ans. (c) : The vascular cambium produces secondary xylem on the inside of the ring, and secondary phloem on the outside.

421. The cork cambium, cork and secondary cortex are collectively called:
(a) Phellem (b) Phelloderm
(c) Phellogen (d) periderm

AIPMT (Screening)-2011

Ans. (d) : The cork cambium (phellogen) divide to produce or cut off both sides the outer side differentiate into outer cork (phelllem) and inner side differentiate into secondary cortex (phelloderm).

- Cork is impervious to water due to suberin deposition in the cell wall
- Cork cambium, cork and secondary cortex are collectively called as periderm.

422. In Cycas stem, open vascular bundle is characterized by
(a) phloem being sand witched between xylem
(b) cambium present in between xylem and phloem
(c) xylem being sand witched between phloem
(d) xylem and phloem occurring on different radii

CMC Vellore-2009

Ans. (b) : Secondary growth in stellar region → It is due to activity of cambium. The cambium which is present between xylem and phloem called the intra fascicular cambium. The cambium between the vascular bundle called interfascicular cambium, inter fascicular cambium joined together to form complete cambium ring.

423. Jute fibres are obtained from the
(a) secondary phloem (b) pith
(c) xylem (d) endodermis

JIPMER-2015
DUMET-2009

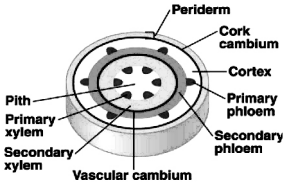
Ans. (a) : Jute fibres mainly compose of the cellulose and lignin. They are under the category of bast fibres which are collected from the skin of the plant or the secondary phloem.

424. Bark refers to?
(a) phellem + phellogen + phelloderm
(b) periderm + cortex
(c) phellem + phelloderm + secondary phloem
(d) periderm + cortex + pericycle + secondary phloem

AIIMS-2009

Ans. (d) : Bark is the outermost layers of stems as well as roots of woody plants. Plants with bark consist of trees woody vines, as well as shrubs. Bark relates to all the tissues outer the vascular cambium as well as it has a nontechnical term. It blankets the wood and contains the main bark along the outer bark. The central bank that is in older stems living tissues comprises the innermost layer of the periderm.

- The external bark on older stems contains the dead tissue on the ground of the stems, along with parts of the extreme periderm as well as all the tissues on the outer side of the periderm. The outer bark on trees that lies outside of the living periderm is also called as **rhytidome**.



425. Cork cambium results in the formation of cork which becomes impermeable to water due to the accumulation of
(a) Resins (b) Suberin
(c) Lignins (d) Tannins.

AIIMS-2004

Ans. (b) : Cork cambium is a secondary lateral meristem that may arises from permanent living cells of hypodermis or outer cortex. It is composed of a single layer of meristematic cells.

- Its cells divide tangentially and periclinally towards the outer surface and produce cork cells. These cells are compactly arranged and have thin cellulose walls in the beginning. As they mature there is a gradual loss of living matter and cells get elongated radially, vertically or tangentially.
- The cell walls become thick because of development of fatty substance called **suberin**, which is impervious to water.

@apna_pdf

426. Cork is formed from
(a) cork camblum (phellogen)
(b) vascular cambium
(c) phloem
(d) xylem.

AIPMT-1988

Ans. (a) : Cells of cork cambium phellogen divide the outside as well as inside to from respectively cork or phellem is made up of dead suberised and rectangular cells filled with air and tannis. It is protective in nature.

427. Abnormal/anomalous secondary growth occurs in
(a) Dracaena (b) ginger
(c) wheat (d) sunflower

AIPMT-1993

Ans. (a) : Monocot trees such as palms grow in thickness by primary thickening meristem situated at the base of the leaf plants like Dracaena show secondary growth by a special cambium. It develops in the form of strips just outside the vascular region. This cambium strips produce secondary vascular bundles which is amphivasal in dracaena.

428. Periderm is produced by
(a) vascular cambium
(b) fascicular cambium
(c) phellogen
(d) intrafascicular cambium.

AIPMT-1993

Ans. (c) : Periderm is produced by phellogen.
• Cell of secondary cortex are parenchymatous.
•Phellogen, phellem, and phelloderm are collectively known as periderm.

429. Examples for lateral meristems are
(a) Fascicular cambium and procambium
(b) Procambium and dermatogen
(c) Fascicular cambium and cork cambium
(d) Phellogen and procambium

Karnataka CET-2009

Ans. (c) : Lateral meristems are also called secondary meristems. The vascular cambium produces secondary xylem and phloem. Cork and fascicular cambium help in secondary growth.

430. Secondary cortex is also known as :
(a) Phellem (b) Phelloderm
(c) Phellogen (d) Bark

Karnataka CET-2012

Ans. (b) : Secondary cortex is also known as 'Phelloderm'. Phelloderm is a layer of parenchyma produced by the cork cambium, and inner secondary cortex of the cork cambium. It helps in the storage of food materials and ergastic substances.

431. Which one of the following pairs is an example for lateral meristem?
(a) Interfascicular cambium and phellem
(b) Procambium and phelloderm
(c) Phellogen and fascicular cambium
(d) Phellogen and phelloderm

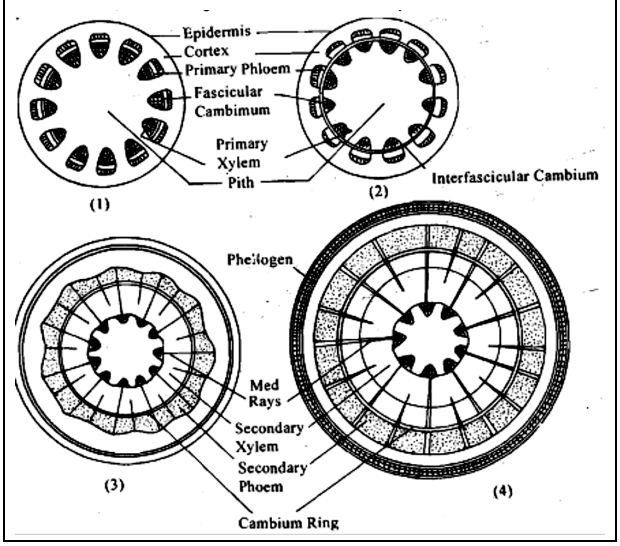
Karnataka CET-2010

Ans. (c) : Fascicular vascular cambium, interfascicular cambium, and cork–cambium (Phellogen) are examples of lateral meristems. These are responsible for producing the secondary tissue.

432. For a critical study of secondary growth in plants, which one of the following pairs is suitable?
(a) Wheat and maiden hair fern
(b) Sugarcane and sunflower
(c) Teak and pine
(d) Deodar and fern

AIPMT-2007

Ans. (c) : Secondary growth is observed in dicots angiosperm and gymnosperm. It is not observed in pteridophytes and is rarely observed in monocots.
• In wheat and sugarcane, there is no secondary growth, and they are monocots.
• Ferns are neither monocots nor dicots because they have no flowers and don't produce seeds.



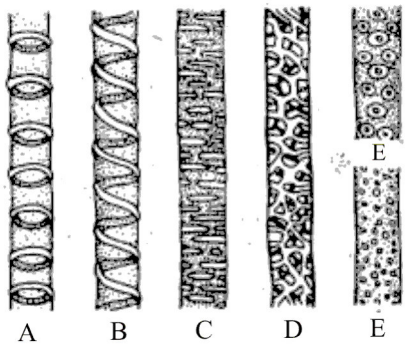
433. Casparian thickenings are found in the cells of
(a) Pericycle of the root
(b) Endodermis of the root
(c) Pericycle of the stem
(d) Endodermis of the stem

Karnataka CET-2006

Ans. (b) : Casparian thickenings are found in the cells of Endodermis of the root. Endodermis are the innermost layer of cortex, and casparian strips are made up of suberin act as water-impermeable layer. Casparian strips act as a barrier for harmful chemicals, herbicides etc.

434. The following diagrams show the types of secondary thickenings in the xylem vessels. Identify the types labelled from A to F. Choose the correct option from those given.

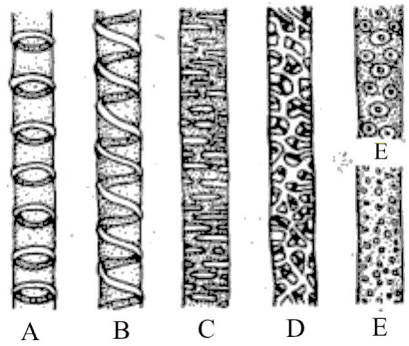
@apna_pdf



(a) A = Spiral, B = Annular, C = Reticulate, D = Scalariform, E = Pitted with border, F = Pitted, simple
(b) A = Annular, B = Spiral, C = Scalariform, D = Reticulate, E = Pitted with border, F = Pitted, simple
(c) A = Annular, B = Spiral, C = Scalariform, D = Reticulate, E = Pitted, simple F = Pitted with border
(d) A = Spiral, B = Annular, C = Scalariform, D = Reticulate, E = Pitted with border, F = Pitted, simple

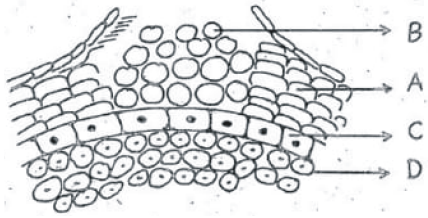
Karnataka CET-2006

Ans. (b) :



A = Annular, B = Spiral, C = Scalariform, D = Reticulate, E = Pitted with border, F = Pitted, simple

435. In the diagram of lenticel, identify the parts as A, B, C, D



(a) A-Complementary cells, B–Phellogen, C–Phelloderm, D–Periderm
(b) A–Complementary cells, B–Phellum, C–Periderm, D–Phelloderm
(c) A–Phellum, B–Periderm, C–Phellogen, D–Phelloderm
(d) A–Phellum, B–Complementary cells, C–Phellogen, D–Phelloderm

Karnataka CET-2007

Ans. (d) : A lenticels is a porous tissue comprising cell with huge intercellular space these can be found in the root of dicotyledonous flowering plant the bark of woody stems. These small opening in the bark enable air to reach the remaining part of the root system.

436. Periderm includes:
(a) Cork cambium only
(b) Cork cambium and cork
(c) Cork and secondary cortex
(d) Cork cambium, cork and secondary cortex

JIPMER-2004

Ans. (d) : The Periderm is the secondary shielding (dermal) tissue that replaces the dermis for the duration of an increase in the thickness of the stems and roots of gymnosperms and dicotyledons. In contrast to the everyday dermis, the periderm is a multilayered tissue machine, maximum of which commonly constitutes the cork, or phylum, the cork cambium or phylogeny, and the phelloderm or secondary cortex. The cork cambium, cork and secondary cortex are together referred to as periderm.

437. The common bottle cork is a product of:
(a) Xylem (b) Vascular Cambium
(c) Dermatogen (d) Phellogen

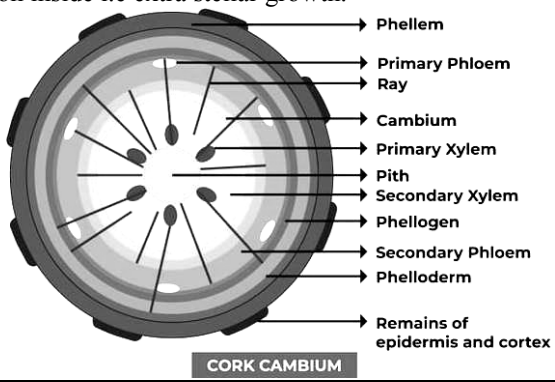
AIPMT (Screening)-2012

Ans. (d) : The common bottle cork is a product of phellogen.
- The common bottle cork produced from Quercus suber.
- Cell of cork cambium divide to produce an outer corky tissue on an inner secondary cortex.

438. Extrastelar secondary growth takes place by :
(a) Vascular cambium (b) Phellogen
(c) Phellem (d) Phelloderm

AIPMT-1998

Ans. (b) : The extrastelar region grow simultaneously. The growth of extrastelar region is initiated by the formation of cork cambium of **phellogen**.
- During secondary growth, rupturing of the epidermal cell and outer cortex by secondary tissues induces the formation of new protective layer, periderm. Pericycle resumes the meristematic activity and divides to form cork cambium/phellogen the cork cambium exhibit meristemetic activity and produces cork/phellem towards the periphery and phelloderm on inside i.e extra stellar growth.



@apna_pdf

439. Transition of Exarch bundles of root to Endarch bundles of stem occurs in

(a) Epicotyl (b) Hypocotyl
(c) Apical bud (d) Coleoptile

AIPMT-1999

Ans. (b) : A hypocotyle is a germinating seedling's stem, normally found underneath the seed leaves but above the root.

- The seeding above the transition point has stem structure, which is characterized by the presence of collateral and Endarch vascular bundles and the region of hypocotyl below the transition point is structurally root, which bear radial and Exarch vascular bundles.

440. Which of the following statements related to plants structure are true?

I. The cotyledons of Mauritius have trichosclereids.
II. Young sieve elements possess cytoplasm without nucleus.
III. Cells of pericycle in dicot root are capable of dedifferentiation.
IV. Cork lacks stomata but yet performs gaseous exchange.

(a) I, II (b) II, III
(c) III, IV (d) II, IV

AP EAMCET-2010

Ans. (c) : Sieve elements contain little cytoplasm and no nucleus they combine to form a series of tube containing the leave shoot and root in a fine network food material are transported from one element to another via perforation termed sieve areas or sieve plant, Cork lacks stomata but it is interrupted by lenticels.

I. Spring and Autumn Wood

441. The anatomy of springwood shows some peculiar features. Identify the correct set of statements about springwood.

(A) It is also called as the earlywood
(B) In spring season cambium produces xylem elements with narrow vessels
(C) It is lighter in colour
(D) The springwood along with autumnwood shows alternate concentric rings forming annual rings
(E) It has lower density

Choose the correct answer from the options given below:

(a) (C), (D) and (E) Only
(b) (A), (B), (D) and (E) Only
(c) (A), (C), (D) and (E) Only
(d) (A), (B) and (D) Only

NEET-2022

Ans. (c) : Spring wood is also called **early wood,** it is lighter in color and has a lower density. The vessels are produced with the wider lumens to transport more water to meet the requirement by increased transpiring surface in spring season.

- The spring and autumn wood appears as alternate concentric rings of light and dark color forming annual rings.

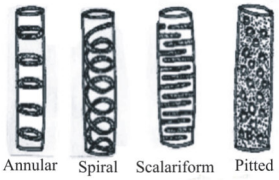
442. Choose the best option that gives the correct match for the terms given in the columns.

Annular	**1**	**Spring**
Scalariform	**2**	**Ring**
Spiral	**3**	**Uniform**
Pitted	**4**	**Ladder**

(a) 4 – 3 – 2 – 1 (b) 2 – 4 – 1 – 3
(c) 2 – 3 – 4 – 1 (d) 3 – 4 – 1 – 2

SRM JEEE -2017

Ans. (b) : (a) Annular thickening:- These are ring Like thickening present on the inner side of primary wall.
(b) Spiral or helical thickening:- These are spiral or Helical thickening of secondary wall materials.
(c) Scalar form thickening:- The Thickening appear as parallel transverse bands like the rungs of a ladder.
(d) Simple pit:- A pit is said to be simple where the secondary wall does not arch over the pit chamber and so the rim of the pit aperture contains no border.

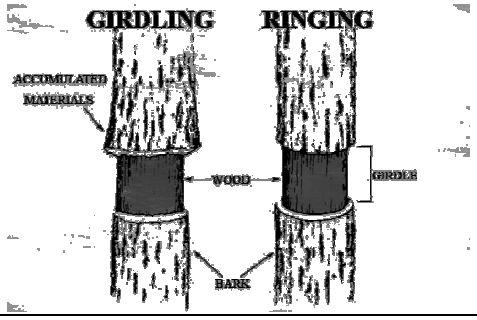


443. In a ring girdled plant :

(a) The root dies first
(b) The shoot and root die together
(c) Neither root nor shoot will die
(d) The shoot dies first

AIPMT-2015

Ans. (a) : In the ring girdled plant, the root dies first. A ring of bark is cut from the stem. It also removes phloem. The phenomenon of ring girdling occurs when the cork cambium and phloem are stripped away, as result nutrition and water movement in the plant stop. The root dies because it is unable to obtain enough sugar to survive.



444. Dendrochronology is the study of

(a) height of a tree
(b) diameter of a tree
(c) age of the tree by counting the number of annual rings in the main stem
(d) None of the above

BVP-2012
UP CPMT-2011, 2004

@apna_pdf

Ans. (c) : Study of age of trees by counting the number of annual rings in the main stem is Dendrochronology.
• Each year, the tree forms new cells, arranged in concentric circles called annual rings or annual growth rings.

445. Growth rings are formed due to activity of
(a) extrastelar cambium (b) intrastelar cambium
(c) interstelar cambium (d) Both (b) and (c)

CMC Ludhiana-2012

Ans. (b) : The cambium present between xylem and phloem in vascular bundle is called interafasicular cambium. The intrafasicular cambium joint to interfasicular cambium together called/Inter stellar cambium.
• The winter season activity of cambium loss and produces small sized vessels which are dark colored and loss amount it is called winter wood or autumn wood or late wood. In spring season the activity of cambium are more, it produces large sized narrow vessels large in amount called spring wood or early wood.

446. Annual rings are formed by period activity of
(a) vascular cambium
(b) vascular elements
(c) pericyle and endodermis
(d) Both (a) and (b)

JCECE-2014

Ans. (a) : Annual rings are formed by secondary xylem also called as growth ring. The activity of cambium does not remain same. It is changeable in the whole year. Activity of vascular cambium is affected by physiological and environmental factors.

447. Diffuse porous wood is characteristics of those plants which are growing in: -
(a) Alpine region (b) Cold winter regions
(c) Temperate climate (d) Tropics

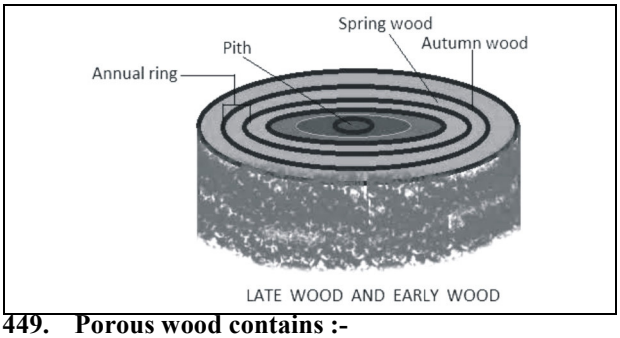
AIPMT-2003

Ans. (d): Diffuse porous wood are most common in trees growing in the regions with tropical climate. In a diffused porous wood, the large sized vessels are distributed through spring wood and autumn wood. Eg. Syzygium cumini.

448. Select the correct pair amongst the following.
(a) Spring wood-light colour, high density
(b) Spring wood-dark colour, low density
(c) Autumn wood-light colour, high density
(d) Autumn wood-dark colour, high density

AIIMS-2013

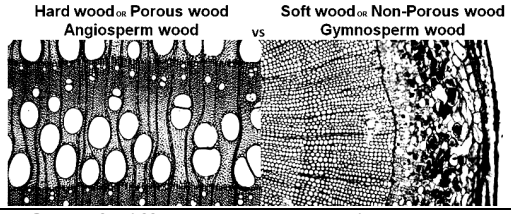
Ans. (d) : Based on the influence of various physiological condition and environmental factors the two types of wood formed are: -
1. **Autumn wood (Late wood) -** The wood formed in the winter season is called **autumn wood**. It is dark color wood with high density. It contains compactly arranged smaller and narrower elements which have comparatively thicker walls. In autumn wood, tracheids and fibers are more abundant than those found in the spring wood.
2. **Spring wood (Early wood) -** The wood formed in spring season is called spring wood. It is light colour wood and with low density. Spring wood consists of larger and wider xylem elements.



449. Porous wood contains :-
(a) Vessels (b) Fibres only
(c) Tracheids (d) Sieve tubes.

AIIMS-2001

Ans. (a) : Vessels are joined end to end to form continuous tubular structures with perforations in their cross walls. Water and minerals are efficiently conducted through these perforations. Vessels are present in most of the angiosperms. Hence, the wood can be termed as porous due to these perforations.
• Porous wood is the dicotyledonous wood that contains abundant vessels. Porous wood can be ring porous or diffuse porous.
• In ring porous wood, vessels are very broad in spring wood and are quite narrow in the autumn wood. Eg. *Dalbergia sisoo, and Cassia fistula*.



450. Out of diffuse porous and ring porous woods, which is correct?
(a) Ring porous wood carries more water for short period.
(b) Diffuse porous wood carries more water.
(c) Ring porous wood carries more water when need is higher.
(d) Diffuse porous wood is less specialized but conducts water rapidly throughout.

AIPMT-1989

Ans. (c) : Ring porous wood carries more water need is higher. Ring porous wood provides better translocation when requirement of plant is more. Hence, it is very advanced than diffuse porous wood.

451. The trees growing in temperature regions show clear demarcation between spring wood and autumn wood. This is because
(a) The water stress is more
(b) The climatic conditions are not uniform throughout the year
(c) The climatic conditions are uniform throughout the year
(d) The temperature is high

Karnataka CET-2019

Ans. (b) : The climatic conditions are not uniform throughout the year.
• It causes to show clear demarcation between spring wood and autumn wood.

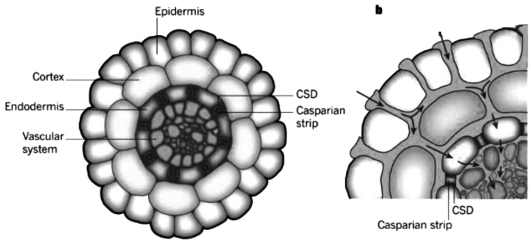
@apna_pdf

452. Casparian bands are found in

(a) Endodermis (b) Pericycle
(c) Periderm (d) Cortex

AIPMT-1999

Ans. (a) :



Casparian bands are found in 'endodermis.

- Casparian strips are usually present in the endodermis. It is a cell wall material that is present in the radial and transverse walls of the endodermis of roots.

J. Heart and Sap Wood

453. Identify the incorrect statement.

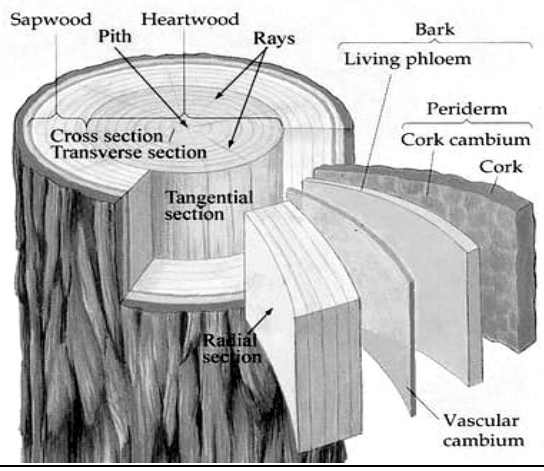
(a) Sapwood is involved in conduction of water and minerals from root to leaf
(b) Sapwood is the innermost secondary xylem and is lighter in colour
(c) Due to deposition of tannins, resins, oils etc., heart wood is dark in colour
(d) Heart wood does not conduct water but gives mechanical support

NEET-2020 Phase-I

Ans. (b) : Sapwood (Alburnum) : Outer living layers of secondary wood of trees, which in transport of H_2O and minerals. Sapwood is the outermost secondary xylem and is lighter in color.

Heart wood (Duramen) : Dead central wood of trees, heart wood is darker in color due to deposition of tannins of other substances.

- Peripheral region of the secondary xylem is lighter in color. This is term as sapwood.
- In the trunk and older branches of large trees, only outer secondary xylem which is sapwood serves in water conduction.
- The inner part which is heartwood is composed of dead but structurally strong xylem.



454. Age of a tree can be estimated by:

(a) diameter of its heartwood
(b) its height and girth
(c) biomass
(d) number of annual rings

NEET-2013

Ans. (d) : Age of tree can be estimated by number of annual rings. The two kinds of woods that appear as alternate concentric ring. Constitute an annual ring heartwood comprises dead element with highly lignified wall that give mechanical support to the stem.

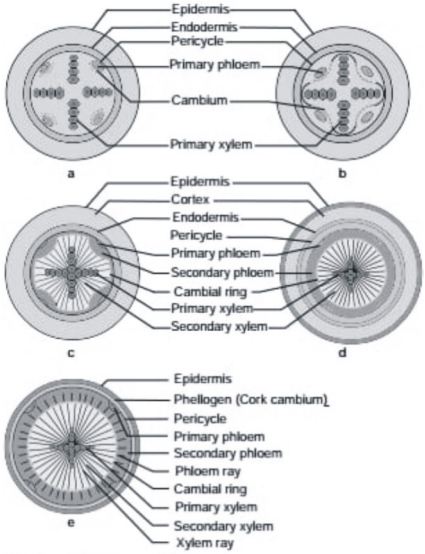
455. A secondary growth proceeds, in a dicot stem, the thickness of

(a) sapwood increases
(b) heartwood increases
(c) both sapwood and heartwood increases
(d) both sapwood and heartwood remains the same.

AIIMS-2016
Karnataka CET-2006

Ans. (b) : Secondary growth occur only dicot plants during the secondary growth the thickness of heartwood increases because of the formation of cambium ring which is found between xylem and phloem. They are responsible for secondary growth.

- Thus, secondary growth is the outward growth of the plants, making it thicker and wider. Secondary growth is important to woody plants, because they grow much taller than the other plants and need more support in their stems and roots.
- Lateral meristem are the dividing cells in secondary growth and are produce secondary tissues.



Different stages of the secondary growth

456. Which exposed wood will decay faster?

(a) Sapwood
(b) Softwood
(c) Wood with lot of fibers
(d) Heartwood

AIPMT-1993

@apna_pdf

Ans. (a) : Sapwood decay faster and sapwood is less durable because it is susceptible to attack by pathogen and insects. It is physiologically active and conducting of water takes place through it. Heartwood is not attacked by pathogens and insects as it is physiologically inactive. It is filled with tennis, resins and gums which are not preferred by insects and pathogens.

457. As a tree grows older, which of the following increases more rapidly in thickness?
(a) Heartwood (b) Sapwood
(c) Phloem (d) Cortex

AIPMT-1994

Ans. (a) : In older trees the volume of heartwood increases each year due to the secondary growth.
• Heart wood is also called duramen. It is dead central wood of trees.

458. The inner, darker and harder portion of secondary xylem that can not conduct water, in an older dicot stem, is called ……
(a) Bast (b) Alburnum
(c) Duramen (d) Wood

Karnataka CET-2005

Ans. (c) : The inner, darker and harder portion of secondary xylem that can not conduct water, in an older dicot stem is called duramen.
• The amount of duramen or heartwood rises as the tree grows older while the amount of sapwood almost remains constant.

459. What is/are true about heart wood?
A. It does not help in water conduction
B. It is also called alburnum.
C. It is dark in color but very soft.
D. It has tracheary elements which are filled with tannin, resin etc.
(a) A and D (b) B and D
(c) A, B and C (d) B, C and D

Karnataka CET-2009

Ans. (a) : Heart wood does not help in water conduction.
• Heart wood has tracheary elements which are filled with tannin, resin, etc.

460. Tyloses are found in …….
(a) Secondary xylem
(b) Secondary phloem
(c) Sclerenchyma fibres
(d) Sclereids

Karnataka CET-2010

Ans. (a) : Tyloses are found in secondary xylem. These are common in xylem vessels of many genus of angiosperm including Rhus, Robinia, Morus, Sassafras but they never occurs in many genera. Tylose often block water transport in vessels and cause injury by dehydration.

461. Tyloses an outgrowth from ray or axial parenchyma cell into the lumen of a vessel, which partially or completely blocks the cavity are present in
(a) Periderm (b) heart wood
(c) sap wood (d) secondary cortex

JIPMER-2014

Ans. (b) : In woody plant like heartwood, an extension of parenchymatous cell into the lumen of vessels is observed, this is called as Tyloses. When there is any injury or infection, the cavity is blocked by Tyloses so that no further damage or destruction.

462. Match the following lists.

List I	List II
(A) Tyloses	(i) Coenocytic
(B) Periderm	(ii) Adaxial epidermis
(C) Motor cells	(iii) Complementary cells
(D) Laticifers	(iv) Heart wood
	(v) Conjunctive tissue

The correct match is

	A	B	C	D
(a)	(iii)	(ii)	(i)	(v)
(b)	(ii)	(v)	(i)	(iii)
(c)	(iv)	(iii)	(ii)	(i)
(d)	(iv)	(i)	(iii)	(v)

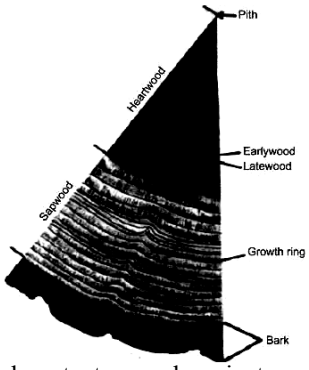
AP EAMCET-2013

Ans. (c):
(a) Tyloses – (iv) Heart wood
(b) Periderm – (iii) Complementary cells
(c) Motor cells – (ii) Adaxial epidermis
(d) Laticifers – (i) Coenocytic

463. Heartwood differs from sapwood in –
(a) Presence of rays and fibres
(b) Abscence of vessels and parenchyma
(c) Having dead and non-conducting elements
(d) Being susceptible to pests and pathogens

AIPMT (Screening)-2010

Ans. (c) : Heartwood **(Duramen)** and sapwood **(Alburnum)** are two distinct forms of wood found in older woody trees. The heartwood is composed of dead xylem vessels that have been filled with Tyloses and are rich in deposits of resins and tannins. These are unusable and are darker. The sapwood contains nearly created functioning vessels that seem lighter.



The heartwood protects wood against pest attack while also increasing its durability.

464. Half life period of C^{14} is : -
(a) 500 years (b) 5000 years
(c) 50 years (d) 5×10^4 year

AIPMT-2001

Ans. (b) : The half-period of C^{14} is 5000 years. It is used in the determination of age of fossils by using technique called carbon dating.
• C^{14} has a half-life of 5,730 ± 40 years- i.e. half the amount of the radio isotope present at any given time will undergo spontaneous disintegration during the succeeding 5,730 years.

@apna_pdf

07 STRUCTURAL ORGANIZATION IN ANIMALS

A. Tissue

1. Vagina, oesophagus, urethra contain which type of tissue?
(a) Stratified squamous epithelium
(b) Simple squamous epithelium
(c) Ciliated epithelium
(d) Columnar epithelium

Manipal-2010
AMU-2009
Punjab MET-2008
Uttarakhand PMT-2004

Ans. (a) : Vagina, oesophagus, urethra contain stratified squamous epithelium. It is a type of tissue found covering the lining parts of the body. The major function of this tissue is protection.

2. Thin filament of myofibril is made up of
(a) Actin and Myosin
(b) Actin, Tropomyosin and Troponin
(c) Actin, Tubulin and Troponin
(d) Myosin and Tropomyosin

TS EAMCET 10.05.2023 Shift-I

Ans. (b) : The thin filament of myofibril is made up of actin, tropomyosin and troponin.
• Actin is the main protein in the thin filament. It is a long, thin protein that forms a helix.
• Tropomyosin is a regulatory proteins that binds to actin and blocks the binding site for myosin.
• Troponin is a complex of three proteins that bind to tropomyosin and regulate its movement.

3. Match the following

List – I		List – II	
A.	Chondrocytes	I.	Liver
B.	Dendrites	II.	Muscle
C.	Sarcolemma	III.	Cartilage
D.	Haversian canal	IV.	Nerve cells
		V.	Bone

(a) A – I, B – III, C – IV, D - V
(b) A – III, B – IV, C – II, D - V
(c) A – III, B – IV, C – I, D - V
(d) A – II, B – IV, C – V, D - I

TS EAMCET-11.05.2023, Shift-I

Ans. (b) : The correct match–

Chondrocytes	–	Cartilage
Dendrites	–	Nerve cells
Sarcolemma	–	Muscle
Haversian canal	–	Bone

4. Assertion (A) : Pseudo stratified epithelium gives the false appearance of stratified epithelium
Reason (R) : Pseudo stratified epithelium is made up of more than one layer of cells to provide protection against stress
(a) Both A and R are true and R is the correct explanation of A
(b) Both A and R are true but R is not the correct explanation of A
(c) A is true and R is false
(d) A is wrong and R is true

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : Assertion is True– Pseudo stratified epithelium is madeup of a single layer of cells, but the nuclei of the cells are arranged in different levels, giving the false appearance of a stratified epithelium.
Reason (R) is False– Pseudo stratified epithelium is not made up of more than one layer of cells, but the nuclei are arranged in different levels.
Therefore, both A and R are true, but R is not the correct explanation of A. So the answer is (c).

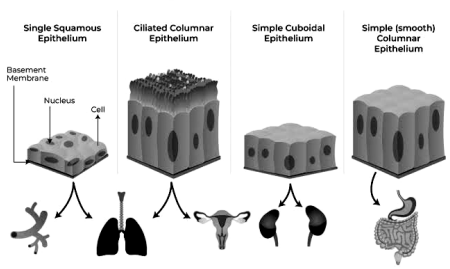
5. Match List-I with List-II.

	List-I		List-II
(A)	Columnar epithelium	(i)	Ducts of glands
(B)	Ciliated epithelium	(ii)	Inner lining of stomach and intestine
(C)	Squamous epithelium	(iii)	Inner lining of bronchioles
(D)	Cuboidal epithelium	(iv)	Endothelium

Choose the correct answer from the options given below :
(a) (A)-(ii), (B)-(iii), (C)-(i), (D)-(iv)
(b) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)
(c) (A)-(iii), (B)-(ii), (C)-(i), (D)-(iv)
(d) (A)-(iii), (B)-(ii), (C)-(iv), (D)-(i)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Correct option is (b) because,
■ Columnar epithelium is present in inner lining of stomach and intestine.
■ Ciliated epithelium is present in inner lining of blood vessels and is called endothelium.
■ Squamous epithelium present in inner lining of blood vessels and is called endothelium.
■ Cuboidal epithelium is present in the lining of renal tubules and ducts of glands.



@apna_pdf

6. Match List I with List II :

	List I		List II
A.	Mast cells	I.	Ciliated epithelium
B.	Inner surface of bronchiole	II.	Areolar connective tissue
C.	Blood	III.	Cuboidal epithelium
D.	Tubular parts of nephron	IV.	Specialised connective tissue

Choose the correct answer from the options given below :

(a) A-III, B-IV, C-II, D-I
(b) A-I, B-II, C-IV, D-III
(c) A-II, B-III, C-J, D-IV
(d) A-II, B-I, C-IV, D-III

NEET (UG) 07.05.2023

Ans. (d) : Mast cell is a type of white blood cell that found in connective tissue and found in throughout the body in loose connective tissue.

• Blood is a specialized body fluid. It transport oxygen from lungs to the tissue etc.

• Epithelial cells which line the inner surface of bronchioles and small bronchi are known as ciliated epithelium.

• Tubular part of nephron consists of a proximal tubule and distal tubule connected by Henle's loop, cuboidal epithelial present in tubular part.

7. Given below are two statements :/ नीचे दो कथन दिये गये हैं :

Stateement I /: Ligaments are dense irregular tissue.

Statement II : Cartilage is dense regular tissue.

In the light of the above statements, choose the correct answer from the options given below :

(a) Statement I is false but Statement II is true.
(b) Both Statement I and Statement II are true.
(c) Both Statement I and Statement II are false.
(d) Statement I is true but Statement II is false.

NEET (UG) 07.05.2023

Ans. (d) : Dense irregular connective tissue comprises structures such as ligaments and tendons.

• They are found in different shapes and sizes in the body. Some look like pieces of string, others look like pieces of string others look like narrow or wide bands.

Cartilage and bones are not examples of dense regular connective tissue. Bone and cartilage are actually a specialized connective tissue.

Hence option (d) is correct answer.

8. The supportive skeletal structures in epiglottis and pubic symphysis of human being are the examples of

(a) Bone (b) Cartilage
(c) Adipose tissue (d) Areolar tissue

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : The supportive skeletal structures in epiglottis and pubic symphysis of human being are the examples of cartilage. It forms rubber-like padding to cover and protect long bones at the joints and terminals. It forms the supportive skeletal structures in the human external ears and also at the nose tip.

9. Match the following

List-I		List-II	
A.	**Totipotent cell**	**i.**	**Haemopoietic stem cells**
B.	**Pluripotent cell**	**ii.**	**Muscle stem cells**
C.	**Multipotent cell**	**iii.**	**8 cell stage blastocyst**
D.	**Unipotent cell**	**iv**	**Inner cell mass**
		v	**Mast cell**

The correct match is

Options:

	A	B	C	D
(a)	III	V	IV	II
(b)	III	IV	I	II
(c)	II	III	IV	I
(d)	V	III	II	IV

TS EAMCET-09.08.2021 Shift-I

Ans. (b) :

List-I		List-II	
A.	Totipotent cell	iii.	8 cell stage blastocyst
B.	Pluripotent cell	iv.	Inner cell mass
C.	Multipotent cell	i.	Haemopoietic stem cells
D.	Unipotent cell	ii	Muscle stem cells

10. The branch of "Histology" is also called ____

(a) Anatomy
(b) Micro-Anatomy
(c) Cytology
(d) None of these options are correct

AP EAMCET-25.09.2020 Shift-I

Ans. (b) : The branch of "Histology" is also called micro-Anatomy. It is the microscopic study of animal and plant cell and tissues through staining and sectioning and examining them under a microscope (electron or light microscope)

11. Study the following statements

(A) Compound epithelium forms the lining of the larger pancreatic ducts as stratified cuboidal epithelium

(B) Cartilage is a vascular tissue surrounded by fibrous connective tissue sheath called perichondrium

(C) Gap junctions in cardiac muscles permit electrical impulses to be conducted rapidly

(D) Mylienated nerve fibres are found in grey matter of the central nervous system

Among the above, identify incorrect statements

@apna_pdf

Options:

(a) A, B (b) A, C
(c) B, C (d) B, D

AP EAMCET-24.04.2019 Shift-I

Ans. (d) : Perichondrium is the outermost covering of the cartilage. In the matrix of cartilage, blood circulation is absent but it is present in perichondrium. Myelinated nerve fibres are found in white matter of the central nervous system and in most peripheral nerves.

12. The basement membrane acts as

(a) plasma membrane (b) plasmalemma
(c) Both (a) and (b) (d) None of these

CG PMT-2007

Ans. (c) : The basement membrane acts as plasma membrane and plasmalemma. They are a dense, sheet-like form of extracellular matrix (ECM) that underlie epithelium, endothelium, etc. Basement membranes separate tissues and protects them from mechanical stress.

13. The cells of a tissue are similar in

(a) structure (b) function
(c) origin (d) both (b) and (c)

CG PMT-2007

Ans. (d) : The cells of a tissue are similar in function and origin. A group of cells are called as tissue that has a similar origin, structure and function. The same origin means that they are resulting from the same layer of cells in the embryo. Therefore, they have similar structures and perform same functions.

14. Protective structure like nails, hoofs, hairs and horns in mammals are produced in and derivative of

(a) stratum granulosum and epidermis
(b) stratum corneum and epidermal derivatives
(c) stratum malpighi and epidermis
(d) stratum lucidum and epidermal derivatives

BVP-2013

Ans. (b) : Nails, claws, hoofs, hair, horns and feathers all are formed by the outermost layer of the epidermis and stratum corneum. The stratum corneum major function is to protect the skin and underlying tissues from dehydration, chemicals and mechanical stress.

15. Carotene pigment is found in the cells of

(a) dermis (b) epidermis
(c) adipose cell (d) Both (a) and (b)

BVP-2012

Ans. (b) : Carotene pigment is found in the cells of epidermis. It plays a role in providing colour to the skin along with melanin. Carotene is an orange-yellow pigment abundant in carrots and other leafy green vegetables.

16. Velamen tissues are associated with:

(a) haustorial function
(b) assimilation
(c) absorption of moisture
(d) nutrition

BCECE-2002

Ans. (c) : Velamen tissues are associated with absorption of moisture. It is also known as **velamen radicum,** is a porous, multi layered epidermis covering the roots of epiphytic and semi-epiphytic plants. It is capable of absorbing water (in the form of moisture) from the air.

17. Integument is usually called jack of all trades' because:

(a) performs various functions
(b) is most incomplete organ
(c) gives shape to various structures of body
(d) protects the body

Haryana PMT-1999

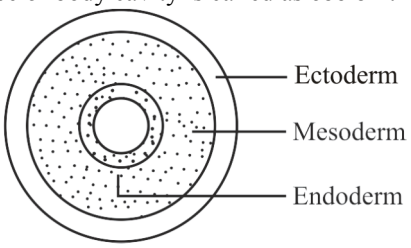
Ans. (a) : Integument is usually called **Jack of all trades** because it performs various functions. It performs many intricate functions such as body temperature regulation, cell fluid maintenance, synthesis of vitamin-D and detection of stimuli.

18. Coelom is a space between

(a) ectoderm and endoderm
(b) mesoderm and ectoderm
(c) splitted mesoderm
(d) mesoderm and body wall

J&K CET-2004

Ans. (c) : In triploblastic animal, a space is created between the body wall and the alimentary canal due to splitting of mesoderm, during embryonic development. This space or body cavity is called as **coelom.**



19. Match the types of animal tissues listed under Column I with the location given under Column II; choose the answer which gives the correct Combination of the alphabets of the two columns:

	Column-I (Tissues)		Column-II (Location)
A	Simple columnar epithelium	p	Wall of heart
B	Cardiac muscle	q	Bone joints
C	Adipose tissue	r	Inner lining of stomach and intestine
D	Hyaline cartilage	s	Below the skin in the abdomen, buttocks, thighs and breasts
		t	Diaphragm

@apna_pdf

(a) A = p, B = r, C = s, D = t
(b) A = r, B = p, C = t, D = s
(c) A = r, B = p, C = s, D = q
(d) A = r, B = t, C = q, D = s

Karnataka CET-2000

Ans. (c) :

	Column-I (Tissues)		Column-II (Location)
A	Simple columnar epithelium	r	Inner lining of stomach and intestine
B	Cardiac muscle	p	Wall of heart
C	Adipose tissue	s	Below the skin in the abdomen, buttocks, thighs and breasts
D	Hyaline cartilage	q	Bone joints

20. Stratum germinativum is an example of which kind of epithelium?

(a) Cuboidal (b) Ciliated
(c) Columnar (d) Squamous

Haryana PMT-2000

Ans. (c) : Stratum germinativum is an example of columnar epithelium. It is the most basal layer consisting of columnar epithelium. It is constantly getting germinated, and the new cells push older cells towards the outer layer of the epidermis. It is the deepest layer of the five layers of the epidermis and also the outer covering of skin in mammals.

21. A metazoa without tissue organisation is called :

(a) parazoa (b) protozoa
(c) eumetazoa (d) dermatozoa

Punjab MET-2004

Ans. (a) : A metazoa without tissue organization is called parazoa. It is the subkingdom of animals that lack true tissues and are considered more primitive in their organization.

22. In rabbit, end of a long bone is connected in another by

(a) tendon (b) ligaments
(c) muscle (d) cartilage

VMMC-2012
UP CPMT-2008

Ans. (b) : : In rabbit end of long bone is connected in another by ligaments, which is a fibrous connective tissue usually serves to hold structures together and keep them stable. It connect one bone to other at joints bilateral.

23. The inherent capacity of a cell to regenerate a new whole organisms is called as

(a) ontogeny (b) totipotency
(c) phylogeny (d) proliferation

Punjab MET-2011

Ans. (b) : The inherent capacity of a cell to regenerate a new whole organisms is called as "totipotency" It is the potential to develop and produce differentiated cells in a living body.

24. The ratio of methane, ammonia and hydrogen in Stanley Millers experiment was

(a) 3 : 1 : 2 (b) 2 : 1 : 2
(c) 1 : 2 : 1 (d) 5 : 4 : 1

Rajasthan PMT-2009

Ans. (b) : The ratio of CH_4, NH_3 and H_2 was 2:1:2 in Stanley Miller's experiment. The Miller experiment was helpful in understanding the condition of earth's early atmosphere.

B. Epithelial Tissue and Junctions

25. The ciliated epithelial cells are required to move particles or mucus in a specific direction. In humans, these cells are mainly present in

(a) Fallopian tubes and Pancreatic duct
(b) Eustachian tube and Salivary duct
(c) Bronchioles and Fallopian tubes
(d) Bile duct and Bronchioles

NEET (Re-Exam)-04.09.2022
NEET-2019
Karnataka CET-2017
JCECE-2012
BCECE-2012
AIPMT (Screening)-2011
WB JEE-2011

Ans. (c) : In human cilliated epithelial cells are present in bronchioles and fallopian tubes. In bronchiole they help in movement of mucus while in fallopian tubes, they help in movement of egg or ovum towards the uterus.

26. The lining of intestine and kidneys in humans is :

(a) kcratinized (b) brush border
(c) ciliated (d) none of these

AP EAMCET-2011
Manipal-2008
BVP-2007
MGIMS Wardha-2006

Ans. (b) : The lining of intestine and kidneys in humans is brush border. They are found in the luminal (inner) surfaces of the small intestine and the proximal tubule of the kidney. They are made up of numerous microvilli projecting at the free surface of epithelial lining. The presence of microvilli greatly increase the surface area for absorption. Brush border epithelium, also known as **striated border or brush border.**

27. Bowmans glands are located in the

(a) proximal end of uriniferous tubules
(b) anterior pituitary
(c) female reproductive system of cockroach
(d) olfactory epithelium of our nose

BCECE-2014, 2013
Rajasthan PMT-2010
DUMET-2008

@apna_pdf

Ans. (d) : Bowman's glands are located in the olfactory epithelium of our nose. Bowman's glands are also called as olfactory gland. They are situated in the olfactory epithelium. It produces mucus to moister the olfactory epithelium and dissolve odour-containing gases.

28. Ciliated epithelium is present in;

(a) Trachea (b) Ureter
(c) Intestine (d) Nasal chamber

VMMC-2007
Rajasthan PMT-2006, 2005
UP CPMT-2002

Ans. (a) : Ciliated epithelium is present in trachea. It is modified columnar epithelium which have cilia, on free surface, example trachea, uterus, etc.

29. The type of epithelium that is found in proximal convoluted tubule of nephron is

(a) Simple squamous epithelium
(b) Simple cuboidal epithelium
(c) Simple columnar epithelium
(d) Simple glandular epithelium

TS EAMCET 10.05.2023 Shift-I

Ans. (b) : The proximal convulated tubule of nephron is lined with simple cuboidal epithelium. This type of epithelium is made up of a single layer of cells that are cubed-shaped. The cells have a brush border of microvilli, which are tiny projections that increase the surface area of the cells. This allows the cells to absorb more of the nutrients and other substances from the glomerular filtrate.

30. Dense irregular connective tissue occurs in

(a) Umbilical cord
(b) Deeper region of dermis of skin
(c) Vocal cords
(d) Epiglottis

AP EAPCET-23.05.2023, Shift-II

Ans. (b) : Dense irregular connective tissue occurs in deeper region of dermis of skin. The dense irregular fibrous connective tissue can be also found in joint capsules, the connective tissue that envelops muscles (Muscle fascia) and the skin's dermis.

31. Given below are two statements:

Statement I : Goblet cells are unicellular glands.

Statement II : Earwax is the secretion of exocrine gland.

In the light of the above statements, choose the correct answer from the options given below:

(a) Both Statement I and Statement II are true
(b) Both Statement I and Statement II are false
(c) Statement I is true but Statement II is false
(d) Statement I is false but Statement II is true

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : The goblet cells are unicellular because some of the columnar or cuboidal cells get specialized for secretion and are called glandular epithelium. They are responsible for the production and maintenance of the protective mucus.

■ Exocrine glands secrete mucus, saliva, earwax, oil, milk, digestive enzymes and other cell products. It releases chemical substances through ducts to outside the body or onto another surface within the body.

32. Which type of epithelium is present in Vas deferentia ?

(a) Simple Squamous epithelium
(b) Stratified Squamous epithelium
(c) Pseudo Stratified Columnar epithelium
(d) Simple Columnar epithelium

AP EAMCET-11.07.2022 Shift-II

Ans. (c) : Pseudo stratified columnar epithelium present in vas deferentia.

These are tissues farmed by a single layer of cells that give the appearance of being made from multiple layers, especially when seen in cross section.

33. Match the following:

	List-I	**List-II**
A)	**Moist surface of pharynx**	**I) Non ciliated columnar epithelium**
B)	**Larger ducts of salivary glands**	**II) Transitional epithelium**
C)	**Ventricles of Brain**	**III) Stratified cuboidal epithelium**
D)	**Lining of stomach**	**IV) Stratified non keratinised squamous epithelium**
		V) Ciliated columnar epithelium

The correct match is

	A	**B**	**C**	**D**
(a)	IV	III	II	I
(b)	IV	III	V	I
(c)	I	V	III	IV
(d)	V	II	I	IV

TS EAMCET-30.07.2022 Shift-II

Ans. (b) :

List-I		**List-II**	
(A)	Moist surface of pharynx	(IV)	Stratified non-keratinised squamous epithelium
(B)	Larger ducts of salivary glands	(III)	Stratified cuboidal epithelium
(C)	Ventricles of Brain	(V)	Ciliated columnar epithelium
(D)	Lining of stomach	(I)	Non ciliated columnar epithelium.

34. The junction between epithelial cells that prevent the leakage of body fluids

(a) Desmosomes (b) Tight junctions
(c) Gap junctions (d) Synapses

TS EAMCET-31.07.2022 Shift-II

Ans. (b) : The junction between epithelial cells that prevent the leakage of body fluids Tight junctions. Tight junctions form the continuous intercellular barrier between epithelial cells, which is required to separate tissue spaces and regulate selective movement of solutes across the epithelium. Tight junctions create a water tight seal between two adjacent animal cells.

@apna_pdf

35. Match the following:

List-I	List-II
(A) Moist surface of pharynx	**(I) Non ciliated columnar epithelium**
(B) Larger ducts of salivary glands	**(II) Transitional epithelium**
(C) Ventricles of Brain	**(III) Stratified cuboidal epithelium**
(D) Lining of stomach	**(IV) Stratified non keratinized squamous epithelium**
	(V) Ciliated columnar epithelium

The correct match is

	A	B	C	D
(a)	IV	III	II	I
(b)	IV	III	V	I
(c)	I	V	III	IV
(d)	V	II	I	IV

TS EAMCET-30.07.2022 Shift-II

Ans. (b) :

	List (A)		List (B)
A.	Moist surface of pharynx	**(iv)**	Stratified non keratinized squamous epithelium
B.	Larger ducts of salivary glands	**(iii)**	Stratified cuboidal epithelium
C.	Ventricles of Brain	**(v)**	Ciliated columnar epithelium
D.	Lining of stomach	**(i)**	Non ciliated columnar epithelium

36. Match List-I with List-II

	List-I		List-II
(A)	**Bronchioles**	**(i)**	**Dense Regular Connective Tissue**
(B)	**Goblet Cell**	**(ii)**	**Loose Connective Tissue**
(C)	**Tendons**	**(iii)**	**Glandular Tissue**
(D)	**Adipose Tissue**	**(iv)**	**Ciliated Epithelium**

Choose the correct answer from the options given below :

(a) (A) - (iii), (B) - (iv), (C) - (ii), (D) - (i)
(b) (A) - (iv), (B) - (iii), (C) - (i), (D) - (ii)
(c) (A) - (i), (B) - (ii), (C) - (iii), (D) - (iv)
(d) (A) - (ii), (B) - (i), (C) - (iv), (D) - (iii)

NEET-2022

	List-I		List-II
(A)	Bronchioles	(iv)	Ciliated Epithelium
(B)	Goblet Cell	(iii)	Glandular Tissue
(C)	Tendons	(i)	Dense Regular Connective Tissue
(D)	Adipose Tissue	(ii)	Loose Connective Tissue

37. Match the following:

Epithelium		Found in
(A) Pavement epithelium	**(i)**	**Germinal epithelium**
(B) Simple cuboidal epithelium	**(ii)**	**Lining of intestine**
(C) Ciliated columnar epithelium	**(iii)**	**Wall of urinary bladder**
(D) Non ciliated columnar epithelium	**(iv)**	**Fallopian tube**
	(v)	**Mesothelium**

The correct match is

	A	B	C	D
(a)	v	iii	ii	iv
(b)	ii	iv	i	v
(c)	v	i	iv	ii
(d)	iii	ii	iv	ii

TS EAMCET-10.08.2021 Shift-I

Ans. (c):

	Epithelium		Found in
(A)	Pavement epithelium	(v)	Mesothelium
(B)	Simple cuboidal epithelium	(i)	Germinal epithelium
(C)	Ciliated columnar epithelium	(iv)	Fallopian tube
(D)	Non ciliated columnar epithelium	(ii)	Lining of intestine

38. Ciliated epithelium is found in

(a) Bronchioles and fallopians tubes
(b) Fallopian tubes and pancreatic duct
(c) Bile duct and fallopians tubes
(d) Salivary duct and eustachian tube

TS EAMCET-29.09.2020 Shift-I

Ans. (a) : Inner surface of bronchi, bronchioles and fallopian tubes is lined by ciliated epithelium. The majority of the respiratory tree, from the nasal cavity to the bronchi, is lined by pseudostratified columnar ciliated epithelium. The bronchioles are lined by simple columnar to the cuboidal epithelium, and the alveoli possess a lining of thin squamous epthielium that allows for gas exchange.

@apna_pdf

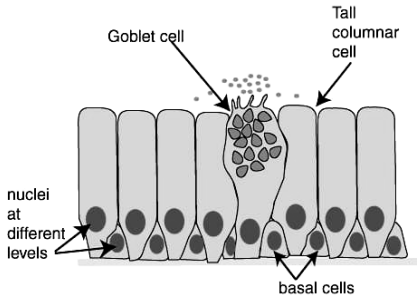
39. Goblet cells of alimentary canal are modified from

(a) Columnar epithelial cells
(b) Chondrocytes
(c) Compound epithelial cells
(d) Squamous epithelial cells

NEET-2020 Phase-I

Ans. (a) : Goblet cells of alimentary canal are modified from columnar epithelial cells.

On the outside of the mucous membranes of organs, goblet cells, modified epithelial cells with a columnar shape, secrete mucus.



- It is found in lower digestive system and the lungs.
- Histologically, they are mucous merocrine exocrine glands.

40. Identify the wrong matching

(A) Goblet cells –Unicellular glands that produce enzymes
(B) Salivary gland – Multi cellular gland
(C) Exocrine glands – secrete mucus, saliva, earwax, oil, milk, digestive enzymes
(D) Tight junctions in epithelium – help to stop substances from leaking across a tissue

(a) A (b) B
(c) C (d) D

AP EAMCET-25.09.2020 Shift-II

Ans. (a) : The Goblet cells are simple columnar epithelial cells that secrete the mucins, like mucin(5AC), which are significant component of mucus.

41. Which of the following epithelium found in the walls of blood vessels and air sacs of lungs and are involved in functions like forming a diffusion boundary ?

(a) Cubiodal epithelium
(b) Columnar epithelium
(c) Squamous epithelium
(d) Ciliated epithelium

AP EAMCET-25.09.2020 Shift-II

Ans. (c) : The type of epithelial cells that is found in the lining of blood vessels and lungs is squamous epithelium. They are extremely thin and flat and form a delicate lining. They are involved in functions like forming a diffusion boundary.

42. Match the following

	Set-I		Set-II
A	Prevent leakages of body fluids between cells	i	Gap Junctions
B	Provide cytoplasmic channels between cells	ii	Ligaments
C	Act as rivets in binding the cells	iii	Tight Junctions
D	Attach bones to other bones	iv	Anchoring Junctions
		v	Tendons

The correct match is

	(A)	(B)	(C)	(D)
(a)	iii	ii	i	v
(b)	ii	iii	i	iv
(c)	iii	i	v	iv
(d)	iii	i	iv	ii

TS EAMCET-09.05.2019 Shift-I

Ans.(d):

	List - I		List-II
(A)	Prevent leakages of body fluids between cells.	(iii)	Tight Junctions
(B)	Provide cytoplasmic channels between cells.	(i)	Gap junctions
(C)	Act as rivets in binding the cells	(iv)	Anchoring junctions
(D)	Attach bones to other bones	(ii)	Ligaments

43. Match the following cell structure with its characteristic feature :

(A) Tight junctions (i) Cement neighbouring cells together to form sheet
(B) Adhering junctions (ii) Transmit information through chemical to another cells
(C) Gap junctions (iii) Establish a barrier to prevent leakage of fluid across epithelial cells
(D) Synaptic junctions (iv) Cytoplasmic channels to facilitate communication between adjacent cells

Select correct option from the following :

@apna_pdf

(a) (A)-(iv), (B)-(iii), (C)-(i), (D)-(ii)
(b) (A)-(ii), (B)-(iv), (C)-(i), (D)-(iii)
(c) (A)-(iv), (B)-(ii), (C)-(i), (D)-(iii)
(d) (A)-(iii), (B)-(i), (C)-(iv), (D)-(ii)

NEET (Odisha)-2019

Ans. (d):

List - I		List - II	
1.	Tight junctions	(iii)	Establish a barrier to prevent leakage prevent leakage of fluid across epithelial cells
2.	Adhering junctions	(i)	Cement neighbouring cells together to form sheet
3.	Gap junctions	(iv)	Cytoplasmic channels to facilitate communication between adjacent cells
4.	Synaptic junctions	(ii)	Transmit information through chemical to another cells

44. Read the following regarding cellular junctions and specializations
(A) Tight junctions prevent leakages of body fluids.
(B) Keratin filaments anchor desmosomes in inter cellular space.
(C) Communicating junctions comparable to plasma desmata of plant cells.
(D) Stereocilia are short and motile structures seen in internal ear.
Identify the correct statements
Options :
(a) A & B (b) B & C
(c) A & C (d) A & D

AP EAMCET-28.04.2017 Shift-I

Ans. (c) : Tight junctions are also known as **occluding junctions or zonulae occludentes.** They form a watertight closure between two cells, preventing chemicals from flowing through a tissue. The communating junctions between plant cells are called plasmodesmata. They are the only intercellular junctions in plants.

45. The endothelium of blood vessel is composed of
(a) cuboidal epithelium
(b) squamous epithelium
(c) columnar epithelium
(d) ciliated epithelium

Punjab MET-1999

Ans. (b) : The endothelium of blood vessel is composed of squamous epithelium. It is a thin layer of flat cells which forms the interior lining of the blood and lymphatic vessels.

46. The epithelial cells lining the stomach of vertebrates is protected from damage by HCl because
(a) HCl is too dilute
(b) the epithelial cells are resistant to the action of HCl
(c) HCl is neutralised by alkaline gastric juice
(d) the epithelial cells are covered with a mucous secretion

BVP-2010

Ans. (d) : The epithelial cells lining the stomach of vertebrates is protected from damage by HCl because the epithelial cells are covered with a mucous secretion. The mucous covers the stomach wall with a protective coating, together with a bicarbonate, this ensures that the stomach wall itself is not damaged by HCl.

47. Tissue present in skin is
(a) stratified squamous epithelium
(b) ciliated epithelium
(c) squamous epithelium
(d) stratified cuboidal epithelium

UP CPMT-2010, 2007
JCECE-2008

Ans. (a) : Tissue present in skin is stratified squamous epithelium. It provides protection to the underlying tissue against chemical and mechanical damage and water loss.

48. Which have no specific organ for respiration but respire ?
(a) Rabbit (b) Cockroach
(c) Earthworm (d) Frog

DUMET-2005
UP CPMT-2003

Ans. (c) : Earthworm have no specific organ for respiration but respire through their moist body surface into the air and vice versa in to the blood stream. The oxygen diffuses in the body via the skin into the capillaries that lay just below the skin.

49. Pacinian corpuscles occur in the skin of certain parts of body in mammals. These are :
(a) type of glands
(b) pain receptors
(c) naked tactile receptors
(d) encapsulated pressure receptors

AFMC -2011
Rajasthan PMT - 1998

Ans. (d) : Pacinian corpuscles occur in the skin of certain parts of body in mammals. These are encapsulated pressure receptors.
It is also known as **Vater Pacini or lamellar corpuscles,** which are sensory receptors for vibration. They are present in the whole body specially found in hands and feet.

50. Fallopian tube is lined by:
(a) pseudostratified epithelium
(b) ciliated epithelium
(c) cuboidal epithelium
(d) squamous epithelium

VMMC-2002
Rajasthan PMT - 1998

@apna_pdf

Ans. (b) : Fallopian tube is lined by ciliated epithelium cell. Fallopian tubes function as channels for oocytes transport and fertilization. The main function of cilliated cells in fallopian tube is to transport the ovum from the ovary toward the uterus and help to remove genotoxic stress after ovulation.

51. The secretion of tears, milk, sweat and oil are functions of which of the following tissues?
(a) Epithelial (b) Nervous
(c) Loose connective (d) Lymphoid

J&K CET-2012

Ans. (a) : The secretion of tears, milk, sweat and oil are functions of epithelial tissue. It covers the external surface of the body. The epithelial tissues derived from endoderm generally forms glandular epithelium which forms the linning cells of all the glands.

52. In which one of the following preparations, are you likely to come across cell junctions most frequently?
(a) Ciliated epithelium (b) Thrombocytes
(c) Tendon (d) Hyaline cartilage

Rajasthan PMT-2010

Ans. (a) : The cell junctions come across most frequently in the preparation of ciliated epithelium. They are especially abundant in epithelial tissues. Ciliated epithelium performs the function of moving particles or fluid over the epithelial surface in such structures as the trachea, etc.

53. The type of epithelial cells, which line the inner surface of Fallopian tubes, bronchioles and small bronchi, are known as
(a) squamous epithelium
(b) columnar epithelium
(c) ciliated epithelium
(d) cubical epithelium

Rajasthan PMT-2010
AIIMS-2006, 2010, 2009

Ans. (c) : The type of epithelial cells, which line the inner surface of Fallopian tubes, bronchioles and small bronchi, are known as ciliated epithelium. It is found in the lining of the fallopian tubes, bronchioles, and small bronchi. The cilia are the hair-like structures that are present on the cell and help in the movement of various particles.

54. Exposed surface of the human body is covered the tissue :
(a) glandular epithelium
(b) stratified squamous epithelium
(c) ciliated epithelium
(d) epidermis

Rajasthan PMT-1998

Ans. (b) : The exposed surface of the human body is covered by the tissue stratified squamous epithelium. It is a protective tissue that is found in the outer layer of the skin. it protects our skin from mechanical or physical damage and also prevents water loss.

55. Cutaneous glands are
(a) gastric glands (b) sebaceous glands
(c) thyroid gluids (d) thymus glands

CG PMT-2007, 2006

Ans. (b) : Cutaneous glands are sebaceous glands. They are small oil-producing gland present in the skin of mammals. These glands secrete the oily, waxy substance called **sebum** which lubricates the skin and hairs of mammals.

56. Pseudostratified epithelium is always
(a) single layered (b) double layered
(c) multilayered (d) uncertain

CG PMT-2007

Ans. (a) : Pseudostratified epithelium is always single layered that appeared to be made from multiple layers, especially when seen in cross section. The nuclei of these epithelial cells are at different levels leading to the illusion of being stratified.

57. Most of the glands of the body are of
(a) holocrine type (b) merocrine type
(c) apocrine type (d) None of these

CG PMT-2007

Ans. (b) : Most of the glands of the body are of merocrine type. They secrete their secretions stared in secretory vesicles by exocytosis. The 'salivary gland' is a type of merocrine gland.

58. The intercellular matrix is negligible or absent in which of the following tissues?
(a) Connective tissue (b) Epithelial tissue
(c) Muscular tissue (d) Cardiac tissue

CG PMT-2007

Ans. (b) : The intracellular matrix is negligible or absent in epithelial tissue because they are very closely attached to each other. The exchange of materials takes place by the sodium potassium ATPase pump.

59. Cells of the epithelial tissue rest on a basement membrane, which is made up of
(a) mono saccharides
(b) muco polysaccharides
(c) disaccharides
(d) lipids

CG PMT-2007

Ans. (b) : Cells of the epithelial tissue rest on a basement membrane, which is made up of muco polysaccharides. The basement membrane is non - cellular skinny fibrous membrane on which all epithelia rest. Epithelial is the outermost layer of cell that cover the surface of the body.

60. Zonula adherens is another name for:
(a) desmosome (b) mesosomes
(c) gap junction (d) terminal bars

Haryana PMT-2002
AIIMS-1994

Ans. (d) : Zonula adherens is also known as **terminal bars or adherens junctions.** They are protein complexes that occur at cell-cell junctions and cell-matrix junctions in epithelial and endothelial tissues, usually more basal than tight junctions.

61. Which one affects liver, muscle and adipose tissue?
(a) Androgen (b) Insulin
(c) Progesterone (d) Glucagon

Haryana PMT-2005

@apna_pdf

Ans. (b) : The liver, muscle, and adipose tissue are affected by insulin. It is secreted from β- cell of islets of langerhans. It also increases hepatic lipid synthesis for subsequent storage in adipose tissue and stimulates glucose uptake into fat and muscle.

62. Which one of the following is correct?
(a) Mesoderm - brain
(b) Ectoderm - liver
(c) Mesoderm - skeleton
(d) Endodermis-epidermis

Haryana PMT-2004

Ans. (c) : The muscles of skeletal system are formed by the mesoderm. It is one of the three primary germ layers that form during embryonic development.

63. Mammary glands are modified:
(a) sweat glands (b) ceruminous glands
(c) glands of Zeis (d) Inguinal glands

BVP-2013
Manipal-2003
Haryana PMT-2004

Ans. (a) : Mammary glands functionally produce milk, structurally, they are modified sweat glands. These glands are found in both males and females body but are more develop in females, while in males it is in rudimentary state.

64. Adjacent epithelial cells are held together by, means of
(a) microsomes (b) liposomes
(c) desmosomes (d) glyoxysomes

BVP - 2011
CMC Vellore - 2008
AMU-2006

Ans. (c) : The adjacent epithelial cells are held together by desmosomes. It form links between cells and provide a connection between intermediate filaments of the cell cytoskeletons of adjacent cells. This structure provide strength to tissues.

65. Brush bordered epithelium is found in :
(a) fallopian tube (b) small intestine
(c) stomach (d) trachea

JIPMER-2001
AIIMS-1995

Ans. (b) : Brush border cells are found mainly in the small intestine tract. It is type of columnar epithelium covered with microvilli. The brush borders of the intestinal lining are the site of terminal carbohydrate digestions.

66. An example of vestigial organ is
(a) ear of cow
(b) hair of bear
(c) nail of monkey
(d) nictitating membrane of man

Manipal-2013

Ans. (d) : The nictitating membrane (third eyelid) is located ventromedially between the lacrimal caruncle and the globes. It is present in amphibians such as frogs. It helps protect the eyes of the amphibians from water and mud while swimming in water. It also helps keep the eyes moist when the frog is on land.

67. The tissue which covers the external surface of the animal body and the internal surface of visceral organs is
(a) Epithelial tissues (b) Connective tissue
(c) Adipose tissue (d) None of these

J&K CET-2015

Ans. (a) : The tissue which covers the external surface of the animal body and the internal surface of visceral organs is epithelial tissues. It forms the outer covering on all internal and external surface of body and hollow organs. It is consists of fiber and polysaccharides secreted by epithelial cells. The function of epithelium tissue are protection, transpiration, secretion and absorption.

68. Epithelial cells of the intestine involved in food absorption have _____on their surface
(a) pinocytic vesicles (b) phagocytic vesicles
(c) zymogen granules (d) microvilli

CG PMT-2006

Ans. (d) : Epithelial cells of the intestine involved in food absorption have microvilli on their surface. They are brush- like structures which provide a larger surface area for the absorption of nutrients from the intestine.

69. In simple epithelium, the cells are
(a) continuously dividing to provide cells forming an organ
(b) hardened to provide support to the organs
(c) loosely connected to one another to form an irregular layer
(d) cemented directly to one another to form a single layer

Haryana PMT-2010

Ans. (d) : In simple epithelium, the cells are cemented directly to one another to form a single layer. An epithelium is a sheet or tube of firmly adherent cells with minimum material and space between them.

70. The main function of sweat gland is:
(a) excretion of salts
(b) water regulation
(c) thermo-regulation
(d) excretory in function

Haryana PMT-2003

Ans. (c) : The main function of sweat gland is thermo-regulation. They are coiled and tubular in structure. They secretes a watery fluid containing minor amounts of urea, lactic acid, and other substances. It is mainly water, but it also contains salts. The main function of the sweat gland is to control body temperature.

71. Salivary glands are absent in
(a) Anopheles maculipennis
(b) Musca domestica
(c) Blatta orientalis
(d) Rana hexadactyla

BVP-2015

Ans. (d) : Salivary glands are absent in *Rana hexadactyla*. The salivary gland, found in the buccal cavity of animals which helps in moisturizing and lubricating the food and turning it into bolus. Salivary glands contain a special enzyme i.e. α - amylase secreted by saliva present in buccal cavity of animal.

@apna_pdf

72. Stratum luciderm has a shiny substance called
(a) luciferin (b) eleidin
(c) cardiolipin (d) cerumen
VMMC-2015

Ans. (b) : Stratum luciderm has a shiny substance called eleidin. It is clear intracellular protein which is present in the stratum lucidum of the skin.

73. Hair cells are present in skin they are
(a) epidermal in origin and made of dead cells
(b) epidermal in origin and made of living cells
(c) dermal in origin and made of living cells
(d) dermal in origin and made of dead cells
VMMC-2015
AIPMT-1993

Ans. (a) : Hair cells are present in skin they are epidermal in origin and made of dead cells. The hair shaft is a thin, flexible cylinder of non - living , keratinized epithelial cells. Hair is a keratinous filament growing out of the epidermis, It is primarily made of dead, keratinized cells.

74. Stratified and non-keratinised squamous epithelium occurs in
(a) epidermis of skin (b) vagina and cervix
(c) buccal cavity (d) Both (b) and (c)
VMMC-2015

Ans. (d) : Stratified and non-keratinised squamous epithelium occurs in vagina and cervix and buccal cavity. It consist of squamous (flattend) epithelial cells arranged in layers upon a basement membranes.

75. The cavities of alveoli of lungs are lined by
(a) Cuboidal epithelium
(b) Columnar epithelium
(c) Stratified cuboidal epithelium
(d) Squamous epithelium
Kerala PMT-2008
J&K CET-2007

Ans. (d) : The cavities of alveoli of lungs are lined by squamous epithelium. It helps in exchange of gases in the alveoli of lungs. The squamous epithelium are mainly found in the wall of blood vessels and air sacs of lungs.

76. Which of the following is a type of intercellular junction between animal cells?
(a) Middle lamella (b) Plasmodesmata
(c) Desmosome (d) Glycocalyx
CG PMT-2010

Ans. (c) : Desmosomes are intercellular junctions that connect intermediate filaments to the cell surface and mediate strong cell-cell adhesion.

77. The nature of sebaceous gland, present in dermis of majority of the mammals are
(a) holocrine (b) apocrine
(c) merocrine (d) Both (a) and (b)
BVP-2013

Ans. (a) : The nature of sebaceous gland, present in dermis of majority of the mammals are holocrine. It produces sebum through holocrine secretion. The sebum on the skin keeps it flexible and prevents from drying out.

78. Transitional epithelium is found in
(a) lungs (b) liver
(c) urinary bladder (d) stomach
Haryana PMT-2011

Ans. (c) : Transitional epithelium is found in urinary bladder, urethra, urinary duct etc. They are also called as urathelium. It a type of stratified epithelium . It consist of multiple layers of epithelial cell. The transition epithelium works as a barrier between the lumen and the blood stream.

79. Which of the following generally modifies into glands ?
(a) Muscular tissue (b) Nervous tissue
(c) Connective tissue (d) Epithelial tissue
AMU-2003

Ans. (d) : Epithelial tissue generally modifies into glands. It is a highly cellular tissue that overlies body surface, lines cavites and forms glands.

80. Melanin protect from
(a) U.V. rays (b) Visible rays
(c) Infrared rays (d) X-rays
AIPMT-2002

Ans. (a) : Melanin is produced by specialized endodermal cells called **melanocytes**.
Their dispersion in these cells is controlled by melanocyte- stimulating hormone & melatonin.
Melanin is a pigment present in skin and protect from harmful effects of UV-rays.

81. Proximal convoluted tubule (PCT) is lined with
(a) cuboidal epithelium
(b) simple brush border epithelium
(c) simple cuboidal brush border epithelium
(d) simple ciliated brush border epithelium
(e) columnar epithelium
Kerala PMT-2008

Ans. (c) : Proximal convoluted tubule (PCT) is lined with simple cuboidal brush border epithelium. It is characterised by the presence of microvilli over its surface . These microvilli greatly increase the surface area for absorbtion.
Simple cuboidal , epithelium are present at walls of the renal tubules and parts of the eye and thyroid, and also on the lining of nephron.

82. The thinnest skin is present on the:
(a) eyelids (b) soles of feet
(c) back of the hand (d) forehead
J&K CET-2002

Ans. (a) : The thinnest skin is present on the eyelids. Skin is thickest on the palms and soles of the feet (1.5 mm thick) while the thinnest skin is found on the eyelids and the postauricular region (0.05 mm thick).

83. The function of tracheal hair is to:
(a) pass mucus out (b) Pass mucus in
(c) pass air out (d) pass air in
BVP-2003

Ans. (a) : The function of tracheal hair is to pass mucus out. The cilia within the trachea trap foreign particles.

84. Match List I with List II and find the correct option

@apna_pdf

List - I (Epithelial tissue)		List - II (Location)	
1.	Cuboidal	A.	Epidermis of skin
2.	Ciliated	B.	Inner lining of blood vessels
3.	Columnar	C.	Inner surface of gall bladder
4.	Squamous	D.	Inner lining of fallopian tube
5.	Keratinized squamous	E.	Lining of pancreatic duct

(a) 1 - C, 2 - D, 3 - B, 4 - C, 5 - A
(b) 1 - C, 2 - D, 3 - E, 4 - B, 5 - A
(c) 1 - E, 2 - D, 3 - C, 4 - B, 5 - A
(d) 1 - C, 2 - D, 3 - E, 4 - A, 5 - B
(e) 1 - C, 2 - E, 3 - D, 4 - A, 5 - B

Kerala PMT-2009

List - I (Epithelial tissue)		List - II (Location)	
1.	Cuboidal	E.	Lining of pancreatic duct
2.	Ciliated	D.	Inner lining of fallopian tube
3.	Columnar	C.	Inner surface of gall bladder
4.	Squamous	B.	Inner lining of blood vessels
5.	Keratinized squamous	A.	Epidermis of skin

85. The second layer of epidermis in rat integument is
(a) Stratum lucidum
(b) Stratum germinations
(c) Stratum corneum
(d) Stratum granulosum
(e) Dermis

Kerala PMT-2009

Ans. (a) : The second layer of epidermis in rat integument is stratum lucidum. It is 2-3 cell layers, present in thicker skin found in the palms and soles, is a thin clear layer consisting of eleidin which is a transformation product of keratohyalin. The epidermis and the dermis are top two layer of skin in body.

86. The inner lining of the ducts of sweat glands and pancreatic duct is formed by the epithelium
(a) Pseudostratified
(b) Stratified cubodial
(c) Stratified non - keratinized squamous
(d) Transitional

AP EAMCET-2014

Ans. (b) : The inner lining of the ducts of sweat glands and pancreatic duct is formed by the epithelium stratified cubodial. Their major functions are protection, excretion and secretion. This tissue can be found lining kidney tubules, bronchioles in lungs, etc.

87. The nasal chamber of rabbit has three thin twisted bony plates called conchae. They are lined by
(a) striated cuboidal epithelium
(b) simple cuboidal epithelium
(c) simple squamous epithelium
(d) simple ciliated columnar epithelium

JCECE-2010

Ans. (d) : The nasal chamber of rabbit has three thin twisted bony plates called conchae. They are lined by simple ciliated columnar epithelium. They have one pair of paranasal sinuses which are located in the lateral wall of the nasal cavity.

88. Part of epidermis that keeps out unwanted particles is called
(a) columnar epithelium
(b) squamous epithelium
(c) ciliated epithelium
(d) cuboidal epithelium

KVPY SB & SX-2013

Ans. (c) : Part of epidermis that keeps out unwanted particles is called ciliated epithelium. Ciliated epithelium lines the human respiratory tract from the posterior third of the nose to the bronchioles.

89. Schneiderian membrane is found in
(a) loop of henle
(b) trachea
(c) Bowman's capsule
(d) nasal mucosa

AIIMS-1995

Ans. (d) : Schneiderian membrane is found in nasal mucosa. The schneiderian membrane is the mucous membrane that covers the inner part of the maxillary sinus cavity. It is the mucous membrane of nasal passage.

90. Pseudostratified epithelium is found in
(a) seminiferous tubule (b) Fallopian tube
(c) trachea (d) kidney tubules

AIIMS-2016
DUMET-2004

Ans. (c) : Pseudostratified epithelium is found in trachea. Pseudostratified columnar epithelia are tissues formed by a single layer of cells that give the appearance of being made from multiple layers.

91. Epidermis is specialized for
(a) Respiration (b) Absorption
(c) Protection (d) All of these

AIIMS-2011

Ans. (d) : Epidermis is outer most layer of the body . It is specialised for respiration, absorption and protection . Its main function is to protect the body from damage and dehydration.

92. In lungs, the air is separated from the venous blood through
(a) transitional epithelium + tunica externa of blood vessel
(b) squamous epithelium + endothelium of blood vessel

@apna_pdf

(c) squamous epithelium + tunica media of blood vessel
(d) none of the above

AIPMT-1997

Ans. (b) : In lungs, the air is separated from the venous blood through squamous epithelium and endothelium of blood vessel.

93. Basement membrane is made up of
(a) no cell product of epithelial cell
(b) epidermal cell only
(c) endodermal cell
(d) both (b) and (c)

AIPMT-1997

Ans. (a) : Basement membrane is made up of no cell product of epithelial cell. They are a dense sheet like form of extracellular matrix (ECM) that underlie epithelia and endothelia and surround muscle, fat and Schwann cells. Basement membranes separate tissues and protect them mechanical stress.

94. The layer of actively dividing cells of skin is termed as
(a) Stratum compactum
(b) stratum corneum
(c) stratum malpighii/stratum germinativum
(d) stratum lucidum

AIPMT-1993

Ans. (c) : The layer of actively dividing cells of the skin is called the stratum malpighi/stratum germinativum. It is the innermost layer of the skin, located on the basement layer. Its cells are active and continuously produce the germinative layer.

95. The epithelial cells lining the stomach of vertebrates is protected from damage by HCl because
(a) HCl is too dilute
(b) The epithelial cells are resistant to the action of HCl
(c) HCl is neutralized by alkaline gastric juice
(d) The epithelial cells are covered with a mucous secretion

CMC Vellore-2012

Ans. (d) : The epithelial cells lining the stomach of vertebrates is protected from damage by HCl as the epithelial cells are covered with a mucous secretion. The mucus is secreted by the glands of stomach mucosa that makes a covering over the wall of the stomach, which protects the lining of the stomach from the harmful action of HCl.

96. Peyer's patches produce:
(a) Mucous (b) Trypsin
(c) Lymphocytes (d) Enterokinase

Manipal-2002

Ans. (c) : Peyer's patches produce lymphocytes. They are located in the ileum of small intestine. They are masses of lymphatic tissue.

97. Meissner's corpuscles occur in
(a) Brain (b) nerve cells
(c) skin (d) tongue

WB JEE-2011

Ans. (c) : Meissner's corpuscles occur in skin. They lie between the dermal papillae just beneath the epidermis of the fingers, palms and soles are elongated receptors formed by a connective tissue capsule that comprises several lamellae of Schwann cells.

98. From the following pairs regarding the type of animal tissue with its location. Choose the incorrect ones
(a) Pseudo stratified epithelium - Eustachian tube
(b) Keratinized stratified epithelium - Conjunctiva of eyes
(c) Squamous epithelium - Alveoli of lungs
(d) Cuboidal epithelium - Pancreatic ducts

MGIMS Wardha-2015

Ans. (b) : The conjunctiva of the eye consists of a epithelial layer which is composed of stratified columnar epithelium. It is non-keratinized with interspread goblet cells.

99. During the cold the hairs are raised and brought up more or less in vertical position by :
(a) sebaceous glands (b) hair follicles
(c) capillary plexus (d) arrector pili

J&K CET-2005

Ans. (d) : During the cold the hairs are raised and brought up more or less in vertical position by arrector pili. The arrector pili muscle is a tiny muscle connected to each hair follicle and the skin. When it contracts it causes the hair to stand erect and "goose bump" form on the skin.

100. The layer of cells that secrete enamel of tooth is:
(a) Dentoblast (b) Ameloblast
(c) Osteoblast (d) Odontoblast

DUMET-2003

Ans. (b) : The layer of cells that secrete enamel of tooth is **ameloblast.** Enamel matrix proteins are secreted by ameloblasts into the enamel space and are later degraded and proteolytically removed also by ameloblasts. Ameloblasts cover the papilla of the enamel organ.

101. Epithelial cells in animals are held by specialized junctions, one of them being "Gap junction". Function of a "Gap junction" is to
(a) facilitate cell-cell communication by rapid transfer of small molecules
(b) cement the neighbouring cells
(c) stop substances from leaking
(d) provide gaps in the tissue to facilitate uptake of small molecules across tissues

KVPY SB & SX-2016

Ans. (a) : Epithelial cells in animals are held by specialized junctions one of them being "Gap junction" function of a "Gap junction" is to facilitate cell-cell communication by rapid transfer of small molecules. Epithelial cells are held together by strong anchoring (zonula adherens) junctions. Gap junctions are cytoplasmic communications between two epithelial cells for rapid transfer of some ions and small molecule.

@apna_pdf

102. Epithelial tissue serves as
(a) protective sheath
(b) reproductive structures
(c) corpuscle
(d) nerve cells

CG PMT-2004

Ans. (a) : Epithelial tissue serves as protective sheath. It performs a variety of functions that include protection, secretion, absorption, excretion, filtration, diffusion and sensory reception.

103. Stratified epithelium is found in
(a) Seminiferous tubule
(b) Fallopian tube
(c) Nasal cavity
(d) Kidney tubules

JIPMER-2011
J&K CET-2011

Ans. (c) : Stratified epithelium is found in nasal cavity. It is a type of epithelial tissue that contains more than one layer of epithelial cells.

104. The epithelium found in the inner linings of stomach and intestine is
(a) columnar (b) squamous
(c) stratified (d) pseudo stratified

WB JEE-2015

Ans. (a) : The epithelium found in the inner linings of stomach and intestine is columnar. The mucosal lining of the stomach is simple columnar epithelium with numerous tubular gastric glands.

105. In which one of the following preparations are you likely to come across cell junctions most frequently ?
(a) Hyaline cartilage (b) Ciliated epithelium
(c) Thrombocytes (d) Tendon

AIPMT-2007

Ans. (b) : Cell junctions come across most frequently in the preparation of ciliated epithelium cell. Epithelial cells are bound together is sheets of tissue called to as epithelia.

106. Match the following lists.

List I	List II
(A) Simple squamous epithelium	(I) Ureters
(B) Simple cuboidal epithelium	(II) Epididymis
(C) Non-ciliated simple columnar epithelium	(III) Lining of alveoli of lungs
(D) Transitional epithelium	(IV) Lining of thyroid vesicles
(E) Pseudostratified non-ciliated columnar epithelium	(V) Mucosa of stomach and intestine

The correct match is

	(A)	(B)	(C)	(D)	(E)
(a)	(III)	(IV)	(V)	(I)	(II)
(b)	(I)	(II)	(IV)	(III)	(V)
(c)	(V)	(III)	(II)	(IV)	(I)
(d)	(II)	(IV)	(III)	(V)	(I)

AP EAMCET-2013

Ans. (a) :

List I	List II
(A) Simple squamous epithelium	(III)Lining of alveoli of lungs
(B) Simple cuboidal epithelium	(IV) Lining of thyroid vesicles
(C) Non-ciliated simple columnar epithelium	(V) Mucosa of stomach and intestine
(D) Transitional epithelium	(I)Ureters
(E) Pseudostratified non-ciliated columnar epithelium	(II) Epididymis

107. The mucosal lining of food pipe of mammals is composed of
(a) Simple squamous and ciliated epithelium
(b) Stratified cuboidal epithelium
(c) Stratified columar epithelium
(d) Simple columnar epithelium

UP CPMT-2014

Ans. (a) : The mucosal lining of the oesophagus (food pipe) in mammals is composed of simple squamous and ciliated epithelium. In rest of the intestine the the mucosal layer is covered by simple columnar epithelium.

108. Characteristic of simple epithelium is:
(a) They are arranged indiscriminately
(b) They make a definite layer
(c) Continue to divide and help in organ function
(d) None

AIPMT-2000

Ans. (b) : Simple epithelium is made up of a single layer of cells which is found in the lining of blood vessels, etc. These single layers of cells rest on a basement membrane. This makes a definite layer.

109. A large proportion of oxygen is left unused in the human blood even after its uptakes by the body tissues. This O_2
(a) helps in releasing more O_2 to the epithelial tissues
(b) acts as a reserve during muscular exercise
(c) raises the pCO_2 of blood to 75 mm of Hg
(d) is enough to keep oxyhaemoglobin saturation at 96%

AIPMT (Screening)-2011

Ans. (b) : A large proportion of oxygen is left unused in the human blood even after its uptakes by the body tissues. This O_2 acts as a reserve during muscular exercise.

110. Note the following :
(A) It forms the lining of the cavities of alveoli of the lungs
(B) It forms of the lining of wet surfaces like buccal cavity and oesophagus
(C) It occurs in the ducts of sweat glands
(D) It forms the lining of salivary glands and sweat glands

@apna_pdf

(E) It is a loose connective tissue

Which of the above are associated with simple epithelial tissue ?

(a) A and D (b) B and C
(c) C and A (d) D and E

AP EAMCET-2009

Ans. (a) : The simple epithelium is made up of a single layer of cells that covers the external surface of the body. They receive nutrients from underlying connective tissues.

111. Match the following lists and choose the correct option

List - I	List – II
A. Columnar epithelium	**1. Larynx**
B. Ligaments	**2. Eosinopaenia**
C. Chondnoblast	**3. Elastic tissue**
D. Acidophils	**4. Urinary bladder**
E. Uninucleated spindle- shaped muscle fibres	**5. Microvilli**

(a) A-5 B-3 C-1 D-2 E-4
(b) A-5 B-1 C-3 D-2 E-4
(c) A-1 B-5 C-3 D-2 E-4
(d) A-5 B-3 C-1 D-4 E-2

Manipal-2010

Ans. (a) :
Columnar epithelium – Microvilli
Ligaments – Elastic tissue
Chondroblast – Larynx
Acidophils – Eosinopaenia
Uninucleated spindle- shaped muscle fibres – Urinary bladder

112. The four sketch (A, B, C and D) given below, represent four different types of animal tissues. Which one of these is correctly identified in the options given, along with its correct location and function

		Tissue	Location	Function
(a)	(D)	Smooth muscle tissue	Heart	Heart contraction
(b)	(A)	Columnar epithelium	Nephron	Secretion and absorption
(c)	(B)	Glandular epithelium/	Intestine	Secretion
(d)	(C)	Collagen fibres	Cartilage	Attach skeletal muscles to bones

AIPMT (Mains)-2012

Ans. (c) : It is also known as glandular tissue located in intestine, it involved in the production and release of different Secretory products, such as sweat, saliva breast milk, digestive enzymes, and hormone among many other substances.

C. Connective Tissue

113. Mast cells of connective tissue contain

(a) vasopressin and relaxin
(b) heparin and histamine
(c) heparin and calcitonin
(d) serotonin and melanin

BCECE-2014
Uttarakhand PMT-2011
JIPMER-2011
Punjab MET-2010
CG PMT-2006
AIPMT-2004

Ans. (b) : Mast cells of connective tissue contain heparin and histamine. They release these chemicals during allergic reactions and certain immune responses.

114. Which of the following protein is present in Cartilage?

(a) Actine (b) Chondrin
(c) Casein (d) Ostein

Manipal-2012
AFMC-2002
JIPMER-2000
AIPMT-1997

Ans. (b) : Chondrin protein is present in cartilage. It is also known as **cartilagin**. It helps to keep cartilage healthy by absorbing fluid into the connective tissue.

115. Blood is a kind of

(a) areolar tissue
(b) connective tissue
(c) fluid connective tissue
(d) reticular connective tissue

BCECE-2014
Jipmer - 2012
BVP-2009
Uttarakhand PMT-2009

Ans. (c) : Blood is a kind of fluid connective tissue as it has both a fluid called plasma and various other cells like RBCs, WBCs, and platelets. It helps in transporting gases, nutrients etc. to various body parts.

116. Match the following :

(A) Reticular tissue	**I. Ligament**
(B) Dense regular connective tissue	**II. Vocal cords**

@apna_pdf

(C) Dense irregular connective tissue — **III. Basement membrane**
(D) Elastic connective tissue — **IV. Eustachian tubes**
V. Periosteum

(a) A-III, B-I, C-IV, D-II
(b) A-II, B-I, C-III, D-V
(c) A-III, B-I, C-V, D-II
(d) A-IV, B-II, C-I, D-III

TS EAMCET-10.05.2023, Shift-II

Ans. (c) :
Reticulor tissue → basment membrane
• Basement membranes are made of reticular tissue because they need to able to support and anchor other tissues.
Dense regular connective tissue → ligament
• Ligaments are made of dense regular connective tissues because they need to be strong and have a lot of tensile strength to connect together.
Dense irregular connective tissue → periostium
The periostium is made of dense regular connective tissue because it needs to be strong and protect the bone.
Elastic connective tissue → vocal cords
• Vocal cords are made of elastic connective tissue because they need to be able to stretch and vibrate to produce sound.

117. Which tissue provides thermal insulation?
(a) Areolar tissue (b) Adipose tissue
(c) Reticular tissue (d) Tendons

AP EAMCET-12.07.2022 Shift-II

Ans. (b) : Adipose tissue is specialized for energy storage and thermal insulation.
It is a fat storing tissue which forms an insulating layer below the skin which keeps the body warm.

118. The supportive skeletal structures in epiglottis and pubic symphysis of human being are the examples of
(a) Bone (b) Cartilage
(c) Adipose tissue (d) Areolar tissue

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : The supportive skeletal structure in epiglottis and pubic symphysis of human beings are the example of cartilage.

119. Match the following

Connective tissue	**Example**
(A) Dense regular connective tissue	**(I) Dermis**
(B) Dense irregular connective tissue	**(II) Wharton's Jelly**
(C) Elastic connective tissue	**(III) Lymphoid organs**
(D) Mucous connective tissue	**(IV) Tendon**
	(V) Vocal Cords

The correct match is

	A	**B**	**C**	**D**
(a)	IV	III	V	II
	A	**B**	**C**	**D**
(b)	IV	I	V	II
	A	**B**	**C**	**D**
(c)	II	V	I	IV
	A	**B**	**C**	**D**
(d)	III	IV	I	II

TS EAMCET-09.08.2021 Shift-II

Ans. (b) :

Connective tissue		**Example**	
A.	Dense regular connective tissue	IV	Tendon
B.	Dense irregular connective tissue	I	Dermis
C.	Elastic connective tissue	V	Vocal Cords
D.	Mucous connective tissue	II	Wharton's Jelly

120. Match the Column-I with Column-II and select the correct option.

	Column-I		**Column-II**
A.	**Fibroblasts**	**i.**	**Storage of fat**
B.	**Mast cells**	**ii**	**Secretion of elastin fibres**
C.	**Macrophages**	**iii.**	**Secretion of histamines**
D.	**Adipocytes**	**iv.**	**Phagocytosis**

(a) A-iv, B-i, C-ii, D-iii
(b) A-ii, B-iii, C-iv, D-i
(c) A-i, B-ii, C-iii, D-iv
(d) A-iii, B-ii, C-i, D-iv

MHT CET-07.10.2020 Shift-I

Ans. (b) :

	Column-I		Column-II
A.	Fibroblasts	ii.	Secretion of elastin fibres
B.	Mast cells	iii.	Secretion of histamines
C.	Macrophages	iv.	Phagocytosis
D.	Adipocytes	i.	Storage of fat

121. The white adipose tissue appears opaque due to _____.
(a) large amount of intra-cellular protein
(b) large amount of extra-cellular fat
(c) large number of adipocytes
(d) more number of white fibres

MHT CET 5.10.2020 Shift-I

Ans. (c) : The white adipose tissue appears opaque due to large number of adipocytes. It is a specialized connective tissue present mainly beneath the skin. Its main function is to store energy in the form of lipids.

122. Which of the following is correct?

Column-I		**Column-II**	
(1)	Blood and lymph	(a)	Connective tissue
(2)	Bones and muscles	(b)	Skeletal tissue
(3)	Skin epidermis	(c)	Nervous tissue
(4)	Cartilage and muscles	(d)	Connective tissue

AIIMS-27.05.2018 Shift-II

@apna_pdf

Ans. (a) : Blood and lymph are examples of fluid connective tissues.
- Muscle is not a skeletal tissue and also not a connective tissue.
- Skin epidermis is the outermost protective covering.
- Cartilage and muscles is not a connective tissue.

123. Match the following

List-I	List-II
A. Carcinoma	**i. B and T Lymphocytes**
B. Sarcoma	**ii. Connective tissue**
C. Lymphoma	**iii. Bone marrow cells**
D. Leukemia	**iv. Epithelial tissue**

The correct answer is:

	A	B	C	D
(a)	iv	i	ii	iii
(b)	iii	i	ii	iv
(c)	iv	ii	i	iii
(d)	iii	ii	i	iv

TS EAMCET-02.05.2018 Shift-II

Ans. (c)

List-I	List-II
A. Carcinoma	iv. Epithelial tissue
B. Sarcoma	ii. Connective tissue
C. Lymphoma	i. B and T Lymphocytes
D. Leukemia	iii. Bone marrow cells

124. Which of the following forms a strong inextensible attachment of skeletal muscle to a bone?
(a) Tendon
(b) Ligaments
(c) Areolar connective tissue
(d) Adipose tissue

VMMC-2011
CG PMT - 2005

Ans. (a) : Muscles and bones are connected by fibrous connective tissue called **tendons**. They can join muscles to object like the eyeball. A tendon helps a bone or other structure in moving.

125. Bone is mainly composed of
(a) Iron and phosphorus
(b) Sulphur and calcium
(c) Calcium and phosphorus
(d) Calcium and magnesium

WB JEE-2012

Ans. (c) : Bone is mainly composed of calcium and phosphorus make up the majority of the bone's composition. Bones are made up of hard tissues which are a kind of hard dense connective tissue.

126. The outer covering of cartilage is called
(a) Peritonium (b) periosteum
(c) endosteum (d) perichondrium

BVP-2010
WB JEE-2010

Ans. (d) : The outer covering of cartilage is called perichondrium. It protects bones from injury and damage, nourish cartilage through blood vessels, and facilitate cartilage growth.

127. Fats are richly found in
(a) alveolar tissue (b) lymph glands
(c) adipose tissue (d) liver cells

Punjab MET-1999

Ans. (c) : Fats are richly found in adipose tissue. They contain numerous nerves cells and blood vessels storing and releasing energy to fuel the body and release important hormone vital to the body's needs.

128. Which of the following cells secrets histamine?
(a) Plasma cells (b) Mast cells
(c) Monocytes (d) NK-cells

AMU-2015
Manipal-2012
Haryana PMT - 2005

Ans. (b) : Mast cells secrete histamine on exposure to the allergic component. It is also known as **mastocyte** or **labrocyte**. It also secretes heparin, serotonin etc. which help combat inflammation.

129. Aging of an animal body is associated with deterioration in its
(a) connective tissue (b) glandular tissue
(c) epithelial tissue (d) both [a] and [b]

BVP 2008
Uttarakhand PMT-2007

Ans. (a) : Aging of an animal body is associated with deterioration in its connective tissue. Aging is the time-related deterioration of the physiological functions necessary for survival and fertility.

130. Ligament connects :
(a) bone to bone (b) bone to muscle
(c) muscle to muscle (d) both b and c

AMU-2005
Uttarakhand PMT-2004
Manipal-2004

Ans. (a) : A ligament is a fibrous connecting tissue the attaches bone to bone and serves to hold structures together and keep them stable.

131. Which one is a specialized connective tissue among these?
(a) Adipose tissue (b) Bone
(c) Areolar tissue (d) Fibroblasts
(e) Muscle

Kerala PMT-2015

Ans. (b) : Specialised connective tissue include cartilage, blood and bone. These tissues contribute to diverse the functions. Bones have a hard and non pliable ground substances rich in calcium salts and collagen fibres which gives its strength.

132. Collagen fibers are characteristic of which tissue?
(a) Muscle (b) Epithelial
(c) Connective (d) Nervous

J&K CET-2012

Ans. (c) : Collagen fibers are characteristic of connective tissue. Collagen fibers form approximately 20-25% of the protein content of humans.

@apna_pdf

133. Excessive pulling of ligaments between two bones cause
(a) Fracture of the bones
(b) Sprain
(c) Breakage of the muscles
(d) All of the above

AMU -2000

Ans. (b) : Excessive pulling of ligaments between two bones cause sprain. A sprain is an injury to the band of collagen tissue i.e. a ligament, which connects two or more bones to a joint.

134. The blubber is formed by:
(a) elastic tissue (b) reticular tissue
(c) adipose tissue (d) fibrous tissue

AP EAMCET-2004

Ans. (c) : Blubber is a thick layer of fat formed by adipose tissue. Animals (like Camel) store extra digested food in the form of adipose tissue, which contains molecules called lipids.

135. Heparin is secreted by :
(a) mast cell (b) alveolar cell
(c) plasma cell (d) goblet cell

Haryana PMT-2005

Ans. (a) : Heparin is secreted by mast cells. It is an anticoagulant that is used to prevent the formation of blood clots.

136. Cartilage is produced by :
(a) chondroblasts (b) fibroblasts
(c) epithelium (d) osteoblasts

JIPMER-2000
AIIMS-1994

Ans. (a) : Cartilage is produced by chondroblast. These are an immature type of cells that secrete a huge amount of extracellular matrix made up of collagen fibres etc.

137. Which of the following is loose connective tissue?
(a) Nervous tissue (b) Blood
(c) Adipose (d) Areolar

J&K CET-2013
JIPMER-2001

Ans. (c & d) : Both adipose and areolar tissues are type of loose connective tissue. Areolar tissue serve as a support framework for epithelium. Adipose tissues helps store the energy in form of fat.

138. Organ of Golgi is the sensing structure formed at the junction of
(a) two nerves
(b) two bones
(c) nerve and muscles
(d) muscles and tendon

AMU-2008

Ans. (d) : Organ of Golgi is also known as the **Golgi tendon organ**, is a tree like sensory ending enclosed in a spindle like connective tissue capsule that lies near the junction of a tendon with a muscle. They play a role in the management of muscle tension.

139. Major constituent of vertebrate bone is:
(a) calcium phosphate (b) calcium chloride
(c) calcium oxalate (d) calcium sulphate

Haryana PMT-1999

Ans. (a) : The major constituent of vertebrate bone is calcium phosphate. The matrix of the bone is made up of 30% of collagen protein and 70% of calcium phosphate. It makes the bony framework hard and strong.

140. Increase in capillary permeability is induced by:
(a) heparin (b) gastrin
(c) histamine (d) fibrin

AP EAMCET-2001

Ans. (c) : Increase in capillary permeability is induced by histamine. It is an organic nitrogenous compound that causes vasodilation which results in fall in the blood pressure. It also stimulates the synthesis and release of various vascular smooth muscle relaxants.

141. In which of the following tissue preparations signet ring appearance is obtained ?
(a) Epithelial tissue
(b) Dense connective tissue
(c) Adipose tissue
(d) Reticular tissue

Haryana PMT-2004
Manipal-2003

Ans. (c) : Signet ring appearance is obtained is tissue preparation of adipose tissue preparation. Adipose tissue contain unilocular cells called adipocytes. These adipocytes cells contain a large lipid droplet which pushes the nucleus against the plasma membrane and giving the cell a signet ring shape.

142. Which of the following type of cartilage is found in inter-vertebral disc of mammal?
(a) Hyaline cartilage
(b) Fibrous cartilage
(c) Calcified cartilage
(d) Elastic cartilage

MGIMS Wardha-2009

Ans. (b) : The type of cartilage that is found in inter-vertebral disc of mammal fibrous-cartilage. It provides the tough material of the intervertebral discs, the intra-articular cartilages of the knee, wrist and temporo-mandibular joints.

143. The type of connective tissue that is associated with the umbilical cord is
(a) areolar connective tissue
(b) Jelly – like connective tissue
(c) adipose connective tissue
(d) reticular connective tissue

Manipal-2009
AP EAMCET - 2009

Ans. (b) : The type of connective tissue that is associated with the umbilical cord is jelly-like connective tissue which is also known as **wharton's jelly**. It provide support for the veins and arteries of the umbilical cord.

144. Difference between bone and cartilage is
(a) Haversian canal (b) blood vessel
(c) lymph vessel (d) all of these

VMMC-2007

@apna_pdf

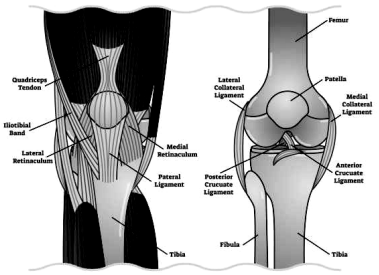
Ans. (d) : The major difference between the bone and cartilage is **Haversian canal**, it is predominately present in the bone and absent in cartilage.
These canal carry blood vessels, lymph vessels and connective tissues along with nerve

145. What will happen if ligaments are cut or broken
(a) Bones will move freely at joints
(b) No movement at joint
(c) Bone will become unfix
(d) Bone will become fixed

AIPMT-2002

Ans. (c) : The main function of ligament to joint two bones. It is a connective tissue.
- When the ligament break then the bones is unfixed in their place.
- Ligament are connected to hold each other firmly.

KNEE TENDONS



146. Achondroplasia is a disease related with the defect in the formation of
(a) membrane
(b) cartilage
(c) bone
(d) mucosa

AIIMS-1994

Ans. (b) : Achondroplasia is a disease related with the defect in the formation of cartilage. Achondroplasia is a Greek word meaning **'Without cartilage formation'** and is one of the most common causes of dwarfism.

147. Which steroid is used for transformation: -
(a) Cortisol
(b) Cholesterol
(c) Testosteron
(d) Progesteron

AIPMT-2002

Ans. (b) : Cholesterol steroid is used for transformation. It forms a major component of animal cell membranes liposome (artifically created spheres surrounded by a phospholipid bilayer like a membrane) which are used for transformation. Biotransformation is a biological process where an organic compound is modified into useable product.

148. Yellow bone marrow is found especially in the medullary cavity of
(a) short bones (b) spongy bones
(c) long bones (d) all of these

AIIMS-1996

Ans. (c) : Yellow bone marrow is found especially in the medullary cavity of long bones. It is made mostly of fat and contains stem cells (adipocytes and mesenchymal stem cells). These cells preserve fats for energy production and develop bone, cartilage, muscles and fat cells.

149. Ligament is mainly made up of
(a) reticulin (b) elastin
(c) myosin (d) collagen

JIPMER-2008

Ans. (d) : Ligament is mainly made up of collagen. Ligament is a fibrous connective tissue that attaches bones to bone and usually serves to hold structure together and keep them stable.

150. The colour in the brown fat is due is
(a) Its larger capacity for generating heat
(b) Large number of mitochondria present
(c) A high concentration of iron containing cytochrome pigments
(d) Presence of chromatophores

AIIMS-2014

Ans. (c) The colour in the brown fat is due to a high concentration of iron containing cytochrome pigment.
The adipose cells of brown fat are multilocular, each cell with several small fat globules. It is loaded with a large number of mitochondria, which is found in hibernating mammals such as rats, rodents etc.

151. Histamine secreting cells are found in
(a) connective tissues (b) lungs
(c) muscular tissue (d) nervous tissue

AIPMT-1989

Ans. (a) : Histamine secreting cells are found in connective tissues. It is an organic nitrogen compound involved in local immune responses and regulating physiological function in the gut and act as neurotransmitter.

152. Formation of cartilage bones involves
(a) deposition of bony matter by osteoblasts and resorption by chondroclasts
(b) deposition of bony matter by osteoclasts and resorption by chondroclasts
(c) deposition of bony matter by osteoclasts only
(d) deposition of bony matter by osteoblasts only

AIPMT-1993

Ans. (a) : Cartilage bone formation involves the deposition of bony material by osteoblasts and resorption by chondroclasts. Ossification is the process of the formation of cartilaginous bone. Chondroblasts are cartilage forming cells.

153. Tissue that contains fat globules is known as:
(a) duraepithelium (b) adipose tissue
(c) nepiepithelium (d) none of these

JCECE-2002

Ans. (b) : Tissue that contains fat globules is known as adipose tissue. It is also called as fatty tissue or fat tissue which is composed of a fat cells called adipocytes. They are energy storing cells that contain large globules of fat known as lipid droplets which surrounded by a structural network of fibers.

@apna_pdf

154. The white fibres are resistant to stretching and formed of a substance, the protein collagen, which on boiling with water yields

(a) Gelatin (b) Elastin
(c) Ossein (d) Chondrin

CMC Vellore-2012

Ans. (a) : The white fibres are resistant to stretching and formed of a substance, the protein collagen, which on boiling with water yields gelatin. White fibres are bounded by a mucoprotein. They are inelastic, inextensible and colourless. On boiling the collagen fibres swell up and form gelatin.

155. Adipocytes are mainly found in

(a) bones (b) cartilages
(c) connective tissue (d) nerves

WB JEE-2007

Ans. (c) : Adipocytes are mainly found in connective tissue. Adipocytes, which are fat cells makes up the adipose tissue, sometimes also known as fat tissue or fatty tissues. They are energy storing cells that contain large fat globules called lipid droplets that are surrounded by a structural network of fibres.

156. Which cell is without nucleus ?

(a) Erythrocyte (b) Leucocytes
(c) Muscles cells (d) Bone cell

Rajasthan PMT-1999

Ans. (a) : Erythrocyte cell is without nucleus. Unlike most other eukaryotic cells mature red blood cell don't have nuclei. When they enter the blood stream for the first time, they eject their nuclei and organelles, so that they can carry more hemoglobin and thus, more oxygen. Each red blood cell has a life span of about 120 days.

157. Inter-vertebral disc consists of a shock absorber connective tissue known as

(a) hyaline cartilage (b) elastic cartilage
(c) fibrocartilage (d) reticulo cartilage
(e) calcified cartilage

CMC Vellore-2008

Ans. (c) : Inter-vertebral disc consists of a shock absorber connective tissue known as fibro cartilage. It is found predominantly in the intervertebral discs of the spine and at the insertions of ligaments. It acts as a cushion within joints, where it helps manage compression forces and reduces stress placed on joints.

158. What type of cartilaginous tissue is found the inter - vertebral discs?

(a) Costal cartilage
(b) Hyaline cartilage
(c) White fibrous cartilage
(d) Yellow elastic cartilage

WB JEE-2014

Ans. (c) : White fibrous cartilage or Fibro cartilage of cartilaginous tissue is found in the inter-vertebral discs. It is a transitional tissue which is a blend of hyaline cartilage and dense fibrous connective tissue.

159. Embryonic connective tissue is derived from

(a) ectoderm (b) endoderm
(c) mesogloea (d) mesenchyme

BVP-2011

Ans. (d) : Embryonic connective tissue is derived from mesenchyme (mesoderm). It is a loosely organized embryonic connective tissue with undifferentiated cells that produce most of the tissue of the body.

160. In bony vertebrates, the laying down of bone is often preceded by the presence of :

(a) chitin (b) starch
(c) cartilage (d) platelets

Punjab MET-2005

Ans. (c) : In bony vertebrates, the laying down of bone is often preceded by the presence of cartilage. It is a strong, flexible connective tissue that protects bones and joints. It acts as a shock absorber.

161. Except blood, the cells of connective tissues secrete certain substances that act as matrix. These substances are

(a) conjugated proteins
(b) signalling molecules
(c) cholesterol
(d) growth hormones
(e) modified polysaccharides

Kerala PMT-2013

Ans. (e) : Except blood, the cells of connective tissues secrete certain substances that act as matrix. These substances are modified polysaccharides which is made up of glycoproteins, fibrous proteins and glycosaminoglycans. The matrix gives the tissue its density, which provides structural and mechanical support and also helps in the exchange of nutrients and waste.

162. The kind of tissue that forms the supportive structure in our pinna (external ears) is also found in -

(a) tip of the nose
(b) vertebrae
(c) nails
(d) ear ossicles

AIPMT-2009

Ans. (a) : The kind of tissue that forms the supportive structure in our pinna (external ears) is also found in tip of the nose. The yellow elastic fibrocartilage is found in the pinna, epiglottis, tip of the nose etc.

163. Match the following

List - I	List - II
A. Columnar epithelium	1. Larynx
B. Ligaments	2. Eosinopaenia
C. Chondrioblast	3. Elastic tissue
D. Acidophils	4. Urinary bladder
E. Uninucleated spindle shaped muscle fibers	5. Microvilli

@apna_pdf

	A	B	C	D	E
(a)	5	3	1	2	4
(b)	5	1	3	2	4
(c)	1	5	3	2	4
(d)	5	3	1	4	2

AP EAMCET-2006

Ans. (a) :

List-I		List-II	
A	Columnar epithelium	**5**	Microvilli
B	Ligaments	3	Elastic tissue
C	Chondrioblast	1	Larynx
D	Acidophils	2	Eosinopaenia
E	Uninucleated spindle shaped muscle fibers	4	Urinary bladder

164. Match the types of animal tissues given under list I with the parts/organs in which they occur, given under list II.

List I (Tissue)	**List II (Part/Organ)**
(A) Squamous epithelium	(i) Walls of nose
(B) Hyaline cartilage	(ii) Bowman's capsule
(C) Adipose tissue	(iii) Iris
(D) Smooth muscle	(iv) Yellow bone marrow
	(v) Ear pinna

The correct match is :

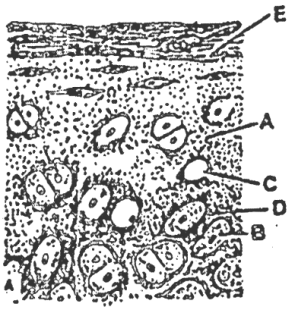
	A	B	C	D
(a)	5	1	4	2
(b)	5	4	1	3
(c)	2	1	4	3
(d)	2	4	1	3

AP EAMCET-2010

Ans. (c) :

List I (Tissue)		List II (Part/organ)
A. Squamous-epithelium	-	Bowman's Capsule
B. Hyaline Cartilage	-	Walls of nose
C. Adipose tissue	-	Yellow bone marrow
D. Smooth muscle	-	Iris

165. In the diagram of section of Hyalin cartilage, the different parts have been indicated by alphabets; choose the answer in which these alphabets correctly match with the parts they indicates.



(a) A = Chondrin; B = Chondrocyte; C = Lacunae; D = Capsular matrix; E = Perichondrium

(b) A = Chondrin; B = Lacunae; C = Chondrocyte; D = Capsular matrix; E = Perichondrium

(c) A = Perichondrium; B = Chondrocyte; C = Lacunae; D = Capsular matrix; E = Chondrin

(d) A = Capsular matrix; B = Chondrocyte; C = Lacunae; D = Perichondrium; E = Chondrin

Karnataka CET-2004

Ans. (a) : Hyaline cartilage- It is a smooth transparent glassy cartilage that covers the bone surfaces ends. It decreases the joint friction.

A = **Chondrin** is a bluish white gelatin like substance, that forms the matrix of the cartilage.

B = **Chondrocyte** are the only cells found in healthy cartilage.

C = **Lacunae** the cartilage cells in hyaline cartilage are contained in cavities in the matrix, called lacunae.

D = **Capsular matrix** is a thin zone of the matrix, that surrounds each lacuna, consist of water.

E = **Perichondrium** is a layer of dense irregular connective tissue that surrounds the cartilage of the developing bone. It is not present in fibrous cartilage.

166. Match the following columns

Column - I		**Column - II**	
A	**Skeletal tissue**	**1**	**Between muscles**
B	**Blood**	**2**	**Vascular tissue**
C	**Areolar tissue**	**3**	**Sweat glands**
D	**Serous glands**	**4**	**Cartilage**

(a) A-4 B-2 C-1 D-3

(b) A-1 B-2 C-3 D-4

(c) A-2 B-1 C-3 D-4

(d) A-4 B-2 C-1 D-3

Manipal-2011

Ans. (a) :

Column - I		Column - II	
A	Skeletal tissue	4	Cartilage
B	Blood	2	Vascular tissue
C	Areolar tissue	1	Between muscles
D	Serous glands	3	Sweat glands

@apna_pdf

D. Muscle Tissue

167. Assertion (A): Cardiac muscle is highly resistant to fatigue.
Reason (R): Cardiac muscles are innervated by the somatic nervous system

(a) Both A and R are correct and R is the correct explanation of A.
(b) Both A and R are correct but R is not the correct explanation of A.
(c) A is correct but R is incorrect.
(d) A is incorrect but R is correct.

AP EAPCET-23.05.2023, Shift-II

Ans. (c) : Assertion (A) is correct– Cardiac muscle is highly resistant to fatigue because it has a high number of mitochondria, which produce ATP. ATP is the energy source for muscle contraction.
Reason (R) is incorrect– Cardiac muscles are innervated by the autonomic nervous system, not the somatic nervous system. The somatic nervous system controls voluntary movements, while the autonomic nervous system control involuntary movements.

168. Identify the muscles that are ectodermal in origin

(a) Intercostal muscles and phrenic muscles
(b) Cardiac muscles
(c) Muscles of Iris and Ciliary body
(d) Muscles of intestine

AP EAPCET-12.07.2022 Shift-I

Ans. (c) : Muscles of Iris and ciliary body is the muscles that are ectodermal in origin.

169. The contractile element present in a striated muscle fibril, between two successive Z-lines, is called

(a) sarcomere (b) sarcoplasm
(c) sarcosomes (d) all of these

CMC Vellore-2019
AIIMS-1994

Ans. (a) : The contractile element present in a striated muscle fibril, between two successive Z-lines is called **sarcomere**. It is the smallest functional unit of a myofibril. It occurs as repeating units along the length of a myofibril and occupy the region between Z-lines of the myofibril.

170. Which of the following cells have lost their capacity to divided in order to get specialised?

(a) Muscle cells and nerve cells
(b) Bone marrow cells and liver cells
(c) Kidney and intestinal cells
(d) Retinal cells

BVP-2010

Ans. (a) : Muscle cells and nerve cells have lost their capacity to divided is order to get specialized because they lack centrioles, which are essential for mitosis.

171. What type of muscles are found in heart?

(a) Skeletal (b) Cardiac muscles
(c) Non-striated (d) All of these

UP CPMT-2012

Ans. (b) : Cardiac muscles are found in heart. Cardiac muscles makes up the thick middle layer of the heart and is surrounded by a thin outer layer called epicardium or visceral pericardium and an inner endocardium.

172. Muscles of the heart are

(a) striated and voluntary
(b) non-striated and voluntary
(c) striated, unbranched and involuntary
(d) non-striated and involuntary
(e) striated, branched and involuntary

Kerala PMT-2015
HP CET-2012

Ans. (e) : Muscles of the heart are striated, branched and involuntary. The muscle layer of the heart is called as **myocardium.** It is responsible for the pumping of the heat.

173. The skeletal muscle fibre is a 'syncytium', which means it is

(a) made up of many fibres
(b) made up of many proteins
(c) long and slender
(d) swollen in the middle with tapered ends
(e) multinucleated

Kerala PMT-2015

Ans. (e) : Skeletal muscle fiber is " syncytium" which means it is multinucleated. They are commonly called **muscle fibres,** are multinucleated syncytia formed during development by the fusion of mononucleated precursor cells called the **myoblasts.**

174. Muscle tone' is defined as:

(a) voluntary resistance to passive strength
(b) involuntary resistance to passive strength
(c) stimulated resistance to passive strength
(d) none of these

Haryana PMT-1999

Ans. (c) : Muscle tone is defined as stimulated resistant to passive strength. It is important for generating reflexes, maintaining posture and balance etc. Muscle tone is regulated by the activity of the motor neurons and can be affected by various factors, like age, disease and nerve damage.

@apna_pdf

175. Which of the following muscle types CANNOT be used voluntarily?

(a) Both striated and smooth
(b) Both cardiac and striated
(c) Both smooth and cardiac
(d) Cardiac, striated and smooth

KVPY SA-2014

Ans. (c) : Cardiac muscle are found in the heart wall. It is an involuntary muscle that is responsible for the pumping action of the heart. Smooth muscle has no striations which is not under voluntary control, has only one nucleous per cell, which is tapered at both ends and is called **involuntary muscle**.
Both smooth muscle (unstraited muscle) and cardiac muscle are functionally involuntary.

176. Heart muscle is sensitive to

(a) heat
(b) chemical
(c) electrical
(d) heat, chemical, electrical, mechanical

VMMC-2010

Ans. (d) : Heart muscle is sensitive to heat, electrical stimuli, chemical stimuli and mechanical stimuli. The heart is made up of cardiac muscle which consist of special cell called cardiomyocytes.

177. Largest smooth muscle is present in

(a) leg
(b) thigh
(c) uterus of pregnant woman
(d) urethra

VMMC-2007
UP CPMT-2002

Ans. (c) : Largest smooth muscle present in the pregnant women's uterus. It is strongest muscle in the human body where it may reach a length of 500 nm. During pregnancy the smooth muscle cell becomes enlarged, thus the largest smooth muscle is present in uterus.

178. Cardiac muscles contract :

(a) quickly and they fatigue
(b) quickly and unfatigued
(c) slowly and are not fatigued
(d) slowly and they fatigue

BCECE-2002

Ans. (b) : The sinoatrial node is the site of electrical activity that causes cardiac muscle contraction. As a result of stimulation that spreads from the sinoatrial node, each cardiac muscle cell fibres an action potential, which causes the muscle cell to contract. The hearts muscles are cardiac. These striated muscles are uncontrollable. They never get tired and they work nonstop.

179. Lipofuscin granules are found in:

(a) nerve cell (b) cardiac muscle
(c) red muscle (d) cartilage

BVP-2003

Ans. (a) : Lipofuscin granules are found in nerve cell. It is a fine yellow brown pigment granules composed of lipid-containing residues of lysosomal digestion. It is considered to be one of the aging or "wear-and-tear" pigments, found in nerve cells, liver, kidney etc.

180. Striated muscles contract because of :

(a) Sliding of myosin rods on actin rods
(b) Sliding of actin rods on myosin rods
(c) actin rods coming close to each other
(d) myosin rods coming close to each other

Uttarakhand PMT-2006

Ans. (b) : Striated muscles contract because of sliding of actin rods on myosin rods. The sliding filament theory explains the process of muscle contraction according to which contraction of a mucles fibre takes place by the sliding of the actin over the myosin.

181. Stimulus several times greater than threshold stimulus is provided to muscle fibre. It will :

(a) contract with same force
(b) contract forcefully
(c) contract sightly
(d) undergo tetany

Uttarakhand PMT-2006

Ans. (a) : Stimulus several times greater than threshold stimulus is provided to muscle fibre. It will contract with same force.

182. Which among the following is not skeleton eye muscle?

(a) Medial reetus (b) Lateral reetus
(c) Ciliary muscle (d) Oblique muscle

BCECE-2001

Ans. (c) : Ciliary muscle is not skeleton eye muscle, it is an intrinsic muscle of the eye, formed as a ring of smooth muscle in the eye's middle layer, uvea (vascular layer) which controls accommodation for viewing objects at varying distances and regulates the flow of aqueous humor into Schlemm's canal.

183. Which of the following originates from mesoderm?

(a) Eye ball and retina (b) Dermis and heart
(c) Intestine (d) All of these

Haryana PMT-2000

Ans. (b) : Dermis and heart originates from mesoderm.

@apna_pdf

E. Neural Tissue

184. Which one of the following cell types contains Nissl's granules?

(a) Eosinophils (b) Hepatocytes
(c) Cardiomyocyte (d) Neurons

KVPY (SA)-2021
Assam CEE-2014
BVP-2001, 2008
Uttarakhand PMT-2007
DUMET-2006
Uttarakhand-2005
J&K CET-2001

Ans. (d) : Nissl's bodies or Nissl's granules are discrete granular structures in neurons that consist of RER (rough endoplasmic reticulum). The granules are helpful in protein synthesis and transformation of protein to the cyton. The term " Nissl's Bodies" generally refers to discrete clumps of rough endoplasmic reticulum in nerve cells.

185. Cell of Schwann are associated with

(a) Nervous tissue (b) Skeletal muscle
(c) Cardiac muscle (d) Connective tissue
(e) Cartilage tissue

J&K CET-2014
UP CPMT-2010
Kerala PMT-2009
UP CPMT-2007

Ans. (a) : Cell of Schwann are associated with nervous tissue. Schwann cells are major glial cell type in the peripheral nervous system. The two type of Schwann cell are myelinating and nonmyelinating.

- Schwann cell are a type of glial cell that surrounds neurons, keeping them olive and sometimes covering them with a peripheral nervous system.

186. Which of the following is not a connective tissue?

(a) Neuroglia (b) Blood
(c) Adipose tissue (d) Cartilage

NEET-2022

Ans. (a) : Neuroglia are part of nervous tissue.

- Neuroglia are the supportive cells of nervous tissue.
- They make up more than half the volume of neural tissue.
- **Neurons,** the unit of neural system are excitable cells.

187. Pick up the incorrect statement about neuroglia.

(a) Ependymal cells are ciliated
(b) Astrocytes are phagocytic cells
(c) Oligodendrocytes form the myelin sheath
(d) Satellite cells surround the cell bodies in ganglia

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Any of the cells that hold nerve cells in place and help them work the way they should. The types of neuroglia include oligodendrocytes, atrocities, microglia, and ependymal cells also celled glial cell.

- Astrocytes are large star-shaped cells which form interconnected network arounds the neurons. They froms blood -brain barrier as they secrete basal lamina around the blood vessels.

188. Oligodendrocytes are types of _____.

(a) Plasma cells (b) Epithelial cells
(c) Neuroglial cells (d) Goblet cells

MHT CET-07.10.2020 Shift-I

Ans. (c) : Oligodendrocytes are types of neuroglial cells. Oligodendrocytes are the myelinating cells of the central nervous system (CNS) that function to produced myelin. Myelination finally produces the insulating sheath of axons of nerve fibres.

Oligodendrocytes have also been classified into categories-

(1) Interfascicular Oligodendrocytes that occur between nerve fibers in white matters.

(2) Oligodendrocytes in the neutrophils of gray matter and satellite Oligodendrocytes that are in close association with neuronal cell bodies.

189. The longest cell of human body is

(a) Skeletal muscle fibre
(b) Nerve cell
(c) Smooth muscle fibre
(d) Glial cell

HP CET-2018

Ans. (b) : The longest cell in the human body is the Nerve cell. It is approximately 3 feet in length. It carries information throughout the body.

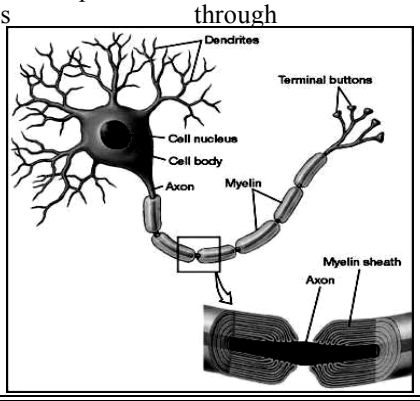
Some of the neurons are 1-1.5 meters long. The role of body part in to give signals throughout our body. The nerve cell is the primary cell in our nervous system. Humans generally have three kinds of neurons, motor neurons, sensory neurons and interneurons.

190. Which of the following statement is correct for node of Ranvier of nerve

(a) Neurilemma is discontinuous
(b) Myelin sheath is discontinuous
(c) Both neurilemma & Myelin sheath are discontinuous
(d) Covered by myelin sheath

AIPMT-2002

Ans. (b) : Myelin sheath are surrounded by Schwann cells. Neurilemma is an outer layer of Schwann cells, surrounded by axon of the neuron. The gaps between two adjacent myelin sheaths are called **nodes of Ranvier**. This provides faster transmission of electrical impulses through axon.



@apna_pdf

191. Which one of the following systems is not mesodermal in origin?
(a) Circulatory system (b) Muscular system
(c) Nervous system (d) None of the above
J&K CET-2004

Ans. (c) : Cell of mesodermal origin are the most abundant in the human body, representing a great variety of cell types. Including the musculoskeletal system (bone, cartilage and muscle), cardiovascular system (heart blood and blood vessels), as well as the connective tissues found throughout the our bodies.

192. The following cells cannot be grown under tissue culture conditions:
(a) Hela cells (b) Leucocytes
(c) Kidney cells (d) Nerve cells
DUMET-2003

Ans. (d) : Nerve cells cannot be grown under tissue culture conditions. Cells cultured in the lab can be classified into three different types;
1. Primary cells
2. Transformed cells
3. Self-renewing cells.
• Primary cells, such as fibroblasts obtained from skin biopsies and hepatocytes isolated from liver explants, are directly isolated from human tissue.

193. Which of the following tissue originates exclusively from the ectoderm of the embryo?
(a) Epithelial tissue (b) Muscular tissue
(c) Connective tissue (d) Nervous tissue
Karnataka CET-2005

Ans. (d) : Nervous tissue originates exclusively from the ectoderm of the embryo. Nervous tissue is found in the brain, spinal cord and nerves. Nervous tissues are specialized for being stimulated to transmit stimulus from one to another part of the body rapidly.
• Nervous tissue makes up the central nervous system and other peripheral in our body. From the ectodermal cell of the embryo the nerves tissue develops.

194. In which mitosis does not takes place?
(a) Muscle cell (b) Bone cell
(c) Epithelial cell (d) Nerve cell
BCECE-2014
Rajasthan PMT-1995

Ans. (d) : Mitosis has six phases apart from interphase. The first five phase divides the nucleus and its genetic information in half, while the final step splits the entire parent cell into two identical daughter cells. In nerve cell mitosis does not take place.
• The main reason of nerve cells not dividing in that, they do not have centriole an organelles playing an important role in cell division. Through microtubuler are present in the neuron. They are unable to organism into a centriole.

195. What used to described as Nissls granules in a nerve cell are now identified as
(a) Cell metabolites (b) Fat granules
(c) Ribosomes (d) Mitochondria
BVP-2008

Ans. (c) : Nissl granules are the substances found in the neurons which are a large granular type of body. These granules are rough endoplasmic reticuloum with rosettes of free ribosomes. These are very useful for protein synthesis and also helps to transport these proteins to the part known as cyton.

196. Which of the following regarded as a unit of nervous tissue?
(a) Myelin sheath (b) Axons
(c) Dendrites (d) Neurons
Punjab MET-2010

Ans. (d) : The nervous system transmits signals between the brain and the rest of the body, including internal organs. The basic unit of the nervous system is a nerve cell or neuron.
• Neurons are specialized to transmit information throughout the body.

197. Nerve cells are the part of
(a) Epithelial tissue (b) Connective tissue
(c) Muscles tissue (d) Nervous tissue
DUMET-2005
UP CPMT-2003

Ans. (d) : The basic unit of nervous system is the nerve cell. Each nerve cell consists of the cell body, which includes nucleus, axon and dendrites. Nerve cells are also called neurons. Neurons are present all over the body, especially in brain and spinal cord.

198. The most appropriate definition of neuroglial cell are that they are
(a) Secretory cell
(b) Compound alveolar gland
(c) Non -sensory and supporting cell
(d) Sensory and supporting cells
VMMC-2013

Ans. (c) : Neuroglial cells are specialised cells found in the brain and spinal cord, supporting the neurons and their fibres.
• Star-shaped glia cells called as astrocytes and are the most abundant cell in the human brain.
• They also do not form synapses, and they retain the ability to divide through out their lifespan.

199. Lipofuscin granules are found in :
(a) Nerve cell (b) Cardiac muscle
(c) Red muscle (d) Cartilage
BCECE-2006

Ans. (a) : Lipofuscin is a brownish pigment left over from the breakdown and absorption of damaged Blood cells. Lipofuscin is found in nerve cell.
• Lipofuscin accumaulation is characteristic for nerve cells that are postmitotic. The research was focused on lipofuscin accumulation in gonglianic cells.
• Postganglionic sympathetic neurons cell bodies of the superior cervical ganglion in humans during ageing.

200. Minimum regeneration power is present in
(a) Nervous tissue (b) Connective tissue
(c) Epithelial tissue (d) None of the above
VMMC-2007
Rajasthan PMT-2005

@apna_pdf

Ans. (a) : Nervous tissue has minimum regeneration power. Nervous tissue is composed of neurons, also called nerve cells and neurolgial cells.

• Nervous tissue has least capacity of regeneration because nerve cells are differentiated. Cells have lost the capacity of dedifferentiation.

201. Collagen fibre are secreted by :

(a) Mast cells (b) Macrophage
(c) Histiocytes (d) Fibroblasts

BCECE-2004

Ans. (d) : Fibroblasts are developmentally programmed to produce collagen matrix which is main structural component of connective tissue. Fibroblasts have cell surface receptors called integrins.

Which specifically attach to proteins in the matrix including Type 1 collagen.

202. Nodes of Ranvier are found in……..

(a) Muscle fibre (b) Neuron
(c) Axon (d) Sperm

Karnataka CET-2004

Ans. (c) A neuron is composed of 3 major parts, cell body, axon and dendrites. There are 2 types of axon namely Myelinated and non myelinated. The gaps between two adjacent myelin sheath are called node of Ranvier. The nodes of Ranvier are located along the axon of neurons.

203. Read the following statements and choose the correct option.

(i) Blood cells secrete fibres of structural proteins called collagen or elastin
(ii) Neuroglial cells protect and support the nephrons
(iii) Osteocytes are present in spaces called lacunae
(iv) Striated muscle fibres are bundles together in a parallel fashion
(v) Biceps are involuntary and striated

(a) iii and iv statement are wrong
(b) ii and iv statement are wrong
(c) i and iii statement are wrong
(d) ii and iii statement are wrong
(e) i, ii and v statement are wrong

Kerala PMT-2012

Ans. (e) : Cells of the blood tissue that do not secret fibres of structural proteins are refered to as elastin. All collagen all cells of connective tissue except blood secrete collagen.

• Neuroglial cells protect neurons from physical and chemical damage.

• The muscles of biceps are voluntary and striated.

204. Match the terms listed under column I with the structures which they occur given under column II; choose the answer which gives the correct combination of alphabets of the columns:

	Column-I (Structure)		Column-II (Occurrence)
A	Haversian canal	p	Kidney
B	Dendrites	q	Cartilage
C	Sarcolemma	r	Muscle
D	Chondrocytes	s	Nerve cells
		t	Bone

(a) A = t, B = s, C = r, D = q
(b) A = s, B = t, C = q, D = r
(c) A = q, B = r, C = s, D = t
(d) A = p, B = t, C = s, D = t

Karnataka CET-2000

Ans. (a) : Haversian canal are present in bone of mammals.

• Dendrites are the finger- like cells present on the end of a nerve cell.

• Sarcolemma - The plasma membrane of a skeletal muscle fibre is called the sarcolemma.

• Chondrocytes - The cartilage is solely composed of cells known as chondrocytes.

F. Earthworm

205. The two organisms which breathe only through their moist skin are

(a) fish and frog
(b) frog and earthworm
(c) leech and earthworm
(d) fish and earthworm

AP EAMCET-12.07.2022 Shift-II
BCECE-2015
J&K CET-2012
CG PMT-2008
AMU-2008
VMMC-2008
UP CPMT-2008
Rajasthan PMT-2008

Ans. (c) : Fish breathe through gills while frogs breathe through lung and skin.

• Leeches and earthworms breathe through their skin. Their skin is moist, thin and is supplied abundantly with blood vessals. Amphibians and fishes have numerous cutanneous glands.

206. Earthworms are

(a) ureotelic when plenty of water is available
(b) uricotelic when plenty of water is available
(c) uricotelic under conditions of water scarcity
(d) ammonotelic when plenty of water is available

BCECE-2013
CMC Vellore-2012
BHU PMT (Mains)-2010
CMC Ludhiana-2009
JCECE-2007, 2009
AFMC-2008
AIPMT-2006

@apna_pdf

Ans. (d) : Earthworms have nephridia, an excretory organ, that helps in the removal of wastes in the form of ammonia when an excess of water is available. Earthworms are both ammonotelic, in water, and ureotelic on land.

207. Chloragogen cells of earthworms are analogous to vertebrate

(a) lungs (b) liver
(c) gut (d) kidney

BVP-2008, 2014
AFMC -2011
Uttarakhand PMT-2007
JIPMER-2006
UP CPMT-2005
MGIMS Wardha-2005
Rajasthan PMT-1998
AIIMS-1997
JIPMER-1996

Ans. (b) : Chloragogen cells are analogous to the liver of vertebrates. Chloragogen cells also called Y cells are star-shaped cells in annelids involved with excretory functions and intermediary metabolism. They are present in coelomic fluid of the earthworm and perform the similar function as the liver of human beings.

208. The function of typhlosole in earthworm is to:

(a) secrete digestive juice
(b) slowdown rate of passage of food
(c) increase absorptive area of intestinal epithelium
(d) have no function

BHU PMT (Screening)-2011
Manipal-2006
BVP-2005
Haryana PMT-2004
Rajasthan PMT-2004
Manipal-2003
JIPMER-1995

Ans. (c) : Its function to increase intestine surface area for more efficient absorption of digested nutrients. In different earthworm families, the typhlosole appears to have multiple origins.

• Typhlosolar region is a part of intestine which runs from 27th segment up to 24 to 25 segments infront of the anus. The mid dorsal wall of intestine to thrown into longitudinal fold called typhlosole.

209. In a copulating pair of Pheretima posthuma which of the two processes take place ?

(a) Internal fertilization and reciprocal fertilization
(b) Cross fertilization and reciprocal fertilization
(c) Reciprocal fertilization and internal fertilization
(d) External fertilization and internal fertilization

MGIMS Wardha-2012
HP CET-2011
AP EAMCET-2011
Rajasthan PMT-1999
BCECE-2006

Ans. (b) : In the copulating pair of pheretima posthuma cross fertilization and reciprocal fertilization process takes place. Cross fertilization means fusion of egg from one individual with a sperm or male gamete from a different Individual.

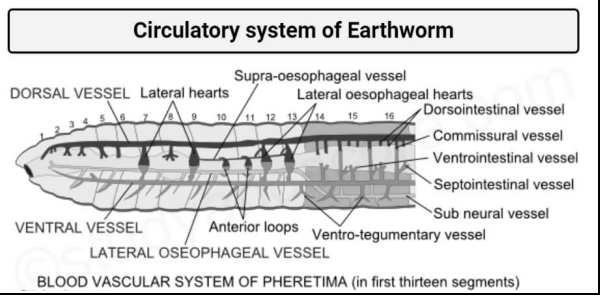
210. Blood circulation in earthworm is :

(a) Closed type
(b) Open type
(c) Haemoglobin is present in RBC
(d) Oxygen not transported by blood

AIIMS-26.05.2019 Shift-I
CMC Vellore-2011
JCECE-2008
UP CPMT-2006

Ans. (a) : Vertebrates have a **closed circulatory system**. In closed circulatory systems the blood closed within vessels of different size and wall thickness. In this system, blood is pumped by heart through vessels.

• The earthworm has a closed circulatory system that circulates blood exclusively through vessels. They have three main vessels that supply the blood to organs within the earthworm. The ventral blood vessels carrying blood back from the body of earthworm.



211. Blood of Pheretima is

(a) blue with haemocyanin in corpuscles
(b) blue with haemoglobin in corpuscles
(c) red with haemoglobin in corpuscles
(d) red with haemoglobin in plasma

CMC Vellore-2011
BVP-2010
Punjab MET-2008
Rajasthan PMT-1995
AIPMT-1990

Ans. (d) : Pheretima is a genus of earthworms that belongs to phylum annelida. The blood of phertima is red in colour due to the presence of haemoglobin, which is an iron containing pigment.

• Blood of pheretima is red in colour and respiratory pigment haemoglobin in dissolved in blood plasma.

212. The female genital pore of pheretima posthuma located upon the segment

(a) 14^{th} (b) 16^{th}
(c) 18^{th} (d) 15^{th}

VMMC-2012
JIPMER-2009
MGIMS Wardha-2008
CG PMT-2008
UP CPMT-2008
Rajasthan PMT-2008

@apna_pdf

Ans. (a) : In pheretima posthuma (common Indian earthworm), female genital pore are present upon segment 14th, while one pair ovary an segment 13th.

• Ovarien and funnels are present beneath the ovaries which continue into oviduct join together and open on the ventral side as a single median female genital pore on the 14th segment.

213. Metanephridia is the excretory system in

(a) Cockroach (b) Locust
(c) Earthworm (d) Birds

J&K CET-2013
BCECE-2007
BVP-2001
AIIMS-2002
AFMC-2000
BCECE-2009
Rajasthan PMT-2000

Ans. (c) : Metanephridia is a type of nephridium, found in every segment of earthworm. They are an important part of the excretory system and help in the formation of urine to excrete the waste out of the body while conserving the water.

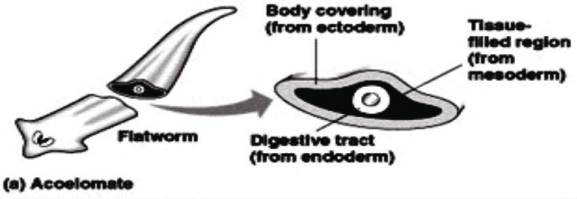
• Metanephridium is an excretory organ found in invertebrates like arthropods, annelids and molluscs.

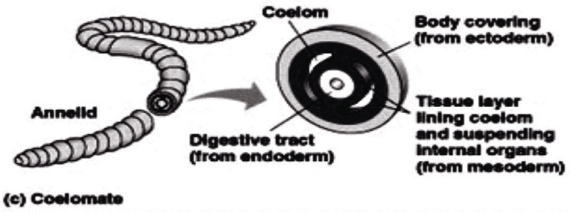
214. Earthworms have no skeleton but during burrowing the anterior end becomes turgid and acts as a hydraulic skeleton. It is due to:

(a) gut peristalsis
(b) setae
(c) coelomic fluid
(d) blood

Manipal-2012
BHU PMT (Screening)-2010
AIPMT-2009, 2008

Ans. (c) : The hydraulic skeleton is the system of support found in soft bodies invertebrates, which relies on the incompressibility of fluids contained within the body cavity. The coelomic fluid of annelids plays a role in locomotion and regulation of fluid transfer through the body wall.





• In earthworms, the coleomic fluid is under pressure within the coelom and therefore provides support for internal organs. Due to the hydraulic skeleton, during burrowing, the anterior and becomes turgid and aids in relaxation of longitudinal muscles.

215. Earthworms are

(a) useful
(b) harmful
(c) more useful than harmful
(d) more harmful

AFMC-2000
Manipal-2001
AIPMT-1990, 1989

Ans. (a) : Earthworms make the soil pores which helps in respiration and penetration of the roots for developing plants. The process of increasing soil fertility by earthworms is called vermicomposting. All over the world they are used as bait for fishing.

• Earthworms are in general beneficial to Agriculture. Their habit of burrowing and swallowing earth increases fertility of soil in many types.

216. The function of Typhlosole in earthworm is

(a) Increasing the effective area of absorption in the intestine
(b) Grinding of soil particles
(c) Grinding of decaying leaves
(d) Transportation

Karnataka CET-20.05.2023

Ans. (a) : Typhlosole is a drosal fold of the intestine in earthworms that increases the effective area of absorption in the intestine. It is a highly vascularized structure that allows for more efficient absorption of nutrients from the digested food.

217. Match the following body parts of earth worm respect to their segments

	Part		Segments
A.	Gizzard	i.	4th , 5th, & 6th
B.	Pharyngeal nephredia	ii	17th,&19th
C.	Nerve ring	iii.	8th & 9th
D.	Accessory glands	iv.	3rd & 4tn

(a) A-ii, B-i, C-iii, D-vi
(b) A-ii, B-iv, C-i, D-iii
(c) A-iii, B-iv, C-i, D-ii
(d) A-iii, B-i, C-iv, D-ii

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : • Gizzard is a muscular organ that function as a grind food. Located at 8th and 9th segments of the earthworms.

• Pharyngeal nephridia are excretory organs that help to remove waste product from the blood. They are located in the 3rd and 4th segment.

• Nerve ring–is a nerve cord that encircles the pharynx. Located in the 4th, 5th and 6th segments.

• Accessory glands–are a pair of glands that produce mucus. They are located at the 17th and 19th segments of the earthworms.

@apna_pdf

218. The functions of enteronephric nephridia of Pheretima.
(a) Osmoregulation and excretion
(b) Excretion and digestion
(c) Digestion and respiration
(d) Osmoregulation and digestion

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : The functions of enteronephric nephridia of Pheretima osmoregulation and excretion. The nephridia are coiled, tubular like organ, filter and remove nitrogenous waste from earthworms body.

219. In earthworm nerve ring is present
(a) around the oesophagus in the 3rd and 4th segments
(b) around the pharynx in the 3rd and 4th segments
(c) around the gizzard in the 8th segment
(d) around the pharynx in the 5th and 6th segments

TS EAMCET-11.05.2023, Shift-I

Ans. (b) : In earthworm nerve ring is present around the pharynx in the 3rd and 4th segments. Nerve in earthworm encircle pharynx and comprises of supra pharyngeal ganglia located above pharynx, sub pharyngeal ganglia located above pharynx, sub pharyngeal ganglia below pharynx and circum-pharyngeal connectives connecting the supra and sub pharyngeal ganglia.

220. Rows of S-shaped setae in the body of earthworm are present in all the segments, except
(a) The first, last and clitellum
(b) The last segment
(c) The first segment
(d) The first and last segment

Karnataka CET-2022

Ans. (a) : Setae are the 'S' shaped stiff bristles present or the complete body of earthworm except for the first and last clitellar segments. Setae are chitinous structures that help in the earthworm in locomotion.

221. Study the following and pick up the incorrect statement.
(a) In Pheretima, integumentary nephridia are found in 4th, 5th and 6th segments only
(b) Tubifex is an oligochaete found in fresh water
(c) Trichinella is a round worm included in class Aphasmidia
(d) Cestodes exhibit pseudometamerism

TS EAMCET-30.07.2022 Shift-I

Ans. (a) : In pheretima integumentary nephridia are not found in 4th, 5th and 6th segment only but occur at all segment except first two segment.

222. The following are the various external apertures in Pheretima
(A) Male genital apertures
(b) Spermathecal apertures
(c) Nephridiopres
(d) Female genital aperture
Arrange the apertures in a correct sequence from anterior end to posterior end
(a) B, C, D, A
(b) A, B, C, D
(c) C, B, A, D
(d) C, B, D, A

TS EAMCET-10.08.2021 Shift-I

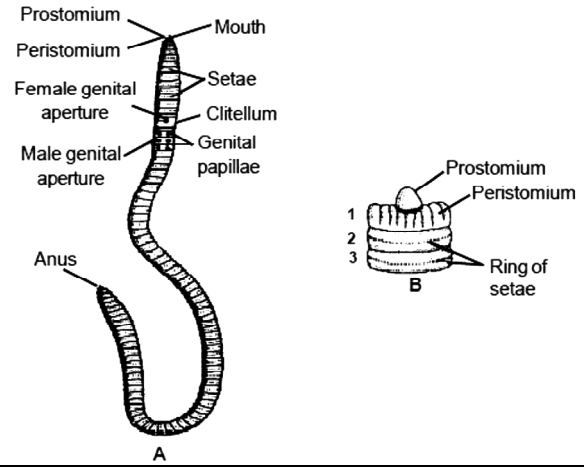
Ans. (d) :

Apperture	Segment No.
Nephridiopres -	3 to 5
Spermathecal aperture -	6 to 9
Female genital aperture-	14-16
Male genital aperture -	17-18

223. Following are the statements about prostomium of earthworm.
(A) It serves as a covering for mouth.
(B) It helps to open cracks in the soil into which it can crawl.
(C) It is one of the sensory structures.
(D) It is the first body segment.
Choose the correct answer from the options given below.
(a) (B) and (C) are correct
(b) (A), (B) and (C) are correct
(c) (A), (B) and (D) are correct
(d) (A), (B), (C) and (D) are correct

NEET-2021

Ans. (b) : In earthworm , Prostomium serves as a covering of the mouth and as a wedge to force open cracks in the soil into which the earthworm may crawl. The prostomium also act as a sensory in function.

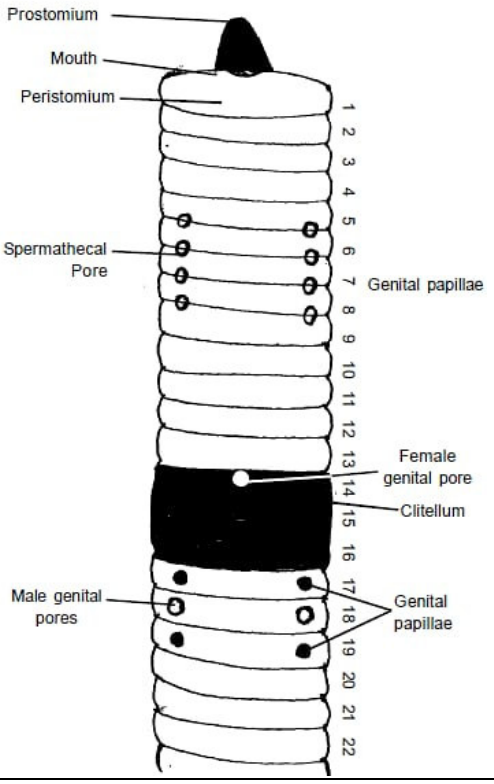


224. Which statement in incorrect for earthworm
(a) Two pair of testis is present in 10th and 11th segment
(b) One pair of ovaries in attached at the inter-segmental septum of the 12th and 13th segment
(c) It is hermaphrodite
(d) Male genital pore is present in 14th segment

AIIMS-26.05.2019 Shift-II

Ans. (d) : A pair of male genital pores are present on the ventro-lateral sides of the 18th segment. A single female genital pore is present in the mid ventral line of 14th segment.

@apna_pdf



225. Mark the correct statement regarding earthworm

(a) One pair of female genital pores are present in 14th segment

(b) Four pairs of spermathecae are situated on ventro lateral sides of the intersegmental grooves i.e. 5th segments

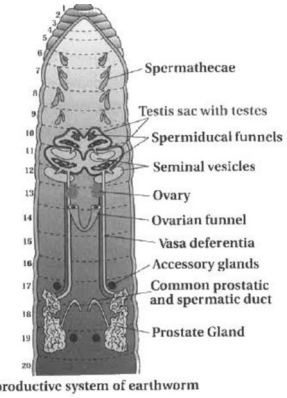
(c) Clitellum is present in 13-15 segements

(d) Four pairs of spermathecae are located in 6th-9th segments

AIIMS-25.05.2019 Shift-I
TS EAMCET-08.05.2019 Shift-II

Ans. (d) : In earth worm 4 pair of spermathecae are 5/6, 6/7, 7/8, 8/9.

• Spermathecae is a cavity where sperms are stored, there are 4 pairs of small flask shaped structure called as spermathecae. These are present ventro-laterally, one pair in each segment 6th, 7th, 8th and 9th.



Reproductive system of earthworm

226. Match the following with reference to earthworm

List -I		List-II	
(A)	**4-6th segments**	**(i)**	**Cingulum**
(B)	**14-16thsegments**	**(ii)**	**Stomach**
(C)	**9-14thsegments**	**(iii)**	**Blood glands**
(D)	**10-11thsegments**	**(iv)**	**Testes**

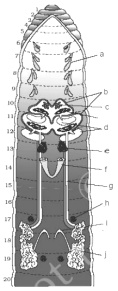
The correct answer is

	(A)	(B)	(C)	(D)
(a)	(ii)	(iii)	(i)	(iv)
(b)	(i)	(ii)	(iv)	(iii)
(c)	(iv)	(i)	(ii)	(iii)
(d)	(iii)	(i)	(ii)	(iv)

TS EAMCET-03.05.2018 Shift-I

Ans. (d) : 4-6th segments – Blood glands
14-16thsegments – Cingulum
9-14thsegments – Stomach
10-11thsegments – Testes

227. Choose the correct option from the following based on the diagram:



(a) (a) Spermathecae (e) ovary (f) ovarian funnel (j) prostate gland

(b) (a) testis sac (h) accessory glands (g) ovarian funnel, (i) prostate gland

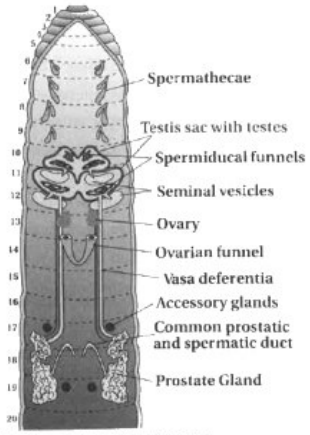
(c) (h) Spermathecae (a) ovary (j) ovarian funnel (c) accessory glands

(d) (h) testis sac (a) accessory glands (i) ovarian funnel, (g) prostate gland

AIIMS-26.05.2018 Shift-I
Kerala PMT-2011, 2009

Ans. (a) : The given diagram is reproductive system of earthworm.
The correct labels are as follows :
(a) spermathecae (e) ovary (f) ovarian funnel (i) prostate gland.

@apna_pdf



Reproductive system of earthworm

228. In earthworm, the characteristic internal median fold of dorsal wall of the intestine called typhlosole is present in
(a) 5 to 9 segments
(b) 9 to 14 segments
(c) 26 to 35 segments
(d) 15 to last segment
(e) 35 to last segment

Kerala PMT-2008

Ans. (c) : 26 to 35 segment is the present of internal median fold of dorsal wall of the intestine called typhlosole. This increases the area of absorption in the intestine.

229. Specialised chemoreceptors located on the anterior part of earthworms are
(a) heat receptors
(b) photo receptors
(c) taste receptors
(d) pressure receptors
(e) auditory receptors

Kerala PMT-2012

Ans. (c) : Specialised chemoreceptors located on the anterior part of earthworms are taste receptors indeed, earthworms are known to have chemoreceptors principally on the prostonium or on the buccal epithelium that are associated with the nervous system and more particularly with axons and dendrites.

230. Efferent salivary ducts in Periplaneta open into
(a) stomach
(b) base of pharynx
(c) base of hypopharynx
(d) base of oesophagus

JCECE-2010

Ans. (c) : Efferent salivary ducts in Periplaneta open in to base of hypopharynx.
• Each salivary gland of Periplaneta includes flattend glandular part and a long pyriform sack-like recervoir or receptacle.

231. In earthworm, gizzard is found, in which of the following segments?
(a) 9^{th} segment (b) 18^{th}segment
(c) 13^{th}segment (d) 16^{th}segment

UP CPMT-2009

Ans. (a) : The gizzard is a prominent oval also hard, thick walled and highly muscular organ present in the eighth segment.

232. Body of earthworm is divided into how many similar segments which are called metamers or somites?
(a) 60 - 120 (b) 100 - 120
(c) 80 - 120 (d) 120 - or more

UP CPMT-2007

Ans. (b) : Body of earthworm is divided into 100 - 120 similar segments are called metamers or somites. Each segment has muscles and bristles, known as setae. That are help in the movement.

233. Microvilli of intestinal epithelium are similar in function with
(a) Typhlosole in earthworm
(b) Hepatic caecae in cockroach
(c) Intestinal caecum in earthworm
(d) Malpighian tubules in cockroach.

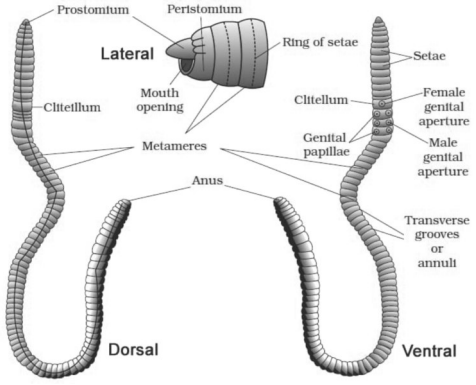
AIIMS-2010

Ans. (a) : Microvilli helps in the absorption of nutrient in the small intestine.
- Thousands of microvillus forms a brush border structure that is present on the apical area of epithelium intestine.
- Digestive system of earthworm instead of coiling the mid dorsal wall of the intestine forms a longitudinal, tongue like fold which is known as typhlosole.
- This structure helps in making the absorption of nutrient, more efficient.

234. Which one of the following correctly describes the location of some body parts in the earthworm (Pheretima)?
(a) Four pairs of spermatheca in 4-7 segments
(b) One pair of ovaries attached at inter-segmental septum of 14^{th} and 15^{th} segments
(c) Two pairs of testes in 10^{th} and 11^{th} segments
(d) Two pairs of accessory glands in 16-18^{th} segments

AIIMS-2014

Ans. (c) : In pheretima (earthworm) two pairs of testes are present in the 10^{th} and 11^{th} Segments.
•Each testis is sac of the 10^{th} segment encloses a testis and seminal Funnel. Each testis sac of the 11^{th} Segment encloses a testis, a seminal vesicle and seminal funnel.
• A pair of spermathecae are located in each segment from 6^{th} to 9^{th} segments. They are structures that receive sperms after mating.
• One pair of ovaries is attached to the intersegmental septum of the 12^{th} and 13^{th} segments.



@apna_pdf

235. What is common between earthworm and Periplaneta?
(a) Both have red coloured blood
(b) Both possess and styles
(c) Both have malpighian tubules
(d) Both have segmented body

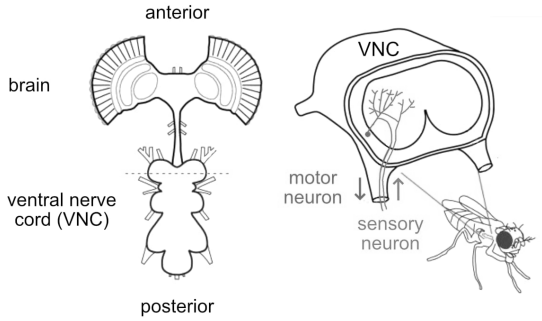
AIIMS-2012

Ans. (d) : The body of earthworm shows metameric segmentation, while in periplaneta it is externally segmented. They inhabits the upper layer of the moist soil, while in periplaneta, body is externally segmented and live in damp place both are non-chordates.
• Segmentation is mostly external in arthropods and mainly internal in man and other chordates.

236. Which one features is common to leech, cockroach and scorpion?
(a) Nephridia
(b) Ventral nerve cord
(c) Cephalization
(d) Antennae.

JIPMER-2010
AIIMS-2004

Ans. (b) : The ventral nerve cord is a cord of nervous tissue that runs the length of the animal in the lower part of its body. It is the common characteristic of lower Chordates like, leech, cockroach, Scorpion.
• Nephridia are the excretory organs in annelida like in earthworm and leech, cockroach, and scorpion.



237. Earthworm possesses hearts
(a) 6 pairs (b) 4 pairs
(c) 2 pairs (d) 1

JCECE-2007
AFMC-2006
AIPMT-1991

Ans. (b) : The earthworm's circulatory system consists of four pairs of hearts, one pair each in segments 7, 9, 12 and 13. Hearts located in the 7^{th} and 9^{th} segments are called lateral hearts with 4 pairs of valves and those in the 12^{th} and 13^{th} segments are called lateral esophageal hearts with 3 pairs of valves.

238. In Pheretima, the number of ring vessels per segment in 12th and 13th segment, is–
(a) 10 pairs (b) 10 pairs
(c) 12 pairs (d) 24 pairs

AP EAMCET - 2003
Uttarakhand PMT-2010

Ans. (c) : In Pheretima, the number of ring vessels per segment in 12th and 13th segment, is 12 pairs. These are about 12 vessels per segment. Through these vessels blood of lateral oesophageals reaches the supraesophageal.

239. Silicates consumed along with food by Pheretima and excreted by–
(a) Flame cells (b) chloragogen cells
(c) intestinal cells (d) basal cells

Uttarakhand PMT-2010

Ans. (b) : Silicates consumed along with food by pheretima and excreted by chloragogen cells. The chloragogen cells excrete silicates consumed along with the food by pheretima.

240. If an earthworm is left in 40 solution for a long time, which part would be left undissloved?
(a) Setae (b) Sperma thecae
(c) Sand particles (d) Circular muscles

Punjab MET-2007

Ans. (a) : If an earthworm is left in 40 solution for a long time, Setae would be left undissolved. Setae are chitinous structures that help the earthworm in locomotion.

241. Which of the following is the character of dorsal blood vessel of the earthworm?
(a) Collecting in the whole body
(b) Collecting in first 13 segments
(c) Distributing in the whole body
(d) Distributing in the first 13 segments

Punjab MET-2007

Ans. (d) : Ventral blood vessel is found below the alimentary canal and above the ventral nerve cord. It is also a long blood vessel that runs from second segment to the last segment of the body. In the interior segments (first 13 segments) ventral blood vessel supplies blood to the body wall..

242. The part of spermatheca of earthworm that acts as store house of spermatozoa is
(a) ampulla (b) diverticulum
(c) both [a] and [b] (d) none of these

Punjab MET-2007

Ans. (b) : The part of spermatheca of earthworm that acts as store house of spermatozoa is diverticulum. The spermatheca consists of two distinct areas, the dorsal sperm storage area, consisting of appocrine glandular epithelium and the ventral part, which includes the fertilisation area.

243. The most commonly occurring species of an earthworm in India is
(a) Pheretima communissima
(b) Eutyphacus
(c) Pheretima posthuma
(d) Lumbricus

BCECE-2015

Ans. (c) : The most commonly occurring species of an earthworm in India is pheretima posthuma. Pheretima is a genus of earthworm found mostly in New Guinea and parts of Southeast Asia.

@apna_pdf

244. In earthworms setae are present in all segments except the :
(a) First and the last segments
(b) First and the clitellum
(c) First segment
(d) Clitellum and last segments
(e) First, clitellum and last segments

Kerala PMT-2011
Rajasthan PMT-1995

Ans. (e) : In earthworms setaes are present in all segments except the first clitellum and last segments. In each segment bear a ring of tiny curved, chitinous structure known as setae. Setae helps in locomotion and copulation.

245. Which of the following organs in earthworm neutralizes humic acid present in humus?
(a) Typhlosole
(b) Calciferous glands
(c) Intestinal caecum
(d) Gizzard

J&K CET-2013
DUMET-2011

Ans. (b) : Calciferous glands in earthworm neutraliges humic acid present in human the calciferous gland are present in segments 10^{th} -14^{th} , and consist of a pair of oesophageal pouches in segment 10^{th} and a pair of oesophageal gland in each of segments 11^{th} and 12^{th}.
• In segment 10^{th} the oesophageal epithelium is raised up to into long narrow longitudinal folds projecting into the lumen. Clitellum or cingulum - It is circular or glandular band around 14th, 15th and 16th, it secrets albumen, globulin and egg case (cocoon). It divides the body of the earthworm into pre-clitellar, citellar and post- clitellar.

246. Integumentary nephridia are also called:
(a) enteronephric
(b) exonephric
(c) sometimes enteronephric and sometimes exonephric
(d) both [a] and [b]

DUMET-2004

Ans. (b) : Integumentary nephridia are also called exonephric, having the excretory organs discharge through the body wall (as in some annelids worms).
• Enteronephric nephridia eject their wastes into the alimentary canal. There are smallest V shaped and without nephrostome. Integumentary nephridia are scattered in body wall of pheretima.

247. In Pheretima, septa are absent between which segments?
(a) 3/4 and 9/10 (b) 4/5 and 8/9
(c) 5/6 and 7/8 (d) 7/8 and 6/7

JIPMER-2009
Rajasthan PMT-2008
CG PMT-2008

Ans. (a) : In Pheretima, septa are absent between 3/4 and 9/10 segments. The body cavity of an earthworm is a true coelom with lies between the body wall and the alimentary canal. It is lined by the coelomic epithelium derived from the mesoderm.

248. Which parasite is present in seminal vessicle of Earth worm ?
(a) Monocystis (b) Nosema
(c) Sarcocystis (d) Nictotherus

Rajasthan PMT-1999

Ans. (a) : Monocystis parasite is present in seminal vessicle of Earthworm. Monocystis is the most common genus of protozoans to infect earthworms.

249. Segments of Earthworm are called :
(a) metamere (b) sarcomere
(c) prostomium (d) podomeres

Rajasthan PMT-1999

Ans. (a) : Segments of Earthworm are called metamere, means one of the similar body segments into which earthworms, crayfish and similar animals are divided longitudinally.
• The growing adult form known as the trophozoite and the reproductive form of these Parasites occur in the seminal vesicle of the earth worms.

250. Haemoglobin in Earthworm is present in :
(a) RBC (b) protoplasm
(c) coelomic fluid (d) plasma

MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (d) : Haemoglobin in Earthworm is present in plasma, which is the respiratory pigment that carries oxygen to different part of the body. It is present in the red blood cells of almost all vertebrates.
Erthrocytes are absent in them.

251. In earthworm the dorsal wall of the intestine from the 26^{th} segment to 95^{th} segment forms a median internal fold called.
(a) trochophore (b) typhlosole
(c) clitellum (d) trachea
(e) nephridium

CMC Vellore-2008

Ans. (b) : In earthworm the dorsal wall of the intestine from the 26^{th} segment to 95^{th} segment forms a median internal fold called typhlosole.
• Typhlosole is highly glandular, Vascular, longitudinal ridge, increasing the area for absorption of digested food.

252. Effective organ for intake of food in Earthworm is :
(a) Mouth (b) Buccal cavity
(c) Pharynx (d) Stomach

Rajasthan PMT-1995

Ans. (c) : Effective organ for intake of food in Earthworm is Pharynx. Earthworms push the pharynx out of their mouths to grasp hold of organic matter. They pull the food back into their mouths and then wet it with saliva.

253. Function of chloragogen cells of Earthworm is:
(a) Digestion (b) Locomotion
(c) Excretion (d) Respiration

Rajasthan PMT-1995
Manipal-2006

@apna_pdf

Ans. (c) : Function of chloragogen cells of Earthworm is excretion.
• Chloragogen cells or yellow cells are present in the region of intestine in Phertima. The exact function of the cells is not fully known but, it is belived that they are concerned with storage of reserve food and also excretory in function.

254. The function of clitellum in Pheretima is:
(a) formation of cocoon
(b) secretion of hormone
(c) nutrition of sperm
(d) respiration

Rajasthan PMT-1997, 2002
BVP-2010
JCECE-2003

Ans. (a) : The function of clitellum in Pheretima is formation of Cocoon. An adult earthworm develops a belt like Swelling Called Cingulum or Clitellum, Which covers the several segments towards the front of the animal. This is a part of reproductive system that creates egg Capsules (cocoons).

255. The nephridia, in earthworm, are analogous to
(a) gills of prawn
(b) trachea of insects
(c) nematoblasts of Hydra
(d) flame cells of Planaria

VMMC-2004
Rajasthan PMT-1995

Ans. (d) : The nephridia, in earthworm are analogous to flame cells of planaria. A pair of nephridia is present on each segment of the earthworm.
• A flame cell is specialized excretory cell. These are the simplest animals to have an excretory system flame cells function like a kidney.
• Removing waste material flame cells are called protonephrdia.

256. Identify the wrong statement regarding earthworm
(a) The first body segment is called peristomium
(b) Prostomium contains the mouth
(c) Clitellum is made up of glandular tissue
(d) Prostomium is sensory in function
(e) Body setae are S-shaped

Kerala PMT-2013

Ans. (b) : Correct statement about earthworm is–
- The first body segment is called peristomium.
- Clitellum is made up of glandular tissue.
- Clitellum is sensory in function.
- Body setae are S - shaped.

257. In earthworm, the circular muscles are highely develop in:
(a) body wall (b) typhlosole
(c) gizzard (d) pharynx

Manipal-2006

Ans. (c) : Gizzard is formed when the esophagus expands and modifies into a large, distinct, Muscular organ, the gizzard helps in the digestion process, it reduces the particle size of food.

258. Which of the blood vessel is the largest in earthworm and possess valves?
(a) Dorsal blood vessel
(b) Sub-neural blood vessel
(c) Ventral blood vessel
(d) Supra oesophageal blood vessels

Manipal-2006

Ans. (a) : The dorsal blood vessel is the largest vessel. In earthworm collects blood throughout the anterior body of the earthworm. Contractile peristalsis pushes blood from anterior to posterior directions through the dorsal vessel.

259. Regarding blood circulation, it may be said that in Pheretima the dorsal vessel is a
(a) collecting vessel in first, two segments and distributing vessel in other
(b) distributing vessel in first, five segments and distributing vessel in other
(c) collecting vessel in first thirteen segments and distributing vessel in intestinal region
(d) distributing vessel in first thirteen segments and collecting vessel in intestinal region

Punjab MET-1999, 2003
AFMC-2002
Manipal-2012

Ans. (d) : In the region behind 13th segments blood laden with digested nutruient and O_2 is collected in the dorsal vessel while in anterior region of body , some of this blood in supplied by dorsal vessel to various parts.

260. Spermathecae in earthworm is :
(a) for producing sperm
(b) for storage of sperm obtained from male earthworm during copulation and used in future
(c) both a and b
(d) none of the above

Rajasthan PMT-1998
AFMC-2005

Ans. (b) : In earthworms, spermatheca is an organ of the female reproductive tract and it is an internal sac that is pear shaped. The main function of this is to receive and store the sperm from the male component of the body during copulation.

261. Life span-of Earthworm is:
(a) 1-3 yrs (b) 2-6 yrs
(c) $3\frac{1}{2}-10$ yrs (d) 61/6 - 15yrs

Rajasthan PMT-1996

Ans. (c) : Worms are the invertebrates that belong mostly to the phylum platyhelminthes and Annelida. Worm like invertebrates have a lifespan that varies according to species. For instance, earthworms such as the Red wiggler worms live between 4-5 years. Some worms get life span more than 10 years too.

262. Copulation of Earthworm lasts for:
(a) 5-6 hrs (b) 15 min
(c) 1 hrs (d) 2-3 hrs

Rajasthan PMT-1996

@apna_pdf

Ans. (c) : Sexual intercourse, also called coitus or copulation, reproductive act in which reproduction male organ enters the female tract (reproductive). In earthworms copulation lasts for about an hour. Then the worms separate and later they lay their eggs in coccon.

263. Role of chromophill cells of Earthworm pharynx is:

(a) Fat storage (b) Helps in excretion
(c) Cocoon formation (d) Saliva secretion

Rajasthan PMT-1996

Ans. (d) : The earthworms pharynx or throat is used to grab leaves and pull them back into its mouth. Then it gets them nice and wet with saliva.

264. Earthworms have no special sense organs. Still they are sensitive to

(a) touch and sound
(b) light and sound
(c) touch, taste and sound
(d) touch, taste and light

BVP-2008
Uttarakhand PMT-2007
JIPMER-1996

Ans. (d) : Earthworms have no eyes and no ears, but they have light sensitive cells that help them to tell the difference between light and darkness. Their bodies are sensitive to vibrations.

• Earthworms do not have any receptors to perceive sound stimuli.

265. If the skin of earthworm becomes dry, it dies due to :

(a) asphyxia (b) starvation
(c) intoxication (d) dehydration

AFMC -2011

Ans. (a) : Earthworm and frog have moist and skin slimy that helps then respiration by diffusion of oxygen but, if the skin becomes dry, they well not able to respire and due to lack of oxygen asphyxia, they will die.

• Respiratory exchange occurs through moist body surface into their blood stream. If the skin of earthworm becomes dry, it dies due to asphyxia.

266. Protozoan living in the seminal vesicles of earthworm is:

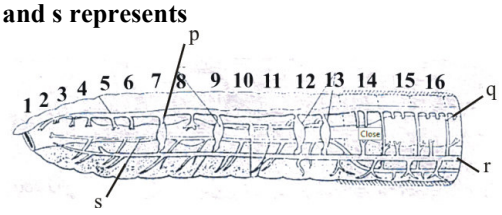
(a) Monocystis (b) Balantidium
(c) Trichonympha (d) Opalina

Rajasthan PMT-2006
JIPMER-1997

Ans. (a) : Two common parasites are monocytsis and Rhabditis, these infect earthworms only. Monocytsis is the commonest protozoan genus to infect earthworms, but another nine genera have been recorded in Britain.

Monocystis is an internal parasites which residen in the seminal vesicle of Pheretima Posthuma (earthworm).

267. In the circulatory system of Pheretima, p, q, r and s represents



(a)	(p)Lateral hearts	(q)Sub neural vessel	(r)Commissural vessel	(s)Lateral oesophageal vessel
(b)	(p)Lateral hearts	(q)Lateral oesophageal vessel	(r)Sub neural vessel	(s)Commissural vessel
(c)	(p)Lateral hearts	(q)Commissural vessel	(r)Sub neural vessel	(s)Lateral oesophageal vessel
(d)	(p)Commissural vessel	(q)Lateral hearts	(r)Lateral oesophageal vessel	(s)Sub neural vessel
(e)	(p)Commissural vessel	(q)Lateral hearts	(r)Sub neural vessel	(s)Sub oesophageal vessel

Kerala PMT-2015

Ans. (c) : In the above figure (in question given) of the circulatory system of pheretima or earthworm.

p → Lateral hearts
q → Commissural vessel
r → Sub neural vessel
s → Lateral oesophageal vessel.

268. The structure in earthworm which serves as a wedge to force open cracks in the soil is

(a) Peristomium (b) Setae
(c) Clitellum (d) Typhlosole
(e) Prostomium

Kerala PMT-2015

Ans. (e) : The prostomium is a small fleshy lobe like structure that over hangs the mouth of the Earthworm or acts as a covering for the mouth and its main function is to serve as wedge to force open cracks in the soil into which the Earthworm may crawl in or live.

269. Nephrostome is a component of :

(a) septal nephridia
(b) integumentary nephridia
(c) pharyngeal and septal nephridia
(d) pharyngeal and integumentary nephridia

Rajasthan PMT-1998

Ans. (a) : The nephredium consist of an opening called the nephrostone a long convoluted tubule and another opening called the Nephridiopore.

• Nephrostome lies in the neck region and is component of septal nephridia.

270. The lateral hearts in earthworm have

(a) four pairs of valves and are situated in segments 7 and 9
(b) four pairs of valves and are situated in segments 6 and 8
(c) three pairs of valves and are situated in segments 8 and 10
(d) two pairs of valves and are situated in segments 6 and 11

AMU-2010

@apna_pdf

Ans. (a) : The anterior loops are devoid of the valves. Four pair of valves and are situated in segment 7 and 9. The four pairs of valves in the lateral hearts allow the blood to flow only downwards. One pair is situated in the 7^{th} segment and the other pair is situated in the 9^{th} segment.

271. An evolutionary pattern characterized by a rapid increase in the number and kinds of closely related species is called
(a) convergent evolution
(b) divergent evolution
(c) adaptive radiation
(d) Both (b) and (c)

AMU-2010

Ans. (c) : In evolutionary biology convergent evolution is defined as the process whereby distantly related organisms independently evolve similar traits to adapt to similar necessities.
• Adaptive radiation refers to the diversification of a group of organisms into different from and occupying different ecological niches.

272. The colour of the body in earthworm is brown due to the presence of
(a) Porphyrin (b) haemoglobin
(c) blood (d) haemocyanin

UP CPMT-2001, 2013
HP CET-2012
VMMC-2004

Ans. (a) : The colour of the body in earthworm is brown due to the presence of porphyrin pigment.
• Porphyrins are a group of heterocyclic macrocycle organic compounds, composed of four modified pyrrole subunits interconnected to their are carbon atoms vill methane bridge.

273. Four pairs of pulsatile heart in Pheretima are located in segments
(a) 7, 9, 12 and 13 (b) 11, 14, 17 and 18
(c) 10, 13, 16 and 17 (d) 4, 5, 10 and 13

CG PMT-2007

Ans. (a) : Earthworms belongs to phylum annelida which is triploblastic and has a true coloem. These have segmented body. The hearts in the 12^{th} and 13^{th}segements of earthworm are called as lateral esophageal heart. While the anterior pairs in the 7^{th} and 9^{th} segment are called as the lateral heart.

274. In Pheretima, locomotion occurs with the help of :
(a) circular muscles
(b) longitudinal muscles and setae
(c) circular, longitudinal muscles and setae
(d) parapodia

J&K CET-2006
Rajasthan PMT-2002

Ans. (c) : Locomotion in pheretima is carried out by longitudinal and circular muscles. Longitudinal muscles run lengthwise along the body. The circular muscles encircle the body and help in increasing or decreasing the width of the organism.

275. Select the correct statement :
(a) Birds are poikilothermic
(b) Flatworms are coelomic animals
(c) Earthworm is metamerically segmented
(d) Fishes are radially symmetrical

J&K CET-2006

Ans. (c) : Earthworm is metamerically segmented body. It belong to phylum annelida.
• Each segment is known as the metamer and the segmentation is known as metameric segmentation.

276. Blood of which of the following animals does not carry O_2?
(a) Frog (b) Insects
(c) Lung fish (d) Earthworm

JIPMER-1995

Ans. (d) : In earthworm, RBCs in blood remains absent.
• In earthworm, haemoglobin is the respiratory pigment which carries oxygen to different parts of the body. It is present in the blood plasma.

277. The function of blood gland in Pheretima is:
(a) production of RBC
(b) production of phagocytes
(c) maintenance of blood volume
(d) maintenance of blood circulation

AP EAMCET-2001

Ans. (b) : The blood glands are located in the 4^{th}, 5^{th} and 6^{th} segments. These blood glands produce blood cells and haemoglobin. The blood glands are phagocyte in nature.

278. Spermatophores of Pheretima are formed due to secretions of:
(a) seminal vesicles (b) spermiducal funnel
(c) prostrate glands (d) spermathecae

AP EAMCET-2001

Ans. (c) : A pair of large prostrate glands are present in earthen in earthworms. These glands are present on either side of the intestine and extend from the 17^{th} to 20^{th} segment. They produce a secretion serve as a medium for the transfers of sperms.

279. Haemoglobin is found dissolved in the plasma of
(a) bird (b) man
(c) frog (d) earthworm

CMC Ludhiana-2010
DUMET-2007

Ans. (d) : Annelids have haemoglobin dissolved in plasma because they don't have a proper respiratory system and the haemoglobin is dissolved in plasma for the diffusion of gases and other materials.
• Blood glands are present on the 4^{th},$5^{th}$and 6^{th} segments . They produce blood cells and hemoglobin which is dissolved in blood plasma.
• Earthworm has no red blood cells, heaemoglobin remains dissoleved in Plasma through which oxygen transport take place.

@apna_pdf

280. Match the following lists

List-I (Pheretima)		List-II (Cell features)	
A.	**Phagocytes**	**1.**	**Small cells having yellowish granules**
B.	**Chloragogen cells**	**2.**	**Elongated cells**
C.	**Circular cells**	**3.**	**Largest cells with membranous folds**
D.	**Mucocytes**	**4.**	**Cells with characteristic markings on the surface**

The correct set is

	A	B	C	D
(a)	3	4	1	2
(b)	2	1	4	3
(c)	4	3	2	1
(d)	3	1	4	2

AP EAMCET-2008

Ans. (d) :

List-I (Pheretima)		List-II (Cell features)	
A.	Phagocytes	1.	Small cells having yellowish granules
B.	Chloragogen cells	2.	Largest cells with membranous folds
C.	Circular cells	3.	Cells with characteristic markings on the surface
D.	Mucocytes	4.	Elongated cells

281. In Pheretima, the red coloured round bodies in 4th, 5th and 6th segment above the alimentary canal are believed to be involved in:

(a) Reproduction
(b) Digestion
(c) Excretion
(d) Leucocyte production

AP EAMCET-2005

Ans. (d): 4th 5th and 6th segments above the pharyngeal mass are connected with the pharyngeal or salivary gland. Small red colored follicular bodies called blood gland are found in these segment. It produced white blood corpuscles leucocytes and hemoglobin.

282. The following are associated with Pheretima. Match them:

	List-I		List-II
A.	**Yellow cells**	**1.**	**Primordial germ cells**
B.	**Oval sphincteredpores**	**2.**	**Totipotent**
C.	**Basal cells**	**3.**	**Deamination**
D.	**Parietal layer**	**4.**	**The septum between 14/15**

	A	B	C	D
(a)	3	4	2	1
(b)	3	2	4	1
(c)	3	1	2	4
(d)	4	1	2	3

AP EAMCET-2005

Ans. (a) : List-I — **List-II**

A. Yellow Cell — 3. Deamination
B. Oval sphinctered pores — 4. The septum between 14/15
C. Basal Cell — 2. Totipotent
D. Parietal layer — 1. Primordial

• Yellow cell are also known as chloragogen cell. These take part in excretion (deamination). The septum between 14/15 segments are performed by many minute oval Sphinctered pores. Basal cell is totipotent in nature. Parietal layer takes part the formation of primordial germ cell.

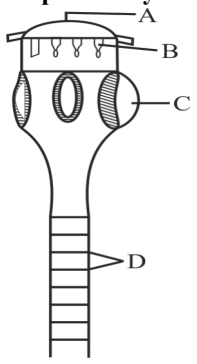
283. Which one of the following pairs of items correctly belongs to the category of organs mentioned against it?

(a) Nephridia of earthworm and malpighian tubules of cockroach - Excretory organs
(b) Wings of honeybee and wings of crow - Homologous organs
(c) Thorn of *Bougainvillea* and tendrils of *Cucurbita* - Analogous organs
(d) Nictitating membrane and blind spot in human eye - Vestigial organs

AIPMT-2008

Ans. (a) : Nephridia coiled, tubular duct like organs, filter and remove waste from an earthworm body. The excretory organ of cockroach is the malpighian tubules.
• It is found at the junction of the midgut and hind gut and about 150 in number.
• Nephridia are excretory organs in the member of Annelids. Malphghian tubules are excretory organs in Arthropod.

284. In the diagram given by the side, different parts are indicated by alphabets. Choose the answer in which these alphabets correctly match with the parts they indicate.



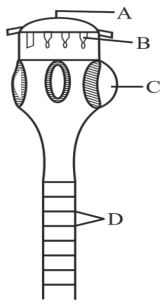
(a) A = mouth, B = Tentacles, C = Sucker, D = Segments

@apna_pdf

(b) A = Sucker, B = Hairs, C = Ring D = Proglottids
(c) A = Rostellum, B = Hooks, C = Sucker, D = Proglottids
(d) A = Suctorial mouth B = Hooks B = Sucker, D = Segments

Karnataka CET-2008

Ans. (c) :



A = Rostellum , B = Hooks
C = Sucker, D = Preglottids

285. Fertilization in earthworm occurs in
(a) cocoon (b) spermathecae
(c) coelom (d) seminal vesicles

UP CPMT-2005

Ans. (a): Earthworm is **monoecious or hermaphrodite** which reproduce sexually. They are protandrous, there is no self fertilization. Fertilization is external and occurs in cocoon.

286. In the transverse section of pheretima, identify the correct sequence of body wall layers from outer to inner side.
(A) Circular muscles
(B) Parietal peritoneum
(C) Epidermis
(D) Cuticle
(E) Longitudinal muscles
(a) C → B→E→A→D
(b) D→C→E→A→B
(c) D→C→A→E→B
(d) D→B→A→E→C

AP EAMCET-2013

Ans. (c) : D. Cuticle → C. Epidermis → A. Circular muscles→ E. Longitudinal muscles → B. Parietal peritoneum.

287. Match the following lists

List I		List II
(A) Aggregate fruitlets of berries appearing as a single fruit	(i)	Rubus
(B) Achenes on the inner margins of receptacle	(ii)	Artabotrys
(C) Etaerio of drupes	(iii)	Ficus
(D) Etaerio of follicles	(iv)	Magnolia
	(v)	Annona

The correct match is

	A	B	C	D
(a)	(v)	(iii)	(i)	(iv)
(b)	(ii)	(i)	(v)	(iv)
(c)	(ii)	(iv)	(iii)	(v)
(d)	(iv)	(iii)	(i)	(ii)

AP EAMCET-2013

Ans. (a) :
Rubus - Etaerio of drupes.
Ficus - Achenes on the inner margins of receptacles.
Magnolia - Etaerio of follicles.
Annona - Aggregate fruit lets of berries appearing as a single fruit
Artabotrys - Non-edible green round fruit.

288. Earthworm is
(a) polychaeta (b) oligochaeta
(c) hirudinea (d) None of these

UP CPMT-2011

Ans. (b): Phylum Annelida are divided into four main classes Primarily on the basis of the presence or absecnce of parapodial Setae, Metamers and other morphological features - are -
Class 1. Polychaeta
Class 2. Oligochaeta
Class 3. hirudinea
Class 4. Archiannelida
• Earthworm is the member of class oligochaeta.
• Oligochaets are mostly terrestrial, some in fresh water segmentation external and internal, head indistinct without sensory organs, few setae are embedded in the skin. Parapodial is absent.

289. In which one of the following organisms its excretory organs are correctly stated
(a) Frog –– Kidneys, skin and buccal epithelium
(b) Humans - – Kidneys, sebaceous glands and tear glands
(c) Earthworm –– Pharyngeal, integumentary and septal nephridia
(d) Cockroach –– Malpighian tubules and enteric caeca

AIPMT (Mains)-2010

Ans. (c) : Nephridia is the excretory organ of the earthworm.
- Earthworms have three types of nephridial structures called as septal, integumentary and pharyngeal nephridia.
- These three nephridial structures are present on different positions in the body and also very different in structures.
- Septal and pharyngeal nephridia are both enteronephric i.e., nitrogen products are expelled in gut. Integumentary nephridia is exonephric i.e., nitrogen waste products are directly discharge outside.
- In frogs and humans main excretory organ are kidneys, while in cockroach excretory organ are malpighian tubules.

@apna_pdf

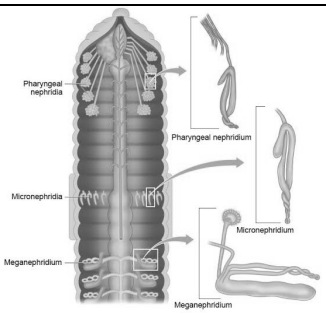


Figure: 4. 5 *Lampito mauritii* – Types of Nephridia

290. The enteronephric nephridia of Pheretima is consists of the following parts :

I. a nephrostome
II. terminal nephridial duct
III. septal excretory canal
IV. supra-intestinal excretory canal
V. long thick walled excretory canal

(a) II, V (b) I, III, IV, V
(c) III, IV, V (d) I, III, IV

AP EAMCET-2006

Ans. (a) : Enteronepheric nephridia (septal nephridia) are the largest nephridia of Pheretima. A typical septal nephridia consists of three main parts i.e,

- Nephrostome: It is ciliated funnel communicating with the coelom.
- Body of nephridia consists of two pans, a short straight lobe and a long twisted lobe.
- Terminal duct: Distal limb of nephridium ends in a short and narrow duct called terminal duct.

291. Arrange the external openings and their segmental numbers of Pheretima

Set-I	Set-II
(A) Male genital apertures	**1. Between 12/13 to last segment**
(B) Dorsal pores	**2. From 3rd to last segment**
(C) Spermathecal apertures	**3. 18th segment**
(D) Nephridiopores	**4. From 5/6 to 8/9 segment**

(a) A-2, B-1, C-3, D-4 (b) A-3, B-1, C-4, D-2
(c) A-3, B-4, C-2, D-1 (d) A-2, B-3, C-1, D-4

AP EAMCET-2007

Ans. (b) : A-3, B-1, C-4, D-2

Set-I	Set-II
(A) Male genital apertures	3. 18th segment
(B) Dorsal pores	1. Between 12/13 to last segment
(C) Spermathecal apertures	4. From 5/6 to 8/9 segment
(D) Nephridiopores	2. From 3rd to last segment

292. During the development of zygote of earthworm micromeres develop into

(a) Mesoderm
(b) Endoderm
(c) Ectoderm
(d) All the three germinal layers

AP EAMCET-2007

Ans. (b) : Micromeres give rise to the endoderm, a portion of the ectoderm, and also secondary mesenchyme cells during normal development.

- Micromeres fractionated by elutriation developed into gastrula like or exogastrula–like embryoids.

293. A transverse section of Pheretima taken through the 10th segment is observed in microscope. Which of the following structures can be observed in the section?

(a) Stomach, Dorsal blood vessel, Ventral blood vessel, Supra-oesophageal vessel, Anterior loops, Ring vessel and Micronephridia
(b) Stomach, Dorsal blood vessel, Ventral blood vessel, Lateral hearts, Ring vessels and Pharyngeal nephridia
(c) Intestine, Dorsal blood vessel, Ventral blood vessel, Supra-oesophageal vessel and Septal nephridia
(d) Stomach, dorsal blood vessel, sub neural blood vessel and Lateral hearts

AP EAMCET-2007

Ans. (a) : Stomach, dorsal blood vessel, ventral blood vessel, supra-oesopnogeal vessel, anteriar loops, ring vessel and micronephridia.

Explanation– Lateral hearts occur in 7th and 9th segment intestine-extends from 15th to last segment subneural blood vessel extends from 14th segment upto posterior end.

- Pharyngeal nephridia occur in 4th, 5th and 6th segments septal nephridia occur on both faces of each inter segmental septum behind 15th segment.
- The digestive system of earthworm is complete the following parts - mouth, buccal cavity, pharynx, oesophagus stomach, pre, typhlosolar region , interstinal, caeca which act like liver, typhlosole which increases the absorption digested food.

294. In Pheretima, gizzard, buccal cavity, pharynx oesophagus and pharyngeal nephritides receive the blood from which blood vessel

(a) supra oesophageal (b) lateral oesophageal
(c) dorsal blood (d) subneural

AP EAMCET-2009

Ans. (c) : In Pheretima posthuma, the dorsal blood vessel is considered as dorsal tubular heart. This blood vessel is a collecting blood vessel behind 13th segment, it works as the distributing vessel. The blood flows in it from backward to forward.

295. The location of lymph glands in Pheretima is

(a) 4th 5th and 6th segments
(b) 10th to 20th segments
(c) 26th to the last segments
(d) 13th segments

AP EAMCET-2009

@apna_pdf

Ans. (c) : In Pheretima, lymph gland are present on both sides of dorsal blood vessel from segment 26th and those behind it.

296. Forests of nephridia are present in
(a) pharyngeal region
(b) clitellar region
(c) anal region
(d) None of the above

UP CPMT-2002

Ans. (b) : Nephridia lie scattered on the entire inner or Parietal surface of body wall in segment, except the first two . There are 200-250 nephridia in each segment but in the segments of clitellum (segments 14 to 16) their number increases to more than 2000 constituting the forests of nephridia.

297. Which process is related to the digestive tract of detrivores?
(a) Pulverisation (b) Osmosis
(c) Diffusion (d) Humification

UP CPMT-2013

Ans. (b) : Detrivores are the animals which feed on dead remains of plants and animals.
• The detrivores ingest dead organic compounds through their mouth, show intracellular digestion (breakdown of complex dead organic matter into the simpler forms inside the cell) and then excreted remain through the anus.

G. Cockroach

298. Which one of the following has an open circulatory system ?
(a) Pheretima (b) Periplaneta
(c) Hirudinaria (d) Octopus

AP EAMCET-25.09.2020 Shift-II
JCECE-2009, 2013
CMC Vellore-2012
CMC Ludhiana-2009, 2010
CG PMT-2007
JCECE-2009
AFMC-2008
Rajasthan PMT-2001

Ans. (b) : Periplaneta has an open type of circulataroy system in which blood or hemolymph, flows with in the body cavity or haemocoel.
• The members of phylum Annelida have closed circulatory system eg- Hirudinaria and Pheretima. Both annelids and show closed circulatory system and they are just like Octopus, which has a closed circulatory system belongs to the phylum Mollusca.

299. Heart of cockroach is
(a) 6 - chambered (b) 9 - chambered
(c) 29 - chambered (d) 13 - chambered

Tripura JEE-2022
TS EAMCET-12.05.2017
BCECE-2015
Manipal-2005, 2014
VMMC-2013
CMC Vellore-2009
Rajasthan PMT-2009
AFMC-2005

Ans. (d) : There are 13 chambers in the heart of Cockroaches. Heart of Cockroaches is multi chambered , tube-shaped. Each chamber receive oxygenated blood through a pair of aperture called Ostia.
• Cockroaches are pests that live in unsanitary and moist environments. They are dark brown in colour and belong to the arthropod phylum, Blattidae family and insect class.

300. Cockroach has 'superposition vision'. This type of vision has the following characteristic features 'EXCEPT'
(a) It generates a blurred image
(b) The ommatidium receives light not only through its own cornea but also from adjoining ommatidia
(c) It produces Mosaic Vision
(d) Superposition image is formed in the dim light and these images are formed in nocturnal insects

TS EAMCET-02.05.2018 Shift-I
J&K CET-2006
Punjab MET-2006
Rajasthan PMT-2002
NEET (Odisha)-2019
Rajasthan PMT-1999

Ans. (c) : Mosaic vision-cockroaches have eyes located on the dorsal surface of the head which are called compound eyes.
• Each eye has about 2000 hexagonal ommatidia with which they can receive multiple images of an object at once. This is called mosaic vision.

301. In cockroach, larval and nymphal characters are maintained by
(a) ecdysone (b) salivary glands
(c) parotid gland (d) juvenile hormone

VMMC-2012
UP CPMT-2008, 2012
UP CPMT-2012
JIPMER-2009
CG PMT-2008
Rajasthan PMT-2008

Ans. (d) : In cockroach larval and nymphal characters are maintained by juvenile hormone which is secreted by corpora allata (an endocrinel gland).
• The nymph of cockroach comes out from ootheca. A nymph resembles the adult in general structure but lacks the wings and mature reproductive organs.

302. Infant/Juvenile stage of Cockroach is called:
(a) Maggot (b) Nymph
(c) Zoea (d) Grub

VMMC-2014
UP CPMT-2013
JCECE-2012
Rajasthan PMT-2004, 1995

Ans. (b) : The life cycle of cockroaches is divided into three developmental stages, the egg, the young nymph and the adult cockroach. As the egg hatch, the young cockroaches known as nymph are developed.

@apna_pdf

303. **Assertion (A) : In cockroaches the sex of offspring depends on the fertilizing sperm.**
Reason (R) : Cockroach males are heterogametic with XO chromosomes
The correct option among the following is
(a) A and R are true. R is the correct explanation of A
(b) A and R are true, but R is not the correct explanation A
(c) A is true but R is false
(d) Both A and R are false

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : Assertion (A) is true. In cockroaches, the male has a single X chromosomes and no Y chromosomes while the female has two X chromosomes. So, the sex of the offspring depends on the fertilizing sperm. If the sperm carries an X chromosome, the offspring will be female. If the sperm does not carry an X chromosome, the offspring will be male.
Reason is also true. Cockroach males are heterogametic, meaning that they have different sex chromosomes. The female cockroach is homogametic meaning that she has two of the same sex chromosomes.

304. **Given below are two statements :**
Statement I : In cockroach, the forewings are transparent and prothoracic in origin.
Statement II : In cockroach, the hind wings are opaque, leathery and mesothoracic in origin.
In the light of the above statements, choose the correct answer from the options given below :
(a) Both Statement I and Statement II are true
(b) Both Statement I and Statement II are false
(c) Statement I is correct but Statement II is false
(d) Statement I is incorrect but Statement II is true

RE-NEET (UG)-06.06.2023 (Manipur)
Tripura JEE-2017

Ans. (b) : Both statement-I and statement-II are false because, in cockroach the first pair of wings arises from mesothorax and from prothorax. Moreover they are opaque, dark and leathery and not transparent as mentioned in statement-I.
Statement-II is also incorrect as the hind wings in cockroach are transparent, membranous and are metathoracic in origin.

305. **The Cockroach is :**
(a) Ureotelic only
(b) Ureotelic and Uricotelic
(c) Ammonotelic only
(d) Uricotelic only

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) : The cockroach is uricotelic because cockroach excretion is performed by malpighian tubules. Each tubule is lined by glandular and cilliated cells. They absorb nitrogenous waste products and convert them into uric acid which is excreted out through the hindgut.
■ Mammals, many terrestrial amphibians and marine fishes are ureotelic in nature.
■ Many bony fishes, aquatic insects are ammonotelic in nature.

306. **In cockroach, excretion is brought about by-**
A. Phallic gland
B. Urecose gland
C. Nephrocytes
D. Fat body
E. Collaterial glands
Choose the correct answer from the options given below:
(a) B and D only (b) A and E only
(c) A, B and E only (d) B, C and D only

NEET (UG) 07.05.2023

Ans. (d) : Malpighian tubules, uricose gland, fat body and nephrocytes are elements of the cockroach's excretory system that aid in the evacuation of nitrogenous waste as well as the formation of uric acid.
• Collateral glands found in female cockroach and aid in the secretion of the ootheca egg casing.
• Phallic gland is a part of the male reproductive gland. It is large club-shaped secretes the outer most layer.

307. **Which of the following is characteristic feature of cockroach regarding sexual dimorphism?**
(a) Presence of anal cerci
(b) Dark brown body colour and anal cerci
(c) Presence of anal styles
(d) Presence of sclerites

NEET (UG) 07.05.2023

Ans. (c) : Sexual dimorphism in cockroaches varies widely. In the cockroach, males and females have slightly different morphology, hence showing sexual dimorphism. Male cockroach bear a pair of short, thread like anal style which are absent in female.

308. **Match List - I with List - II regarding the organs of Cockroach:**

List-I		List-II	
A.	**Crop**	**i.**	**grinding the food particles**
B.	**Proventriculus**	**ii.**	**secretion of digestive juice**
C.	**Hepatic caecae**	**iii.**	**removal of nitrogenous waste**
D.	**Malpighian tubules**	**iv.**	**storage of food**

Choose the correct answer from the options given below:
(a) (A) - (iv), (B) - (i), (C) - (ii), (D) - (iii)
(b) (A) - (iii), (B) - (ii), (C) - (i), (D) - (iv)
(c) (A) - (ii), (B) - (iv), (C) - (i), (D) - (iii)
(d) (A) - (i), (B) - (iv), (C) - (iii), (D) - (ii)

NEET (Re-Exam)-04.09.2022

Ans. (a) :
Crop → Storage of food.
Proventriculus → Grinding the food particles.
Hepatic caecae → Secretion of digestive Juice.
Malpighian tubules → Removal of nitrogenous waste.

@apna_pdf

309. In cockroaches, digestive juice is secreted by the

(a) gizzard
(b) Malpighian tubules
(c) crop
(d) oesophagus
(e) hepatic caeca

NEET (Re-Exam)-04.09.2022
Kerala PMT-2012

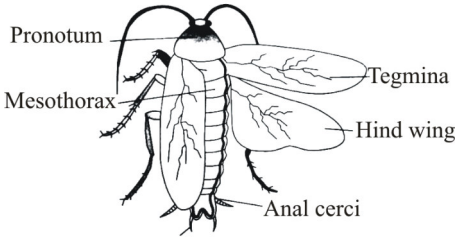
Ans. (e) : The hepatic caeca is located at the junction of the foregut and midgut of the cockroach and is composed of 6-8 thin, transparent cecal tubules. These tubules are arranged in rosettes. It helps in digestion by secreting digestive juices. It produces digestive enzymes.

310. Tegmina in cockroach, arises from

(a) Prothorax and Mesothorax
(b) Prothorax
(c) Mesothorax
(d) Metathorax

NEET-2022

Ans. (c) : Tegmina or forewings (The first pair of wings) in cockroach arises from mesothorax.
- No wing arises from prothorax. It lacks wings.
- Hind wings arises from meta thorax.



311. Number of rectal papillae present in cockroach

(a) Three (b) Six
(c) Nine pairs (d) Six pairs

TS EAMCET-09.08.2021 Shift-II

Ans. (b) : In cockroach, the inner walls of the rectums has six longitudinal chitinous folds, called '**Rectal papillae**'. They help in the reabsorption of water from the undigested food.

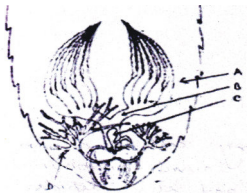
312. In corpora adipose of cockroach, function of oenocytes is

(a) Store food
(b) Contain Symbiotic bacteria
(c) Store lipids
(d) Store uric acid

TS EAMCET-09.08.2021 Shift-II

Ans. (c) : In corpora adipose of cockroach, function of oenocytes is store lipids. Oenocytes have been implicated in the regulation of energy metabolism.

313.



Observe the above diagram of female reproductive system of cockroach and identify A, B, C and D

	A	B	C	D
(a)	Oviduct	Ovariole	Gonapophysis	Spermathecae
(b)	Ovariole	Oviduct	Genital Pouch	Conglobate gland
(c)	Germanium	Vagina	Phalic gland	Utricular gland
(d)	Ovary	Oviduct	Spermathecae	Collaterial glands

TS EAMCET-09.08.2021 Shift-II

Ans. (d) : The female reproductive system of cockroach consist of two large ovaries. The ovaries lie laterally in the 2^{nd} - 6^{th} abdominal segments. Each ovary is formed of a group of eight ovarian tubules or ovarioles. They contain a chain of developing ova. Oviducts from each ovary unit into a single median oviduct (also called vagina) and it opens into the genital chamber. A pair of spermatheca is present in the 6^{th} segment which opens into the genital chamber.

314. In a certain taxon of insects (Example: Cockroach), some have 17 chromosomes and the others have 18 chromosomes. The 17 and 18 chromosomes bearing organisms are _____

(a) All males
(b) All females
(c) Males and females respectively
(d) Females and males respectively

AP EAMCET-06.09.2021 Shift-I

Ans. (c): In a certain taxon of insects (**e.g. - cockroach)** some have 17 chromosomes and the others have 18 chromosome. The 17 and 18 chromosome bearing organisms are males and females respectively. Because the sex determination in this taxon of insects is of male heterogamty with XO type. This means females have their eggs bearing an additional X chromosome besides autosomes.

315. The inner surface of labrum of cockroach bears_____

(a) Gustatory Sensillae
(b) Olfactory Sensillae
(c) Nasireceptor Sensillae
(d) Chemoreceptor Sensillae

AP EAMCET-06.09.2021 Shift-I

Ans. (a): The inner surface of labrum of cockroach bears gustatory sensillae. The labrum of partially or completely obscures the mandibles and helps hold food in a position when the insect feeds.

316. Study the following and pick up the correct statements

I. Contraction of the dorso longitudinal muscles elevate the wings in cockroach

II. Rectal papillae help in water conservation in cockroach

@apna_pdf

III. Second chamber of heart from the anterior part lies in metathorax of cockroach

IV. Inner cuticular lining of the trachea of cockroach is called intima

(a) I, II (b) II, IV
(c) III, IV (d) I, III

TS EAMCET-10.08.2021 Shift-I

Ans. (b) : Relaxation of dorso ventral muscle help in depressing the wing in cockroach during flight.

- Rectal papillae are 6 longitudinal folds found in inner wall of rectum these rectal papillae help in conservation of water in cockroach.
- Inner cuticular lining of trachea of cockroach called **intima**. Intima produce chitinous ring called **Taenidia**. Taenidia preserved the collapse of the trachea.

317. The following reaction takes place in this part of cockroach, Potassium urate $+CO_2 + H_2O \rightarrow KHCO_3 + H_2O$ + uric acid

(a) Rectum
(b) Hepatic caecae
(c) Malpighian tubules
(d) Haemocoel

TS EAMCET-10.08.2021 Shift-I

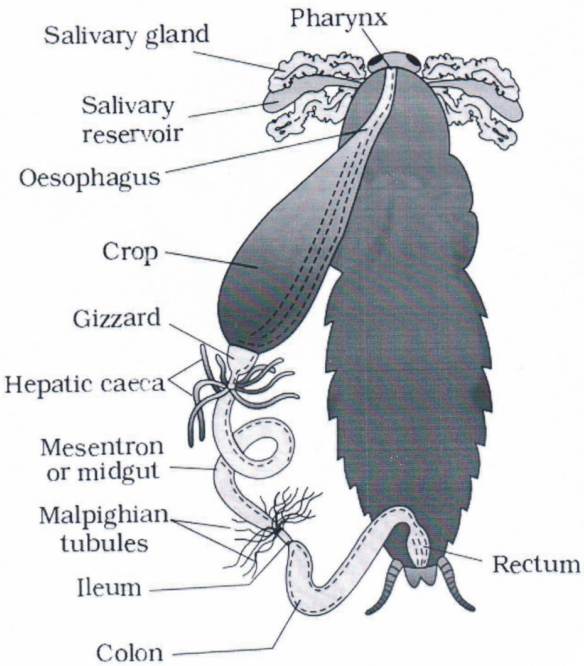
Ans. (c) : Malpighian tubules absorb nitrogenous waste product. Potassium urate ($KC_5H_3N_4O_3$) is nitrogenous compound. Potassium urate is absorbed and uric acid is released.

318. Study the following diagram and identify A, B, C and D

	A	B	C	D
(a)	Oesophagus	Malpighian tubules	Hepatic caecae	Ileum
(b)	Crop	Hepatic caecae	Malpighian tubules	Rectum
(c)	Stomach	Trachea	Malpighian tubules	Ileum
(d)	Gizzard	Malpighian tubules	Gastric caecae	Rectum

TS EAMCET-10.08.2021 Shift-I

Ans. (b) :



319. Anus in cockroach occurs on ————

(a) 9th sternum
(b) 10th sternum
(c) Dorsal surface of 10th tergum
(d) Ventral surface of 10th tergum

AP EAMCET-03.09.2021 Shift-I

Ans. (d) : In cockroach anus occurs on ventral surface of 10th tergum.The anus is the opening through which the gastrointestinal canal ends and exits outside the body.

320. What external changes are visible after the last moult of a cockroach nymph ————

(a) Labium develops
(b) Anal cerci develop
(c) Both fore wings and hind wings develop
(d) Hind wings develop

AP EAMCET-03.09.2021 Shift-I

Ans. (c) : The development of fore wings and hind wings are external changes that are visible after the last moult of a cockroach nymph. Cockroach undergoes paurometabolus development. Nymph undergoes moulting about 13 times to reach the adult form.

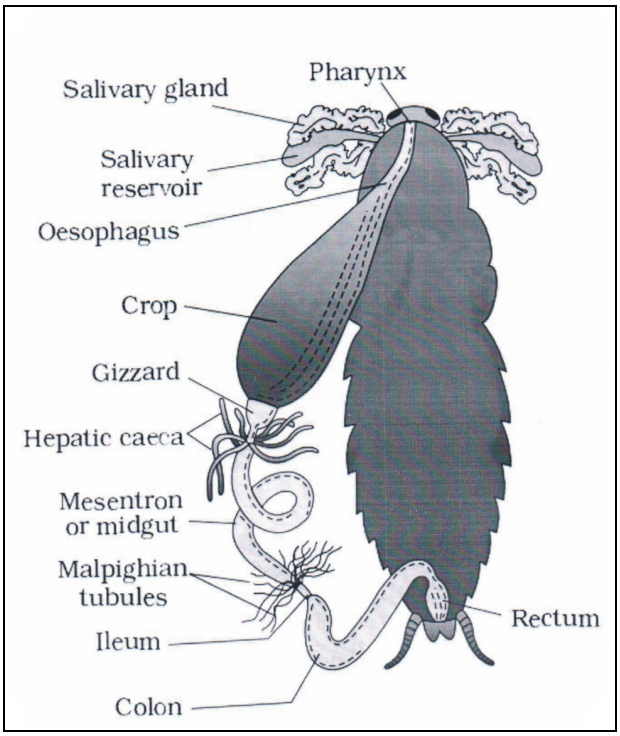
321. Digestion in Periplaneta begins in _____

(a) Pharynx (b) Pre oral cavity
(c) Crop (d) Midgut

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : The digestive system of Periplaneta consists of foregut, midgut and hindgut. Food is taken by mouth, it enter in pre oral cavity. From here it enters in the mouth and mixes with saliva and then enters in the crop.

@apna_pdf



322. Which of the following abdominal segment of cockroach is without a nerve ganglion?

(a) 1st segment (b) 2nd segment
(c) 5th segment (d) 7th segment

TS EAMCET-09.08.2021 Shift-I

Ans. (c) : 5th segment of cockroach is without a nerve ganglion nerve. Nerve ganglion occurs in 1-7 segments.

323. Stomodeal valve is formed from

(a) Crop (b) Mesenteron
(c) Gizzard (d) Ventriculus

TS EAMCET-09.08.2021 Shift-I

Ans. (c) : Stomodeal valve is formed from Gizzard. Gizzard of cockroach helps in the crushing of food and is considered to be a part of digestive system. The crop opens into a short, muscular organ called gizzard or proventriculus.

324. In cockroach, the ootheca are formed by secretion of _____

(a) Collateral gland (b) Mushroom gland
(c) Phallic gland (d) Conglobate gland

AP EAPCET-07.09.2021 Shift-I

Ans. (a) : : The collateral glands of the cockroach are the sexual accessory glands, present in 3rd and 4th abdominal segments of female cockroach and helps in secretion of egg case of Ootheca. Collateral glands are present in female cockroaches as part of the reproductive system.

325. In the given diagram ommatidium of cockroach. Identify the parts labelled 1, 2, 3, 4, 5, 6 and select the correct option?

Graph

(a) 1–Cone, 2–Corneagen cells, 3–Cornea, 4–Retinal pigmental sheath, 5–Rhabdome, 6–Nerve fibers
(b) 1–Cornea, 2–Corneagen cells, 3–Cone, 4–Retinal pigmental sheath, 5–Nerve fibers, 6–Rhabdome
(c) 1–Cornea, 2–Cone, 3–Corneagen cells 4–Retinal pigmental sheath, 5–Nerve fibers, 6–Rhabdome
(d) 1–Cornea, 2–Corneagen cells, 3– Cone, 4–Retinal pigmental sheath, 5– Rhabdome, 6–Never fibers

AP EAPCET-07.09.2021 Shift-I

Ans. (d) :
A- Cornea
B- Corneagen cell
C- Cone
D- Retinal pigmental sheath
E- Rhabdome
F- Never fibers

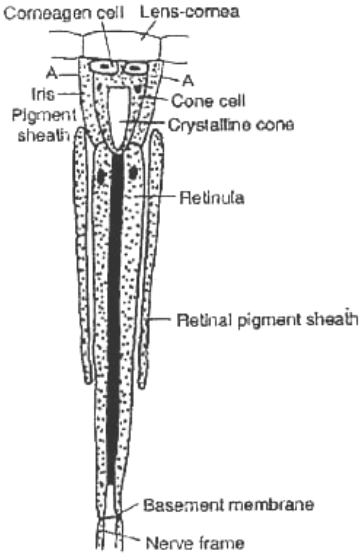


Fig. L.S. Ommatidium

326. How many Terga are visible in male cockroach

(a) 9 (b) 10
(c) 8 (d) 7

AP EAMCET-05.10.2021 Shift-I

Ans. (a) : The body of cockroach is covered by exoskeleton called sclerites . The sclerites on the dorsal surface is knowns as tergum or terga, sclerites on vertral side is sterum on stera and 2 lateral sclerites are pleurons on pleura. There are 10 tergal plates. The 8th tergum in the male and both 8th & 9th terga in the femare are not visible as they are overlapped by the 7th tergum.

• Nine terga are visible in male cockroach. Hence the correct answer is 'nine'.

327. True coelom of cockroach occurs ____

(a) Around gonads (b) Around heart
(c) In thorax (d) Below heart

AP EAMCET-05.10.2021 Shift-I

Ans. (a) : True coelom of cockroach occurs the gonads.

• Cockroach a schizocoelomates that is true coelomates, which is situated in the body cavity and helps in the food digestion properly.

@apna_pdf

328. Which of the following characteristics is incorrect with respect to cockroach?

(a) 10^{th} abdominal segment in both sexes, bears a pair of anal cerci

(b) A ring of gastric caecae is present at the junction of midgut and hind gut

(c) Hypopharynx lies within the cavity enclosed by the mouth parts

(d) In females, 7^{th}-9^{th} sterna together form a genital pouch

NEET-2021

Ans. (b) : Point (b) is incorrect because gastric or hepatic caeca are present at the junction of the foregut and midgut. They are ring-shaped 6 to 8 blind tubules, which releases digestive juice.

- Hypopharynx lies within the cavity enclosed by mouth parts.
- In female Cockroach, the 7^{th} sternum is boat shaped and together with the 8^{th} and 9^{th} sterna forms a genital pouch.
- 10^{th} abdominal segment in both sexes, bears a pair of anal Cerci and 9^{th} sternum only in male Cockroach, bears a pair of Chitinous anal style.

329. Efferent salivary ducts in Periplaneta open into

(a) stomach (b) base of pharynx

(c) base of hypopharynx (d) base of oesophagus

TS EAMCET-28.09.2020 Shift-II

AP EAMCET-2007

Ans. (c) : The efferent salivary duct opens at the base of the hypopharynx, which is situated on the floor of the buccal cavity. The gland secrete digestive enzymes which are stored in reservoir till they are required for digestion of food.

330. Match the following:

	Column – I		Column – II
a.	Testis in males	p.	$4^{th} – 6^{th}$ abdominal segments
b.	Mushroom shaped gland	q.	$6^{th} – 7^{th}$ abdominal segments
c.	Ovaries in females	r.	$2^{nd} – 6^{th}$ abdominal segments
d.	Anal cerci	s.	10^{th} segment

(a) (a – p), (b – r), (c – q), (d – s)

(b) (a – q), (b – p), (c – r), (d – s)

(c) (a – p), (b – q), (c – r), (d – s)

(d) (a – s), (b – q), (c – r), (d – p)

AP EAMCET-24.09.2020 Shift-I

Ans. (c) : Testis in males – 4^{th}-6^{th} abdominal segments
Mushroom shaped gland – 6^{th}-7^{th} abdominal segments
Ovaries in females – 2^{nd} - 6^{th} abdominal segments
Anal cerci – 10^{th} segment

331. Match the following related to cockroach

	List-I		List-II
A.	Pronotum	I.	Nervures
B.	Tarsus	II.	Intima
C.	Wings	III.	Tergum of thorax
D.	Trachea	IV.	Ligula
		V.	Plantulae

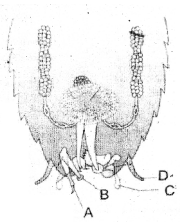
The correct match is:

	A	B	C	D
(a)	III	IV	I	II
(b)	III	V	I	II
(c)	II	I	V	III
(d)	IV	I	II	III

TS EAMCET-28.09.2020 Shift-II

Ans. (b) : Pronotum → Tergum of thorax
Tarsus → Plantulae
Wings → Nervures
Trachea → Intima

332.



Find out the pseudopenis in the above diagram

(a) A (b) B

(c) C (d) D

TS EAMCET-28.09.2020 Shift-II

Ans. (b) : A pseudopenis is any structure found on an animal that while superficially appearing to be a penis, is derived from a different developmental path. A pseudo penis is present in left phallomere which help in copulation.

- On the left side of titilator, there is a shorter and broader arm ending in a black hammer-like head called pseudopenis.

333. Match the following :

Cells of corpora adiposa of cockroach	Function
(A) Trophocytes	I. Symbiotic bacteria
(B) Mycetocytes	II. Store uric acid
(C) Oenocytes	III. Intra cellular digestion
(D) Urate cells	IV. Secrete lipids
	V. Store food

The correct match is

Options:

	A	B	C	D
(a)	V	III	IV	II
(b)	IV	III	II	I
(c)	V	I	IV	II
(d)	II	IV	I	V

TS EAMCET-15.05.2016

TS EAMCET-28.09.2020 Shift-I

@apna_pdf

Ans. (c) : Trophocytes → Store food
Mycetocytes → Symbiotic bacteria
Oenocytes → Secrete lipids
Urate cells → Store uric acid

334. In cockroch, ootheca around the eggs is secreted by
(a) Utricular majors (b) Phalic gland
(c) Collaterial glands (d) Utricular breviores

TS EAMCET-28.09.2020 Shift-I

Ans. (c) : The ootheca is formed when collateral glands secrete onto the inner surface of the vestibulum.
• Phallic glands, utricular majors and utricular breviores are present in male reproductive system.

335. Triangular joint in the leg of Periplaneta is
(a) Coxa (b) Trochanter
(c) Tibia (d) Tarsus

TS EAMCET-28.09.2020 Shift-I

Ans. (b) : The parts of the legs of a cockroach are the coxa, trochanter, femur, tibia and then the tarsus. The coxa is the upper part of the leg. The coxa region helps to connect the leg to the thoracic region of the body.
• Then comes the trochanter which acts as the knee of the cockroach.
• Femur is the largest region of the leg. Tibia of an insect is slender in comparison to the femur but is generally longer than femur.

336. Observe the following diagram of labium of cockroach and pick up the correct set of labelling:

	I	II	III	IV
(a)	Paraglossa	Labial palp	Sub mentum	Mentum
(b)	Glossa	Maxillary palp	Mentum	Pre mentum
(c)	Pre mentum	Antenna	Sub mentum	Mentum
(d)	Galea	Lacinia	Stipes	Cardo

TS EAMCET-29.09.2020 Shift-I

Ans. (a) : Paraglossa → Labial palp → Sub mentum → Mentum

337. Choose the correct option regarding the following statements
Statement 1-Both males and females bear a pair of short, thread like anal styles
Statement 2- Only in males 10th segment bears a pair of jointed filamentous structures called anal cerci.
(a) Both statements are correct
(b) Only statement 1 is correct
(c) Only statement 2 is correct
(d) Both are wrong

AP EAMCET-24.09.2020 Shift-II

Ans. (d) : Male cockroach has a pair of short, thread-like anal styles arising from the 9th abdominal segment that are absent in females.
• The 10th segment bears a pair of jointed filamentous structures called anal cerci in both the sexes.

338. Arthrodial membrane in cockroach_____
(a) Connect thorax with abdomen
(b) Joins sclerites together
(c) Found on compound eye
(d) Helps to walk on smooth surface

AP EAMCET-24.09.2020 Shift-II

Ans. (b) : In cockroaches exoskeleton of each segment consist of four chitinous plates called sclerites, the adjacent sclerites are joined together by thin, soft arthrodial membrane to allow free movement.

339. Identify the incorrect statement about morphology of cockroach.
(1) Head is formed by the fusion of six segments
(2) A pair of thread like antennae arises from membranous sockets lying in front of eyes
(3) Tegmina are opaque dark and leathery and cover the hind wings, also helps in flight
(4) In females, the 7th sternum is boat shaped and together with the 8th and 9th sterna form a brood pouch
(a) 1 (b) 2
(c) 3 (d) 4

AP EAMCET-25.09.2020 Shift-I

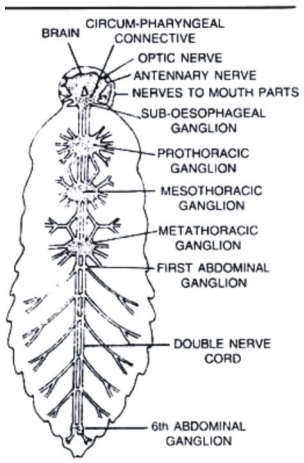
Ans. (c) : In the case of cockroaches, the fore wings (mesothoracic) are not used for flight as they are thick, opaque and leathery, they only cover and protect the hind wings. They are also called tegmina.
• A pair of antennae is present in cockroaches. These arise from membranous sockets lying in front of eyes.
•Each antenna is made up of segments called podomeres.
• Brood or genital pouch contains female gonopore, spermathecal pores and collaterial glands.

340. If the head of cockroach is removed, it may live for few days because
(a) the cockroach does not have nervous system.
(b) the head holds a small proportion of a nervous system while the rest is situated along the ventral part of its body.
(c) the head holds a 1/3rd of a nervous system while the rest is situated along the dorsal part of its body
(d) the supra-oesophageal ganglia of the cockroach are situated in ventral part of abdomen.

NEET-2020 Phase-I

Ans. (b) : If the head of cockroach is cut off, it will still be alive for as long as one week, because the head holds a bit of a nervous system while the rest is situated along to ventral part of the body.
• This is the reason Cockroach may live for few days even after removal of the head from the body.

@apna_pdf



Nervous system of cockroach

341. In cockroach, identify the parts of the foregut in correct sequence:

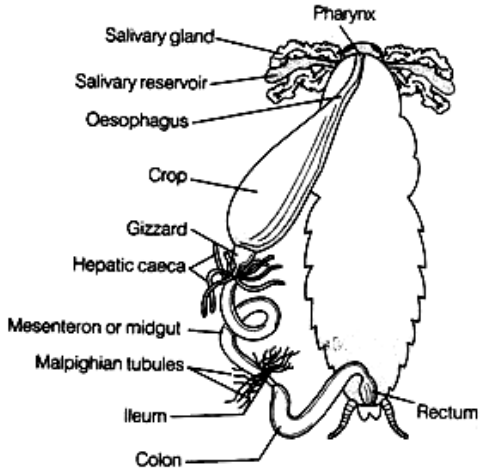
(a) Mouth → Pharynx → Oesophagus → Crop Gizzard
(b) Mouth → Oesophagus → Pharynx → Crop Gizzard
(c) Mouth → Crop → Pharynx → Oesophagus → Gizzard
(d) Mouth → Gizzard → Crop → Pharynx → Oesophagus

NEET-2020 Phase-II
NEET-2019

Ans. (a) The parts of the foregut in correct sequence is given below-

Mouth → pharynx → Oesophagus → crop → Girrard

- The alimentary canal of the cockroach is divided into three regions: foregut, midgut and hindgut.
- The foregut is start with the mouth. The food particle is ingested through the mouth, which leads to the pharynx, a small tube - like structure. It connects to another tube -like structure called the oesophagus.
- This leads to a large sac-like structure known as a crop (Here, the food is stored prior to digestion). A small cup-like structure beneath the crop is known as the gizzard.



Alimentary canal of cockroach

342. Match the following columns with reference to cockroach and select the correct option:

	Column – I		Column – II
A.	Grinding of the food particles	i.	Hepatic caecal
B.	Secrete gastric Juice	ii.	10^{th} segment
C.	10 pairs	iii.	Proventriculus
D.	Anal Cerci	iv.	Spiracles
		v.	Alary muscles

(a) (A)-(ii), (B)-(iii), (C)-(i), (D)-(iv)
(b) (A)-(iii), (B)-(i), (C)-(iv), (D)-(ii)
(c) (A)-(iv), (B)-(iii), (C)-(v), (D)-(ii)
(d) (A)-(i), (B)-(iv), (C)-(iii), (D)-(ii)

NEET-2020 Phase-II

Ans. (b) :

(A)	Grinding of the food particles	(iii)	Proventriculus
(B)	Secrete gastric Juice	(i)	Hepatic caeca
(C)	10 pairs	(iv)	Spiracles
(D)	Anal cerci	(ii)	10^{th} segment

343. Alary muscle is associated with

(a) heart and circulation
(b) Malpighian tubules and excretion
(c) trachea and respiration
(d) None of the above

TS EAMCET-08.05.2019 Shift-I
TS EAMCET-02.05.2018 Shift-II
UP CPMT-2002

Ans. (a) : Alary muscle is associaated with heart and circulation or pericardial sinus of the cockroach. The alary muscels are 12 pairs in number. It helps in the alternate conteractin and relaxation of the heart.

344. Which of the following statements are true with respect to the circulatory system of *Periplaneta americana*?

A. Heart consists of 13 chambers
B. Haemolymph brings oxygen from….. and tracheae and supplies to different organs.
C. Contraction of heart chambers causes the blood to flow into aorta and from there in to sinus' of head
D. Alary muscles facilitate the flow of blood through the heart.

(a) A & B (b) A & C
(c) B & D (d) B & C

TS EAMCET-09.05.2019 Shift-I

Ans. (b) : A cockroach has an open circulatory system and the heart is an elongated muscular tube which consist of 13 segments. The heart receives oxygenated blood from the dorsal sinus through ostia. The alary muscles hold the heart in position. Presence of aorta and veins is not seen in circulatory system of cockroach.

345. The cells of fat body of cockroach which contain symbiotic bacteria are

(a) Mycetocytes (b) Trophocytes
(c) Oenocytes (d) Urate cells

TS EAMCET-08.05.2019 Shift-II

@apna_pdf

Ans. (a) : The cells of the cockroach's fat body that contain the symbiotic bacteria are mycetocytes.
• Mycetocytes harboring an endosymbiont species of bacteria and urocytes depositing uric acid in urate vacuoles.

346. Identify the correct sequence of flow of circulation of blood in *Periplaneta americana*

(a) Heart → head sinus → aorta→ pericardial haemocoel → perivisceral haemocoel and sternal haemocoel
(b) Heart → pericardial haemocoel → aorta→ perivisceral haemocoel and sternal haemocoel → head sinus
(c) Heart → aorta→ head sinus → perivisceral haemocoel and sternal haemocoel → pericardial haemocoel
(d) Heart → pericardial haemocoel and sternal haemocoel → pericardial haemocoel → aorta→ head sinus

TS EAMCET-08.05.2019 Shift-II

Ans. (c) : The correct option is 'c'.
Heart → Aorta → head sinus → perivisceral haemocoel and sterna haemocoel → pericardial haemocoel.

347. Thermoreceptor sensillae of cockroach are present on

(a) Maxillary palps (b) Antennae
(c) Tarsi of legs (d) Labial palps

TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Cockroach's thermoreceptor sensilla are present on the tarsus of the legs. Thermoreceptor sensilla of cockroach are located in the 1^{st}, 2^{2nd}, 3^{rd} segment of the tarsus of legs of cockroach.

348. In cockroach, thermo receptor sensillae are present on

(a) Maxillary palps, labial palps and antennae
(b) Labrum, maxillary and labial palps
(c) First three segments of the tarsus of legs
(d) Anal cerci

AP EAMCET-24.04.2019 Shift-I

Ans. (c) : Cockroaches are cursorial and nocturnal.
• They have 3 pairs of legs. Thermoreceptor sensilla of cockroach are located in the 1^{st}, 2^{nd}, 3^{rd} segment of the tarsus of legs of cockroach.

349. Match the following

List-I		List-II	
A.	**Urate cells**	**I.**	**Discharge uric acid during copulation**
B.	**Utriculi majors**	**II.**	**Nourishes the sperms**
C.	**Utriculi breviores**	**III.**	**Storage excretion**
D.	**Phallomeres**	**IV.**	**Nitrogenous waste eliminated during moulting**
		V.	**Helps in copulation**

The correct answer is

Options :

	A	B	C	D
(a)	III	I	IV	II
(b)	III	I	II	V
(c)	I	IV	II	V
(d)	I	II	III	IV

AP EAMCET-24.04.2019 Shift-I
AP EAMCET-2014

Ans. (b) :
Urate cells → Storage excretion
Utriculi majors→ Discharge uric acid during copulation
Utriculi breviores→ Nourishe the sperms
Phallomeres→ Helps in copulation

350. Match the following which are related to cockroach

List-I	List-II
(A) Adductor muscles	**(i) Depression of wings**
(B) Dorsal longitudinal museles	**(ii) Respiration**
(C) Alary muscles	**(iii) Mandibles**
(D) Dorsoventral Muscles	**(iv) Excretion**
	(v) Blood circulation

The correct answer is

Options:

	A	B	C	D
(a)	III	II	V	I
(b)	I	III	V	II
(c)	III	I	V	II
(d)	IV	I	III	II

AP EAMCET-24.04.2019 Shift-II

Ans. (c) : Adductor muscles → Mandibles
Dorsal longitudinal muscles → Depression of wings
Alary muscles → Blood circulation
Dorsoventral muscles → Respiration

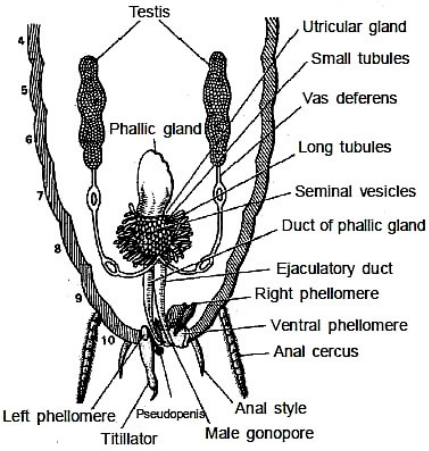
351. In cockroach:

(a) Ejaculatory duct opens in phallic gland
(b) Phallic gland stores sperms
(c) Vas deferens opens in phallic gland
(d) Phallic gland opens in left phallomere

AIIMS-26.05.2019 Shift-I

Ans. (d) : A phallic or the conglobate gland is associated with the male reproductive system of the Periplaneta (Cockroach). The duct of this gland opens near the gonopore. Its function is still not known. It is a large elongate sac-like structure that lies beneath the mushroom-shape gland and ejaculatory duct. Phallic gland opens in the left phallomere.

@apna_pdf



352. Choose the correct statement for Periplaneta americana

(a) It has 6 muscular hearts
(b) It has 10 thoracic segments
(c) Anal style is present in both male and female
(d) It is nocturnal and present in damp places

AIIMS-25.05.2019 Shift-I
AIPMT-1992

Ans. (d) : It is nocturnal and present in damp places is the correct statements for periplaneta americana. The cockroach has a single heart which consists of an elongated muscular tube lying along mid dorsal line of its thorax and abdomen.

- It has 3 thoracic segments namely prothorax, mesothroax and metathorax.
- Only males bear a pair of short, thread like anal styles.
- They are nocturnal omnivores which are mostly found in damp places.

353. The sense organs present on proximal parts of tibia in Cockroach are sensitive to

(a) Sound vibrations
(b) Taste
(c) Movement of flagellae of antennae
(d) Ground vibrations

AP EAMCET-25.04.2018 Shift-II

Ans. (d) : The sense organ present on proximal parts of tibia in Cockroach are sensitive to ground vibrations.

- These sense organs are anal cerci. They are present at the end of abdomen arising from the 10^{th} segment of the Cockroach's body.

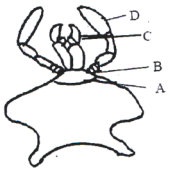
354. Statement (S) : The corpora adiposa cells perform 'storage excretion' in *Periplaneta americana*
Reason (R) : The fat body contains urate cells which absorb and store uric acid and it is the major excretory organ
Which of the following is true?

(a) Both (S) and (R)are true and (R) is the correct explanation of (S)
(b) Both (S) and (R) are true, but (R) is not the correct explanation of (S)
(c) (S) is true, but (R) is false
(d) (S) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-II

Ans. (a) : Fat body is a lobed white structures. Urate cells present in these bodies are associated with excretion. These cells absorb and store uric acid throughout the life. This is called storage excretion as they remain stored in the cells of the corpora adipose.

355. The following schematic diagram represents the labium in the mouth parts of cockroach. Identify A, B, C and D.



(a) A-Submentum, B-Glossa, C-Labial palp, D-Palpiger
(b) A-Labrum, B-Palpiger, C-Glossa, D-Labial palp
(c) A-Palpiger, B-Glossa, C-Mentum, D-Labial palp
(d) A-Mentum, B-Palpiger, C-Glossa, D-Labial palp

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : Labium of cockroach represents the lower lip and covers the mouth from ventral side.It is made of two basal chitinous plates, mentum and sub-mentum.

- The meaning of Palpiger is the portion of the labium of an insect that bears the palpi.
- Glossa in cockroach is the part of labium.
- Labial palp:- It is formed by the fusion of second pair of maxillae.

356. In cockroach, if the sub-oesophageal ganglion is damaged, which part of the cockroach is affected

(a) Abdomen
(b) Ommatidia
(c) Wings and legs
(d) Reproductive organs

TS EAMCET-02.05.2018 Shift-I

Ans. (c) : The sub-oesophageal ganglion is the major motor center and controls the movements of the muscles, mouth parts, wings and legs. A double nerve cord arises from the sub-oesophageal ganglion that travels down the posterior and of the body through the thorax and abdomen.

357. Identify the correct statement with reference to the nervous system of the cockroach.

(p) The nervous system of cockroach is called as Autonomous nervous system.
(q) There are 3 thoracic and 6 abdominal ganglion
(r) Sub-oesophageal ganglion controls the movements of mouth parts
(s) The 6^{th} abdominal ganglion innervates the 6^{th} abdominal segment
The correct answer is

(a) p, s & r (b) p, q & r
(c) q, r & s (d) s & q

TS EAMCET-02.05.2018 Shift-I

@apna_pdf

Ans. (b) : The nervous system of the cockroach consists of a series of fused, segmented ganglia that connect to paired longitudinal connectives on ventral side. Three ganglia are located in the thorax and six in the abdomen.

- The sub-oesophageal ganglion is the principal motor centre and controls the movement of muscles, mouth parts, wing and legs.
- From the 6th abdominal ganglion 3 pairs of nerves are given off to supply the 7th, 8th and 9th segment. It is also gives a branch to innervate the circus and other associated structures.

358. Cockroach is a cursorial insect and runs on the smooth surfaces using 'A' and runs on the rough surfaces using 'B' parts of the body. What are 'A' and 'B'

(a) A- Claws and arolium: B- plantulae
(b) A- Plantulae : B- Claws and arolium
(c) A- Pivot : B- Cibarium
(d) A and B- claws only

TS EAMCET-03.05.2018 Shift-I

Ans. (b) : The arolium is attached to the claws and moves with them, but the mechanical design of the pretarsus still allows some independent control of claw and arolium use depending on surface roughness.

359. The following are the joints of each leg of a Cockroach

(I) Tibia
(II) Coxa
(III) Tarsus
(IV) Femur
(V) Trochanter

Arrange them in correct sequence from thorax to tip

(a) II, I, III, IV, V
(b) II, V, IV I, III
(c) III, I, IV, V II
(d) V, IV, III, II, I

AP EAMCET-25.04.2018 Shift-I

Ans. (b) : Each leg is composed of five types of segments. The five types of segments are as follows-
(I). Coxa- It is a upper portion of the leg and attaches the leg to the thorax.
(II). Trochanter- It is the smallest segment of leg and act like knee.
(III). Femur- It is regarded as the thigh region of the leg of the cockroach.
(IV) Tibia- It resembles the shin bone as present in human leg and it is longest segment of the leg of cockroach.
(V) Tarsus- It acts like the ankle and foot of the cockroach.

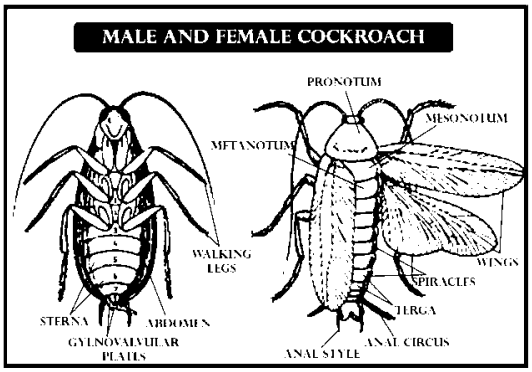
360. Which of the following features is used to identify a male cockroach from a female cockroach?

(a) Presence of a boat shaped sternum on the 9th abdominal segment
(b) Presence of caudal styles
(c) Presence of anal cerci
(d) Forewings with darker tegmina

NEET-2018

Ans. (b) : In male cockroach, the 9th segment bear a pair short, small, spine like unjointed caudal or anal style which are absent in female cockroach.

- The body of male cockroach is smaller while the body of female cockroach is relatively larger.
- The abdomen of male cockroach is slender, where as abdomen of female cockroach boat shaped.
- Antennae of male cockroach are smaller than female. Wing of male cockroach are larger where as the wings of female cockroaches are smaller.



361. In female cockroach, each ovary consists of

(a) 4 ovarioles (b) 6 ovarioles
(c) 8 ovarioles (d) 10 ovarioles

Tripura JEE-2017

Ans. (c) : The female reproductive system of cockroaches consists of two large ovaries, lying laterally in the 2-6 abdominal segments. Each ovary is made up of a cluster of eight ovarian ducts, or ovules, which contain a series of developing ovules, so there are a total of 16 ovules.

362. In female cockroach, each ovary consists of

(a) 4 ovarioles (b) 6 ovarioles
(c) 8 ovarioles (d) 10 ovarioles

Tripura JEE-2017

Ans. (c) : In female cockroach, each ovary consists of 8 ovarioles. The body of cockroach has three segments, head, thorax and abdomen. The female reproductive system consists of two large ovaries and laying laterally in the 2nd - 6th abdominal segments.

363. Statement (S) : In *Periplaneta americana* opening and closing of stigmata is influenced by CO_2 tension in haemolymph and oxygen tension in the tracheae.

Reason (R) : The air enters into tracheoles and oxygen from the air is taken into the cells and CO_2 is released into haemolymph.

(a) Both (S) and (R) are correct and (R) is the correct explanation to (S)
(b) Both (S) and (R) are correct but (R) is not the correct explanation to (S)
(c) (S) is correct but (R)is not correct
(d) (R) is correct but (S) is not correct

TS EAMCET-12.05.2017

@apna_pdf

Ans. (a) : Air enters the system through spiracles during inspiration and comes to the trachea, then it comes to the tracheoles which contain fluids , the O_2 gets dissolved in these fluids and reaches the tissue cells. CO_2 also dissolve in hemolymph and reach the body surface which is permeable to gases and allows CO_2 to pass out.

364. Which of the following cells of cockroach secrete saliva

(a) Glandular cells of mesenteron
(b) Acinar cells
(c) Stomodaeum cells
(d) Proctodaeum cells

TS EAMCET-12.05.2017

Ans. (b) : Acinar cells of cockroach secrete saliva. It consists of water, mucus, electrolytes, and enzymes like amylase. Mesenteron is the main site of enzyme production, digestion and absorption.

365. Study the following with reference to reproductive system of Periplaneta

(I) Testes are located in 2-6 abdominal segments.
(II) Secretion of utriculi breviores forms the inner of spermatophore.
(III) In total a pair of ovaries consists of eight ovarioles.
(IV) A pair of branched colleterial glands is present behind the ovaries.

Indentify the incorrect statements :

Options:

(a) II, III, IV
(b) I, III, IV
(c) I, II, IV
(d) I, II, III

AP EAMCET-28.04.2017 Shift-II

Ans. (d) : The reproductive system of a male cockroach consists of testes vas deferens, ejaculatory duct, utricular gland and sex gland. Testes are located in 4^{th}-6^{th} abdominal segments. The reproductive system of a female cockroaches consist of ovaries, genital chambers, vagina, collaterial glands, external genitalia and oviducts. Each ovary is formed of a group of eight ovarian tubules or ovarioles.

• Secretion of utriculi breviores nourishes the sperms and the secretion of utriculi majors forms the inner of spermatophores.

366. Identify the Incorrect statement regarding cockroach

(a) The claws and the arolium help in locomotion on rough surfaces
(b) Plantulae are useful in locomotion on smooth surfaces which are located on tibia of legs.
(c) Mycetocytes contain symbiotic bacteria
(d) Stomodeal valve secretes peritrophic membrane

AP EAMCET-28.04.2017 Shift-I

Ans. (b) The claws and the arolium help in locomotion on rough surface while the plantulae help in locomotion on smooth surface. The distal part of tarsus generally bears the claw and is known as pretarsus. On the underside of the tarsal segments in the region of pretarsus, the plantulae is present.

367. The number of abdominal segments in male and female cockroach is

(a) 10, 10 (b) 9, 10
(c) 10, 11 (d) 8, 10
(e) 9, 9

Kerala PMT-2008

Ans. (a) : The body of the cockroach is segment and divisible The back part of the body is called abdomen. The abdomen of an adult cockroach has 10 segments (male and female) while an embryo has 11 segments. In both sexes the 10^{th} segments bears a pair of small, filamentous and sensory anal cerci.

368. In Periplaneta, ductus ejaculatorius of male reproductive system lies in

(a) 6^{th} segment (b) 7^{th} segment
(c) 8^{th} segment (d) 5^{th} segment

AP EAMCET-2014

Ans. (b) : In periplaneta, ductus ejaculatorius of male reproductive system lies in 7^{th} segment and cockroaches are bisexual (monoecious) animals. The male reproductive system consists of a pair of testes, vas deferens, ejaculatory duct, utricular gland and sex gland.

369. Assertion: The development in cockroach is heterometabolous metamorphosis.

Reason: The young ones resemble the adults in all.

(a) If both Assertion and Reason are true and the Reason is a correct explanation of the Assertion
(b) If both Assertion and Reason are true but Reason is not a correct explanation of the Assertion
(c) If Assertion is true but the Reason is false
(d) If both Assertion and Reason are false.

AIIMS-1995

Ans. (c) : The development in cockroaches is heterometabolous metamorphosis. It also called gradual metamorphosis or holometaboly. Paurometabolous is the type of growth that occurs in insects such as cockroaches, which includes just three stages, i.e. egg nymph, and adult. It is called incomplete metamorphosis or parurometabolous since it lacks the pupa stage.

• The young ones resembles the adults in all reason is totally wrong, because the young insect is called the imago. It is not the same as the adult in all characters.

371. Blatta orientalis can be distinguished from periplaneta americana in that the female of Blatta is with

(a) smaller wings (b) vestigeal wings
(c) large wings (d) large eyes

AIIMS-1998

@apna_pdf

Ans. (b) : It differs from blatta in having a wider body and wings in both sexes and they can fly. Both Periplaneta Americana and Blatta orientalis are feathers of the genus. In these sections, feathers are either developed or inconspicuous. Hence, they differ in the absence of the development of a single pair.

371. The body cells in cockroach discharge their nitrogenous waste in the haemolymph mainly in the form of :
(a) Calcium carbonate
(b) Ammonia
(c) Potassium urate
(d) Urea

AIPMT (Re-Exam)-2015

Ans. (c) : The nitrogenous waste or excretory product in insects is **potassium urate**.
• It is released into the haemolymph and taken up by the cell lining malpighian tubules.
• This facilitate the absorption of urate crystals by reacting with water and carbon dioxide to form potassium, hydrogen, carbonate and uric acid.
• The former is absorbed back into the blood, while the latter it excreted out of the body in the form of crystals after water is reabsorbed completely in the rectum.
• Uric acid is least toxic and requires less water. Hence, insects, birds are uricotelic in nature.
• Urea is intermediate form, requiring optimal water for removal most mammals including human are uricotelic.

372. Two common characters found in centipede, cockroach, and crab are-
(a) Compound eyes and anal cerci
(b) Jointed legs and chitinous exoskeleton
(c) Green gland and tracheae
(d) Book lungs and antennae

AIPMT-2006

Ans. (b) : Centipede, Cockroach and crab, all belong to phylum Arthropod which are characterized by joined legs and chitinous exoskeleton. Arthropods have bilaterally symmetrical and metamerically segmented body with haemocoel and open blood vascular system.

373. Ommatidia serve the purpose of photoreception in: -
(a) Cockroach (b) Frog
(c) Humans (d) Sunflower

AIPMT-2003

Ans. (a): Ommatidia serve the purpose of photoreception in cockroach. The compound eyes of arthropods like insects, crustaceans and millipedes are composed of units called as ommatidia. An ommatidium contains a cluster of photoreceptor cells surrounded by support cells and pigments cells.
• Cockroaches have mosaic vision due to the presence of ommatidia.

374. What is not a common feature is Periplaneta and Scorpions?
(a) Excretory organs are malpighian tubules
(b) No appendages in abdomen
(c) Respiratory organs are trachea
(d) Both are mostly terrestrial arthropods

AIIMS-2014

Ans. (c) : Periplaneta or cockroaches and scorpions are of the kingdom animal and phylum arthropoda. They have many similar characteristics. The excretory organs in both are the malpighian tubules.
• Spiracles are the small openings present along the edges of the abdomen of periplaneta, through which respiratory gases are carried and from tissues via small tubes called **tracheae**. Series of vascular thin plates called a **book lungs** to serve as a respiratory organ in Scorpion.

375. Tracheae of cockroach and mammal are similar in having
(a) paired nature
(b) noncollapsible walls
(c) ciliate inner lining
(d) origin from head

AIPMT-1993

Ans. (b) : Tracheae are known to balance the pressure inside the system. It is a dense array of a network of air tubes found in the internal system. This network of transverse and longitudinal trachea equalizes pressure throughout the system and is noncollapsible wall.

376. Periplaneta has no respiratory pigment in its blood because
(a) air is conducted directly to body tissues
(b) it has haemocoelom
(c) it has anaerobic respiration
(d) it lacks blood cell in blood

Punjab MET-2006

Ans. (a) : Periplaneta has no respiratory pigment in its blood because air is conducted directly to body tissues.
•The blood (hemolymph) of cockroaches is colourless because there is no respiratory pigment in their blood. Plasma and many blood corpuscles make up the hemolymph (hemocyte).

377. The dorsal plate of skeleton found on the abdomen of cockroach is called
(a) pleuron (b) sternum
(c) tergum (d) vertex

Punjab MET-2007

Ans. (c) : The segments on the dorsal side are called tergum and those on the ventral side are called sternum.
• Cockroaches have three pairs of jointed appendages and two pairs of wings.

378. The correct arrangement of leg parts of cockroach is
(a) coxa, femur, trochanter, tibia and claws
(b) coxa, trochanter, femur, tibia, tarsus and claws
(c) coxa, tibia, femur, plantulae and claws
(d) none of the above

Punjab MET-2007

Ans. (b) : Each leg of the cockroach is consists of five parts. These parts are as follows-
• A five-jointed tarsus ending in a pair of curved claws.
• A stout and flat coxa
• An elongated femur
• A slender tibia, and
• A small trochanter

@apna_pdf

379. Study the following statements with reference to nervous system in Periplanata

(I) The brain is mainly a sensory and an endocrine center

(II) All thoracic ganglia supply nerves to the parts of their respective segments only

(III) Sixth abdominal ganglion is the largest of all the abdominal ganglia

(IV) Frontal ganglion is connected to the ingluvial ganglion by a recurrent nerve

From the above identify the correct statements

(a) II, IV (b) II, III
(c) I, III (d) I, IV

AP EAMCET-2016

Ans. (d) : In a cockroach, the brain is represented by a supra-oesophageal ganglion which supplies nerves to the maxillary and labial palps.

• The ganglion in 7^{th} abdominal segment is the largest of all the abdominal ganglia and probably formed by the fusion of 3 pairs of ganglia.

380. In the female cockroach the anterior wall, roof and floor of genital pouch are formed respectively by the following abdominal sterna of

(a) 7^{th}, 8^{th} and 9^{th} segments
(b) 8^{th}, 7^{th} and 9^{th} segments
(c) 9^{th}, 8^{th} and 7^{th} segments
(d) 8^{th}, 9^{th} and 7^{th} segments

AP EAMCET-2016

Ans. (a) : In females, the 7^{th} sternum is boat shaped and joins with the 8^{th} and 9^{th} sternum to form a brood or genital pouch, anteriorly containing the female gonopore, spermathecal pore and collateral glands.

381. About how many times does the nymph of the *Periplaneta americana* undergo moulting before becoming an adult ?

(a) 4 (b) 2
(c) 17 (d) 3
(e) 13

Kerala PMT-2011

Ans. (e) : The young or immature form of cockroach is called nymph, The nymphs look very much like adults.
•The nymph grows by moulting up to 13 times to reach the adults form.

382. The taste receptors of cockroach are:

(a) compounds eyes
(b) campaniform sensillae
(c) palps of maxillary labium
(d) tactile hairs

DUMET-2006

Ans. (c) : The taste receptors or chemoreceptors of cockroach are plaps of maxillary labium.

• Compound eyes are involved in vision, not taste.

• Campaniform sensilla are mechanoreceptors found in exoskeleton of insects.

383. Which of the following part of Cockroach leg is attached to thorax ventrally?

(a) Trochanter (b) Claw
(c) Femur (d) Coxa

Karnataka CET-2013

Ans. (d) : The upper part of the leg, called the coxa, connects the leg to the thorax. Coxa is most swollen segment in the leg of cockroach. The trochanter acts as a knee and allows the cockroach to bend its leg.

384. Fertilized eggs of P. americana are encased in

(a) Ootheca (b) Cocoon
(c) Genital chamber (d) Phallomere

DUMET-2011

Ans. (a) : Female cockroaches produce egg cases known as oothecae.Oothecae contains many eggs and are covered with a protein substance that hardens overtime to provide protection and stability. In cockroach, the ootheca contains 16 fertilized eggs present in two rows.

• The production of ootheca is widely seen across numerous insect species for protection from parasites and other forms of predation.

385. The egg case in female cockroach is formed by the secretions of:

(a) collateral glands (b) conglobate glands
(c) mushroom glands (d) prothoracle glands

Manipal-2002
AIIMS-2000
AP EAMCET-1998

Ans. (a) : The collateral glands of the cockroach are the sexual accessory glands, present in 3^{rd} and 4^{th} abdominal segments of female cockroach and helps in secretion of egg case of Ootheaca. Ootheca contains 16 fertilized eggs which are enveloped by a proteinaceous secretion secreted by the colleterial gland that gradually hardens to form a strong, protective casing around the eggs.

386. How many egg are found in egg chamber of female Cockroach?

(a) 2 (b) 4
(c) 8 (d) 16

Rajasthan PMT-2002

Ans. (d) : Ootheca is a caspsule or case containing eggs In cockroaches, ootheca contains 16 fertilized eggs present in two rows (8+8).

387. Zymogenic cell is present in :

(a) corpora adipose
(b) salivary gland of Cockroach
(c) gizzard of Cockroach
(d) compound eye of Cockroach

AIPMT (Screening)-2011
Rajasthan PMT-1999

Ans. (c) : Zymogenic cell also known as chief cell or peptic cells are release pepsinogen and chymosin.

• Zymogenic cell is present in gizzard of cockroach.

• Gizzard of cockroach helps in the crushing of food and is considered to be a part of digestive system.

388. Changing of a small Cockroach into adults is known as :

(a) moulting (b) metamorphosis
(c) ecdysis (d) transformation

Rajasthan PMT-1999

@apna_pdf

Ans. (b) : Transformation is a broad term but metamorphosis is a specific term used to define the chronological changes of larval animal to become adults. The life cycle of cockroach has 3 stage of metamorphosis (egg, nymph, adult).

389. Which of the two parts of Periplanata appear similar in structure fundamentally?
(a) Legs and maxillae
(b) Mandibles and antennae
(c) Anal cerci and wings
(d) Labrum and anal styees

Manipal-2014

Ans. (a) : Legs and maxillae are the two parts of Periplanata appear similar in structure fundamentally.
• Maxillae are paired structure present behind the mandible in mouth region. Each consists of protopodite, exopodite and endopodite. The mouth part of cockroach is biting and chewing type.
• Legs have 5 segments- coxa, trochanter, femur, tibia and tarsus. The leg of cockroach is Cursorial leg (runnig legs).

390. Conglobate gland is found in
(a) female cockroach
(b) male cockroach
(c) Anopheles mosquito
(d) Culex mosquito

Manipal-2005, 2014

Ans. (b) : Conglobate glands are present in the sixth abdominal segment of male cockroach.

391. Which of the following statements is incorrect pertaining to cockroach?
(a) Ostia have valves which allow the blood to pass only in to the heart.
(b) Thoracic and abdominal spiracles are valvular.
(c) The wall of the trachea is made with lamina propria, endothelium and taenidia.
(d) The taenidia keeps the trachea always open and prevent it from collapsing.

AP EAMCET-2015

Ans. (c) : The wall of trachea is made of three layers- outer basement membrane, middle one cell thick epithelium and inner layer of cuticle called intima, which are continuous with the cuticle of the body surface.

392. Statement (S): Respiratory system of Periplaneta is "Polypneustic" type.
Reason (R): In Periplaneta thorasic spiracles help in expiration and abdominal spiracles help in inspiration.
(a) Both (S) and (R) are correct (R) is the correct the explanation to (S)
(b) Both (S) and (R) are correct but (R) is not the correct explanation to (S)
(c) (S) is correct but (R) is wrong
(d) (S) is wrong but (R) is correct

TS EAMCET-15.05.2016

Ans. (c) : The respiratory system of Periplaneta is 'polypneustic' type because the spiracles of cockroach are in two pairs and at least 8 pair of spiracles are functional. The respiration is cockroach occurs through spiracles. During inspiration, abdominal spiracles are closed and air flows in through open thoracic spiracles during expiration air flows out open abdominal spiracles while thoracic spiracles are closed.

393. In which part of cockroach exoskeleton is invaginated:
(a) Proctodium (b) Stomodium
(c) Mesenteron (d) Both (a) and (b)

Rajasthan PMT-1995

Ans. (d) : Both stomodeum and proctodeum, being ectodermal are lined by epidermis and exoskeleton. The meserteron (midgut) is endodermal and is responsible for enzymes secretion, hydrolysis and absorption.

394. Metamorphosis in cockroach is:
(a) Complete (b) Incomplete
(c) Holometabolous (d) Absent

Rajasthan PMT-1995

Ans. (b) : Incomplete metamorphosis- a type of metamorphosis found in insects. The insect goes through 3 stage of growth: Egg- Nymph, Adult. Insects that undergo incomplete metamorphosis include grasshoppers, cicadas, cockroaches and lice.

395. Super position image formation takes place in cockroach during
(a) Dim light (b) Diffused light
(c) Bright light (d) None of these

CMC Vellore-2011

Ans. (a) : Super position images are formed in dim light and are not sharp because it is formed by overlapping of many images. It is a blurred image. The eyes of cockroach is compound eye and composed of many units called ommatidium.

396. Which of the following is absent in the mouth part of housefly?
(a) Labrum (b) Epipharynx
(c) Mandibles (d) Maxillary palps

VMMC-2004

Ans. (c) : House fly has sponging and sucking type of parts and these mouth parts are suitable for feeding on liquid food such as nectar, fruit juice etc. Mandibles are the used to crush, grasp and defend against the predators. Mandible is modified into stylets for piercing.

397. Cellulose digesting zooflagellate found in wood cockroaches is :
(a) Lophomonas (b) Trichomonas
(c) Trichonympha (d) Leishmania

Punjab MET-2005

Ans. (c) : Trichonympha helps its host to digest cellulose and in return receives a constant supply of food and shelter. Trichonympha is a cellulose-digesting zooflagellate.

398. In cockroach, the arthrodial membrane
(a) forms the hind wings
(b) covers the compound eyes
(c) forms the hypopharynx
(d) forms the tegmina
(e) joins the sclerites

Kerala PMT-2014

@apna_pdf

Ans. (e) : Arthrodial membrane is a thin and flexible membrane that joins the sclerites. Arthrodial membrane is also known as the intersegmental membrane. Moreover, this arthrodial membrane is a flexible cuticle and it helps in providing free movement to insects like cockroaches.

399. Which one of the following is not a sensory structure in cockroach?

(a) Antennae (b) Eyes
(c) Anal cerci (d) Maxillary palps
(e) Proventriculus

Kerala PMT-2014

Ans. (e) : Antennae - one of a pair of slender, movable, segmental sensory organ on the head of insect used for sensing odors.

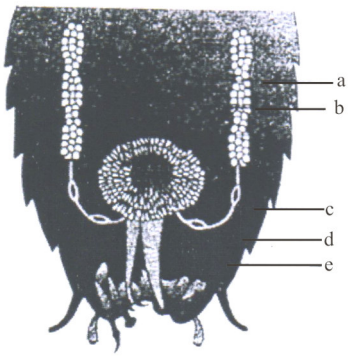
• Eyes- A compound eye is a visual organ, consist of thousands of ommatidia.

• Anal cerci- the 10^{th} segment of the abdomen contain anal cerci serve as sensory organs but can also used for defence or mating.

Maxillary palp- These palps serve as organ of touch and taste in feeding.

Proventriculus - The opening of crop is called peritoneum/ proventriculus. It plays a role in digestion.

400. In the male reproductive system of cockroach, a, b, c, d and e represents.



(a) a-phallic gland, b-small tubules, c-vas deferens, d-ejaculatory duct, e-right phallomere.
(b) a-phallic gland, b-vas deferens, c-small tubules, d-ejaculatory duct, e-right phallomere.
(c) a-phallic gland, b-ejaculatory duct, c-vas deferens, d-right phallomere, e-small tubules.
(d) a-small tubules, b-phallic gland, c-vas deferens, d-ejaculatory duct, e-testis.
(e) a-caudal style, b-phallic gland, c-small tubules, d-vas deferens, e-ejaculatory duct.

Kerala PMT-2013

Ans. (a) : This is a diagram of reproductive system of male cockroach. In the diagram 'a' is phallic gland, 'b' is small tubules, 'c' is vas deferens, 'd' is ejaculatory duct, 'e' is right phallomere.

401. Trophocytes, mycetocytes oenocytes and urate cells are found in the fat body of cockroach. Which statement is correct?

(a) Trophocytes contain reserve food
(b) Mycetocytes contain symbiotic bacteria
(c) Oenocytes sex wax and urate cells contain uric acid
(d) All of the above

BVP-2010
CMC Vellore-2007

Ans. (d) : Trophocytes are major cells of a storage organ, the fat body from which stored glycogen and lipids are mobilized under starvation. Mycetocytes contain an endosymbiont species of bacteria. Oenocytes is the source of cuticularised war. Urocytes depositing uric acid in urate vacuoles.

402. Functionally heart of cockroach is:

(a) Neurogenic (b) Agenic
(c) Epigenic (d) Myogenic

Rajasthan PMT-1996

Ans. (a) : The heart of cockroach is neurogenic because it requires a nervous impulse to contract. On the wall of the heart, cluster of neurons is present that produces the rhythmic output for the heartbeat.

• In the neurogenic heart, present in most arthropods like cockroaches, the heartbeats are initiated by a nerve signal. Hence, the cockroach has a neurogenic heart.

403. Externally male and female cockroach can be differentiated by:

(a) Wingless condition
(b) Length of abdomen
(c) Length of maxillae
(d) Conglobate gland

Rajasthan PMT-1996

Ans. (b) : The body of male cockroach is smaller than the female cockroach's body. The body of female cockroach is relatively larger than the male body. The abdomen of the female is boot shaped and the last segments blunt. Hence, the male and female cockroach can be differentiated by length of abdomen.

404. Mushroom gland is a part of

(a) male reproductive system of cockroach
(b) female reproductive system of cockroach
(c) male reproductive system of frog
(d) aemale reproductive system of frog

UP CPMT-2010

Ans. (a) : Mushroom shaped gland are present in the male reproductive system of Cockroaches.

• It has a mass of glandular tubules of three kinds, the peripheral long tubules are utricle major, the central tubules are small short tubules or utricle herbivores and behind the shirt central tubules are some short but more bulbous tubules forming the seminal vesicles filled with sperms.

405. In cockroach, the longest podomere is

(a) Coxa (b) Tarsus
(c) Tibia (d) Femur

VMMC-2013

Ans. (c) : In cockroach, the longest pedomere is tibia. Cockroach can run and walk with their legs. The five segments of the legs are the coxa, trochanter, femur, tibia and tarsus. Coxa is short and articulates the legs with the thorax. The first four segments of the tarsus are known as tarsomeres.

@apna_pdf

406. Which of the following cockroaches cannot fly?
(a) Male Blatta orientalis
(b) Male Periplaneta Americana
(c) Female Blatta orientalis
(d) Female Periplaneta Americana

JIPMER-1998

Ans. (c) : Blatta orientalis cockroach, female doesn't have the capacity to fly. Adult males have fully developed wings and adult females have short, triangular wing pads. Both females and males are unable to fly, but suitable answer is female Blatta orientalis.

407. Which among these is not involved in excretion in cockroaches?
(a) Malphigian tubules (b) Nephrocytes
(c) Urecose glands (d) Maxillary palps
(e) Fat body

Kerala PMT-2015

Ans. (d) : Exertion in cockroach is primarily performed by malpighian tubules. They absorb nitrogenous waste products and convert them into uric acid. Malphigian tubules situated at the junction of Malphigian tubules at the Hindgut and midgut. In addition, the fat body, nephrocytes and urecose glands also help in excretion. While the maxillary pulps are used for cleaning the antennae and also the front pairs of legs.

408. Which one of the following is the correct statement about the circulatory system of cockroach?
(a) It is closed type of circulatory system
(b) It is a complicated type of circulatory system
(c) It takes place without the participation of tissue
(d) It has 13-chambered heart and in each segment one pair of ostia are present

UP CPMT-2001

Ans. (d) : The heart of the cockroach is elongated, thick, muscular, tubular and 13-chambered.
• Cockroaches have an open circulatory system. They took blood vessels and capillaries. Dorsal sclerite is called tergum or tergite, ventral is called sternum or sternite and two lateral are called pleura or pleurisies.

409. Stink glands are present between these abdominal segments in cockroach:
(a) 4th and 5th (b) 5th and 6th
(c) 6th and 7th (d) 7th and 8th

JCECE-2008
UP CPMT-2007
AP EAMCET-2003, 2002

Ans. (b) : Stink gland is characteristic feature of cockroach that produces a fluid which help to protect it from predator. It is present between 5th and 6th abdominal segment.

410. Abdominal ganglia in cockroach are found in segments:
(a) 1, 2, 3, 4, 6 and 7 (b) 1, 2, 3, 4, 5 and 6
(c) 3, 4, 5, 6, 7 and 8 (d) 8, 9, and 10

AP EAMCET-2003

Ans. (a) : Cockroach has in total 9 ganglia in number. Out of these ganglia, 3 are present in the thorax and 6 are present in the abdomen.
• These six ganglia are present in the 1^{st}, 2^{nd}, 3^{rd}, 4^{th}, 6^{th} and 7^{th} segment of the nervous system of the cockroach.
• Each ganglion of the nerve cord is formed by the fusion of two ganglia except the ganglion in the 7^{th} abdominal segment is the largest of the all the abdominal ganglia and probably formed by the fusion of 3 pairs of ganglia.

411. The lateral sclerite in cockroach is called as:
(a) palpiger
(b) arthrodial membrane
(c) pleuron
(d) pellicle

AP EAMCET-2004

Ans. (c) : Lateral sclerite in cockroach is called pleuron. It is a parts of exoskeleton of cockroach which protect the body and prevent loss of water from body.
• Dorsal surface of exoskeleton covered by chitinous plate called tergum.
• Ventral surface of exoskeleton covered by sternum.
• Tergum and sternum connected with the help of pleuron in lateral side.

412. Moulting hormone is secreted by :
(a) corpora cardlacum
(b) prothoracic gland
(c) corpora allata
(d) neurosecretory hormone

Haryana PMT-2005

Ans. (b) : Moulting hormones (ecdysones) are a group of steroid hormones, found in insects and crustacean, which are responsible for maintenance of the normal moulting, growth and maturation pattern. It is a steroid hormone secreted by prothoracic gland that in its active form, stimulates metamorphosis and regulates melting in insects.

413. Hepatic caecae in cockroach are derived from :
(a) crop (b) ileum
(c) midgut (d) gizzard

JIPMER-2000

Ans. (c) : The hepatic caecae is present at the junction of the foregut and midgut of the cockroach. The midgut is the middle part of the digestive system of cockroaches. It is responsible for the digestion and absorption of food. Their function is to secrete the digestive juices to facilitate digestion.

414. Alary muscles of cockroach are associated with
(a) Malpighian tubules and excretion
(b) trachea and respiration
(c) heart and circulation
(d) None of the above

AMU-2008
VMMC-2008

Ans. (c) : Alary muscles are a pair of triangular fans like muscles in the heart of the cockroach. The contraction and relaxation of alary muscle regulate the blood flow. This helps in the circulation of the hemolymph in the body of cockroach.

@apna_pdf

415. Reduced, functionless mandibles present in:
(a) mosquito (b) cockroach
(c) butterfly (d) bed bud
AP EAMCET-2001

Ans. (c) : Few adult Lepidoptera lack mandibles, with the remaining mouthparts forming an elongated sucking tube.
• The exception is the mandibulate mouth (family micropterigidae). Which have fully developed mandibles an adults.

416. The endoskeleton in the head of cockroach is known as
(a) notum (b) pleura
(c) apodeme (d) tentorium
CG PMT-2011

Ans. (d) : The endoskeleton in the head of cockroach is known as tentorium. The tentorium is formed by the tube-like shaped in word extension which are the part of the exoskeleton.

417. The number of valves in the gut of cockroach is:
(a) 4 (b) 3
(c) 2 (d) 1
AP EAMCET-2000

Ans. (c) : The number of valves in the gut of cockroach is 2.

418. The palpiger of cockroach bears:
(a) labial palp (b) submentum
(c) ligula (d) labrum
AP EAMCET-2000

Ans. (a) : **Labium**: it is also called a lower lip. It covers the mouth from the ventral side. It has palpiger, a lateral appendage of the mentum and the ligula, and bearing the labial palp.
Labrum: It is also called as upper lip. It helps in holding the food and protecting the mouth.

419. In Periplaneta the cuticular lipid is secreted by :
(a) hypudermal cells (b) oenocyte cells
(c) dermal gland cells (d) basal cells
Rajasthan PMT-2000

Ans. (b) : Periplaneta the cuticular lipid is secreted by oenocyte cells.
• Oenocytes are involved in lipid processing and detoxification and secrete wax.

420. Which one of the following mouth parts arc found in Cockroach ?
(a) Cutting and chewing
(b) Piercing
(c) Sucking
(d) Drilling
Rajasthan PMT-2000

Ans. (a) : Cockroaches have cutting and chewing type of mouth parts that help in biting and chewing of food.
• The mouth parts include labrum, labium, mandibles, maxilla and hypopharynx.

421. In cockroach, the female genital pore is located at:
(a) between 9-10 terga
(b) in the centre of 8th sternum
(c) between 9-10 sternum
(d) below 10th sternum as between paraprocts
AP EAMCET-1999

Ans. (b) : In cockroach the female genital pore is located at in the centre of 8^{th} sternum.
• In females, the 7^{th} sternum is boat shaped and together with the 8^{th} and 9^{th} sterna forms a brood or genital pouch whose anterior part contains female gonopore, spermathecal pores and collateral glands.

422. The pincer like structures present on the stipes of maxilla of cockroach are:
(a) galea (b) cardo
(c) lacinia (d) para glossa
AP EAMCET-1999

Ans. (c) : Marillary palpifer is present on the stripe.
• There are two lobes present on stripe namely an outer galea and inner lacinia.

423. Haemolymph of cockroach contains
(a) erythrocytes and plasma
(b) respiratory pigments only
(c) haemocytes, leucocytes and plasma
(d) haemocytes and plasma
JCECE-2015

Ans. (d) : The haemolymph of cockroach is composed of colourless plasma and numerous types of haemocytes.
• Cockroaches, like other insects have an open circulatory system and their blood is also known as haemolymph.

424. Mouth part type in mosquito is
(a) sucking and piercing type
(b) biting and chewing type
(c) sponging type
(d) None of the above
CMC Ludhiana-2010

Ans. (a) : Mosquitoes have mouthparts that are used for piercing and sucking. The piercing and sucking mouthparts are peculiar characteristics of mosquito because they are adapted for piercing the tissues of the animal in case of female mosquitoes or plant to suck blood or plant juice in case of male mosquitoes.

425. Which is the cutting organ in the mouth parts of cockroach ?
(a) Labium (b) Maxillary palp
(c) Mandible (d) Labrum
Karnataka CET-2012

Ans. (c) : The mouthparts of the cockroach include labrum mandibles, maxillae and labium. Mandibles, is the cutting organ in the mouth parts of cockroach.
• Mandibles also work as grinding and mixing. The inner margins of mandibles have teeth like structure. Each mandibles has two types of teeth.

@apna_pdf

426. Cockroaches can climb smooth or steep surfaces due to the presence of adhesive pads found on the tarsus of their legs. They are called……

(a) Tibia (b) Plantulae
(c) Arolium (d) Pretarsus

Karnataka CET-2010

Ans. (c) : Cockroaches can climb smooth or steep surfaces due to the presence of adhesive pads found on the tarsus of their legs. They are called arolium. They possess smooth flexible pads found at the distal end of the leg on the tarsus. The first four segments of the tarsus contain pads called as the euplantula, while the most flexible fifth segments found at the distal end of the tarsus and is called as the pretarsus.

427. Which one of the following is the true description about an animal concerned?

(a) Rat - Left kidney is slightly higher in position than the right one
(b) Cockroach - 10 pairs of spiracles (2 pairs on thorax and 8 pairs on abdomen.
(c) Earthworm - The alimentary canal consists of a sequence of pharynx, oesophagus, stomach, gizzard and intestine
(d) Frog - Body divisible into three regions-head, neck and trunk

AIPMT-2008

Ans. (b) : There are 10 pairs of spiracles in cockroach. Two pairs are thoracic in which **first pair** is known as **mesothoracic**, lying infront of the mesothorax between the bases of first and **second pair** of legs and are the largest. The second pair is called **metathoracic**.

• Abdominal spiracles are eight pairs. The first pair is dorsal in position and lies on the lateral margins of the first abdominal tergum. The remaining are situated on the sides of their corresponding segments in the pleura between the terga and sterna.

• **Spiracles** are mean for intake of fresh air and release of foul air.

428. Six highly chitinous plate-like teeth are found in ..... of cockroach

(a) mandible (b) gizzard
(c) mexilla (d) rectum

JIPMER-2014

Ans. (b) : Six highly chitinous plate-like teeth are found in gizzard of cockroach.

• The gizzard is short muscular organ that has chitin in form of proventicular teeth. These teeth serve to facilitate food grinding.

429. Arrange the ganglia of autonomous nervous system of cockroach in correct sequence from anterior to posterior end.

(A) Frontal ganglion
(B) Proventricular ganglion
(C) Hypocerebral ganglion
(D) Visceral ganglion

(a) A–C–D–B (b) A–D–C–B
(c) B–C–D–A (d) B–D–A–C

AP EAMCET-2013

Ans. (a) : (a) Frontal ganglion- This is small median ganglion located dorsally upon the pharynx just in front of the brain.

(c) Hypocerebral ganglion- This is also a small median ganglion located dorsally upon the oesophagus behind the brain.

(d) Visceral ganglion- This is located mid-dorsally upon the crop at about its middle.

(b) Proventricular ganglia- Last ganglia in the nervous system. It is present on the gizzard.

430. In Periplanata, two pair of wings are parts of thorax, these exoskeleton (I and II pair of wings) of insect arise from

(a) Mesothorax and prothorax respectively
(b) Prothorax and mesothorax respectively
(c) Mesothorax and metathorax respectively
(d) Metathorax and mesothorax respectively

UP CPMT-2014

Ans. (c): In cockroach exoskeleton (1^{st} and 2^{nd} pairs of wings) are part of thorax. These parts of exoskeleton in insects arise from mesothorax and metathorax respectively.

431. Which of the following features is not present in *Periplaneta americana*

(a) Metamerically segmented body
(b) Schizocoelom as body cavity
(c) Indeterminate and radial cleavage during embryonic development
(d) Exoskeleton composed of N-acetylglucosamine

NEET-2016 Phase-I

Ans. (c) : *Periplanata americana* is the American cockroach. Shows spiral and determinate types of cleavage during embryonic development. Indeterminate and radial cleavage is a features of deuterostomes while cockroach is an example of protostomes.

432. The sclerite that covers the top to the head and the space between the two compound eyes in Periplaneta is :

(a) clypeus (b) labrum
(c) vertex (d) genae

AP EAMCET-2006

Ans. (c) : The sclerite that covers the top to the head and the space between the two compound eyes in Periplaneta is vertex. Labrum represents upper lip attached with clypeus.

433. What will you look for to identify the sex of the following ?

(a) Male shark – Claspers borne on pelvic fins
(b) Female Ascaris – Sharply curved posterior end
(c) Male frog – A copulatory pad on the first digit of the hind limb
(d) Female cockroach – Anal cerci

AIPMT (Screening)-2011

@apna_pdf

Ans. (a) : The male shark have claspers bone which is present on the inner margins of pelvic fins. Clasper help in the copulation.
- During the copulation semen release through the clasper into female shark through cloaca.
- Female Ascaris possess straight and blunt posterior end.
- Copulatory pad is present on first digit of forelimb in male frog.
- Anal cerci are present in both male and female cockroach while anal style is present only in the male cockroach.

434. The cells, present in the fat bodies of cockroach, which contain symbiotic bacteria that synthesise amino acids are
(a) Trophocytes (b) Mycetocytes
(c) Oenocytes (d) Urate cells

AP EAMCET-2010

Ans. (b) : Mycetocytes are the cell present in the fat bodies of cockroach which contain symbiotic bacteria that synthesis amino acid.
- Trophocytes contain reserve food in the cockroach and help during starvation.
- Oenocytes are involved in lipid processing and detoxification and secrete wax.
- Urate cells are present in cockroaches which contains uric acid.

435. In cockroach, the thermo-receptor sensilla are present on
(a) Antennae, maxillary and labial palps
(b) Labrum, maxillary and labial palps
(c) First, second and third tarsomeres of tarsus
(d) Anal cerci and pedicel of antennae

AP EAMCET-2010, 2007

Ans. (c) : Thermo-receptor sensilla are located in the 1^{st}, 2^{nd}, 3^{rd} segment of the tarsus of legs of Cockroach.
- **Antennae** have sensory appendage that generates the olfactory, gustatory, thermal and humidity senses.
- **Maxillary palp** has a long micro-furrow near the ventral edge of the medial surface of the fifth segment, which has a high population density of 73,700 sensilla/sq. mm^2.
- **Labrum** is the flap-like structure that lies immediately in front of the mouth. It is the upper lip of the cockroach's mouth.
- **Labial palps –** One of the pair of jointed, sensory structure carried on the labium of the mouth of an insect.
- **Anal cerci** are a pair of appendages present at the end of the abdomen and function by detecting vibration and are wind sensitive.
- **Pedicel of antennae –** The three basic segments of the typical insect antenna are the scope or scapus, the pedicel and finally flagellum.

436. Note the following
(A) Monocytes (B) Trophocytes
(C) Lymphocytes (D) Mycetocytes
(E) Leucocytes (F) Oenocytes
(G) Urate cells
Which of the above are fat cells in Periplaneta?
(a) A, C, E and H
(b) B, D, F and G
(c) C, E, F and G
(d) A, C, E and F

AP EAMCET-2009

Ans. (b) : Fat body present in the haemocoel of arthropods function like liver of vertebrates. It consists trophocytes for storage of food, mycetocytes for synthesis of glycogen, amino acids, vitamins etc. Oenocytes produce moulting hormone and also involved in intermediary metabolism. Urate cells pickup nitrogen wastes and convert them into uric acid.

437. In cockroach, which of the following is the principal motor centre?
(a) Supraoesophageal ganglia
(b) Suboesophageal ganglia
(c) Metathoracic ganglia
(d) Abdominal ganglia

AP EAMCET-2009

Ans. (b) : The sub - oesophageal ganglion is the principle motor centre and controls the movements of muscles, mouth parts, wings and leg.
- The brain part of cockroaches is made up of oesophageal ganglia.

438. Note the following
(A) Fenestra (B) Pedicel (C) Lacinia
(D) Flagellum (E) Galea (F) Mentum
(G) Palpifer (H) Cardo (I) Glossa
Which of the above found in the first pair of maxillae in case of cockroach ?
(a) C, E, G and H (b) A, C, E and I
(c) A, F, G and I (d) B, E, G and I

AP EAMCET-2009

Ans. (a) : The first maxillae of cockroach has biramous structure, with protopodite containing **cardo** as its basal portion along with stipes articulated at 90°. Stipes bear a jointed expedite or maxillary palp towards out side, its basal podomear called **palpifer** and endopodite towards inside, with two closely placed podomears called **galea** and **lacinia**.

439. Male and female cockroach is differs due to presence or absence of
(a) anal cerci and anal style
(b) anal cerci
(c) anal style
(d) anal sitae

UP CPMT-2006

Ans. (c) : Male and female cockroach is differs due to presence or absence of and style.
- The body of female cockroach is relatively larger than the male.
- The abdomen of female cockroach is boat- shaped and the last segment is blunt.
- The wings of female cockroach are smaller than that of the males and extend up to the tip of the abdomen.
- The antennae of female cockroach are relatively larger than that of the male
- Only a pair of anal cerci is present in female cockroach.

@apna_pdf

440. Organ of mastication in cockroach is

(a) labrum (b) labium
(c) mandibles (d) maxilla

Rajasthan PMT-2005
UP CPMT-2002

Ans. (c) : Mandibles are provided with teeth like structure and are used to masticate the food which helps in easy digestion. Mandibles are a pair of short structures present on either side of the mouth.

441. With reference to cockroach, match the following

	List-I		List-II
(A)	Ocellar spot	(I)	Genae
(B)	Epicranial plates	(II)	Mandibles
(C)	Cheek sclerites	(III)	Fenestra
(D)	Second maxillae	(IV)	Vertex
(E)	Adductor and abductor muscles	(V)	Labium

The correct match is

(a) A-III, B-V, C-I, D-IV, E-II
(b) A-II, B-IV, C-III, D-V, E-I
(c) A-II, B-V, C-I, D-IV, E-III
(d) A-III, B-IV, C-I, D-V, E-II

TS EAMCET-2015

Ans. (d) : Ocellar spot — Fenestra
Epicranial plates — Vertex
Cheek sclerites — Genae
Second maxillae — Labium
Adductor and abductor muscles — Mandibles

442. The number of heart chambers found in cockroach is

(a) 4 (b) 7
(c) 5 (d) 13

UP CPMT-2009
Punjab MET-2009

Ans. (d) : The heart of the cockroach is a long tube like structure. It lies along the mid dorsal line of the throax and abdomen. It is 13 chambered organs and the opening of each chamber into other chamber is guarded by valves.

H. Frogs

443. In which animal diaphragm has no role in respiration?

(a) Frog (b) Rat
(c) Camel (d) Rabbit

AP EAMCET-25.09.2020 Shift-II
HP CET-2012
AMU-2005
Manipal-2003
VMMC-2004
AP EAMCET-1998
BVP-2005

Ans. (a) : Diaphragm has no role in the respiration in frog but in mammals it increase the surface area for respiration.
• Frog is a member of a diverse and largely carnivorous group of short-bodied, tailless amphibians composing the order Anura.

444. Bidders canal is present in

(a) male rabbit (b) male frog
(c) female frog (d) both (b) and (c)

JCECE-2014
AP EAMCET -2011
Rajasthan PMT-2009
Punjab MET-2009
UP CPMT-2009
UP CPMT-2006

Ans. (b) : The bidder canal is located in the male frog's kidney. Vasa efferentia opens into the Bidder's canal and the Bidder's canal is connected to longitudinal collecting tubules, by means of a number of transverse collecting ducts and helps in the passing of the sperms.

445. Different colour of frog skin are controlled by

(a) hormones (b) melanocytes
(c) nervous system (d) Both (a) and (c)

JCECE-2012, 2014
BVP-2012
Uttarakhand PMT-2008
Manipal-2008
MGMIS Wardha-2006
BCECE-2001

Ans. (a) : Change in colour of skin is produced by expansion of pigment in the melanophores under the influence of hormones of pituitary gland.

446. Blastula of frog has

(a) blastopore (b) blastocoel
(c) archenteron (d) gastropore

BCECE-2014
BVP-2007, 2012
Uttarakhand PMT-2008
Manipal-2005, 2008
MGMIS Wardha-2006

Ans. (b) : The process of formation of blastula is called blastulation. The blastula of frog is hollow and has a very well developed blastocoel. The blastula of frog is called amphiblastula and has fluid filled cavity.

447. In frog the vertebra, with an anterior convex surface, is:

(a) atlas (b) urostyle
(c) 8th vertebra (d) 9th vertebra

AFMC-2002
Punjab MET-2003
UP CPMT-2001
AP EAMCET – 1997,2000

Ans. (d) : The ninth vertebra is also known as sacral Vertebra. The centrum of ninth vertebra is biconvex i.e. convex, on both the sides (bearing one convexity anteriorly and two convexities posteriorly).

@apna_pdf

448. The egg of frog is :

(a) Telolecithal (b) Microlecithal
(c) Alecithal (d) Centrolecithal

AMU-2005
Uttarakhand PMT-2004
Manipal-2000, 2004
Rajasthan PMT-2000, 2004
Punjab MET-2004
BVP-2001

Ans. (a) : An egg that has a large quantity of yolk, where the yolk is unevenly distributed all through the cytoplasm, is referred to as telolecithal egg. The yolk in this type of egg is concentrated more towards the vegetal pole.

449. Functional kidney of frog tadpole is :

(a) archipheros (b) pronephros
(c) mesonephros (d) metanephros

Manipal-2011
HP CET-2011
BVP-2003
VMMC-2005
AMU-2004

Ans. (b) : The pronephric kidney is the most primitive type of kidney. It opens into the body cavity and functional unit is ciliated funnel or nephrostomes. For example - Tadpole of the Frog, Pronephros are the functional kidney of a frog tadpole. Pronephric cells of the tadpole undergo apoptosis and their function is replaced by mesonephros which becomes the functional kidney of the adult frog.

450. Mesonephric kidney are

(a) excretory organs of insects
(b) excretory organs of frog
(c) respiratory organs of insects
(d) endocrine glands of insects

UP CPMT-2012
HP CET-2013
BCECE-2001
Haryana PMT-2001
AIPMT-1997

Ans. (b) : Mesonephric kidney are excretory organs of frog. Excretion is via kidneys, and kidneys are mesonephric and adult amphibians are ureotelic.

451. Metamorphosis of Frog from tadpole to adult is controlled by :

(a) adrenalin (b) thyroxin
(c) secretin (d) insulin

Manipal-2005
Rajasthan PMT-2001
AIIMS-1999
DUMET-2005
UP CPMT-2003

Ans. (b) : Metamorphosis of frog from tadpole to adult is controlled by thyroxin. In frogs, thyroid secretion stimulated the metamorphosis from tadpole to adult frog.

452. In frog heart, there are cardiac muscles which consists of fibres called

(a) Purkinje fibres (b) myonemes
(c) telodendria (d) columnae carnae

VMMC-2012
UP CPMT-2008, 2012
CG PMT-2008
JIPMER-2009

Ans. (a) : The frogs heart is made up of three chambers, one ventricle and two atria. The Purkinje fibres are special conducting fibres consisting mainly of electrically excitable cells that are larger than cardiomyocytes with less myofibril and more mitochondria and that perform cardiac action potentials faster and more effectively than any other heart cells.

453. Statements I: In frog, buccopharyngeal cavity acts as a force pump during pulmonary respiration.
Statement II: Vocal sacs and amplexy pads are formed in female frogs during breeding season.
The correct option among the following is

(a) Both statements I and II are true
(b) Both statements I and II are false
(c) Statement I is true. But statement II is false
(d) Statement I is false. But statement II is correct

TS EAMCET-11.05.2023, Shift-II

Ans. (c) : • The buccopharyngeal cavity is a chamber in the head of the frog that helps with respiration.
• During pulmonary respiration, the frog alternately contracts and relaxes the muscles of the floor of the buccopharyngeal cavity.
• Vocal sacs and amplexy pads are only formed in male frog during the breeding season.
So, the statement I is true but statement II is false.

454. Identify the functions of diencephalon in frog's brain among the following

(a) Involuntary movements and sense of smell
(b) Perception of cold and equilibrium
(c) Perception of heat, cold and integrity of autonomous system
(d) Perception of heat and sense of sight

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : The functions of diencephalon in frog's brain among the Perception of heat, cold and integrity of autonomous system. It also play a role in the regulation of body temperature, sleep and appetite.

455. The poison gland found in the skin of all frogs is called

(a) Thymus gland (b) Adrenal gland
(c) Parotid gland (d) Pituitary gland

Tripura JEE-2022

Ans. (c) : They are called parotid gland and are found behind the eyes on toads and some frogs and salamanders. In toads, these glands contain bufotoxin, which is neurotoxin.

@apna_pdf

456. Given below are the statements regarding frog. Choose the correct statements.

(a) Frog is a carnivore, so the length of alimentary canal is short.

(b) Frog never drinks water but absorbs through skin.

(c) The ureters of frog also act as genital ducts.

(d) Frog is uricotelic animal.

Options:

(a) A, B, C only (b) A, B only

(c) A, B, D only (d) A, B, C, D

TS EAMCET-31.07.2022 Shift-I

Ans. (c) : The alimentary canal is short because frog is carnivores. Frog never drink water but absorb through skin. The ureters also act as urogenital ducts and frogs are ureotelic.

457. Assertion (A) : During pulmonary respiration in frog, buccopharyngeal cavity acts like a force pump.

Reason (R) : When the floor buccopharyngeal cavity is lowered, air forces the glottis to open and reach the lungs.

The correct option among the following is

Options:

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)

(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)

(c) (A) is true but (R) is false

(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-I

Ans. (c) : Buccopharyngeal respiration is a mode of respiration via the buccopharyngeal cavity or the mouth. In this mode, the oxygen is taken up simply by diffusion or by the contraction and relaxation of the muscles or the buccopharyngeal cavity. During this mode of respiration, when the air is being pulled in, there is closure of the nostrils, an opening of the glottis, and elevation of the buccal cavity floor.

458. Study the following regarding frog:

(I) Corpora bigemina is present in the mid brain

(II) Bidder's canal is present in the kidney of female frog.

(III) Sinus venosus is present on the ventral side of heart.

(IV) Collumella auris is present in the middle ear

The correct statement from the above are :

(a) Only I and IV

(b) Only I, II and III

(c) Only II, III and IV

(d) Only III and IV

TS EAMCET-29.09.2020 Shift-II

Ans. (a) : From above statement (i) and (iv) are correct. Bidder's canal is present is the kidney of male frog. It facilitates the conduction of sperm from the testis to water.

Sinus venosus is triangular shaped structure present in the dorsal side of the heart.

459. The skull of frog and rabbit is:

(a) dicondylic (b) monocondylic

(c) tricondylic (d) acondylic

TS EAMCET-02.05.2018 Shift-II

JIPMER-1998

Ans. (a) : The skull which is attached to the body with two articulatory condyles is dicondylic skulls. It is found in amphibians and mammals hence, the skull of frog and rabbit is dicondylic.

460. Frog heart when taken out of the body continues to beat for some time

Select the best option from the following statements

(1) Frog is a poikilotherm

(2) Frog does not have any coronary circulation

(3) Heart is "myogenic" in nature

(4) Heart is autoexcitable

(a) Only (3) (b) Only (4)

(c) (1) & (2) (d) (3) & (4)

NEET-2017

Ans. (d) : Frog's heart is myogenic and self-stimulating . • This means the contraction of heart originates within muscles itself. When muscles contract, they release heat which continues the electrochemical reactions in muscles, that enable to the heart to contract even after removal from the body.

461. Acetabulum is the cavity of:

(a) pelvic girdle of frog

(b) sternum of frog

(c) pectoral girdle of frog

(d) all of the above

BVP-2005

Ans. (a) : Acetabulum is the cavity of pelvic girdle of frog. It is formed by a combination of all three bones of the pelvis - the ileum, pubis and ischium.

462. Which one of the following is not a characteristic feature of frog?

(a) The skin is moist and slimy

(b) Each of the fore limbs and hind limbs end in five digits

(c) Hepatic portal and renal portal systems are present

(d) Skin, buccal cavity and lungs are the respiratory organs

(e) heart is three chambered

Kerala PMT-2009

Ans. (b) : Frog fore limbs end in four digits and hind limbs end in five digits. In general, frog have protruding eyes, no tail and neck, webbed hind limbs that are adapted for leaping and swimming. They also possess smooth, moist skins. Many are predominantly aquatic, but some live on land, in burrows or in trees.

@apna_pdf

463. Presence of gills in the tadpole of frog indicates that :-
(a) Fishes evolved from frog like ancestors
(b) Frogs will have gills in future
(c) Frogs evolved from gilled ancestors
(d) Fishes were amphibious in the past

AIPMT-2004

Ans. (c) : It is universally accepted that amphibians (frogs) originated from fishes.
- Resemblance of amphibians to fish is seen in most system of body both are cold blooded. Both usually lay eggs in water.
- Tadpole are the larval form of frog they respire through gills where as adult through skin, hence the presence of gills in the tadpole indicates that frogs are evolved from gilled ancestors.

464. In the development of frog the blastopore forms the future
(a) tympanum (b) mouth
(c) nares (d) anus

AIIMS-1998

Ans. (d) : In the development of frog the blastopore forms the future anus. The blastopore expands into a circle and cell migrating through this circle become the lateral and ventral mesoderm. The cell remaining on the outside become the ectoderm and this outer layer expands vegetally to enclose the entire embryo.

465. Plica semimularis is found in
(a) kidney of mammals
(b) heart of rabbit
(c) ear of mammals
(d) eyes of frog

AIIMS-1998

Ans. (d) : Plica semimularis is found in eyes of frog. The plica semimularis is the thin upper part of the fold of mucous membrane in the supratonsillar fossa that reaches across between the two arches.
- A separate fold is called the plica, triangularis which runs inforoposteriorly from the posterior surface of the platoglossal arch to cover the inferior portion of the tonsil.

466. How do you differentiate a frog from a toad?
(a) Frog has no exoskeleton but toad has scales.
(b) Frog respires through lungs but toad respires through skin
(c) Frog has a tail but toad has no tail.
(d) Frog has no parotid glands but toad has a pair of parotid glands.

Karnataka CET-2011

Ans. (d) : Frog have long legs, compared to their head and body, which are made for jupming. Toads, on the other hand, have much shorter legs and prefer to crawl rather than hop. Frogs have smooth, somewhat slimy skin. Toads have dry, warty skin. Frog has no parotid glands but toad has a pair of parotid glands behind the tympana.

467. Acoelus vertebrae in frog is
(a) 5^{th} vertebrae (b) atlas vertebrae
(c) 8^{th} vertebrae (d) none of these

UP CPMT-2007

Ans. (b) : Acoelus vertebrae in frog is atlas vertebrae.
Acoelous-Type of vertebrae found in most mammals in which the ends of the centrum are flat and the vertebrae are separated by an intervertebral disc.

468. Which one of the following characteristics is common both in humans and adult frogs
(a) Nucleated RBCs
(b) Ureotelic mode of excretion
(c) Four-chambered heart
(d) Internal fertilisation

AIPMT (Mains)-2012

Ans. (b) : One of the common feature between Human and adult frog is having ureotelic mode of excretion. Most animal converts toxic ammonia into less toxic urea.
- Four chambered heart is present in human but three chambered in frog.
- Nucleated RBCs found in frog but not present in human.
- Fertilization is internal in human but external in frog.

469. In frog chromosome number is reduced half
(a) when 2nd polar body is separated
(b) when 2nd polar body is divided
(c) when 3rd polar body is separated
(d) when 1st polar body is separated

JIPMER-2005

Ans. (d) : In frog the number of chromosomes is halved when the first polar body separates. The process of oogenesis occur as meiosis I and meiosis II. In meiosis I, the diploid primary oocyte divides into two unequal haploid daughter cells known as the secondary oocyte and first polar body.

470. The ganglia of sympathetic and the central nervous system in frog develops from the
(a) Neural cell (b) Neural plate cells
(c) Notochordal cells (d) Neural crest cells.

AIIMS-2002

Ans. (d) : In frog, all nerve cells connecting to central nervous system (brain and spinal cord) with receptor and effectors constitute the peripheral nervous system.
- The ganglion is a simple relay for central nervous system output to peripheral autonomic targets.

471. Skin is an accessory organ of respiration in
(a) humans (b) frog
(c) rabbit (d) lizard

AIPMT-1990

Ans. (b) : Skin is an accessory organ of respiration in frog. The respiratory gasses diffuse through the surface of skin in frog. The skin of frog is thin and richly supplied with blood capillaries. It is kept moist by mucus and water.

472. The roof of the cranium of frog is formed by
(a) frontoparietal (b) orbitosphenoid
(c) parasphenoid (d) alisphenoid

AIPMT-1997
Haryana PMT -2000

@apna_pdf

Ans. (a) : The roof of the cranium of frog is formed by forntoparietal.
Frontoparientals-These are a pair of flat bones that forms the dorsal part i.e. the roof of the cranium in frogs.

473. In frog, the surface of attachment of tongue is
(a) pterygoid (b) hyoid apparatus
(c) parasphenoid (d) palatine

AIPMT-1997

Ans. (b) : The hyoid apparatus provides a surface for the attachment of the tongue muscles and the respiratory muscles.
• The hyoid apparatus is located at the bottom of the oral cavity and between the two arms of the hyoid apparatus indirectly helps in the ingestion of food.

474. Bullfrog of India is
(a) *Rana tigrina* (b) R. sylvatica
(c) R. catesbeiana (d) R. esculenta

AIPMT-1992

Ans. (a) : Bullfrog of India is *Rana tigrina*. They specifically refer to the Indian bullfrog of the Asian bullfrog because of their population distribution in regions such as Bangladesh, India, Myanmar, Nepal etc.

475. Addition of a trace of thyroxine or iodine in water containing tadpoles will
(a) keep them in larval stage
(b) hasten their metamorphosis
(c) slow down their metamorphosis
(d) kill the tadpoles

AIPMT-1990

Ans. (b) : The addition of thyroxine to water will accelerate metamorphosis. Thyroxine regulates tissue differentiation and metamorphosis of tadpole larval in frogs. Gundernatch (1912) proved that the metamorphosis of tadpoles into adult frogs is controlled by thyroxine.

476. Tadpole's tail is a/an:
(a) excretory organ
(b) attachment organ
(c) respiratory organ
(d) locomotory organ

AFMC-2003

Ans. (d) : Tadpole's tail is a locomotory organ. Tadpoles have a notochord but except at the base of the tail where a few vertebral elements develop. The tadpole's tail completely lacks either osseous or cartilaginous elements.

477. Shifting of ammonotelism to ureotelism is seen in
(a) fishes (b) frog
(c) protopterus (d) snake

WB JEE-2007

Ans. (b) : Shifting of ammonotelism to ureotelism is seen in frog.In the tadpoles, the end product of nitrogen metabolism is ammonia which is easily disposed of by diffusion in water. After metamorphosis, however the frogs excrete most of their nitrogenous waste in the form of urea and only small amount as ammonia.

478. The centum in typical centrum of frog is
(a) Amphicoelous
(b) Procoelous
(c) Heterocoelus
(d) Acoelous
(d) None of the above

CMC Vellore-2015

Ans. (a) : Amphicoelous ventebrae has a centrum with a concavity on both the ends i.e the posterior and the anterior side.

479. Salivary glands are absent in:
(a) Blatta orientalis (b) Anopheles
(c) Musca domestica (d) Rana hexadactyla

AP EAMCET-1998

Ans. (d) : In Rana hexadactyla, salivary glands are absent, Blatta, Musca and Anopheles are insects in which salivary glands are present. Salivary glands lubricate your mouth, help you swallow and aid in digestion.

480. Flying frog′s scientific name is:
(a) Rhacophorus (b) Bufo
(c) Phyllobates (d) Necturus

AP EAMCET-1998

Ans. (a) : Rhacophorus is a common genus frog inhabiting Africa and South Eastern Asia. In this genus of frog, webs are much developed. That's why, it is also called "Flying Frog". Flying frog is also known as gliding frog.

481. A cup like cavity located on the each side of pectoral girdle of frog is
(a) thoracic cavity (b) acetabulum
(c) glenoid cavity (d) sigmoid arc

Manipal-2014

Ans. (c) : A cup-like cavity is situated on either side of the earlobe of the frog which is called the glenoid cavity. It is present in shoulder girdle.

482. If the size of a fertilized egg of frog is compared with the size of its blastula and gastrula stages, which of the following observation will be correct?
(a) All the three will be of the same size
(b) There is a progressive increase in size from zygote to and blastula to gastrula
(c) Gastrula will be larger, while zygote and blastula will be of same size
(d) Zygote will be smaller, while blastula and gastrula will be larger

Karnataka CET-2005

Ans. (c) : If the size of a fertilized egg of frog is compared with the size of its blastula and gastrula stages, we find that gastrula will be larger, while zygote and blastula will be of same size.

483. Grey crescent is present in:
(a) eye of frog (b) retina of cockroach
(c) brain of rabbit (d) fertilized egg of frog

Karnataka CET-2000

@apna_pdf

Ans. (d) : Grey crescent is present in fertilized egg of frog. Grey crescent is a structure formed on the opposite side of sperm entry in a frog egg. It has a bunch of growth factors, that basically regulate, which part of the cell becomes that part of the body.

484. Food of tadpole (Frog) is:
(a) Aquatic Animals (b) Aquatic insects
(c) Eggs of fishes (d) Aquatic vegetation

Rajasthan PMT-1995

Ans. (a) : Food of tadpole (frog) is aquatic animals. The tadpole is the larval stage in the biological life cycle of an amphibian. Tadpoles have some fish-like features that can not be found in adult amphibians such as a lateral line, gills and a swim tail.

485. Fully mature larva of frog respire by:
(a) skin (b) gills
(c) lungs (d) buccal cavity

BCECE-2001

Ans. (b) : They respire with the help of gills. Only after they grow into the adult stage, most of the amphibians respire through skin and lungs.

486. Which of the following glands is present in frog's skin and not in rabbit's skin?
(a) Sebaceous gland (b) Sweat gland
(c) Mucous gland (d) Moll's gland

CG PMT-2004, 2007

Ans. (c) : Frog skin contains three different types of exocrine glands, granular (poison), mucous and seromucous. The granular gland forms a syncytial secretary compartment within the acinus, which is surrounded by smooth muscles cells. Mucous and seromucous glands are easily distinguishable as separate glands.

487. Frogs and toads belong to the order
(a) Caudata (b) Apoda
(c) Anura (d) Gymnophiona

CMC Vellore-2011

Ans. (c) : Frogs and toads belong to the order Anura. The order Anura (more than 4500 species) includes frogs and toads grouped into approximately thirty families of which Leptodactylidae, Hylidae and Ranidae are the largest. Salamanders, newts, sirens, amphiuma, waterdogs and mudpuppies comprise the order Caudate.

488. In Frog the ear has:
(a) pinna
(b) cochlea and pinna
(c) pinna and drum
(d) ear drum and internal ear

Haryana PMT-2000

Ans. (d) : In frog the ear has ear drum and internal ear. The frog does not have an external ear comparable to that of most other terrestrial vertebrates. There is no pinna and the majority of known species lack an ear canal.

489. The egg of a frog is :
(a) centrolecithal (b) macrolecithal
(c) microlecithal (d) mesolecithal

Punjab MET-2004

Ans. (d) : The egg of frog are mesolecithal. This is because their eggs contain an moderate amount of yolk. The yolk is concentrated in one area of egg (the vegetal pole). Sharks and amphibians are example mesolecithal egg.

490. Wolffian body also known as :
(a) pronephros (b) mesonephros
(c) metanephros (d) abnormal heart

Punjab MET-2005

Ans. (b) : Wolffian body also known as mesonephros. The Wolffian duct is one of the paired embryogenic tubules that drain the primitive kidney to the cloaca.

491. Choose the wrong statement regarding the circulatory system of frog
(a) Sinus venosus receives blood through major veins called vena cava
(b) The ventricle opens into a sac like conus arteriosus
(c) The erythrocytes are nucleated
(d) Special venous connection between liver and intestine called renal portal system is present
(e) Lymphatic system consists of lymph, lymph channels and lymph nodes

Kerala PMT-2014

Ans. (d) : Hepatic portal system is the special venosus connection between liver and intestine, while the connection between kidney and intestine are called renal portal system.

492. Addison of which elements in water, speed up the metamorphosis in frog tadpole larva?
(a) I_2 (b) K
(c) Na (d) C*l*

JCECE-2008

Ans. (a) : The changes in the stages from a larva to an adult are known as metamorphosis. The metamorphosis of frog is controlled by the thyroid hormones that cobntains iodine element thus addition of iodine in water speed up the metamorphosis of frog tadpole.

493. In the pectoral girdle of frog there is a cup like cavity on each side called:
(a) acetabulum (b) sigmoid arc
(c) glenoid cavity (d) thoracic cavity

Manipal-2006

Ans. (c) : The glenohumeral joint along with the humerus form this cavity. This joint form is known as a joint of the synovial, ball and socket by means of the long head of the biceps tendon, the humerus is fixed in place inside the glenoid cavity.

494. A renal portal system is found in
(a) Man (b) Frog
(c) Horse (d) Rabbit

Uttarakhand PMT-2011
BCECE-2011

Ans. (b) : A renal portal system is found in frog. Renal portal of frog drains blood from hind limbs and posterior part of the trunk and supplies to the kidneys.

495. What is the main difference between RBCs of human and frog?

@apna_pdf

(a) Human RBCs are non-nucleated
(b) Haemoglobin is found only in human RBCs
(c) Human RBCs have nucleus
(d) Human RBCs are multi-nucleated

BVP-2010
JCECE-2004
Haryana PMT-2003

Ans. (a) : The main difference between human blood cells and frog blood cell is that human red blood cell lack nuclei whereas frog blood cells contain nuclei, because human need more oxygen than frog.

• They loss nucleus in order to accommodate more haemoglobin, so that they can transport more amount of oxygen.

496. In an egg of frog is divided in a way that one part has animal hemisphere and another part is deficient in that then:
(a) Only animal hemisphere region forms embryo
(b) Both the sites form embryo
(c) Embryo is not formed from any region
(d) Animal hemisphere deficient region forms the embryo

Rajasthan PMT-1996

Ans. (a) : The egg of amphibians are moderately telolecithal (mesolecithal). This means a large amount of yolk is concentrated at the vegetal pole and the opposite, the animal pole is metabolically more active with radial and holoblastic cleavage. Hence, in the animal hemisphere, the blastula consists of many small cells with formation of blastocoels that eventually form the embryo and in the vegetal hemisphere fewer but larger cells are present.

497. Spinal nerves in frog are
(a) 10 pairs (b) 30 pairs
(c) 12 pairs (d) 33 pairs

UP CPMT-2010

Ans. (a) : Peripheral nervous system of a frog comprises of cranial and spinal nerves. In frog there are 10 pairs of spinal nerves that arise from the side of the spinal cord. Each nerve arises by two roots, a ventral (anterior) and a dorsal (posterior), which unite at their point of exit from the vertebral canal and they emerge between vertebrae.

498. Which are of the following sets of characters are applicable in metamorphosis of tadpole larva of frog and toads?
(a) Reabsorption of gills and lengthening of tail
(b) Complex development of gill and lengthening of tail
(c) Reabsorption of gills and resorption of tail
(d) Complex development of gill and resorption of tail

VMMC-2013
J & K CET -2006

Ans. (c) : The process of transformation of larva of some vertebrates and majority of invertebrates into adult is called metamorphosis. Reabsorption of gills and resorption of tail are the characters applicable in metamorphosis of tadpole larva of frog and toads.

499. How can a tadpole be prevented to change into frog for long time ?
(a) By giving very less food
(b) By giving fat-rich food
(c) By adding lot of thyroxine to the water in which they are kept
(d) Provide them an antithyroid substance like thiourea

AFMC -2011

Ans. (d) : The anti thyroid drug like thiourea reduces the secretion of thyroxin hormones, which prevents metamorphosis of frog, because during metamorphosis thyroxin hormones change a tadpole into mature frog.

500. The following is absent in frogs heart:
(a) sinus venosus
(b) inter ventricular septum
(c) semilunar valves
(d) auriculo ventricular valves

JIPMER-1998

Ans. (b) : Inter verntricular septum is absent in frog heart.

501. The third cleavage of frogs egg is of:
(a) transverse and equal type
(b) vertical and equal type
(c) transverse and unequal type
(d) vertical and unequal type

JIPMER-1998

Ans. (c) : Cleavage is the series of mitotic divisions that divides an embryo after fertilization. The first cleavage occurs shortly after the zygote nucleus form. The third cleavage of frog egg is transverse and unequal type.

502. What type of cleavage is found in frog?
(a) Discoidal
(b) Holoblastic unequal
(c) Holoblastic equal
(d) Superficial

UP CPMT-2012, 2010
JIPMER-1997

Ans. (b) : In the frog, the cleavage is of holoblastic unequal type because of a large amount of yolk present towards the vegetal pole. It is the cleavage, which is produces unequal size of blastomeres.

503. Skin plays a very important role in osmoregulation in frog by:
(a) active outflow of water
(b) osmotic inflow of water
(c) active uptake of salts
(d) passive inward diffusion of salt

JIPMER-1997
DUMET-2001

Ans. (b) : Skin plays a very important role in osmoregulation in frog by osmotic inflow of water. It keeps skin moist and maintain the water balance.

• Water absorption across the skin is driven by osmotic gradient. The unique properties of frog skin having high permeability to water and electrolyte, therefore, allow this tissue to contribute to osmoregulation.

@apna_pdf

504. Frogs

(a) are uricotelic
(b) have olfactory lobes in the midbrain
(c) do not have renal portal system
(d) have lymphatic system
(e) have gall bladder which secretes bile

Kerala PMT-2015

Ans. (d) : Frogs are ureotelic. They have olfactory lobes in fore brain. They have renal portal system, it is a venous connection between intestine and kidney. Frog have lymphatic system. They have gall bladder which store bile and it secreted by liver.

505. V^{th} Cranial nerve of frog is called

(a) Optic nerve (b) Vagus
(c) Trigeminal (d) Ophthalmic

MGIMS Wardha-2008, 2010
UP CPMT-2006
BVP-2001

Ans. (c) : Frog's nervous system contains 10 pairs of cranial nerves that serve different purposes. The fifth cranial nerves of the frog is called the trigeminal nerve which arises from the lateral side of the medulla. It receives impulses from the skin of the snout.

506. In the development of frog, the gastrulation process involves.

(a) epiboly (b) emboly
(c) invagination (d) All of these

UP CPMT-2001

Ans. (d) : In the process of gastrulation in frog epiboly, emboly and invagination are take place. Gastrulation starts after the implantation and each germ layer (ectoderm, endoderm and mesoderm) develops into various organs of the body.

- The ectoderm of anamniotes during gastrulation cover the entire embryo is known as epiboly.
- Formation of a gastrula from a blastula by invagination of the germ layers is said to be emboly.
- During invagination, gastrulation is initiated at the future dorsal side of the embryo.

507. During hibernation period, frogs respiration is:

(a) cutaneous (b) pulmonary
(c) pharyngeal (d) buccopharyngeal

Uttarakhand-2005

Ans. (a) : Cutaneous respiration in frogs and other amphibians may be the primary respiratory mode during colder temperatures. Cutaneous respiration is the only form of respiration, which take place when the frog is under water or in hibernation. There is rich supply of blood capillaries to the skin, which are permeable to gases.

508. In frog chromosome number is reduced to half :

(a) when 2nd polar body is separated
(b) when 2nd polar body is divided
(c) when 3rd polar body is separated
(d) when 1st polar body is separated

Haryana PMT-2005

Ans. (d) : In frog, chromosome number is reduced to half when first polar body is separated and secondary oocyte is formed during oogenesis. Oogenesis is process of formation of ova. During oogenesis, secondary oocytes is formed because meiosis -I takes place in primary oocytes.

509. In frog jelly around the eggs is deposited

(a) in water after fertilization
(b) in water during fertilization
(c) in the oviduct
(d) in the ovary

AMU-2008
VMMC-2008

Ans. (c) : Frogs deposit their eggs as a clump of jelly; toads as strings. In female frog, the jelly is deposited around the egg in the oviduct. The oviducts are the tubular structures present in female frog that carry eggs from the ovaries to the cloaca.

510. Frog is

(a) ammonotelic (b) ureotelic
(c) uricotelic (d) None of these

VMMC-2008
AMU-2008

Ans. (b) : Ureotelic animals excrete nitrogenous waste in the form of urea. Frogs are ureotelic animals.

- Tadpoles are ammonotelic as they live in water and secrete ammonia as nitrogenous waste.

511. Structure present in man absent in frog

(a) salivary gland (b) pancreas
(c) adrenal gland (d) thyroid gland

AMU-2008

Ans. (a) : Frogs don't have salivary glands, inside their mouths, that drip saliva, instead the tongue itself secretes the saliva.

- In humans, salivary gland in the mouth secretes salivary enzymesm, which helps in the digestion of carbohydrate. This gland is absent in frogs.

512. Absence of thumb is characteristic of:

(a) Monkey (b) Man
(c) Rabbit (d) Frog

Haryana PMT-1999

@apna_pdf

Ans. (d) : There are 5-digits in hindlimb of frog which is longer in size, and 4 digits in fore limb which is shorter is size and thumb is not present in fore limb, the absence of thumb is a feature of the frog. The structure of the feet and legs varies depending on their habitat.

513. Endostyle is present in:
(a) ammocoetus larva (b) axolotl larva
(c) ascidian tadpole (d) frog′s tadpole

AP EAMCET-2001

Ans. (c) : Endostyle is present in ascidians tadpole, Ascidians are marine invertebrate chordates. Their tadpole larvae contain a dorsal tubular nervous system.

• Ascidians have a free-swimming, tadpole like larva, an adult saclike body with two siphons that allow water flux, and a large bronchial basket, provided with a ventral endostyle.

514. Acetabulum is the cavity of :
(a) pelvic girdle of frog
(b) sternum of frog
(c) pectoral girdle of frog
(d) all of the above

Manipal-2003

Ans. (a) : The perforate acetabulum is a cup shaped opening on each side of the pelvic girdle formed where the ischium, ileum and pubis all meet and into which the head of the femur end.

515. The function of iris in the eyes of frog is to
(a) alter the size of pupil
(b) move nictitating membrane
(c) refract light rays
(d) move the lens forward and backward

VMMC-2010

Ans. (a) : The muscles associated with the iris regulate the amount light entering the eyeball by adjusting the size of the pupil. Smooth muscle cells of a frog iris sphincter contain rhodopsin and contract in response to light. It is the coloured part of the eye, which regulates the size of the pupil controlling the entry of light into the eye.

516. In frog, according to modern theory of blood circulation, the trabeculae help in:
(a) separation of pure and impure blood
(b) to given mechanical strength to the ventricle
(c) increasing the inner surface area of ventricle
(d) to detect blood pressure

AP EAMCET-1997

Ans. (c) : In frog, according to modern theory of blood circulation, the trabeculae help in increasing the inner surface area of ventricle. In frogs the ventricle has thick, muscular and spongy wall. Its inner surface has irregular strands or ridges called trabeculae.

517. Structure of which remain unchanged during metamorphosis in frog's tadpole?
(a) Lungs (b) Brain
(c) Heart (d) intestine

CG PMT-2011

Ans. (b) : The nervous system undergoes least changes during metamorphosis of frog's tadpole frog's nervous system once differentiated remains as such throughout life. However, the brain acquires its normal shape and size. Metamorphosis in frog is a thyroxin mediated process during which changes occurs in the structure of lung, heart and intestine but there is no such a severe change in nervous system.

518. In frog, innominate vein is formed by the union of the veins:
(a) lingual and mandibular
(b) subscapular and internal jugular
(c) branchi and musculocutaneous
(d) external jugular and subclavian

AP EAMCET-2000, 1999

Ans. (b) : An internal jugular (bringing blood from the head) and a subscapular (from the back of shoulder) is the two union veins of innominate vein.

519. In Frog, Astragalus, is a part of:
(a) wrist (b) pectoral girdle
(c) ankle (d) pelvic girdle

AP EAMCET-2000, 1999

Ans. (c) : Astragalus calcaneum is a compound bone of ankle. It is made up of two tarsal bones the tibiole or astragalus and fibulare or caclcaneum. This bone helps in jumping and leaping.

520. In frog skull, the bone that connects sphenethmoid with maxilla:
(a) pterygoid (b) squamosal
(c) palatine (d) pre maxilla

AP EAMCET-1999

Ans. (c) : In frog skull, the bone that connects sphenethmoid with maxilla is palatine.

521. In frog, the nerve that innervates the retractor bulli muscles of the eye:
(a) optic nerves (b) oculomotor
(c) pathetic nerve (d) abducens nerve

AP EAMCET-1999

Ans. (d) : The abducans nerve also known as the 6^{th} cranial nerve, cranial nerve 6^{th} that controls the movement of the lateral rectus muscle.

522. In frog, stratum spongiosum is made up of:
(a) dense connective tissue
(b) loose fibrous connective tissue
(c) fasienti
(d) stratified epithelium

AP EAMCET-1999

@apna_pdf

Ans. (b) : The stratum spongiosum is the large middle layer. It contains the main portions of uterine glands and accompanying blood vessels, the stromal cells are more loosly arranged and larger than in the stratum campactum.

523. The blood supply to the eyes of frog is through:
(a) lingual artery
(b) internal carotid artery
(c) palatine
(d) occipito ventral artery

AP EAMCET-1999

Ans. (b) : Internal carotid artery is the larger outer branch of common carotid arch. This artery supplies the blood to the orbit and eyes of frog.

524. In frog, the hypoglossal nerves are:
(a) 1^{st} pair of spinal nerves
(b) 12^{th} pair of cranial nerves
(c) 9^{th} pair of spinal nerves
(d) 7^{th} pair of cranial nerves

AP EAMCET-1999

Ans. (a) : The hypoglossal nerve is mainly a somatic efferent (motor) nerve to innervate the tongue musculature. The nerve also contains some sympathetic postganglionic fibres from the cervical ganglia, which innervates tongue vessel and some small glands in the oral mucosa.

525. In frog coracoids fenestra is associated with:
(a) pelvic girdle (b) pectoral girdle
(c) skull (d) vertebral column

AP EAMCET-1999

Ans. (b) : Caracoid region is made up of 2 bones namely -
- Clavicle
- Caracoid
- The pectoral girdle is designed to absorb the shock when it lands on its forelimbs, an elastic muscular suspension connecting the pectoral girdle to the skull and vertebral column provides this ability.

526. Acoustic spots in frog are present in
(a) ossious labyrinth
(b) carotid
(c) membranous labyrinth
(d) all of the above

VMMC-2007

Ans. (c) : The membranous labyrinth is Lodged within the body cavities. It contains fluid, the endolymph, and on its walls, the ramification of the acoustic nerves are distributed.

527. Tadpole of frog is
(a) ammonotelic (b) ureotelic
(c) uricotelic (d) none of these

AMU-1996

Ans. (a) : Tadpoles are ammonotelic because they live in water so that ammonia is excreted through their body and frogs are ureotelic because they live on land and excrete urea.

528. Cloacal aperture of frog is used to pass out
(a) sperm (b) faeces
(c) urine (d) all of these

AFMC-2010

Ans. (d) : The ureters act as a urinogenital duct which opens into the cloaca. Cloacal aperture is the opening of the cloaca through this opening urine undigested food, eggs, and sperms are passed away, as it is a common passage. It is present in amphibians, birds, fishes and monotremes.

529. The fourth cleavage plane during development of frog's egg is
(a) Double meridional (b) Single meridional
(c) Single latitudinal (d) Double latitudinal

Karnataka CET-2012

Ans. (a) : The first cleavage in a frog's egg is meridional i.e. from animal to vegetal pole resulting in a two celled stage. These cells are also called as blastomeres. The second cleavage is also meridional and results in four blastomeres. The third cleavage is latitudinal, i.e. in the equatorial direction. Out of the eight blastomeres formed, four are large in size and remain near the vegetal pole. These are called macromeres. The fourth cleavage is meridional and unequal holoblastic. They are unequal and divide the micromeres more rapidly than macromeres.

530. A gradual decrease in the size of the tail during metamorphosis in the life cycle of frog is a good example for
(a) cell senescence
(b) pinocytic activity
(c) programmed cell death
(d) cell necrosis

Karnataka CET-2008

Ans. (c) : A gradual decrease in the size of the toil during metamorphosis in the life cycle of frog is a example of programmed cell death. Apoptosis is the process of programmed cell death. It is used during early development to eliminate unwanted cells. Apoptosis also plays a role in preventing cancers.

531. Cleavage in frog's zygote is
(a) diploblastic (b) heteroblastic
(c) holoblastic (d) meroblastic

UP CPMT-2005

Ans. (c): Cleavage in frogs embryo is **holoblastic unequal and bilateral**. This type of cleavage occur in mesolecithal egg in which the zygote divides completely to form small sized cells towards the animal pole which has almost no yolk and into larger yolky cells towards the vegetal pole.

@apna_pdf

532. Number of cranial nerves in frog

(a) 10 pairs (b) 9 pairs
(c) 12 pairs (d) None of these

UP CPMT-2005

JIPMER -2006

Ans. (a): Number of cranial nerve in amphibian is 10 pairs.

- A frog has 10 pairs of cranial nerves. They are- (i) Olfactory (ii) Optic (iii) Oculomotor (iv) Trochlear (v) Trigeminal (vi) Abducens (vii) Facial (viii) Auditory (ix) Glossopharyngeal (x) Vagus.

533. Bidder's canal is found in

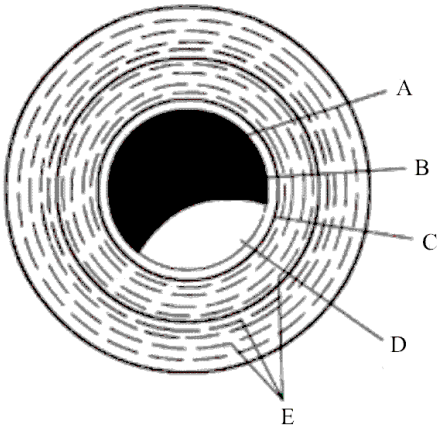
(a) testes of frog (b) kidney of frog
(c) kidney of mammals (d) ovary of mammals

UP CPMT-2011

Ans. (b): Bidder's canal is found in the kidney of male frog and it help in transfer of sperm via the vasa efferentia. Vasa efferentia open into the Bidder's canal.

- The Bidder canal is connected to the longitudinal collecting tubules open into the ureter.

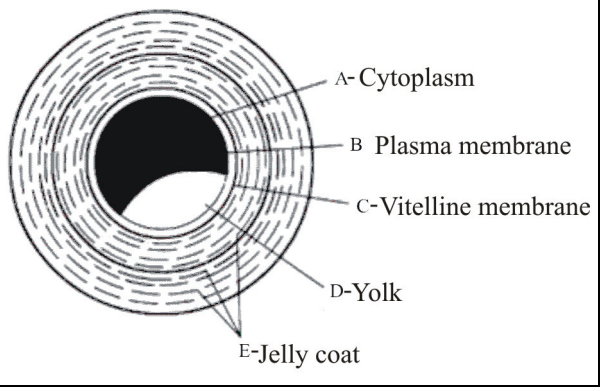
534. The following is a diagram of the just spawned frog's egg, with the parts labelled from A to E Identify the parts and choose the correct option from those given below.



(a) A = Cytoplasm, B = Plasma membrane, C = Vitelline membrane, D = Yolk, E = Jelly Coat
(b) A = Cytoplasm, B = Vitelline membrane, C = Plasma membrane, D = Yolk, E = Jelly Coat
(c) A = Yolk, B = Plasma membrane, C = Vitelline membrane, D = Cytoplasm, E = Jelly Coat
(d) A = Yolk, B = Jelly Coat, C = Vitelline membrane, D = Cytoplasm, E = Plasma membrane

Karnataka CET-2006

Ans. (a) :



535. In frog, the vertebra with an anterior convex surface (i.e. double convexties) is

(a) atlas (b) urostyle
(c) 8^{th} vertebra (d) 9^{th} vertebra

JIPMER-2004

Ans. (d) : The ninth vertebra is also known as sacral vertebra. Both the sides (bearing one convexity anteriorly and two convexities posteriorly). The anterior convexity fits into the posterior concavity of eighth vertebra.The ileum of the pelvic girdle articulates with the transverse process of 9^{th} vertibrae.

536. The epithelial lining in the alveoli of the frogs facing lung cavity is

(a) squamous ciliated
(b) columnar ciliated
(c) columnar nonciliated
(d) squamous nonciliated

JIPMER-2004

Ans. (b) : The epithelial lining in the alveoli of the frogs facing lung cavity is columnar ciliated. Columnar ciliated epithelium is mainly present in inner surface of hollow organs.

537. Carotid labyrinth contains:

(a) olfactory receptors (b) baroreceptors
(c) chemoreceptors (d) phonoreceptors

JIPMER-2015

Ans. (b) : The carotid labyrinth is a gland found at the base of the internal carotid. It is probably a sensory organ. It has baroreceptors which function to control the blood pressure.

538. Acoustic spots in frog are present in

(a) ossius labyrinth
(b) carotid
(c) membranous labyrinth
(d) All of the above

UP CPMT-2002

Ans. (c) : The membranous labyrinth is a group of ducts and chambers filled with endolymphatic fluid. It is located within the bony labyrinth and can be sub-divided into the vestibular labyrinth and cochlear labyrinth.

@apna_pdf

08 CELL : STRUCTURE AND FUNCTIONS

A. Cell : The Unit of Life

1. Wich of the following technique, other than microscopy is used for study of cell?

(a) Maceration (b) Plasmolysis
(c) Chroma tography (d) Autoradiography

BHU-PMT (Screening)-2008
Manipal-2008 / BVP-2008
Uttarakhand PMT-2007
BHU PMT-2004

Ans. (d) : An important method for examining chemical production and tracing the event or metabolic pathways in cells is autoradiography.

2. The term protoplasm for the cell contents was coined by

(a) Von Mohl
(b) J.E. Purkinje
(c) J.S. Huxley and Hertwig
(d) M. Schultz

J&K CET-2005 / JCECE-2005
Punjab MET-2004
CG PMT-2005, 2004

Ans. (b) : J.E Purkinje used term protoplasm in plant cells.

- M.Schultze proposed protoplasmic theory.
- Von Mohl given the importance of the protoplasm in plant cell.
- Huxley explained protoplasm is the physical basis of life in energy generated of the protoplasm.

3. Programmed cell death is scientifically termed as

(a) autotomy (b) cell lysis
(c) apoptosis (d) None of these

BCECE-2014, 2011
VMMC-2012
UP CPMT-2008
Rajasthan PMT-2008
BHU PMT (Screening)-2006

Ans. (c) : Programmed cell death is known as apoptosis, commonly referred to as "cell suicide" or cellular suicide. It is a tightly regulated and controlled process that occurs in multicellular organisms to eliminate unwanted, damaged , infected or potentially harmful cells without causing inflammation or damage to surrounding tissues.

4. Choose the correct statement

A. Porins allow the entry of small proteins present in the membrane of mitochondria, chloroplast and bacteria

B. When a living cell is kept in hypertonic solution, water potential is equal to solute potential.

C. Carrier proteins will allow entry of all substances across the membrane, whereas pumps transport large molecuoles in a passive method

D. Bulk flow occurs by diffusion

(a) A, B (b) C, D
(c) A, D (d) B, C

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : • Porins allow the entry of small proteins present in the membrane of mitochondria, chloroplast and bacteria.
• A living cell is kept in hypertonic solution, water potential is equal to solute potential.
The porins are protein from transporting solutes and metabolites across the outer mitochondrial membrane, chloroplast and bacteria.

5. Assertion (A) : Ions and organic material concentration is higher in cytoplasm than vacuole

Reason (R) : Tonoplast facilitates the transport of ions and other materials against concentration gradient into vacuole

The correct option among the following is

(a) (A) and (R) are true. (R) is the correct explanation for (A)
(b) (A) and (R) are true, but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : The vacuole is an organelle in plant cells that stores various ions, nutrients, and waste products. It helps maintain the cells osmotic balance and pH, and some ions are indeed present at higher concentrations in the vacoule compared to the cytoplasm.

6. Match the column I with Column II.

Column-I		Column-II	
A.	Coronary artery disease	i.	The blood pressure above 140/90.
B.	Hypertension	ii.	Accumulation of calcium, fat cholesterol in coronary arteries
C.	Angina pectoris	iii.	Heart unable to pump sufficient blood
D.	Heart failure	iv.	Chest pain caused by Ischemia

(a) A – i, B – iii, C – ii, D – iv
(b) A – ii, B – i, C – iv, D – iii
(c) A – ii, B – i, C – iii, D – iv
(d) A – iv, B – ii, C – i, D – iii

AP EAPCET-22.05.2023, Shift-II

@apna_pdf

Ans. (b) :

A.	Coronary artery disease	ii.	Accumulation of calcium, fat cholesterol in coronary arteries
B.	Hypertension	i.	The blood pressure above 140/90.
C.	Angina pectoris	iv.	Chest pain caused by Ischemia
D.	Heart failure	iii.	Heart unable to pump sufficient blood

7. Following is not a part of symplastic system

(a) Plasmodesmata (b) Cell membrane
(c) Cell wall (d) Cytoplasm

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : Symplast does not involve intercellular space and cell wall. In this, water moves from epidermis to the xylem passing through cortex, endodermis and pericycle.

8. Structural elements of cells

(a) Nitrogen, Phosphorus, Potassium and Oxygen
(b) Nitrogen, Hydrogen, Oxygen and Carbon
(c) Magnesium, Potassium, Carbon and Chlorine
(d) Oxygen, Nitrogen, Sulphur and Potassium

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : The structural elements of cells Nitrogen, hydrogen, oxygen and carbon. Most biological molecules, such as proteins, carbohydrates, lipids and nucleic acid are exclusively composed of these element.

9. The following cell organelles are considered as endomembrane system

(a) Mitochondria–Lysosome–Endoplasmic reticulum
(b) Endoplamic reticulum–Golgi complex–chloroplast
(c) Endoplasmic reticulum–Lysosomes–Peroxisomes
(d) Endoplasmic reticulum–Golgi complex–Lysosomes

AP EAPCET-23.05.2023, Shift-I

Ans. (d) : The endomembrane system include ER, golgi complex, lysosomes and vacuoles. Since the function of the mitochondria, chloroplast and peroxisomes are not coordinated with the above components, these are not considered as part of the endomembrane system.

10. Choose the correct one

A	B	C
I. Golgi bodies	**Single membrane**	**Protein synthesis**
II. Mitochondrion	**Power house of the cell**	**DNA Replication**
III. Chloroplast	**Carbohydrate synthesis**	**Protein synthesis**
IV. Nucleolus	**Ribosomal factory**	**80s and 70s ribosomes synthesis**

(a) I,II,III,IV (b) II,III
(c) II,III,IV (d) II only

AP EAPCET-11.07.2022 Shift-I

Ans. (b) : Aerobic respiration occurs in the mitochondria and productin of ATP therefore mitochondria is called power house of cell. Mitochondrial DNA replication is initiated at (OH) strand and proceeds. Unidirectionally to produce the full length nascent it strand. Carbohydrates assimilate in chloroplast during the day with some stored as starch or degraded to supply sugars for growth at night.
Most chloroplast proteins are synthesized in the cytoplasm imported and then targeted to a specific chloroplast compartment.
Chloroplasts are specialized to perform photosynthesis.

11. Statement A : Shape of the cell is variable with the function they perform.
Statement B: Neuron cell is longest and branched animal cell that sends and receives signal from brain.

(a) A is false, B is true
(b) Both A and B are false
(c) A is true, B is false
(d) Both A and B are true

AP EAPCET-11.07.2022 Shift-I

Ans. (d) : There is great variability in cell shape ie, spherical, polygonal, disc-like cuboidal, columnar, spindle-like, etc. The shape of the cell may vary with the function they perform e.g. Xylem vessels are long as they have to form long water conducting channels.
Nerve cells are long and branched.

12. Which of the following is the first cell of human life ?

(a) Oosphere (b) 1st polar body
(c) Oospore (d) Synkaryon

MHT CET-07.10.2020 Shift-I

Ans. (d) : Synkaryon refers to a cell that contains two distinct sets of chromosome from two different parent cell within a single nucleus. This occurs in somatic hybridization.

13. The nuclear pores are the passages for which of the following?

(a) RNA and proteins
(b) Chromosomes
(c) Ribosomes and Proteins
(d) Histone proteins

AP EAMCET-24.09.2020 Shift-II

Ans. (a) : RNA and protein molecule travel between the nucleus and cytoplasm through nuclear pores when the RNA produced by nucleus.

14. Choose the correct statements

(i) Ribosomes are found in Cytoplasm, Chloroplasts, Mitochondria and on rough ER
(ii) Mesosomes in bacteria are not the sites of DNA replication
(iii) Algae cell wall made of cellulose, galactans, mannan and calcium carbonate
(iv) Mitochondria, chloroplast and peroxisomes are the part of Endomembrane system

(a) i, iv (b) i, ii
(c) i, iii (d) ii, iii

AP EAMCET-25.04.2018 Shift-I

@apna_pdf

Ans. (c) : Ribosomes are found in both prokaryotic and Eukaryotic cells. The number ranges upto 5,00,000 per cell. In prokaryotic cells the ribosome's are found in free state while in eukaryotic cells they may be free or found associated with ER by their larger subunits. Ribosomes are also found in mitochondria and plastids. The cell wall in algae are made up of mainly two components.
(a) The fribrillar component : cellulose mannans, xylans.
(b) The amorphous component : galactans such as agar and carrageenin.

15. Study the following lists

List -I		List-II	
(A)	**Mesophyll cells**	**(I)**	**Branched and long**
(B)	**Tracheid cells**	**(II)**	**Amoeboid shaped**
(C)	**Nerve cells**	**(III)**	**Round and oval**
(D)	**White blood cells**	**(IV)**	**Elongated**
		(V)	**Long and narrow**

The correct answer is

	(A)	(B)	(C)	(D)
(a)	(i)	(ii)	(v)	(iv)
(b)	(ii)	(iii)	(iv)	(i)
(c)	(iii)	(iv)	(i)	(ii)
(d)	(v)	(iv)	(i)	(iii)

TS EAMCET-03.05.2018 Shift-I

Ans. (c) : (A) Mesophylls cells – Round and oval
(B) Tracheid cells – Elongated
(C) Nerve cells – Branched and long
(D) White blood cell – Amoeboid shaped.

16. Choose wrong pair from the following

(A)	**Theodore Schwann**	**Animal cell**	**Plasma membrane**
(B)	**Vesicles, lamellae, tubules**	**prokaryote**	**contain pigments**
(C)	**Phosphate granule**	**Eukaryote**	**Lysosomes**
(D)	**Nucleosome**	**Eukaryote**	**DNA packaging in nucleus**

Options:
(a) A, B (b) B, C
(c) A, C (d) A, D

AP EAMCET-28.04.2017 Shift-I

Ans. (b) : Vesicles lamellae tubules are present in only prokaryotic cells. They are in folding of plasma membrane. Phosphate granules are inclusions bodies that lie free in the cytoplasm of prokaryotic cell.

17. Study the following table

(A) Peroxysomes	**Glyoxysomes**	**Microbodies**
(B) Flagella	**Peripheral Microtubules**	**9 pairs**
(C) Cytoskeleton	**Eukaryotic cell**	**Cell motility**
(D) Chromoplastids	**Carotenoid pigments**	**Water soluble**

The correct combination are
Options :
(a) A, B, D
(b) A, B, C
(c) B, C, D
(d) A, C, D

AP EAMCET-28.04.2017 Shift-I

Ans. (b) : A, B, C is right and chromoplastids is coloured plastid other then green may be orange, red blue, yellow.
These are found in the ripening pericarp of the fruits.

18. Generally the smaller the cell
(a) the larger the nuclei
(b) the smaller the nuclei
(c) it will be more metabolically active
(d) it will be less metabolically active

Tripura JEE-2017
CMC Ludhiana-2011

Ans. (c) : The surface area of cells determines the exchange of materials. The increase in the volume of cell increase its metabolic activity. A smaller cell is more effective and transporting materials in leveling waste products then a larger cell.

19. 80% of the cell has :
(a) minerals (b) water
(c) protein (d) carbohydrates

AFMC-2000

Ans. (b) : Water is the most abundant molecule in the cells because it accounts for nearly 70-90 percent of its total mass. Water regulates body temperature provides moisture, protects the body organs.

20. Which of the following cells is phagocytic in nature?
(a) Mast cell (b) Podocytes
(c) Macrophages (d) Fibroblast cells

AFMC-2000

Ans. (c) : Neutrophils, Monocyte and Macrophages are types of white blood cells. The granular white blood cells. Neutrophils eosinophils and a granular leucocyte including monocyte and tissue macrophages are phagocytic in nature.

21. Which of the following sets of cell organelles contain DNA?
(a) Nucleus, chloroplast, mitochondria
(b) Nucleus, ribosome, lysosome
(c) Chloroplast, mitochondria, ribosome
(d) Nucleus, nucleolus, ribosomes

BHU PMT-2002

@apna_pdf

Ans. (a) : The nucleus contains the cellular DNA which is used as the primary regulating DNA. Most cellular process are regulated and controlled by the DNA in the nucleus expect the nucleus mitochondria and chloroplast have their own DNA in a circular form as the prokaryotic cells.

22. Those cells lipid is actively synthesized contains more:

(a) Nucleus (b) R.E.R.
(c) S.E.R (d) Golgi body

Rajasthan PMT-1996

Ans. (c) : The smooth endoplasmic reticulum is the major site for synthesis of lipid. In animal cells lipid like steroidal hormones are synthesized in SER.

23. In synapsis two homologous chromosomes are connected at

(a) centromeres (b) chromomeres
(c) telomeres (d) none of these

MGIMS Wardha-2007

Ans. (a) : Chromosomes that are identical to each other are chromosomes that have their chromosomal arms and the same genes arranged in the same order. They are joined to the centromere.

24. The unit used for the measurement of size of cell is

(a) nm (b) mm
(c) Å (d) μm

Manipal-2011

Ans. (d) : Measuring unit of size of the cells is micrometer.

25. Match the Column I with that of Column II and chose the correct combination from the options given,

Column I - Organelle		Column II – Site for	
p.	Rough ER	1.	Synthesis of glycoproteins
q.	Smooth ER	2.	Aerobic respiration
r.	Mitochondria	3.	Synthesis of lipid
s.	Golgi apparatus	4.	Protein synthesis

(a) (p) - (1), (q) - (2), (r) - (3), (s) - (4)
(b) (p) - (2), (q) - (3), (r) - (4), (s) - (1)
(c) (p) - (3), (q) - (4), (r) - (2), (s) - (1)
(d) (p) - (4), (q) - (3), (r) - (2), (s) - (1)
(e) (p) - (4), (q) - (3), (r) - (1), (s) - (2)

Kerala PMT-2015

Ans. (d) :

Rough E R	Protein synthesis
Smooth E.R	Synthesis of lipid.
Mitochondria	Aerobic respiration
Golgi apparatus	Synthesis of glycoproteins.

26. The collection of various types of molecules in a cells is called

(a) Primordial soup (b) Cellular broth
(c) Cellular pool (d) Molecular broth

Ans. (c) : The term cellular pool refers to the collection of different kinds of molecules that compose the cell. It refers to all the various molecules that compose a cell including proteins, lipid, nucleic acid, sugar and organic and inorganic components required for the survival and operation of the cell.

27. Inside a cell, the respiratory enzyme are contained in

(a) Lysosomes (b) Ribosomes
(c) Acrosomes (d) None of these.

AMU-1998

Ans. (d) : The respiratory enzymes are present in the inner membrane of mitochondria. The enzymes for the citric acid cycle (krebs cycle) are located in the matrix.

28. Chemical composition of protoplasm contains :

(a) O, C, H and N
(b) O, N and Fe
(c) O, protein and minerals
(d) H, C and Fe

BVP - 2008
Rajasthan PMT-1998

Ans. (a) : Chemical composition of protoplasm

(i) Water- 80-90%

(ii) Organic matter → Protein (largest), fat, carbohydrate, enzymes, Hormones, Vitamin

Macro elements ranges in large quantity.

Oxygen	-	62%
Carbon	-	20%
Hydrogen	-	10%
Nitrogen	-	3%
Phosphorous	-	1.14%

29. Pure fractions of cellular component can be isolated by

(a) chromatography
(b) scanning electron microscopy
(c) X-ray
(d) differential centrifugation

Kerala CET-2005
Manipal-2013

Ans. (d) : This method involves a series of centrifugation steps at different speed to sequentially isolate different cellular components based on their sedimentation rate.

30. Dutrochet has given the concept about cell in

(a) 1834 (b) 1814
(c) 1822 (d) 1824

JIPMER-2013

Ans. (d) : French scientists Dutrochet is credit with the cell theory. He discovered the connection between the plant cell and animal cell in his theory. He said that cell is a structural unit as well as physiological unit.

31. The theory that all the cells arise from pre-existing cells (Omnis cellula e cellula) was proposed by

(a) Schwann (1839) (b) Brown (1831)
(c) Virchow (1855) (d) Schleiden (1938)

CG PMT-2010
AMU-2015

Ans. (c) : Rudolf Virchow (1855) first explained that cells divided and new cells are formed from pre-existing cells (Omnis cellula-e-cellula).

@apna_pdf

32. The main arena of various types of activities of a cell is –

(a) Plasma membrane (b) Mitochondrian
(c) Cytoplasm (d) Nucleus

AIPMT (Screening)-2010

Ans. (c) : The cytoplasm is the main arena of cellular activities in both the plant and animal cells. various chemical reactions occur in it to keep the cell in the 'living state'

- Plasma membrane separates the intracellular and extracellular compartments of the cell.
- Mitochondria is involved in the production of ATP.
- Nucleus is the central processing unit of the cells, controlling the metabolic activities occurring in the cell.

33. Silk is obtained from:

(a) Bombyx mori (b) Laccifer lacca
(c) Apis mellifera (d) None of these

J&K CET-2004

Ans. (a) : The domestic silk moth, *Bomboxy mori* is a member of the Bombycidae family of moths. Its nearest cousin is the *Bomboxy mondarina* wild silk moth. The caterpillar or larva of a silk moth is called as silkworm. It is significant insect economically and the main source of silk.

34. The type of cell junction which facilitates cell to cell communication is

(a) tight junction (b) adhering junction
(c) gap junction (d) desmosomes
(e) brush borders

Kerala PMT-2008

Ans. (c) : Gap junctions connecting the cytoplasm of adjacent cells to make it easier for cells to interact with out another and allow for the quick movement of ions, small molecules and occasionally larger molecules.

35. The cytoplasm of neighbouring cells is connected with the help of

(a) Middle lamella
(b) Primary wall
(c) Mitochondria
(d) Endomembrane system
(e) Plasmodesmata

Kerala PMT-2012
Punjab MET-2006

Ans. (e). Plasmodesmata are cytoplasm threads or cytoplasmic bridge between two adjacent cells occurs in the plant cell exchange of material or communication between adjacent cell occurs through the plasmodesmata. It was first observed and named plasmodesmata is the by Star burger (1901).

36. By weight the most abundant element in a cell is

(a) carbon (b) hydrogen
(c) oxygen (d) sodium.

AMU-1995

Ans. (c) : Oxygen is the most abundant element found in the human body and it consists of 65% of the total weight. Carbon is the second most abundant element found in the human body and consist of 18.5% of the total weight. Hydrogen consists of 9.5% of the total weight of the human body. Sodium is an alkali metal.

37. A major breakthrough in the studies of cells came with the development of electron microscope. This is because

(a) The resolution power of the electron microscope is much higher than that of the light microscope.
(b) The resolving power of the electron microscope is 200-350 nm as compared to 0.1-0.2 nm for the light microscope.
(c) Electron beam can pass through thick materials, whereas light microscope requires thin sections.
(d) The electron microscope is more powerful than the light microscope as it uses a beam of electrons which has wavelength much longer than that of photons.

AIPMT-2006

Ans. (a) : An electron microscope is a microscope that use a beam of electrons as a source of illumination. The resolution power of the electron microscope is much higher than that of the light microscope.
The increased resolution results from the shorter wavelength of the electron beam, by exocytosis at the plasma membrane.

38. Living cell contains 60 - 75% water. Water present in human body is

(a) 60 - 65% (b) 50 - 55%
(c) 75 - 80% (d) 65 - 70%

AIPMT-1992

Ans. (d) : Water is most abundant substance in living beings. The water content of actively living cells varies between 60-75% .Brain contains 80 – 82% of water in whole human body. The amount of water in the body of human beings changes as per sex, age and also hydration levels.

39. Acetabularia used in Hammerling's nucleocytoplasmic experiments is:

(a) Unicellular fungus
(b) Multicellular fungus
(c) Unicellular uninucleate green algae
(d) Unicellular multinucleate green algae

AIPMT-1989

Ans. (c) : Unicellular uninucleate green algae called *Acetabularia* was used in Hammerlings nucleocytoplasmic experiments. Exchanging rhizoid and stalk was part of Hammerlings work with *Acetabularia*.

40. Nucleoproteins are synthesized in:

(a) Nucleoplasm (b) Nuclear envelope
(c) Nucleolus (d) Cytoplasm

AIPMT-1989

Ans. (d) : Nucleoproteins are conjugated proteins present in cells of living organisms that consist or nucleic acid with protein. Nucleoproteins are synthesized in cytoplasm of the cell.

41. Hammerling's experiments on Acetabularia involved exchanging:

(a) Cytoplasm (b) Nucleus
(c) Rhizoid and stalk (d) Gametes

AIPMT-1990

@apna_pdf

Ans. (c) : Acetabularia cell is made up of three segments rhizoid or base, stalk and cap. rhizoid are contains the mucleus. Hammerling's experiments on Acetabularia involved exchange of rhizoid and stalk.

42. According to modern colloidal theory, the protoplasm is a polyphasic colloidal system. This was first suggested by:

(a) Purkinje (b) Max Schultze
(c) R.A. Fisher (d) E. Strasburger

JCECE-2002

Ans. (c) : Modern colloidal theory was proposed by 'R.A Fisher'. According to this theory protoplasm is the polyphonic colloidal system. Protoplasm is a fluid substance which consists solid and semi-solid particles.

43. Solution of polyethylene glycol (PEG) or a very brief high voltage electric current is used in fusion of

(a) protoplasms (b) protoplasts
(c) somatic cells (d) germinal cells

Punjab MET-2007

Ans. (b) : Polyethylene glycols (PEGs) are products of condensed ethylene oxide and water that can have various derivatives and functions.
Protoplast are naked cells from which cell wall has been removed. Fusions of protoplast is done with solution of PEG or a very brief high voltage current.

44. Which of the following cells are round and biconcave in shape ?

(a) White blood cells
(b) Red blood cells
(c) Columnar epithelial cells
(d) Nerve cells
(e) Mesophyll cells

Kerala PMT-2011

Ans. (b) : The basic feature of human RBCs are circular (round) biconcave and non-nucleated with a diameter of about 7 μm or 10^{-6} meter. WBCs shape is irregular. Columnar epithelium consists of elongated or column like cells. Nerve cells are also called neurons mesophylls are the internal ground tissue present in leaves.

45. The branch of Biology dealing with structure, function and reproduction of cell is:

(a) Cytology (b) Anatomy
(c) Histology (d) Cell biology

J&K CET-2005

Ans. (d) : The study of structure and function of the cell called cell biology including. Physiology, biochemistry and genetics. Cytology is the study of structure of cell where as histology is the study of tissue and cells.

46. Comparing small and large cells, which statement is correct?

(a) Small cells have a small surface area per volume ratio
(b) Exchange rate of nutrients is fast with large cells
(c) Small cells have a large surface area per volume ratio
(d) Exchange rate of nutrients is slow with small cells

DUMET-2011

Ans. (c) : To maintain surface area - to - volume ratio in a balanced state, some cells are provided with microvilli, which increases the absorptive area. In small cells the random, tiny motions of molecules can easily distribute material. Small cell have a large surface area per volume ratio.

47. Which of the following is not a function of water in cell?

(a) It provides energy for chemical reaction
(b) It act as a solvent
(c) It provides a medium for chemical reaction
(d) It release hydrogen ions on ionization

Rajasthan PMT-2002

Ans. (a) : Providing energy for chemical reaction is not a function of water in cell. Water use as universal solvent and act as a maintain a cell inside.

48. A cell is kept in a solution for sometimes, when it bursts. The solution should be :

(a) isotonic (b) hypertonic
(c) hypotonic (d) monotonic

Manipal-2001

Ans. (c) : A cell kept in a certain solution bursts after sometime. Due to the inward movement of water, that is called endosmosis and the type of solution in which endosmosis takes place is known as a hypotonic solution. In a hypotonic solution solute concentration is lower than that of the solute concentration inside the cell, thus facilitating endosmosis leading to the bursting of cell.
Solution that contain the same concentration of water and solutes as the cell cytoplasm are called is isotonic solution. Solution that has a higher concentration of solutes on the outside of a cell is hypertonic solution.

49. Auxetic growth is increase in

(a) cell volume only
(b) cell number only
(c) fatty tissue
(d) intercellular material

BVP-2014

Ans. (a) : Auxetic growth:- growth in certain organism happens as a result of an increase in cell size. There are exactly the same amount of cells. Cell growth result in an increase in body size. For example- Nematodes, rotifers and tunicates.

50. When a cell of diameter 2 μm grows to double its diameter, what will happen to its surface area volume relationship ?

(a) It will remain the same
(b) It will reduce to half
(c) It will double
(d) It can not be determined

Karnataka CET-2005

Ans. (b) :

Initial	Final
◯	◯
$d = 2\mu m$	$d = 4\ \mu m$
so $r = 1\mu m$	$r = 2\mu m$
Surface area $= 4\pi (1)^2$	$SA = 4\pi (2)^2$

@apna_pdf

Volume $= \frac{4}{3}\pi(1)^3$ Volume $= \frac{4}{3}\pi(2)^3$

$\frac{SA}{V} = \frac{4\pi\times1}{\frac{4}{3}\pi\times1} = 3:1$ $\therefore \frac{SA}{V} = \frac{4\pi\times4}{\frac{4}{3}\pi\times8} = 3:2$

Hence, the surface area volume relationship will reduce half.

51. Which of the following sentences is correct?

(a) Cells of all living organisms have a nucleus.
(b) Both animal and plant cells have a well defined cell wall.
(c) In prokaryotes there are no membrane bound cell organelles.
(d) Cells are formed de novo from abiotic materials.

Karnataka CET-2015

Ans. (c) : Prokaryotic cells are simple cells that don't have a nucleus or membrane - bound organelles. They do have DNA and Ribosome. The absence of intracellular compartmentalization indicates the primitive nature of prokaryotic cells. Eg. Bacteria blue green algae, archaea, mycoplasma etc.

52. Cell eating is called:

(a) osmosis (b) diffusion
(c) pinocytosis (d) phagocytosis

Karnataka CET-2000

Ans. (d) : The process which a cell consumes or engulfs a big particle is known as phagocytosis. As a result the phagocytic cell develops many compartments known as phagosomes. This is an additional endocytosis process.

53. The protoplasm is

(a) emulsion (b) colloidal
(c) suspension (d) None of these

JCECE-2014
CG PMT-2004

Ans. (b) : Protoplasm is clear translucent odorless colour less crystallo - colloid type of solution. (eg - sugar, salt acid crystal). Protoplasm is the mixture of the chemicals found in crystal formed. Eg - sugar, salt acid and bases.
On the other hand chemicals of colloidal nature. Eg - Protein, lipids and polysaccharids. An emulsion is a solution of two or more immiscible liquids where one liquid contains a dispersion of the other liquids. A suspension is a heterogeneous mixture.

54. The physical basis of life is

(a) nucleus (b) sex chromosomes
(c) protoplasm (d) DNA

CG PMT-2004

Ans. (c) : Huxley referred to protoplasm as ' Physical basis of life as all the properties of life reside in the protoplasm and also energy is generated in the protoplasm. The nucleus is called the director of the cell as it controls and conducts all activities of a cell. Sex chromosomes are the chromosomes that are responsible for sex determination.

55. Cork cells are dead because they do not possess

(a) Cellulosic cell wall
(b) Permeable cell wall
(c) Protoplast
(d) Meristematic activities

CMC Vellore-2011

Ans. (c) : Cork cells are indeed dead at maturity because they lack several cellular components that are typically found in living cells. During the suberization the protoplast which includes the cells cytoplasm and nucleus, disintegrates and is lost. This means that cork cells no longer have the essential living components required for cellular metabolism.

B. Cell Theory

56. Cell theory was formulated by

(a) Schleiden and Robert Brown
(b) Schleiden and Schwann
(c) Schwann and Robert Brown
(d) Robert Hook and Robert Brown

Karnataka CET-2022
JIPMER-2008,2006
CGPMT-2006,2005
BVP-2002
AMU-2001
Rajasthan PMT-2000
Haryana PMT-1999

Ans. (b) : Cell theory was formulated by Mathias Schleiden and Theodor Schwann in the mid 19^{th} century. They both made significant contributions to the development of cell theory, which states that all living things are composed of one or more cells, the cell is the basic unit of life, and new cells arises from pre- existing cells.

57. The statement omnis cellula e cellula of Rudolf Virchow has been taken from his book:

(a) Cellular pathology (b) Cellular potency
(c) Micrographia (d) Scala naturae

NEET-2019
Manipal-2006, 2014
JIPMER-2011
Rajasthan PMT - 2011
AMU – 2015 / AIIMS-2007

Ans. (a) : The statement Omnis cellula e cellula of Rudolf Virchow has been taken from his book cellular pathology.

58. Robert Hooke used the term cell in the year

(a) 1650 (b) 1665
(c) 1865 (d) 1960

MANIPAL-2008
Uttarakhand PMT-2008
BHU-PMT (Screening)-2008
BVP-2007 / BHU PMT-2004

Ans. (b) : Robert Hook- English botanist (1665)
(i) Coined the term cell
(ii) Discovered cell wall in cork cell.
(iii) Wrote a book Micrographia

59. The cell as a basic unit of structure of living things was discovered by :

(a) Aristotle
(b) Robert Hooke

@apna_pdf

(c) Schleiden and Schwann
(d) Gregor Mendel

J&K CET-2005, 2001
DUMET-2005
UP CPMT-2003

Ans. (b) : Robert Hooke was the first who discovered the cell. He observed honey comb like pattern in thin slice of the cork inclosed by thick cell wall and called it cell and published his work in his book 'Micrographia' which was published in 1665. Actually Robert Hooke discovered dead cell.

60. Identify the correct matches

	Column -I		column -II
A.	Tetany	i.	Autoimmune disorder
B.	Myasthenia gravis	ii.	Decreased bone mass
C.	Gout	iii.	Rapid muscle spasms
D.	Osteoporosis	iv	Accumulation of uric acid in joints

(a) A – iv, B – iii, C – ii, D – i
(b) A – i, B – iii, C – ii, D – iv
(c) A – iii, B – i, C – ii, D – iv
(d) A – iii, B – i, C – iv, D – ii

Ans. (d) :

A.	Tetany	iii.	Rapid muscle spasms
B.	Myasthenia gravis	i.	Autoimmune disorder
C.	Gout	iv.	Accumulation of uric acid in joints
D.	Osteoporosis	ii.	Decreased bone mass

61. Hypertrophy of RBC and spleenomegaly are the symptoms of

(a) Malaria (b) Amoebiasis
(c) Filariasis (d) Typhoid

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : The hypertrophy of RBC and spleenomegaly are the symptoms of malaria.
Typhoid– Typhoid fever is a potentially fetal infection caused by the Salmonella typhi bacteria.
Filariasis is caused by Wuchereria bancrofti.
Amoebiasis is caused by Entamoeba histolytica.

62. In human beings Lymphadentis is caused due to infection of

(a) common round worm
(b) Hooke worm
(c) Filarial worm
(d) Tape worm

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : In human beings Lymphadentis is caused due to infection of filarial worm (e.g.- Wuchereria bancrofti), filarial worm also called as-roundworm (Nematodes). Lymphadentilis is an infection of lymph nodes (also called nymph gland). It is a complication of certain bacterial infections.

63. Match the following lists:

	List I		List II
A	Leeuwenhoek	I)	Observed different kinds of cells forming the tissues in plants
B	Robert Brown	II)	Cell wall is the unique character of the plant cell
C	T. Schwann	III)	New cells are formed from- pre-existing cells
D	M. Schleiden	IV)	First to observe a living cell
E	Rudolf Virchow	V)	Observed nucleus in a cell

The correct match is:

	A	B	C	D	E
(a)	IV	III	V	I	II
(b)	IV	II	V	I	III
(c)	IV	V	II	I	III
(d)	IV	V	I	II	III

TS EAMCET-31.07.2022 Shift-I

Ans. (c) : Leeuwenhoek - First to observe a living cell
Robert Brown - Observed nucleus
T. Schwann - Cell wall is the unique character of the plant cell
M. Schleiden - Observed different kinds of cell forming the tissue in plant
Rudolf Virchow - New cells are formed from pre-existing cells.

64. Fill up the blanks with suitable words.
Schleiden __i__ observed that all plants are composed of different kind of cells.
Schwann __ii__ studied animal cells and reported that plants have __iii__ and all cells have __iv__, and Virchow explained that cells divide and form new cells from __v__. This constitute __vi__.

(A) Cell theory
(B) Zoologist
(C) Existing cells
(D) Cell wall
(E) Plasma membranes
(F) Botanist

Options:

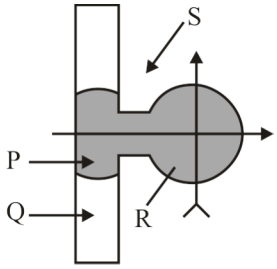
	i	ii	iii	iv	v	vi
(a)	B,	F,	E,	D,	C,	A
(b)	F,	B,	E,	D,	A,	C
(c)	A,	B,	C,	D,	E,	F
(d)	F,	B,	D,	E,	C,	A

TS EAMCET-28.09.2020 Shift-I

Ans. (d) : Schleiden was a Botanist observed that all plant are composed of different kind of cells. Schwann was a Zoologist studied animal cells have plasma membrane and Virchow explained that cells divide and form new cells from existing cells. This constitute cell theory.

@apna_pdf

65. Identify the part which is made up of peripheral membrane protein complex in the given figure?



(a) P (b) R
(c) Q (d) S

GUJCET-2018

Ans. (b): In the given figure peripheral membrane protein is R and Integral membrane protein is P.

66. Which one of the following is a correct match?
(a) Filariasis - Taenia solium
(b) Encephalitis - Culex vishnui
(c) Malaria - Phlebotomus sp.
(d) Kala - azar - Anopheles Stephensi

WB JEE-2012

Ans. (b) :
Filariasis → *Wuchereria bancrofti*
Encephalitis → Herpes simplex viruses
Malaria → Female Anopheles
Kala-azar → *Leishmania donovani* vector by sand fly (phlebotomus)

67. Schleiden (1838) proposed that cell is the structural and functional unit of life. His idea was a
(a) assumption (b) generalisation
(c) hypothesis (d) observation

UP CPMT-2004

Ans. (c) : Schleider (1838) proposed that cell is the structural and functional unit of life. His idea was a hypothesis. Schleiden defined the cell as the basic unit of plant structure. It is suggested that every structural part of a plant was made up of cells or the result of cells.

68. The cell theory is not applicable to
(a) algae (b) fungi
(c) viruses (d) lichens

Manipal-2011

Ans. (c) : The cell theory is applicable to most living organisms, it does not apply to viruses. Viruses are acellular organisms. They are not composed of cells. They are composed of genetic material (DNA or RNA) surrounded by a protein coat, and they cannot carry out essential like processes on their own, So the viruses fall outside the scope of the cell theory.

69. The replication of DNA is a pre-requisite for a eukaryotic cell to undergo division. During the cell cycle the DNA replicates in
(a) S phase (b) G_1 phase
(c) G_2 phase (d) M phase

AFMC-2007

Ans. (a) : S-phase (phase of DNA synthesis) & DNA replication a normal diploid somatic cell with a 2N complement of DNA at the beginning of S-phase acquires a 4N complement of DNA at its end.

70. All tissues consist of cells sentence was said by:
(a) Wallace (b) Virchow
(c) Schleiden (d) none of these

JIPMER-2003

Ans. (c) : In 1838 Mathias Schleiden a German botanist examined a large number of plant observed that all plants are composed of different kinds of cells which form the tissues of the plants.

71. The study related to the structure and function of a cell is called as:
(a) physiology (b) cytology
(c) histology (d) cellology

JCECE - 2005
Punjab MET -2004
Manipal-2000,2002

Ans. (b) : Cytology is the field that uses the smallest possible tissue sample for diagnosis, reducing criteria as much as possible to the cellular level.

72. Nucleated RBC is present in:
(a) man (b) rat
(c) frog (d) rabbit

Haryana PMT-2005

Ans. (c) : The class of animals known as amphibian includes frogs. Red blood cells in amphibians are nuclear. Their nucleus included DNA, the same genetics material found in every other cell.

73. The smallest free living organism is
(a) virus (b) mycoplasma
(c) diatom (d) cyano bacterium

CG PMT-2009
Haryana PMT-2009

Ans. (b) : The mycoplasma are organisms that completely lack a cell wall. They are the smallest living cell known and can survive without oxygen. Many mycoplasma are pathogenic in animals and plants.

74. Organisms without any specific shape are
(a) mycoplasma (b) bacteria
(c) viruses (d) cyanobacteria

CG PMT-2006

Ans. (a) : Organisms without any specific shape are-Mycoplasma
- Bacteria are the sole members of the kingdom Monera. They are the most abundant micro-organism.
- Cyanobacteria is also known as Blue green algae.

75. Robert Hooke thought of the cells, he observed that:
(a) something similar to veins and arteries of animals for conducting fluid
(b) smallest structural unit
(c) smallest functional unit
(d) unit of heredity

Manipal-2006

Ans. (a) The word "cell" was first used by Robert Hooke in 1665. He compared the cells he observed to the arteries and veins of animals because they contains Juice in live plants.

@apna_pdf

76. Mycoplasmas differs from other bacteria in their

(a) DNA (b) RNA
(c) Cell wall (d) Nutrition

CG PMT-2010

Ans. (c) : Mycoplasmas are unique among bacteria because they lack cell wall. Instead of having a rigid peptidoglycan cell wall like most bacteria, they have flexible cell membrane that contains sterols, which provide stability to the cell.

77. Which are the longest cells in the body of man?

(a) Muscle cells of legs (b) Bone cells
(c) Nerve cells (d) None of the above

BVP-2012

Ans. (c) : The longest cell in the human body are nerve cells, also known as neurons. Neurons are the building blocks of the nervous system and are responsible for transmitting information throughout the body.

78. Which of the following theory explain structure of protoplasm?

(a) Surface tension theory
(b) Colloidal theory
(c) Sol-gel theory
(d) Viscosity theory

BVP-2008
Uttarakhand PMT-2007

Ans. (b) : Colloidal theory proposed by Fischer (1894), Hardy (1898), Wilson (1925). According to this theory protoplasm is the polyphasic colloidal system.
The size of colloid particles between more than >.001 μm and less than <.1 μm. Such solute particles called the colloids. e.g – Protein lipids, Milk albumin and solution is called colloidal solution. The colloidal solution has the properties of both true solution and suspension due to the colloidal nature it appears like the jelly like gelatinous viscous and shows elasticity plasticity, contraction, and expansion.

79. Which is correct about cell theory in view of current status of our knowledge about cell structure?

(a) It needs modification due to discovery of sub cellular structures like chloroplasts and mitochondria.
(b) Modified cell theory means that all living being are composed of cells capable of reproducing.
(c) Cell theory does not hold good because all living beings (e.g., viruses) do not have cellular organisation.
(d) Cell theory means that all living objects consists of cells whether or not capable of reproducing.

AIPMT-1993

Ans. (c) : Cell theory does not hold good because all living being do not have cellular organization. This statement is correct about cell theory in view of current status of our knowledge about cell structure. The cell is the basic unit of structure and organization in organisms.

80. The 'Cell theory" states that

(a) all cells have nuclei
(b) cells are the fundamental structural matter of plants and animals
(c) all cells are living
(d) cells reproduce by mitosis and meiosis

CG PMT-2004

Ans. (b) : Cell theory was given by M. Schleiden - (Botanist) and Schwann (Zoologist) (1839) both were German. According to cell theory cell is the structural and functional unit of life, all cells are similar in their chemical composition and metabolism.

81. Witches broom disease is caused by :

(a) fungus (b) phytoplasma
(c) bacteria (d) mineral

Punjab MET-2004

Ans. (b) : Witches brooms are a kind of symptom of plant disease. In this, the plant appears abnormal. Brush - like cluster's s develop is the weak shoots at the same point. The branches may die. It can be caused by a number of pathogens including mites, fungi virus etc. But in the case of potato it is caused by phytoplasma.

C. Outline of Cell

82. Statement I : Mature β-cells synthesis various types of antibodies which are displayed on their membranes.
Statement II : Antigenic site binds to an antibody is called epitope

(a) Both statement I and statement II are true
(b) Both statement I and statement II are false
(c) Statement I is true but statement II is false
(d) Statement I is false but statement II is true

TS EAMCET-09.08.2021 Shift-II

Ans. (a): Mature β-cells can synthesize and display membrane-bound Ig, which is distinct from other lymphocytes. Each mature B-cell clone only secretes one of antibody, which can bind a specific antigen.
The small site on antigen to which a complementary antibody may specifically bind is called an epitopes or antigenic determinant.
Both Statement I and Statement II are true.

83. What will be the genotype of a carrier individual who shows sickle cell anaemic trait

(a) $Hb^B Hb^B$ (b) $Hb^A Hb^S$
(c) $Hb^S Hb^S$ (d) $Hb^A Hb^A$

MHT CET-04.10.2020 Shift-I

Ans. (b) : Sickle cell anaemia is an autosomal linked recessive disease that can be transmitted from parents to the offspring's when both the partners are heterozygous. This disease controlled by single pair of allele, Hb^A and Hb^s.

84. Chemical nature of cellulose is:

(a) Polypeptide (b) polysaccharide
(c) polynucleotide (d) disaccharide

J&K CET-2004

Ans. (b) : Cellulose is a polysaccharide in plant cell wall is made up of cellulose α – D glucose Units, Hemicellulose, (arabinose, Mannose, Xylose, galactose, etc) and pectin (galatose, galacturonic acid and arabinose). Chemical formula of cellulose is $(C_6 H_{10}O_5)_n$.

@apna_pdf

85. Match the columns and identify the correct option

Column I	Column II
(A) Thylakoid	**(i) Disc-shaped sacs Golgi apparatus**
(B) Cristae	**(ii) Condensed structure of DNA**
(C) Cisternae	**(iii) Flat membranous sacs in stroma**
(D) Chromatin	**(iv) Infoldings in mitochondria**

	(A)	**(B)**	**(C)**	**(D)**
(a)	(iii)	(iv)	(ii)	(i)
(b)	(iv)	(iii)	(i)	(ii)
(c)	(iii)	(iv)	(i)	(ii)
(d)	(iii)	(i)	(iv)	(ii)

AIPMT (Re-Exam)-2015

Ans. (c) :

Thylakoid – Flat membranous sacs in stroma of chloroplast.

Cristae – Infoldings in mitochondria.

Cisternae – Disc-shaped sacs in Golgi apparatus.

Chromatin – Condensed structure of DNA.

The Thylakoid are arranged into stacked and unstaked regions called grana and stroma thylakoid respectively that are differentially enriched in photosystem I and II complexes.

- Cristae are infoldings in mitochondria, which greatly increases the surface area of the inner membrane.
- Cisternae are disc shaped sacs in Golgi apparatus.
- Chromatin are condensed structure of DNA.

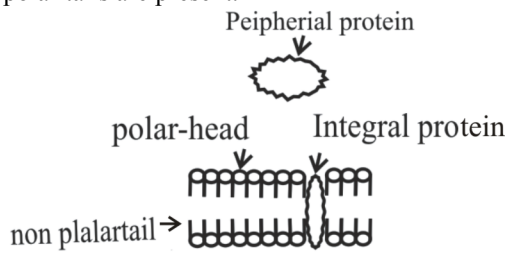
86. In fluid mosaic model of plasma membrane

(a) Upper layer is non-polar and hydrophilic
(b) Polar layer is hydrophobic
(c) Phospholipids form a bimolecular layer in middle part
(d) Proteins form a middle layer

AIPMT-2002

Ans. (c) : Fluid mosaic model of the plasma membrane was proposed by S. J. singer and Garth L. Nicolson .

According to this model, the plasma membrane is a phospholipid bilayer in which the proteins cholestrol and carbohydrates are integrated which give it a mosaic like appearance. In Phospholipids layer upper or outer part like hydrophilic and polar heads of the lipid molecules and inner side of the bilayer hydrophobic & non-polar tails are present.



87. The microscope usually used for seeing living cells or tissues is

(a) compound microscope
(b) electron microscope
(c) phase contrast microscope
(d) light microscope

AIIMS-2012
BVP-2012

Ans. (c) : Phase contrast microscope is used to study dynamic aspects of cells as the cells are living.

- Phase contrast microscopy is based on the principle that small changes in the phase can be transformed into changes in brightness of that object.
- Compound microscope is used for viewing samples at high magnification (40-1000). It contains two types of lenses that function of magnify an object.
- Electron microscope used in biomedical research to investigate the detailed structure of tissues and cells organelles and macromolecular complexes.
- Light microscope are used to view microscopic organism too small to be seen with the naked eye.

88. Genes not located within the nucleus are almost always found in

(a) Cytosol (b) Ribosome
(c) Cytoskeleton (d) Cell membrane

CMC Vellore-2011

Ans. (a) : Genes did not located within the nucleus are almost found in the cytosol. The cytosol is the fluid component of the cytoplasm, and it contains various cellular structures and molecules, including some genetic material, such as mitochondrial DNA.

89. T. Schwann and M Schleiden were :

(a) Dutch biologists (b) Austrian biologists
(c) German biologists (d) English biologists

Haryana PMT-2000
UP CPMT-2001
Haryana PMT-2004

Ans. (c) : Theodore Schwann and Mathias Schleiden were German scientist who made significant contribution to the field of biology. Theodore Schwann (1810-1882) was a German physiologist and one of the founder of the cell theory. He was Born in the city of Neuss, Which was part of the Kingdome of pursia.

Mathias Schleiden (1804-1881) was a German botanist and another important figure in the cell theory. He was born in the city of Hamburg Germany.

90. Read the statements and choose the correct option.

(I) Secretion of interferons is a physiological barrier of innate immunity.
(II) T-lymphocytes are responsible for cell mediated immunity.
(III) Injection given against snake venom is a type of active immunisation.
(IV) Antibodies produced during allergic reactions are of IgA type.

(a) I and II alone are correct
(b) II and IV alone are correct
(c) I alone is correct
(d) II and III alone are correct

@apna_pdf

(e) II alone is correct

Kerala PMT-2013

Ans. (e) : The cell mediated immunity is controlled by the T - Cell. T - lymphocytes initiate the cell mediated immune response by activating the antigen-specific B - cells. T cells have got long life span they are categorized as follows–
Cytotoxic T cells
Helper T cells
Supressor T cells
Memory T cells

D. Types of cell

91. Which of the following is found in animal cell?
(a) Plasmodesmata (b) 80 S ribosomes
(c) Centriole (d) All of these

VMMC-2011

Ans. (c) : Centrioles are small cylindrical, cellular structures found in eukaryotic cells (Animal cells). They play vital role in cell division and are essential components of the centrosome. Centrosomes are regions of the cell where microtubules are organized, and they serves as important centre for cell division.

92. Difference between prokaryote and eukaryote is:
(a) In cell size
(b) In cell shape
(c) In chemical composition of protoplasm
(d) In organization of nuclear material

Rajasthan PMT-2004

Ans. (d) :

Prokaryotic cell	Eukaryotic cell
(1) Cells that lack a well defined nucleus are called prokaryotic.	(1) Cells having a well-defined nucleus are called eukaryotic cells.
(2) Prokaryotic cells do not have membrane-bound nuclei or organelles.	(2) They contain a nucleus and organelles which are bounded by plasma membrane.
(3) They are unicellular Organisms.	(3) They are usually multicellular organisms

Directions: In the following question more than one of the answers given may be correct. Select the correct answer and mark it according to the code:

93. Idioblast is : (1) plant cell different from others (2) animal cell different from others (3) plant cell having cell inclusions (4) animal cell having cell inclusions
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2008, 2005

Ans. (d) : An idioblast is isolated plant cell that differs from neighboring tissues. They have various functions such as a storage of reserves excretory materials, pigments and minerals. They could contain oil, latex, gum, resin, tannin or pigments etc. Most commonly idioblasts are storage cells.
These cells can be classified into three types on the basis of their function –
(1) Excretory Idioblast
(2) Tracheoid Idioblast
(3) Sclerenchymatous Idioblast

94. Animal cell differ from plant cell in possessing
(a) Vacuoles (b) Centrosomes
(c) Plastids (d) Mitochondria

JIPMER-2013
Haryana PMT-1999

Ans. (b) : Animal cell differs from plant cell in possessing centrosome. Centrosome participates in the formation of spindle apparatus during cell division. Animal cells and plant cells both contain a few common constituents like the nucleus, cell membrane and cytoplasm.
The centrosome is a microtubule organizing center found near the nuclei of animal cells.

95. Which is the largest body cell?
(a) Neurons (b) RBCs
(c) Osteocytes (d) Sperms

Haryana PMT-2003

Ans. (a) : Nerve cells or Neurons are the longest body cells. These cells make up the nervous system of our body. These cells are therefore found in the brain and the spinal cord.

96. The organelles which play an important role in the formation of cell plate are:
(a) microtubules (b) endoplasmic reticulum
(c) ribosomes (d) Golgi complexes

AP EAMCET-2000

Ans. (d) : Golgi vesicles play an important role in cell plate formation during cytokinesis of plant cells. The number of Golgi bodies is generally 9 to 10 in a plant cell but is very high in cell engaged in the secretory activity and rapid division. The heavy dependence of cell plate formation on active Golgi stocks explains why plant cells, unlike animal cells, do not disassemble their secretion machinery during cell division.

97. Alginic acid is found in the cell wall of
(a) Gigartina (b) Laminaria
(c) Gelidium (d) Scytonema

CMC Vellore-2009

Ans. (b) : Laminaria is a brown algae. Food is stored as complex carbohydrate which may be in the form of laminarin or manitol.
• The vegetative cells have a cellulosic wall usually covered on the outside by a gelatinous coating of alginic acid.

98. Cell wall of a cell is removed, the remaining is called
(a) etioplast (b) aleuroplast
(c) amyloplast (d) protoplast

BCECE-2004

Ans. (d) : A plant cell without a cell wall is called a protoplast. The cell wall providing structural support and protection when the cell wall is removed, the remaining cell, containing the cell membrane and its contents is referred to as protoplast. Protoplast are commonly used in laboratory research for various purposes such as genetic information and fusion with other protoplast to create hybrid cells.

@apna_pdf

99. Which of the following cells of Leucosolenia sponge is self replicating and capable of giving rise to all other types of cells?

(a) Amoebocyte (b) Chromocyte
(c) Choanocyte (d) Collenocyte

AMU-2002

Ans. (a) : Leucosolenia:-
(1) Leucosolenia is simplest, marine, fixed, cylindrical and colonial sponge.
(2) It is radially summetrical & found in shallow sea water.
- Its mesenchyma has numerous irregular amoebocytes which may be following types.
- Archaeocytes:- Undifferentiated totipotent cells that have the potency to develop into other types of cells.
- Chromocytes:- Pigment cells.

100. Which of the characters are found in cells producing primary tissues ?

(I) Rich in protoplasm, conspicuous nucleus
(II) Thick cell wall, few plasmodesmatal connections
(III) Thin cell wall, many plasmodesmatal connections
(IV) Lignin in cell wall, inconspicuous nucleus

(a) (I, II) (b) (I, IV)
(c) (I, III) (d) (III, IV)

TS EAMCET-2015

Ans. (c) : The primary meristematic tissues are indeed derived from the promeristem or the embryonic meristem. They are indeed roughly spherical polyhedral, or rectangular in shape with thin primary cell walls, which consist mainly of cellulose and lack a secondary wall the dense cytoplasm with a prominent nucleus is typical of actively dividing cells as seen in meristematic tissues. Plasmodesmata are specialized channels or pores that connecting adjacent cell and facillating communication and transport of materials between them.

101. Which of the following structure is not found in a prokaryotic cell?

(a) Plasma membrane (b) Nuclear envelope
(c) Ribosome (d) Mesosome

AIPMT (Re-Exam)-2015

Ans. (b) : The nuclear envelope, also known as the nuclear membrane, is made up of two lipid bilayer membrane that in eukaryotic cells surround the nucleus, this nucleus envelope absent in prokaryote and genetic material is naked, laying in cytoplasm.
They however possess ribosome, mesosome and plasma membrane.
In prokaryote mesosome is a convoluted membranous structure formed in a prokaryote cell. By the invagination of plasma membrane.
These extention help in the synthesis of the cell wall and replication of DNA.
They help in equal distribution of chromosome into the daughter cells.
Mesosomes helps in secretion process as well as bacterial respiration.

102. The thickness of unit membrane is

(a) 20 Å (b) 35 Å
(c) 55 Å (d) 75 Å

BVP-2009

Ans. (d) : Cell membrane contain two lipid layers and two protein layers. Formula - PLLP (protein, lipid, lipid ,Protein) but as trilamillar or tripartite outer protein layer both are 20Å in thickness and lipid bilayer 35Å in thickness thus totals of the cell membrane approximately 75Å.

103. Match the following and choose the correct combination from the options given.

Column - I Cell type		Column - II Size	
A.	**Viruses**	**i.**	**1-2μm**
B.	**PPLO**	**ii.**	**10-20μm**
C.	**Eukaryotic cell**	**iii.**	**About 0.1μm**
D.	**Bacterium**	**iv.**	**0.02-0.2μm**

(a) a – 1, b – 2, c – 3, d – 4
(b) a – 4, b – 3, c – 2, d – 1
(c) a – 1, b – 3, c – 2, d – 4
(d) a – 4, b – 2, c – 3, d – 1
(e) a – 3, b – 4, c – 2, d – 1

Kerala PMT-2013

Ans. (b) : Viruses – 0.02 – 0.2 μm
PPLO – About 0.1 μm
Eukaryotic cell – 10 – 20 μm
Bacterium – 1 – 2μm

E. Prokaryotic Cell

104. Given below are two statements :
Statement I : In prokaryotes, the positively charged DNA is held with some negatively charged proteins in a region called nucleoid.
Statement II : In eukaryotes, the negatively charged DNA is wrapped around the positively charged histone octamer to form nucleosome.
In the light of the above statements, choose the correct answer from the options given below :

(a) Statement I incorrect but statement II is true.
(b) Both Statement I and Statement II are true.
(c) Both Statement I and Statement II are false.
(d) Statement I is correct but Statement II is false.

NEET (UG) 07.05.2023

Ans. (a) : The prokaryotes such as E.Coli do not have a defined nucleus in spite of this their DNA is not scattered throughout the cell.
- The negatively charged DNA is held with some positively changed proteins in a region called as nucleoid.
- The negatively charged DNA is wrapped around the positively changed histone octamer to form a structure called nucleosome.

105. Nucleoid is _____.

(a) chromatin material off eukaryotic cells.
(b) nuclear sap of eukaryotic cells.

@apna_pdf

(c) prokaryotic chromosome associated with proteins.
(d) spherical, acidophilic body present within distinct nucleus.

MHT CET-07.10.2020 Shift-I

Ans. (c) : Prokaryotes can be split into two domains; archaea and bacteria. In prokaryotic cell the intercellular water-soluble components; protein, DNA and metabolites are located together in the cytoplasm enclosed by the cell membrane rather than is separate cellular components.
And nucleoid is unevenly shaped portion that stores genetic material and is found in prokaryotic organisms.

106. Following are prokaryotic cells EXCEPT____

(a) Anabaena (b) Streptococcus
(c) Nostoc (d) Paramecium

MHT CET-04.10.2020 Shift-I

Ans. (d) : Prokaryotes are generally smaller and differ from processes eg, bacteria, blue green algae (Cynodbateria) archaic, mycoplasma etc.
Eukaryote is an organism (Unicellular or multicellular) Whose cells contain a true nucleus. Eg, Protozoa other algae metaphyta and metazoan.
Paramecium is a eukaryote it has well organized cells.

107. Genome of a prokaryotic cell is _____

(a) genes contained in diploid number of chromosomes
(b) total number of genes present in the chromosome
(c) total number of genes on sex chromosome
(d) genes contained in the plasmid

MHT CET-01.10.2020 Shift-I

Ans. (b) : While most prokaryotes like E. coli contain a single circular DNA molecule that makes up their entire genome recent studies have indicated that some prokaryotes contain as many as four linear or circular chromosome. For ex – *Vibrio chlerae* the bacteria that cause cholera, contains two circular chromosomes.

108. Choose the correct statement

(A) Mesosomes are exterior extensions of plasma membrane outside the cell
(B) In prokaryotic cells filamentous extensions of cell walls are called flagella
(C) The membrane of erythrocyte has nearly 70% protein and 20% lipids
(D) The Mitochondria, Chloroplast and peroxisomes are not co-ordinated with endomembrane system

Options:

(a) B, D (b) C, D
(c) B, C (d) A, D

AP EAMCET-25.04.2018 Shift-II

Ans. (a) : Flagella are primarily used for cell movement and are found in prokaryotes as well as some eukaryotes. The prokaryotic flagellum spins, creating forward movement by a corkscrew shaped filament.
Mesosomes are ingrowths from plasma membrane inside the cell.
The membrane of erythrocyte has nearly 52% protein and 40% lipids
Mitochondria, chloroplast and peroxisomes are not the part of endomembrane system because their function is not coordinated.

109. During mitosis, nuclear membrane disappears at

(a) telophase (b) late prophase
(c) late metaphase (d) anaphase

Tripura JEE-2017

Ans. (b) : In late prophase, the nuclear envelope starts to fragment, and by the time of prometaphase, it completely dissolves, allowing the mitotic spindle to interact with the chromosomes. This breakdown of the nuclear membrane is essential for the proper segregation of genetic material during mitosis.

110. The type of ribosome found in prokaryotic cell is

(a) 60 S (b) 70 S
(c) 80 S (d) 100 S

Tripura JEE-2017
Karnataka CET- 2011

Ans. (b) : Ribosome observed in plant cell. by 'Robinson and Brown.' But palade : observed in Ribosomes animal cell the ribosomes occurs in both prokariyotic and eukaryotic cell except mature R.B.C also occur in the nucleus, nucleolus, chloroplast; mitochondria. i.e organelle within the organelles. 2 types ribosome 70S ribosome's (larger sub unit 50 S + smaller unit 30 S). These ribosome's are found in prokaryotes. 80S ribosome (larger subunit 60 S + Smaller subunit 40 S). These ribosome's are found in Eukaryotic cells.

111. Identify the bacterium that appears violet after Gram staining

(a) Salmonella enterica
(b) Escherichia coli
(c) Mycobacterium tuberculosis
(d) Rhizobium meliloti

WB JEE-2012

Ans. (c) : Gram staining technique is based on the ability of bacteria to retain the crystal violet stain in their cell wall. Gram staining includes staining of both gram positive and gram-negative bacteria cell purple with crystal violet followed by stabilization of dye in peptidoglyacan layer with mordant gram's iodine and application of alcohol to dissolve outer membrane and dye from peptidoglyacan layer. Presence of thick petptidoglycan layer in gram positive cells make them retain the dye after alcohol treatment while gram-negative bacteria become colourless.

112. Pili in bacteria represent :

(a) flagella
(b) cilia
(c) extrachromosomal genetic element
(d) outgrowth of cell membrane of donor cell

BHU PMT-2001

Ans. (d) : Sex Pili structure are minute surface appendage which are found in some bacteria like E coli there surface appendages has special function.
It is made up of protein. They are involve the process of conjugation there synthesis depends upon the presence of conjugative genes which are found sex factor plasmid or factor plasmid.

@apna_pdf

113. In many bacteria, the cell membrane becomes invaginated and folded to form:
(a) Pili (b) Cristae
(c) Fimbriae (d) Mesosomes

Haryana PMT – 2003
Uttarakhand PMT-2004
Manipal - 2004

Ans. (d) : Mesosomes (Prokaryotic Mitochondria) was discovered by filzgam.
The invigination of cell membrane or plasma membrane it contains enzyme of replication, respiration due to the presence of these enzyme mesosome are called as mitochondria of the prokaryotes or power house of prokaryotes.
Function of mesosomes :-
(1) It in involved in the replication of DNA.
(2) It take part in respiration.
(3) It is involved in septum formation during binary fission.

114. A prokaryotic cell lacks
(a) True nucleus
(b) Nuclear membrane
(c) Membrane bound organelles
(d) All of the above

MGIMS Wardha-2010
WB JEE-2006
AFMC-2003

Ans. (d) : Prokaryotic cell are the primitive cells which are found in the early formed life on earth. A prokaryotic cell lacks a true nucleus, nuclear membrane and membrane bound organelles.

115. Assertion : Prokaryotic genome consist of a single circular DNA molecule.
Reason : Genetic variations do not occurs in Prokaryotes.
(a) If both assertion and reason are true and reason is the correct explanation of assertion.
(b) If both assertion and reason are true but reason is not the correct explanation of assertion.
(c) If assertion is true but reason is false.
(d) If both assertion and reason are false.

VMMC-2008

Ans. (c) : The assertion is true. Prokaryotic genome consist of a single circular DNA molecule, which is found in organisms like bacteria.
However the reason is false. Genetic variation do occur in prokaryotes. Prokaryotes can undergo various mechanisms of genetic variation, such as mutation horizontal gene transfer (ex-conjugation, transformation and transduction) and recombination.

116. The outer face of the outer membrane of Gram negative bacteria contains
(a) Peptidoglycans (b) Teichoic acid
(c) Lipopolysaccharides (d) Mycoic acid

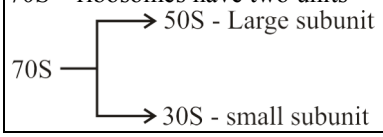
BCECE-2009

Ans. (c) : Gram negative bacteria have a thin peptidoglycon cell wall that is surrounded by a outer membrane containing lipopolysaccharides (LPS). This outer membrane is an important component of Gram-negative bacteria and provides them with additional protection and unique properties.

117. 70S ribosomes have two units. These are
(a) 50S + 30S (b) 40S + 30S
(c) 50S + 20S (d) 40S + 60S

BCECE-2009
J&K CET-2008

Ans. (a) : Ribosomes are of two types, 70 S and 80 S. 70 S ribosomes are present in prokaryotic cells and 80 S ribosomes are present in eukaryotic cells.
70S – ribosomes have two units



118. Respiratory mesosomes are also known as
(a) Mitochondria of bacteria
(b) Chondrioids
(c) Store house of respiratory enzyme
(d) All of the above

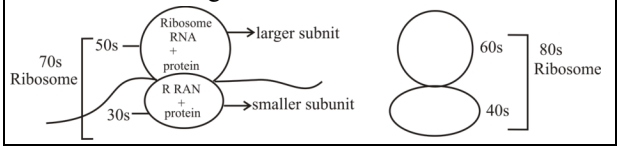
Haryana PMT-2011

Ans. (d) : Respiratory enzymes are located at the cell membrane or plasma membrane of prokaryotes. Mesosomes are the finger like infoldings of the cell membrane in bacterial cells.
Respiratory mesosomes are also known as Mitochondria of bacteria, Chondrioids, Store house of respiratory enzyme.

119. What is true about ribosomes?
(a) These are found only in eukaryotic cells
(b) These are self-splicing introns of some RNAs
(c) The prokaryotic ribosomes are 80S where 'S' stands for sedimentation coefficient
(d) These are composed of ribonucleic acid and proteins

AIPMT (Screening)-2012

Ans. (d) : Ribosome is a small spherical body within a living cell that is the site of protein synthesis and are composed of ribonucleic acid and proteins.
- Ribosome have 2 subunit that is 70S and which is present in prokaryotic cell consist to unit one larger and one smaller.
- 80S ribosome are found in eukaryotic cell where 'S' denotes Svedberg unit.



120. Genetic material of prokaryotic cell
(a) Non histonic double stranded DNA
(b) Histonic double stranded DNA
(c) Histone & DNA both are absent
(d) Histone without DNA

AIPMT-1999

Ans. (a) : Prokaryotic cells, such as bacteria, do not have a membrane- bound nucleus and lack histones, which are proteins that packages and organize DNA in eukaryotic cells, In prokaryotic cells, the genetic material is typically in the form of non-histonic double stranded DNA that floater freely in the cytoplasm.

@apna_pdf

121. Exponential growth is shown by
(a) Unicellular forms
(b) A cell in tissue culture
(c) Embryo
(d) Multicellular plants

AIPMT-1999

Ans. (b) : During the log phase of growth in tissue culture, cells typically exhibit exponential growth this means that the number of cells doubles at regular intervals, leading to rapid increase in cell population.

122. Prokaryotic cells occur in:
(a) PPLO (b) bacteria
(c) cyanobacteria (d) all of these

J&K CET-2002

Ans. (d) : (Greek : Pro - Primitive + karyon - nucleus)
Here primitive or ill defined or incident nucleus is present eg in bacteria, blue green algae (lyxophyceae or cyano phycease or cynobacteria) and PPLO (Pleuro pneumonia like organism) i.e. akaryobionta.
The most extensively studied prokaryote is E. coli. Common bacterium found in intestine of human beings.

123. Broad spectrum antibiotics are those which :
(a) acts on all bacteria and viruses
(b) is effective in very small amounts
(c) acts on both pathogen and host
(d) acts on a variety of pathogenic

Uttarakhand PMT-2006

Ans. (d) : Broad spectrum antibiotics are medications that are effective against a wide range of bacteria, including both Gram positive and Gram negative bacteria. They are not specific to a particular type of bacteria, making them useful when the exact cause of the infection in unknown.

124. Consider the following statements
A. In prokaryotic cells, a special membranous structure formed by the extension of the plasma membrane into the cell is known as polysome
B. The smooth endoplasmic reticulum is the major site for synthesis of glycoproteins
C. RuBisCO is the most abundant protein in the whole of biosphere
D. Mitochondria, chloroplasts and peroxisomes are not considered as part of endomembrane system
Of the above statements
(a) C and D alone are correct
(b) A and B alone are correct
(c) B and C alone are correct
(d) A and D alone are correct
(e) B and D alone are correct

Kerala PMT-2012

Ans. (a) : RuBisCO (Ribulose-15 Biphasphate carboxylase/oxygenase)
Which is bifunctional or Dual in nature. It has affinity with CO_2 and functions as carboxylation and also has affinity with O_2 and act as oxygenation it is most Abundently found on the earth. An about 16% protein of total chloroplast.
Functions of mitochondria, chloroplast and peroxisomes are not coordinated with ER, Golgi complex: lysosomes and vacuoles. Hence these are not considered as a part of the end membrane system.

125. Scientific name of green gram is
(a) Vigna mungo (b) Vigna radiata
(c) Phaseolus mungo (d) Phaseolus sinensis

JCECE-2010

Ans. (b) : The scientific name of green gram is *Vigna radiata*. At is the angiospermic plant belonging to the legume called fabaceae.

126. Which one of the following is not an inclusion body found in prokaryotes ?
(a) Cyanophycean granule
(b) Glycogen granule
(c) Polysome
(d) Phosphate granule

AIPMT-2015

Ans. (c) : Polysome is not an inclusion body found in prokaryotes. Polysome is an aggregation of ribosomes formed under conditions of high concentration of magnesium. An inclusion body is any of various particulate structure. Usually proteins, formed after viral infections in a prokaryotic or eukaryotic cell.
Cell inclusions are considered various nutrient or pigments that can be found within the cell.
Example - Cynophycean granule, Glycogen Granule and phosphate granule.

127. In prokaryotes, chromatophores are
(a) Specialized granules responsible for coloration of cells
(b) Structures responsbile for organizing the shape of the organism
(c) Inclusion bodies lying free inside the cells for carrying out various metabolic activities
(d) Internal membrane systems that may become extensive and complex in photosynthetic bacteria

AIIMS-2006

Ans. (d) : In prokaryotes chromatophores are internal membrane systems that can become extensive and complex in photosynthetic bacteria, these specialized membrane structures house the pigment and other components necessary for photosynthesis, enabling these bacteria to capture and convert light energy into chemical energy.

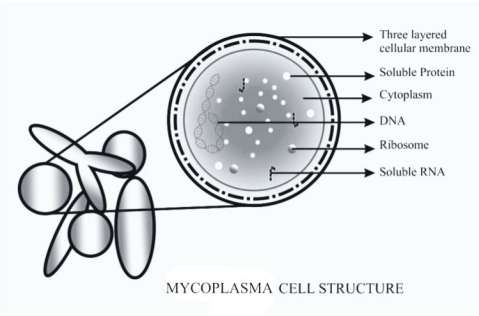
128. The outermost limiting layer of mycoplasma is made up of:
(a) Cell wall (b) Cell membrane
(c) Mucilaginous sheath (d) Slime layer

AIIMS-2009

Ans. (b) : Mycoplasma is a genus of the kingdom monera and smallest bacteria. Its outer limiting layer is formed of cell membrane. They do not have cell wall around the cell membrane So, their cell lack a specific shape. In the absence of a cell wall, they are found to be resistant to many antibiotics like penicillium.
• Plants and cyanobacteria show the presence of mucilaginous sheath which made up of thick gluey substance called **mucilage**.

@apna_pdf

• Slime layer is loosely associated glycoprotein layer which is present outside the cell wall.



MYCOPLASMA CELL STRUCTURE

129. The cells of the bacterium Streptococcus remain arranged in the form of

(a) chain (b) irregular cluster
(c) cube (d) plate

CG PMT-2005

Ans. (a) : Streptococcus bacteria are a type of spherical bacteria which is found in chain. The classification of streptococcus is done on the basis of the blood. Hemolysis – alpha hemolysis beta hemolysis and gamma hemolysis vibrio bacteria are comma-shaped bacteria.

130. In a bacterial cell, the organelle with respiratory enzymes is

(a) mitochondria (b) chondrisome
(c) mesosome (d) centrosome

CG PMT-2005

Ans. (c) : In a bacterial cell, the organelle with respiratory enzymes it the mesosomes. Mesosomes are invagination of the plasma membrane in prokaryotic cells, and they are involved in various functions, including respiratory processes like aerobic respiration and energy production.

131. The genetic material of prokaryotic cells is called

(a) nucleus (b) nucleolus
(c) nucleoide (d) centrosome

CG PMT-2005

Ans. (c) : A nucleoid is an irregularly shaped region in a prokaryotic cell. The genetic material of prokaryotes is circular type of DNA present in the cell centre called Nucleoid. The cell is devoid of a proper nucleus and cell organelles. Since there is no nucleus the cell is attached to cell membrane and is in direct contact with the cytoplasm.

132. In which, mitosis does not occur?

(a) Green algae (b) Fungi
(c) Bacteria (d) higher plants

CG PMT-2005

Ans. (c) : Mitosis or mitotic division is meant for multiplication of cells. Mitosis generally takes place in vegetative or somatic cells. It creates two indentical daughter cells from one mother cell. Cell must have nucleus to undergo mitosis. A fertilized egg undergoes number of mitotic division to from zygote

In plants mitosis occurs in the meristematic cell mitosis does not occurs in bacterial cell as bacterial cell does not have a nucleus.

133. Intracellular compartments are not found in the cells of

(a) lower plants (b) prokaryotes
(c) higher plants (d) eukaryotes

WB JEE-2007

Ans. (b) : Intracellular compartments are not found in the cells of prokaryotes. Prokaryotic cells lack membrane-bound organelles , which are characteristic features of eukaryotic cells.

134. Mesosome in a bacterial cell is :

(a) plasmid
(b) connection between two cells
(c) plasma membrane infolded for respiration
(d) none of these

Manipal-2005

Ans. (c) : The mesosome is an enfolding of the bacterial cell membrane found in some bacterial species. It plays role in cellular respiration and is involved in increasing the surface area for enzymatic reactions, much like the function of eukaryotic mitochondria.

135. In prokaryotes the Glycocalyx when it is thick is called

(a) Slime layer (b) Mesosome
(c) Capsule (d) Cell wall

Karnataka CET-2015

Ans. (c) : In prokaryotes, when the glycocalyx is thick and thick and well- organized it is called a capsule. The capsule is a protective layer outside the cell wall, and it helps the bacterium evade the host immune system and aids in attachment to surfaces.

On the other hand, a thin and unorganized glycocalyx is known as a slime layer. Mesosomes are imagination of the cell membrane and are not related to the glycokalyx.

136. Following is not present in prokaryotic cell

(a) Smooth ER (b) Mitochondria
(c) Golgi body (d) All of the above

Rajasthan PMT-1995

Ans. (d) : The absence of intercellular compartmentalization indicates the primitive nature of prokaryotic cell. Prokaryotes are the organism belonging to kingdom monera and consists of cell types of bacteria absence of nuclear membrane and other membrane bound organelles such as mitochondria, endoplasmic reticulum, Golgi apparatus, vacuoles and lysosome.

137. Extension of plasma membrane in prokaryotic cell is

(a) mesosome (b) hapnoid
(c) ribosome (d) none of these

DUMET-2007

Ans. (a) : Mesosome or chondrioid are formed due to invagination of the plasma membrane of bacteria serve as the respiratory centre.

Prokaryotic cells are devoid of membrane - bound organelles like the nucleus, mitochondria; ER etc

Mesosomes are more prevalent in gram +ve bacteria and they are rich in respiratory enzyme of prokaryotic cell. The ribosome is the nonmembrane bound organelle hence is present in a prokaryotic cell but it is not formed due to the extension of the plasma membrane.

@apna_pdf

138. In the animal body blood bank is:

(a) heart (b) spleen
(c) lungs (d) liver

JCECE-2004

Ans. (b) : Spleen is located behind the stomach and below the lungs. It stores blood and helps in flighting serious inflection it is the part of lymphatic system. The Spleen play importance roles in regard to red blood cell and the immune system it removes old red cell and holds a reserve of blood, which can be valuable in case of hermorrhagic shock, blood loss and also recycles iron. It purifies the blood and helps the immune system to recognize and attack foreign antibodies and disease. The spleen is composed of the red and white pulp. White pulp producers and grows immune cell as well as blood cell, and other purifying blood.

139. Which of the following is always absent in prokaryotic cells?

(a) Ribosome (b) Mitochondria
(c) DNA (d) Cell wall

WB JEE-2014

Ans. (b) : In prokaryotic cells mitochondria is always absent. Prokaryotic is primitive type cells which lack membrane bound structure and well developed nucleus.

140. Shorter generation time of E. coli compared to eukaryotes may be explained on the basis of

(a) Shape
(b) Large surface : volume ratio
(c) Presence of cell wall
(d) Absence of organelles

WB JEE-2008

Ans. (b) : The most extensively studied prokaryote is E. coli a common bacterium found in intestine of human being prokaryotes have large. Surface area to volume ratio and it is responsible for their high metabolic rate, high growth rate and short generation time. This helps them to have a shorter generation time of the doubling time as compared to the eukaryotes.

141. Select the wrong statement of bacterial cell

(a) Mesosome is formed by the extensions of plasma membrane into the cell.
(b) The pili are elongated tubular structures made up of a protein.
(c) Flagellum is composed of filament, hook and basal body.
(d) Ribosomes are about 30 nm by 50 nm in size.
(e) The fimbriae are small bristle like fibres sprouting out of the cell.

Kerala PMT-2013

Ans. (d) : Fimbriae are finger like projections on the ends of fallopian tubes closest to ovaries. Mesosome is formed by extensions of plasma membrane into the cell. The pili are elongated tubular structure. Flagellum is composed of filament, hook and basal body.

F. Eukaryotic Cell

142. Plasmid is

(a) Small extra chromosomal circular self replicating DNA that can carry genes into host organism
(b) Bacteriophage
(c) DNA found in mitochondria
(d) DNA incorporated in bacterial chromosome

BVP-2012
Haryana PMT-2006, 2004, 2003
Manipal-2003

Ans. (a) : Plasmid is extra chromosomal or extranuclear genetic material found mostly in bacteria or prokaryotes. It is made up of ds-circular DNA. usually one in number but it can be more.
Plasmid is semiautonomous & self replicating (Ori sequence or genes are present)

143. Assertion (A): Eukaryotic cells have the ability to adopt a variety of shapes and carry out directed movement.
Reason (R): Micro filament, microtubules and intermediate filaments, constitute the cytoskeleton.

(a) Both A and R are correct and R is the correct explanation of A.
(b) Both A and R are correct but R is not the correct explanation of A.
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : The cytoskeleton is a fibrous or fine tubular structure which constitute the supportive structure of the cell. The cytoskeleton is made up of three elements. Within the cell, they are-Microtubule made up tubulin protein microfilaments made up actin and intermediate filament madeup of structural protein e.g., keratin, vimentin and desmin.

- Cytoskeleton helps the cell maintain its shape and gives support to the cell.
- The cytoskeleton assists in the transporation of communication signals between cells. It forms cellular appendage like protrusions, such as cilia and flagella in some cells.
- Eukaryotic cells have the ability to adopt a variety of shapes and carry out directed movement.

144. The extra food is stored in this form in eukaryotic, multicellular heterotrophs.

(a) Starch (b) Glucose
(c) Glycogen (d) Amino acids

TS EAMCET-11.05.2023, Shift-II

Ans. (c) : Food is stored in the form of glycogen in animals where as, in the form of starch in plants.

145. What are the differences between plant cell and animal cell among the following ?

(A) Cell wall
(B) Cell membrane
(C) Ribosomes

@apna_pdf

(D) Centrioles
(E) Large central vacuole
(F) Plastids
(a) A, B, F only (b) B, C, D, E only
(c) A, B, E, F only (d) A, D, E, F only

TS EAMCET-30.07.2022 Shift-II

Ans. (d) : Cell membrane, ribosomes and mitochondria are common organelles in both plant and animal cells.
Cell wall, large central vacuole and plastids are organelles which found only in plant cells. Centrioles only found in animal cells.

146. One of the following cell organelles is involved in synthesis and storage of fat.
(a) Glyoxysome (b) Peroxisome
(c) Sphaerosome (d) Ribosome

MHT CET 5.10.2020 Shift-I

Ans. (c) : In seeds of some plants such as castor or bean seeds the reserve material is stored in lipid containing bodies known as sphaerosomes. These are very small, spherical bodies with single unit membrane.
• Their main functions are collection translocation and synthesis of fatty substances.

147. Choose the correct statements
(A) Polar molecules cannot pass through non-polar lipid layer since they require carrier proteins.
(B) The plant cell vacuole plays role in osmoregulation.
(C) Golgi apparatus is the site of synthesis of proteins and glycolipids.
(D) Plasmid DNA shows resistance to antibiotics .
(E) On cell maturation, secondary wall is formed as deposition towards the outside the primary wall.
(a) A, B, C only (b) A, B, D only
(c) B, C, E only (d) C, D, E only

TS EAMCET-29.09.2020 Shift-I

Ans. (b) : Polar Dissolves in polar, while non polar dissolves in non polar. So, polar cannot pass through non polar lipid baries in cell membrane.
Vacuole is the store house of water, minerals, salts and ions and its concentration decided the osmoregulation of the cell.
Plasmid DNA shows resistance to antibiotics.

148. Which of the following pair of organelles does not contain DNA?
(a) Chloroplast and Vacuoles
(b) Lysosomes and Vacuoles
(c) Nuclear envelope and Mitochondria
(d) Mitochondria and Lysosomes

NEET-2019

Ans. (b) : Lysosomes are single membrane bound organelle consisting of hydrolytic enzymes, vacuole are large membranous sac, and both Lysosome and vacuoles do not contain DNA. Mitochondria and chloroplast contain their own DNA, so they are also called semi autonomous organelles.
• Lysosome are membrane enclosed organelles that contain an array of enzymes capable of breaking down all type of biological polymers protein nucleic acid, carbohydrates and lipids.
• Vacuoles help maintaining of water balance, sometimes a single vacuole can take up most of the interior space of the plant cells.

149. Which one is only found in plant?
(a) Ribosome (b) Mitochondria
(c) Glyoxysomes (d) Lysosome

JIPMER-2019

Ans. (c) : Glyoxysomes is only found in plant.
• Glyoxysomes are special types of plant peroxisome containing glyoxylate cycle enzyme. Glyoxysome helps in degradation of the lipid residues which are present in plant cells this is required at seed germination. Special fat storing tissue contain–glyoxylate cycle enzyme which is the process of conversion of Acetyl Co-A into succinate. Glyoxysome were discovered by Beevers and Breidenbench.

150. Functions not associated with peroxisomes
i. Converstion of stored lipids to carbohydrates
ii. Catabolism of fatty acids
iii. Involve in photophosphorylation
iv. Production of Hydrogen peroxide
v. Synthesis of phospholipids
The correct answer is
(a) i, iii, iv (b) ii, iii, iv
(c) ii, iv, v (d) iii, v

AP EAMCET-25.04.2018 Shift-II

Ans. (a) : Functions of peroxisome-
1. In C_3 plants concerned with the photorespiration.
2. In animals concerned with lipid metabolism, amino acid, uric acid oxidation.
3. β oxidation of fatty acid.
4. In Brain tissue phospholipid synthesis and in liver cells cholesterol and bile acid synthesis.

151. H_2O_2 is converted to water and oxygen by an enzyme which is present in the cellular organelle.
(a) Glyoxysome (b) Peroxisome
(c) Lysosome (d) Ribosome

TS EAMCET-02.05.2018 Shift-II
DUMET-2001

Ans. (b) : Peroxisome are single unit membrane bound organelle which has dense and granular stroma containing urate oxidase, Deamino oxidase, α- hydroxy acid oxidase, β- hydroxy acid oxidase which produce the H_2O_2 which is highly reactive toxic oxydising agent.
Glycolate oxidase convert into glycolate and catalase enzyme.
catalage enzyme converted H_2O_2 into H_2O and O_2.

152. Catabolism of long chain fatty acids occur in
(a) Glyoxysomes (b) Peroxysomes
(c) Carboxysomes (d) Ribosomes

TS EAMCET-12.05.2017

Ans. (b) : The catabolism of long-chain fatty acids occurs in peroxysomes. These organelles contain enzymes involved in fatty acid oxidation, which breaks down long chain fatty acids to generate energy.

@apna_pdf

153. Which cellular components are found in mycoplasma, spirochaetes and rickettsias?
(a) DNA (b) RNA
(c) Ribsomes (d) All of these
VMMC-2011

Ans. (d) : All three bacterial groups, Mycoplasma, spirochaetes and rickettsias. Contain DNA, RNA and ribosomes.

154. In protoplasm fat store in the form of:
(a) polypeptide (b) triglyceride
(c) polysaccharide (d) nucleosides
Rajasthan PMT-2004

Ans. (b) : In protoplasm fat is stored in the form of triglycerides. Triglycerides are a type of lipid molecule and the most common form of fat storage in living organism, including plants and animals. They play a crucial role in energy storage and transportation within body.

155. Which of the following statement is not true ?
(a) Animal cells never contain chloroplast unlike many plant cells
(b) Animal cells contain ultrascopic chloroplast while plant cells contain microscopic chloroplast
(c) Plant cells have cellulosic cell wall while animal cells do not
(d) Plant cells have central vacuoles while animal-cells do not
Uttarakhand PMT-2007

Ans. (b) : Animal cells contain ultrascopic chloroplast while plant cells contain microscopic chloroplast. This statement is not true. Animal cells do not contain chloroplast at all, regardless of their size, while plant cells contain chloroplasts that are responsible for photosynthesis and are typically microscopic in size.

156. Which of the following is a part of endomembrane system of eukaryotic cell?
(a) Peroxisomes (b) Chloroplasts
(c) Mitochondria (d) Golgi complexes
J&K CET-2008

Ans. (d) : The endomembrane system include endoplasmic reticulum Golgi complexs, lysosomes and vacuoles. Since the function of the mitochondria, chloroplast and peroxisomes are not coordinated with the above components these are not considered as part of the endomembrane system.

157. Microfilaments in eukaryotic cells are made up of
(a) Actin (b) Albumin
(c) Globulin (d) Fibrin
DUMET-2010

Ans. (a) : Microfilaments, also known as actin filaments, are thin, double-helical cylindrical rods made of actin protein found in eukaryotic cells. They play essential roles in cell motility, cell division and maintaining cell shape in both muscle and non-muscle cells.

158. Which of the following does not contain DNA?
(a) Mitochondria (b) Chloroplast
(c) Peroxysome (d) Nucleus
VMMC-2011
Uttarakhand PMT-2009
BHU PMT (Screening)-2009

Ans. (c) : In the nucleus, the chromatin material is found which is organization of DNA and proteins mitochondria and chloroplast also posses extra chromosomal DNA while DNA is absent in peroxysome.

159. Muramic acid is present in the cell wall of
(a) bacteria (b) green algae
(c) red algae (d) rhizopus
CG PMT-2007

Ans. (a) : In Prokaryotes the cell wall is made up of mucopeptide or murein or peptidoglycan this compound is present in both Eubacteria & cyanobacteria.
The mucopeptide consists of alternative unit of
(1) N-Acetyl Glucosamine (NAG)
(2) N-Acetyl muramic acid (NAM)
Both the alternating unit connected by β-1,4- glycoside bond. The different chain of NAM & NAG are inter connected by tetra peptide linkage which consists of 4-amino acid.

160. Which of the following is bounded by double membrane:
(a) Chloroplast (b) Mitochondria
(c) Nucleus (d) All the above
Uttarakhand-2005

Ans. (d) : Cell organelles bounded by double unit membrane – Mitochondria, chloroplast, Nucleus.

161. Study the following table:

List-I	List – II
A. Devoid of flagella	1. Single spherical bacterium
B. Rod shaped	2. Pneumonia causing bacteria
C. Bacteria in pairs	3. Anthrax causing bacteria
D. Comma shaped	4. Cholera causing bacteria
	5. Pleiomorphic bacteria

The correct match is.

	A	B	C	D
(a)	1	2	3	5
(b)	5	4	2	1
(c)	1	3	2	4
(d)	5	1	2	4

AP EAMCET-2004

Ans. (c) :
Devoid of flagella – Single spherical bacterium
Rod shaped – Anthrax causing bacteria
Bacteria in pairs – Pneumonia causing bacteria
Comma shaped – Cholera causing bacteria

162. Bacterial flagella is made up of:
(a) protein (b) amines
(c) lipids (d) carbohydrates
AFMC-2004

Ans. (a) Bacterial flagella is made up of protein. The primary protein building block of bacterial flagella is called flagellin.

@apna_pdf

163. Which one of the following organisms may respire in the absence of oxygen?
(a) Azotobacter (b) Clostridium
(c) Rhizobium (d) Lactobacillus

CG PMT-2006

Ans. (b) : Clostridium is an example of an anaerobic bacterium i.e it can carry out its metabolic processes, including respiration, without the need for oxygen.

164. Barophilic prokaryotes
(a) grow slowly in highly alkaline frozen lakes at high altitudes
(b) occur in water containing high concentrations of barium hydroxide
(c) grow and multiply in very deep marine sediments
(d) readily grown divides in sea water enriched in any soluble salt of barium

CG PMT-2006

Ans. (c) : Barophilic prokaryotes also known as piezophilic or barotolerant prokaryotes, are micro-organisms that thrive and multiply in high- pressure environments, particularly in the deep ocean sediments where pressure is extremely high.

165. The telomeres of eukaryotic chromosomes consists of short sequences of
(a) thymine rich repeats
(b) cytosine rich repeats
(c) adenine rich repeats
(d) guanine rich repeats

Manipal-2007

Ans. (d) : The telomeres of eukaryotic chromosomes consist of short sequences of guanine rich repeats. These repeats are typically TTAGGG in vertebrates, including human. Telomere play a important role in protecting the ends of chromosomes from degradation and fusion, thus maintaining chromosomes stability during cell division.

166. The chief component of the middle lamella in plant cell is
(a) potassium (b) calcium
(c) magnesium (d) phosphorus

DUMET-2009
VMMC-2011
J&K CET-2004

Ans. (b) : The middle lamella is a thin, amorphous cementing layer that helps in the joining of two adjacent plant cells. The main component of the middle lamella is calcium pectate.

167. Extranuclear DNA (genes) are located in
(a) lysosomes and chloroplasts
(b) Golgi complex and ribosomes
(c) chloroplasts and mitochondria
(d) ribosomes and mitochondria

Haryana PMT-2010

Ans. (c) : Extranuclear inheritance or cytoplasmic inheritance is the transmission of genes that occur outside the nucleus. It is found in most eukaryotes and is commonly known to occur in cytoplasmic organelles such as mitochondria and chloroplast.

168. Genophore term was coined by Hans R is for
(a) genetic material of virus
(b) stack on which spore originated
(c) bacterial chromosome
(d) fungal chromosome

Haryana PMT-2008

Ans. (c) : The term "Genophore" was coined by Hans Ris to refer to the bacterial chromosomes it is the main genetic material in bacteria which contains the majority of their genes and is typically found as a single circular DNA molecule within the bacterial cell.

169. Which of the following is a prokaryote?
(a) Amoeba (b) Spirogyra
(c) Bacteria (d) Chlamydomonas

Haryana PMT-2008

Ans. (c) : Prokaryotic organism – bacteria
Eukaryotic — Amoeba, spirogyra, chlamydomonas

170. In which of the following endospores are formed?
(a) Mucor (b) Clostridium
(c) Saccharomyces (d) Rhizopus

Haryana PMT-2003

Ans. (b) : Endospores formation is more common in rod shaped bacteria or bacillus form. Clostridium is rod shaped bacteria hence endospores formed in clostridium.

171
(a) spirilla (b) vibrio
(c) cocci (d) bacilli

AP EAMCET-1997

Ans. (b) : Comma shaped bacteria are known as vibrio. It causes various systemic diseases such as cholera.

172. The most studied prokaryote is
(a) Klebsiella pneumonia
(b) Pseudomonas sp
(c) Escherichia coli
(d) Bacilus thuringiensis

CG PMT-2010

Ans. (c) : The most studied prokaryote is *Escherichia coli*, because of their comparative simplicity.
It is used a model organism due to its rapid growth ease of cultivation and well characterized genetics.

173. Merozygote is formed in
(a) Yeast (b) Spirogyra
(c) Escherichia coil (d) Neurospora

CG PMT-2010

Ans. (c) : Merozygote is formed in *E. coli.* During bacterial conjugation. It is a partial diploid cell resulting from the transfer of a plasmid carrying specific genes into a recipient bacterial cell.

174. In eukaryotic cells, the amount of basic proteins is often found to be
(a) more than the amount of DNA
(b) less than the amount of DNA
(c) equal to the amount of DNA
(d) none of the above

BHU PMT (Screening)-2011
AMU-2011, 1996

@apna_pdf

Ans. (a) : In eukaryotic cells the amount of basic protein is often found to be equal to be more than the amount of DNA All the basic proteins (histones) are present in large quantity in any eukaryotic cell.

175. In which cell organelles a lipoprotein covering is absent in?

(a) Ribosomes (b) Lysosomes
(c) Mitochondria (d) Peroxisomes

BCECE-2008

Ans. (a) : Lipoprotein covering is absent in ribosomes.

176. Which cell organelle is present in both prokaryotic and eukaryotic cell?

(a) Ribosome (b) Mitochondria
(c) ER (d) Nucleus

BCECE-2004

Ans. (a) : Ribosome is present in both prokaryotic and Eukaryotic cell.

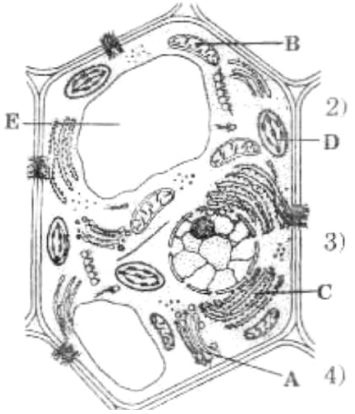
177. The secretion of macromolecules by fusing a transport vesicle to the plasma membrane is

(a) pinocytosis (b) phagocytosis
(c) endocytosis (d) exocytosis

Haryana PMT-2011

Ans. (d) : The secretion of macromolecules by fusing a transport vesicles to the plasma membrane is exocytosis.

178. The diagram of the ultrastructure of a plant cell is given below. Identify the functions of the organelles labelled A,B,C,D,E in the diagram.



(a) A = Principal director of macromolecular traffic, B = Site of oxidative phosphorylation, C = Intracellular transport, D = Site of Photophosphorylation, E = Storage of cell sap.

(b) A = Intracellular transport, B = Site of oxidative phosphorylation, C = Principal director of macromolecular traffic. D = Site of photo phosphorylation. E = Storage of cell sap.

(c) A = Storage of cell sap, B = Site of oxidative phosphorylation, C = Principal director of macromolecular traffic, D = Site of photophosphorylation, E = Intracellular transport .

(d) A = Site of photophosphorylation, B = Storage of cell sap, C = Intercellular transport, D = Site of oxidative phosphorylation, E = Principal director of macromolecular traffic.

Karnataka CET-2010

Ans. (a) : In germinating seeds, the process of breaking down fatty acids takes place exclusively in specialized organelles called glyoxysomes. Glyoxysomes are a type of peroxisomes that are specially involved in lipid metabolism.

179. In germinating seeds fatty acids are degraded exclusively in the:

(a) peroxisomes (b) mitochondria
(c) proplastids (d) glyoxysomes

AIPMT-2008

Ans. (d) : In germinating seeds, the process of breaking down fatty acids takes place exclusively in specialized organelles called glyoxysomes. Glyoxysomes are a type of peroxisomes that are specially involved in lipid metabolism.

180. Which one of the following organisms is not an example of eukaryotic cells ?

(a) Amoeba proteus
(b) Paramecium caudatum
(c) Escherichia coli
(d) Euglena viridis

AIPMT (Screening)-2011

Ans. (c) : • Eukaryotes have well defined nuclei which are enclosed in the nuclear envelope. Eukaryotic cells have membrane bound organ cells. Eukaryotic cells are much larger than Prokaryotic cells. Animals, Plants, fungi fall under eukaryotes. Example- *Amoeba proteus*, *Paramecium caudatum* and *Euglena viridis* etc.

• Prokaryotes are microscopic organism. They are single- celled organisms and lack defined nuclei. *Escherichia coli* is example of Prokaryotic cell.

181. Identify the true statement in the following.

(a) Each nucleosome consists of a core of five types of nine histone molecules
(b) Oxidation of fatty acids and synthesis of phospholipids occur in peroxisomes
(c) Telocentric chromosome contains two unequal arms
(d) Smaller sub-unit of ribosome contains the enzyme peptidyl transferase.

AP EAMCET-2010

Ans. (b) : Peroxisome is a small organelle that is bounded by a single membrane and found in plant and animal. They are the main site or fatty acid oxidation in plant cell and play a significant role in this regard in animal cell.

Each **Nucleosome** is composed of a little less than two turn of DNA wrapped around a set of eight proteins called **Histones**, which are known as **Histone Octamer**.

Telocentric chromosome centromere is located at the terminal end of the chromosome. The chromosome has only one arm.

The small ribosomal subunit programs protein synthesis. The large subunit contains the peptidyl transferase, site, the site at which peptide bonds are formed.

@apna_pdf

182. Some of the enzymes which are associated in converting fats into carbohydrates are present in:

(a) glyoxysomes (b) golgi bodies
(c) microsomes (d) liposomes

AP EAMCET-1997

Ans. (a) : Peroxisomes or glyoxysomes are found in all major groups of eukaryotic organism including yeasts fungi, protozoa, plants and animals plants and animals glyoxysomes are mircobodies with occurs only in fat rich plant cell, where they part in β-oxidation of fats and perform glyoxylate cycle. Glyoxysomes also possess catalase enzyme. Microsomes are artificial structures derived from pieces of endoplasmic reticulum formed during tissue homogenization liposomes are small artificial vesicles of spherical shape that can be created from cholesterol and natural non - toxic phospholipids.
Golgi body is membrane bound organelle found in eukaryotic cells.

183. Choose the wrong statement

(a) HIV virus has RNA as its genetic material
(b) HIV virus replicated in T_H lymphocytes
(c) Anti-retroviral drugs are only partially effective for AIDS treatment
(d) HIV spreads by sexual contact or sharing needle with the infected person and not by mere touch or physical contact
(e) The time-lag between the infection and appearance of AIDS symptom may vary from few hours to a week

Kerala PMT-2008

Ans. (e) : HIV infection symptoms vary depending upon the stage. After initial infection first few weeks, Patient may experience or can experience influenza like symptoms. But with the time HIV tend to be most infections in few months.

184. Match the following with correct combination

Column I	Column II
A. Endoplasmic reticulum	1. Stack of cisternae
B. Spherosome	2. Store oils or fats
C. Dictyosomes	3. Synthesis and storage of lipids
D. Peroxisome	4. Photorespiration
E. Elaioplasts	5. Detoxification of drugs

(a) A-5, B-3, C-1, D-4, E-2
(b) A-5, B-3, C-2, D-4, E-1
(c) A-2, B-3, C-1, D-4, E-5
(d) A-4, B-3, C-1, D-5, E-2
(e) A-3, B-5, C-1, D-4, E-2

Kerala PMT-2008

Ans. (a) : (A) Endoplasmic reticulum – perform detoxification in liver cells.
(B) Spherosome – take part in storage & synthesis of lipids.
(C) Dictyosomes – plate (stack) formation during cell division.
(D) Peroxisomes – Takes part in photorespiration
(E) Elioplast – Specialized in oil synthesis and storage.

185. Which one of the following is absent from the plant cell?

(a) Cell wall (b) Dictyosomes
(c) Centrioles (d) Plastids

J&K CET-2002

Ans. (c) : Centrioles are Paired barrel-shaped organelles located in the cytoplasm of animal cells near the nuclear envelope. Centrosome located near the nucleus in the animal cell and some lower plant cells but in higher plant, it is absent. It is involved in the formation of spindle fiber during cell division.
Dictyosomes are also called as Golgi apparatus or Golgi body organelles, plastid are the main sites of photosynthesis in eukaryotic cells.

186. Animal cell differs form plant cells in not having the:

(a) Cell wall (b) plastids
(c) glyoxysomes (d) all of these

J&K CET-2002

Ans. (d) : Animal cell differ from plant cell in possessing a centrosome that participates in the formation of spindle apparatus during ell division.
Plant cell have plastids but animal cell do not have Plastids centrosomes are absent in plant cells, animal cell have centrosome, Glyoxysomes are micro bodies which occur only in fat rich plant cell.

187. Which one of the following are absent in animal cells?

(a) Cell wall and plastids
(b) Nucleus and centrosome
(c) Mitochondria and Golgi bodies
(d) Chromosome and ribosome

Assam CEE-2014

Ans. (a) : Cell wall and chloroplast or plastid are not present in the animal ell. The cell wall in a plant cell is a very tough. Flexible and sometimes fairly rigid layer that surrounds some type of cells. It surrounds the cell membrane and provides these cells with structural support and protection. Plastids are the main sites of photosynthesis in eukaryotic Plant cells.

188. Choose the wrong statement regarding AIDS

(a) AIDS is an immunodeficiency disease
(b) It is caused by a retrovirus, HIV
(c) HIV selectively infects and kills B-lymphocytes
(d) Retroviruses have RNA genomes that replicate via DNA intermediate
(e) Viral RNA genome is converted into DNA copy by reverse transcriptase

Kerala PMT-2009

Ans. (c) : A retro virus is a type of RNA virus that inserts a copy of its genome into the DNA of a host cell that in invades, thus changing the genome of the cell HIV is an enveloped retrovirus. Each virus particles contains two copies of an RNA genome.
RNA virus such as HIV have RNA genomes, which can also be either double stranded or single stranded. Their genomes can be either RNA or DNA.
Retroviruses are ssRNA viruses that replicate through a DNA.

@apna_pdf

189. The reactions of pentose phosphate pathway (PPP) take place in
(a) Mitochondrion
(b) Cytoplasm
(c) Chloroplast, Peroxisome and Mitochondrion
(d) Chloroplast, Glyoxysome and Mitochondrion
(e) Chloroplast, Lysosome and Mitochondrion

Kerala PMT-2009

Ans. (b) : PPP also called known by HMP (Hexose monophosphate pathway) act as precursor to nucleoside synthesis. The pentose phosphate pathway is a metabolic pathway which is carried out in most of the organism. This pathway occurs parallel to glycolysis. This pathway produces pentose's from Glucose 6-phosphate. The pathway takes place in the cytoplasm is most of pathway takes place in the cytoplasm is most of the organism. In the case of plants, there are certain reactions. Which occurs in the plastids.

190. Consider the following statement: (1) In plant cells, cytokinesis start with the formation of the phragmoplast (2) phragmoplast comprises interzonal macrotubules and Golgi vesicles (3) Primary cell wall is produced by microtubules (4) Phragmoplast is formed by nucleus
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 1, 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2006

Ans. (a) : The phragmoplast is a plant cell specific structure that form during late cytokinesis. This complex assembly of microtubules actin filaments and associated molecules acts as a framework for cell plate assembly and subsequent formation of the future cell wall separating the two daughter cells cellular component.
The phragmoplast (form from golgi body) initially contains the congruent orientation of the cortical array of microtubules which lies just inside the plasma membranes and cellulose micro fibrils lying just outside. In the progressive stages phragmoplast forms barrel shaped organ with microtubules golgi apparatus, ribosome and endoplasmic reticulum. The primary cell wall is assembled by the deposition of polymers, hemicelluloses pectin.

191. Double membrane structure of cell are:
(a) Nucleus (b) chloroplast
(c) mitochondria (d) all of these

AIIMS-2000

Ans. (d) : Nucleus is a spherical cellular component that is surrounded by a nuclear double membrane nucleus is a cellular comportment of the cell containing the genetic material.
The chloroplast is the plant organelle that consist of flattened discoid sacs called thylakoids this organelle consumes carbon dioxide and liberates oxygen. Mitochondria shows catabolism which is defined to be the set of reactions that allows the breakdown of large molecules along with the release of energy.

192. Which of the following enhances or induces fusion of protoplasts?
(a) Polyethylene glycol and sodium nitrate
(b) IAA and kinetin
(c) IAA and gibberellins
(d) Sodium chloride and potassium chloride

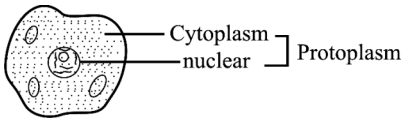
AIPMT-2015

Ans. (a) : Polyethylene glycol (PEG) and sodium nitrate enhances fusion of protoplasts (protoplast fusion), protoplast fusion is physical phenomenon which occurs due to the fusion of protoplast (cell without cell wall) of two more cell.
Polyethylene Glycol and sodium nitrate are most-commonly used protoplast fusion inducing agents which are commonly known as **chemical fucogens**.

193. A protoplast is a cell
(a) Without cell wall
(b) Without plasma membrane
(c) Without nucleus
(d) Undergoing division

AIPMT (Re-Exam)-2015

Ans. (a) : A protoplast in a cell without cell wall. It is a plant, bacterial or fungal cell that had its cell wall removed, either completely or partially via mechanical, chemical or enzymatic actions.
The colour less material comprising the living part of a cell, including the cytoplasm nucleus and other organelles.



194. Match the following and select the correct answer:

A.	**Centriole**	**(i)**	**Infoldings in mitochondria**
B.	**Chlorophyll**	**(ii)**	**Thylakoids**
C.	**Cristae**	**(iii)**	**Nucleic acids**
D.	**Ribozymes**	**(iv)**	**Basal body cilia or flagella**

	(A)	**(B)**	**(C)**	**(D)**
(a)	(iv)	(ii)	(i)	(iii)
(b)	(i)	(ii)	(iv)	(iii)
(c)	(i)	(iii)	(ii)	(iv)
(d)	(iv)	(iii)	(i)	(ii)

AIPMT-2014

Ans. (a) : Basal bodies of eukaryotes are modified centrioles that give rise to cilia and flagella. Have Mg^{++} as central element.
Chlorophyll is found in high concentrations in chloroplasts of plant cells. They are vital for photosynthesis and are specifically arranged in and around photo systems that are embedded in the thylakoid membranes of chloroplasts. The inner membrane of the mitochondrion fold inwards, forming the cristae. The cristae increase the surface area to increase the productivity of cellular respiration.
Ribosome's, also termed RNA molecules are capable of catalyzing specific biochemical reactions are ribonucleic acid that are self splicing.

@apna_pdf

195. A human RBC is placed in 1.5% salt solution. It will :-

(a) Swell up (b) Shrink
(c) Remain unaffected (d) Burst.

AIIMS-2001

Ans. (b) : Human RBC isotonic for 0.9% salt solution water moves from high conc. to low concentration human RBC = 1.5 % salt solution

↓ ↓
Hypotonic Hypertonic

$H_2O\uparrow$ $H_2O\downarrow$

RBCs is an animal cell when a animal cell is placed in 1.5% NaCl the cell shrinks, because, when a cell is placed in high salt concentration exosmosis will occur and the cell will lose water, water moves from higher water concentration to lower water concentration.

196. In plant cells peroxisomes are associated with:

(a) Photorespiration (b) Phototropism
(c) Photoperiodism (d) Photosynthesis

AIPMT-1993

Ans. (a) : Peroxisomes or microbodies are small organelle which contains reducing and oxidizing enzyme catalase, it helps in breakdown of long chain fatty acids through β-oxidation.

Peroxysome produces two plant hormone which are associated with chloroplast and mitochondria and help in photorespiration. Peroxisomes were one of the last major cellular organelles to be discovered. In plant cells peroxisomes are associated with photorespiration.

197. HIV virus affect …… in AIDS patient.

(a) cytotoxic T-cell (b) M-N cell
(c) suppressor cell (d) helper T-cells

Punjab MET-2008

Ans. (d) : HIV finds the white blood cells called CD_4 cells. HIV finds to the CD_4 molecule on the surface of helper T-cells and replicates within them. This results in destruction of CD_4+T – cells and leads to a steady decline in this population of T-cells. The definition of Progressive and slow loss of CD_4+T cells is not clear.

T-cells → Also called T- lymphocytes are major components of the adaptive immune system. Their role include – directly killing infected host cells, Activating other immune cells Producing cytokines and regulating the immune response.

T-cells mainly 2 types–

Cytotoxic T-cells

Helper-T-cells

198. Eukaryotic cell has

(a) chromatin fibre (b) definite nucleus
(c) incipient nucleus (d) None of these

CG PMT-2005

Ans. (b) : The nucleus generally is the double membrane bound organelle found in eukaryotes, which encloses the cell's genetic material. Example plants, animal, fungi cell. Prokaryotes lack a nucleus they have a specialize irregular undefined region in their cytoplasm in which the genetic material floats. This region is called the incipient nucleus.

199. A mature plant cell has

(a) cell wall (b) vacuole
(c) protoplasm (d) All of these

CG PMT-2005

Ans. (d) : The Protoplasm can be defined as a material which comprises of the living part of the cell including the cytoplasm, nucleus and other organelles. Plant cells are characterized by the presence of large vacuoles and cell wall, which are not seen in animal cells.

• Cell wall constructed outside the cell membrane and composed of cellulose and hemicelluloses to pectin. Vacuole outer membrane called tonoplast that maintain water balance.

Protoplasm – responsible for all living processes.

Cytoplasm + nucleus = Protoplasm

Plant cell – cell wall = Protoplasm

200. Which of the following gland is often referred in relation with AIDS?

(a) Thyroid (b) Thymus
(c) Adrenal (d) Pancreas

WB JEE-2007

Ans. (b) : The thymus is a primary lymphoid organ where T cells or T-lymphocytes mature. T cells are critical to the adaptive immune system, where the body adapts specifically to foreign invaders. The HIV virus causes an acquired T-Cell immunodeficiency syndrome (AIDS) by sporadically killing CD_4 + T-cells. Where as the major effect of the virus is on mature peripheral T-cells, HIV can also infect developing thymocytes in the thymus most of which express CD_4.

• Thymus gland is an endocrine gland present in chest between the lung and behind the breast bone/sternum. Thymus and bone marrow creates special immune system cells called lymphocytes. Lymphocytes are 2 type – T-Lymphocyte, B-Lymphocyte.

201. The cell organelles are found in

(a) Bacterial cells
(b) Cyanobacterial cells
(c) Prokaryotic cells
(d) Eukaryotic cells

WB JEE-2007

Ans. (d) : Eukaryotic cells are defined as cells containing organized nucleus and organelles which are enveloped by membrane bound organelles. Eukaryotic cells have a 'Eu' or advanced nucleus (include plant animal fungi protistan) having a well developed nuclear membrane, nucleolus and histone proteins for packaging of chromatin material. Eukaryotic cell also possesses several membrane bound organelles like plastids and mitochondria, nucleus, endoplasmic reticulum, golgi body.

202. A feature of peroxisome in our body is

(a) they are associated with synthesis and storage of lipids
(b) they contain oxidising enzymes and promotes gluconeogenesis
(c) they contain oxygenase a detoxification enzyme
(d) They are not found in intact cells

MGIMS Wardha-2015

@apna_pdf

Ans. (b) : The peroxisome is a single membrane bound organelles which contains oxidative enzymes and is responsible for lipid production and oxidation reactions within the cell.

The important oxidation reactions of peroxisome within a cell are oxidation or breakdown of excess purines ie, adenosines monophosphate to uric acid. It contains the enzyme called D- amino acid oxidase which oxidises amino acids. It also oxidase or metabolises alcohol and drugs in the liver by paroxysmal catalase.

203. Which of the following test is used for AIDS ?

(a) ELISA test (b) Western blot test
(c) P.C.R. (d) None of these

Rajasthan PMT-1999

Ans. (a) : ELISA Stands for enzyme linked immunoassay. It is commonly used laboratory test to detect antibodies in the blood. An antibody is a protein produced by the body's immune system when it detects harmful substances called antigens.

• Western blot is often used in research to separate and identify proteins. In this technique a mixture of proteins is separated based on molecular weight and thus by type through gel electrophoresis.

• PCR (Polymerase chain reaction) used to rapid make several copies of specific DNA sample to diagnose certain infectious disease and genetic changes.

204. Which of the following statement is not true?

(a) Animal cells never contain chloroplast unlike many plant cells
(b) Animal cells contain ultrascopic chloroplast while plant cells contain microscopic chloroplast
(c) Plant cells have cellulosic cell wall while animal cells do not
(d) Plant cells have central vacuoles while animal cells do not

BVP-2008

Ans. (b) : Animal cells do not have chloroplast the process of photosynthesis, where chloroplasts convert photochemical energy into sugar is exclusive to plant cells. Plants play important role as the basis of all life on Earth, as they produce the essential oxygen and serves as a primary source of food for many organisms.

205. Tonofibrils of desmosomes are made up of :

(a) chitin and keratin (b) keratin and actin
(c) actin and desmin (d) keratin and desmin

BVP-2006

Ans. (d) : Tonofibrils are made up of keratinous intermediate filaments called tonofilaments.

These are components of cytoskeleton of cell. Desmosomes fibrils made up of keratin intermediate filaments and other protein.

Desmosomes in the plasma membrane and help in cell adhesion. They are found in the cells of most invertebrates and vertebrates.

206. A mature plant cell has

(a) cell wall and protoplasm
(b) protoplasm and vacuole
(c) vacuole and cell wall
(d) Both [b] and [c]

CG PMT-2004

Ans. (d) : In addition to number of organelles, a mature plant cell also contains a cell wall, a large central vacuole and plastide. In most mature plant cells the central vacuole occupies a large proportion (upto 90%) of the total cell volume. Cell wall-provides structure and support. Protoplasm contains all the metabolic machinery of cell. The vacuole helps maintain the shape and size of the cell.

207. In prokaryotes, chromatophores are

(a) specialised granules responsible for colouration of cells
(b) structures responsible for organising the shape of the organism
(c) inclusion bodies lying free inside the cells for carrying out various metabolic activities
(d) internal membrane systems that may become extensive and complex in photosynthetic bacteria

JIPMER-2011

Ans. (d) : Prokaryotes like some photosynthetic bacteria contain coloured vesicles which are associated with the membrane. These are known as chromatophores. The word chroma means colour. It is structurally and functionally similar to the chloroplast found in eukaryotes. Prokaryotes such as – Cyanobacteria and rhodospirillum. 2 main pigments → carotenoids and bacteriochlorophyll.

208. Bacterium have flagella with all over body is known as

(a) peritrichous (b) amphitrichous
(c) monotrichous (d) none of these

VMMC-2004

Ans. (a) : In the condition of peritrichous bacteria, they have flagella distributed all over their body surface. This arrangement enables them to move in any direction, giving them a 360° range of motion.

209. Which is correct for the structure of cell wall of bacteria and fungi?

(a) Both are made up of cellulose
(b) Both have mucopeptide
(c) Both are made up of N-acetylglucosamine
(d) None of these

VMMC-2004

Ans. (c) : The cell wall of fungus is made up of fungal cellulose of chitin and cell wall of bacteria is made up of peptidoglycans. Fungal celluloses or chitin microfibrils are made up of bundles of unbranched chains of β-1 4 acetyl glucosamine residues.

Peptidoglycans are the structural elements of almost all the bacterial cell walls peptidoglycans are made up of a polysaccharide backbone consisting of alternation muramic acid acetylated glucosamine residues in equal amount.

210. The desmosomes are concerned with :

(a) cytolysis (b) cellular excretion
(c) cell division (d) cell adherence

Haryana PMT-2000

Ans. (d) : A desmosome is a cell structure specialized for cell to cell adhesion, also referred to as a macula adherens. They are localized spot–like adhesions

@apna_pdf

randomly clustered on the lateral sides of plasma membrane a form of junctional complex Desmosomes are one of junctional complex or one of the stronger forms of cell to cell adhesion. These found in tissues, such as cardiac muscle tissue, bladder tissue gastrointestinal mucosa and epithelia.

211. A bacterium divides after every 35 minutes. If a culture containing 10^5 cells per mL is grown, then cell concentration per mL after 175 minutes will be:

(a) 175×10^5 (b) 125×10^5
(c) 48×10^5 (d) 32×10^5

Manipal-2008

Ans. (d) : Total time = 175 min
1 division = 35 min

$$\text{Total division} = \frac{175}{35} = 5$$

1 bacterial cells divides into 2 cell concentration/ml
$= 2^5 \times 10^5 = 32 \times 10^5$ cells/ml

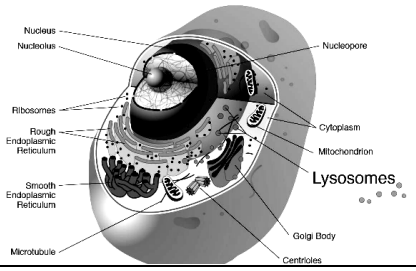
G. Cell Organelles to Understand its Structure and Functions

212. Lysosome contains:

(a) Oxidative enzymes
(b) Hydrolytic enzymes
(c) Reductive enzymes
(d) Anabolic enzymes

MGIMS Wardha-2012
AIPMT-2000
Haryana PMT-2000
AFMC-2007

Ans. (b) : A lysosome is a tiny sac bounded by a single unit membrane of lipoprotein. It contains a dense, finely granular fluid. It consists of glycoprotein hydrolytic (digestive) enzymes called acid hydrolases. These include proteases, lipases, nucleases, glycosidases, sulphatases, acid phosphatases, etc. Lysosomes also digest or damage its own cells by its own enzymes, which lead to cell death. This process is called as autolysis. Hence lysosomes are also called as suicide bags.



213. Study the following table

I.	Interphase nucleus	Synthesis phase	Metabolically active
II.	Nucleosome	Two coils	Histone
III.	Contractile vacuole	Excretion	Single membrance
IV.	Lysosomes	Cistrans faces	Autolysis

Identify correct pair.

(a) III, IV (b) II, IV
(c) I, II (d) I, III

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : • Previously interphase was called resting stage because there is no visible activity related to cell division in this stage. Later studies proved that the interphase of a cell is metabolically quite active.
• Histones are a family of basic protein that assocaites with DNA to form chromatin. There are two types of histones proteins. Core histones and linker histones.

214. Select the correct matching

List - I		List - II		List - III
A	Endoplasmic reticulum	P	Singer + Nicolson	W	Secretion
B	Ribosomes	Q	Palade	X	Protein synthesis
C	Cell membrane	R	Porter	Y	Fluid mosaic model

(a) A-R-W B-Q-X C-P-Y
(b) A-R-W B-P-Y C-Q-X
(c) A-P-W B-Q-X C-R-Y
(d) A-P-W B-R-X C-Q-Y

TS EAMCET 10.05.2023 Shift-I

Ans. (a) :
(A) Endoplasmic reticulum → Porter → Secretion
(B) Ribosomes → Palade → Protein synthesis
(C) Cell membrane → Singer + Nicolson → Fluid mosaic model

215. The smooth and rough endoplasmic reticulum are involved in the synthesis of

(a) Lipids and proteins and secretion
(b) Steroidal hormones and Lipids
(c) Fats and steroidal hormones
(d) Carbohydrates and proteins

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : The smooth and rough endoplasmic reticulum are involved in the synthesis of lipids and proteins and secretion.

216. Name the cell organelle which are involved in the following processes
(A) Conversion of stored lipids to carbohydrates
(B) Catabolism of long chain fatty acids

(a) Lysosome, Peroxysome
(b) Dictyosome, Ribosome
(c) Peroxisome Micro bodies
(d) Glyoxysome, Peroxysome

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : Glyoxysome– Glyoxysome also possess catalase enzyme. In fat storing plant cells, first fats are converted to carbohydrates which are then metabolised.
Peroxysome– A major function of the peroxisome is the breakdown of very long chain fatty acids through beta-oxidation.

217. Assertion (A) : Syncytium is the result of karyokinesis not followed by cytokinesis
Reason (R) : In plant cells, middle lamella formation starts from centre and grows outwards of the cell and leads to wall formation
The correct option among the following is

@apna_pdf

(a) (A) and (R) are true. (R) is the correct explanation for (A)
(b) (A) and (R) are true, but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-11.05.2023, Shift-I

Ans. (b) : In some organisms, karyokinesis is not followed by cytokinesis as a result of which, multinucleate condition arises leading to the formation of syncytium.

• Located between the double cell wall of the neighboring cells, the middle lamella is the first layer of the wall to develops. As it is the outer layer out of the three layers of the cell wall, the middle lamella serves as the portion that connects the neighboring cells.

218. Identify Amembraneous cell organelles

(a) Ribosome, Nucleolus
(b) Nucleolus, Lysosome
(c) Peroxisome, Nucleolus
(d) Ribosome, lysosome

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : Ribosome– Ribosomes are the most important cell organelle which is composed of proteins and also composed of RNA. It is not covered by any membrane.

Nucleolus– Non-membranous organelle is both nucleolus and the centriole.

219. Which of the following statements are correct with respect to Golgi apparatus?

(A) It is the important site of formation of glycoprotein and glycolipids.
(B) It produces cellular energy in the form of
(C) It modifies the protein synthesized by ribosomes on ER.
(D) It facilitates the transport of ions.
(E) It provides mechanical support.
Choose the most appropriate answer from the options given below :

(a) (A) and (D) only (b) (D) and (E) only
(c) (B) and (C) only (d) (A) and (C) only

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) : Golgi apparatus is the important site of formation glycoproteins and glycolipids. It modifies the protein synthesized by ribosomes present on endoplasmic reticulum.

■ Mitochondria produce ATP and cell membranes facilitate the transport of ions.
■ Cytoskeleton provides the mechanical support to the cell.

220. Which of the following functions is carried out by cytoskeleton in a cell?

(a) Transportation
(b) Nuclear Division
(c) Protein synthesis
(d) Motility

NEET (UG) 07.05.2023

Ans. (d) : The cytoskeleton is a structure that helps cells maintain their shape and internal organization and it also provides mechanical support that enables cells to carry out essential functions like division and movement.

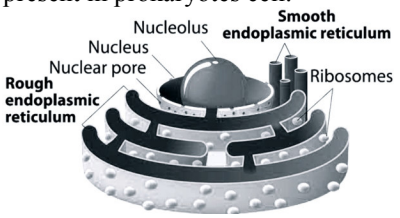
221. Which of the following statements with respect to Endoplasmic Reticulum is incorrect?

(a) SER are the sites for lipid synthesis
(b) RER has ribosomes attached to ER
(c) SER is devoid of ribosomes
(d) In prokaryotes only RER are present

NEET-2022

Ans. (d) : "Endoplasmic Reticulum is a complex network of tubular membranes exclusively present in the cytoplasm of the eukaryotic cell"

• It is not present in prokaryotes cell.



222. What happens if golgi apparatus of a cell is misfunctioning?

(a) Cell wall synthesis takes place
(b) No cell plate formation
(c) Two cells are completely formed during mitosis from a single cell
(d) There is no effect on the cytokinesis

TS EAMCET-31.07.2022 Shift-II

Ans. (b) : Golgi apparatus is present in all eukaryotic cell except RBC and sieve tube elements. In plant cells the unit of golgi apparatus is called as dictyosome while in animal cell it occurs as single compact or loose complex. Golgi vesicles play an important role in cell plate formation during cytokinesis of plant cell. Cell plate formation depend on phrangmoplast vesicles.

223. In which organelle the enzyme catalase is found?

(a) Lysosome (b) Peroxisome
(c) Oxysome (d) Quantasome

Tripura JEE-2021

Ans. (b) : Peroxisome are found in all eukaryotic cells. They contain oxidative enzymes, such as catalase and urate oxidases, at such high concentration that in some cells the peroxisomes stand out in electron micrographs because of the presence of a crystalloid core.

224. Which is the important site of formation of glycoproteins and glycolipids in eukaryotic cells?

(a) Peroxisomes (b) Golgi bodies
(c) Polysomes (d) Endoplasmic reticulum

NEET-2020 Phase-I

Ans. (b) : The golgi apparatus is the important site of formation of glycoproteins and glycolipids in eukaryotic cells.

225. Match the following columns and select the correct option :

	Column – I		**Column–II**
A.	**Smooth endoplasmic Reticulum**	**i.**	**Protein synthesis**
B.	**Rough endoplasmic Reticulum**	**ii.**	**Lipid synthesis**
C.	**Golgi complex**	**iii.**	**Glycosylation**
D.	**Centriole**	**iv.**	**Spindle formation**

@apna_pdf

(a) (A)-(i), (B)-(ii), (C)-(iii), (D)-(iv)
(b) (A)-(ii), (B)-(i), (C)-(iii), (D)-(iv)
(c) (A)-(iii), (B)-(i), (C)-(ii), (D)-(iv)
(d) (A)-(iv), (B)-(ii), (C)-(i), (D)-(iii)

NEET-2020 Phase-II

Ans. (b) :

(A)	Smooth endoplasmic reticulum	(ii)	Lipid synthesis
(B)	Rough endoplasmic reticulum	(i)	Protein synthesis
(C)	Golgi complex	(iii)	Glycosylation
(D)	Centriole	(iv)	Spindle formation

226. Which among the following is not true for Endoplasmic Reticulum?
(a) ATP synthesis (b) Protein Synthesis
(c) Lipid Synthesis (d) Secretion

AP EAMCET-24.09.2020 Shift-I

Ans. (a) : Endoplasmic reticulum is the membranous cellular organelle which is responsible for synthesis and transportation of proteins and enzymes in different parts of the cell. ATP synthesis is the enzyme that makes ATP molecules.

227. Cilium and Flagellum emerge from centriole like structures called
(a) Plasma membrane (b) Basal bodies
(c) Radial bodies (d) Axoneme

AP EAMCET-24.09.2020 Shift-I

Ans. (b) : The centrioles form basal body of cilia & flagella it leads to forming spindle fibres during mitosis. The cilium and flagellum arise from the basal body. The basal body is a protein structure found at the base of a cilium flagellum.

228. Which of the following cell organelles is present in the highest number in secretary cells?
(a) Lysosome
(b) Mitochondria
(c) Golgi complex
(d) Endoplasmic reticulum

NEET (Odisha)-2019

Ans. (c) : The Golgi complex is most abundantly in the secretary cell as the Golgi apparatus is responsible for the packaging is and transport of secretary cell has the largest Golgi apparatus. All glandular cell depend upon Golgi complex for concentrating and pouring their secretion to outside.

229. Match the column I with column II.

Column-I		Column-II	
(A)	**Golgi apparatus**	**(i)**	**Synthesis of protein**
(B)	**Lysosomes**	**(ii)**	**Trap waste and excretory products**
(C)	**Vacuoles**	**(iii)**	**Formation of glycoproteins and glycolipids**
(D)	**Ribosomes**	**(iv)**	**Digesting biomolecules**

Choose the right match from options given below:
(a) (A)-(i), (B)-(ii), (C)-(iv), (D)-(iii)
(b) (A)-(iii), (B)-(iv), (C)-(ii), (D)-(i)
(c) (A)-(iv), (B)-(iii), (C)-(i), (D)-(ii)
(d) (A)-(iii), (B)-(ii), (C)-(iv), (D)-(i)

NEET (Odisha)-2019

Ans. (b) : Golgi apparatus – Formation of glycoproteins and glycolipids.
The proteins and lipids are glycosylated by the activity of glycosyltransferase and the glycans are attached to them.
- **Lysosomes** – Digesting biomolecules
  It contains a hydrolytic enzyme that digests the waste and other bad organelles. When the cell dies, the lysosomes digest the dead cell.
- **Vacuoles** – Trap waste and excretory products
  Vacuoles contains water, sap and excretory products. In plant cells, Vacuole is the part of endomembrane system.
- **Ribosomes** – Synthesis of protein, the ribosome is the structure within living cells that manufactures proteins. It attaches to a strand of messenger RNA.

230. Observe the following functions of the cell.
- **Synthesis of protein and enzymes**
- **Synthesis of lipids**
- **Synthesis on Glycolipids**
- **Enzymes optimally active in acidic pH.**

Arrange the given cell organelles with their respective functions,
(A) Golgi apparatus
(B) Rough endoplasmic reticulum
(C) Smooth Endoplasmic reticulum
(D) Lysosome
(E) Ribosome
(F)Mitochondria
Options:
(a) B, A, C, E (b) E, A, C, D
(c) B, C, E, F (d) E, C, A, D

AP EAMCET-24.04.2019 Shift-II

Ans. (d) : Ribosome : Synthesis of protein and enzymes. **Smooth endoplasmicreticulum** – synthesis of lipid
Golgi apparatus : Synthesis of Glyolipids.
Lysosome : Enzymes optimally active in acidic PH.

231. Which of the following is not correctly paired ?
(a) Mitochondria – Cristae
(b) Lysosome – Microtubule
(c) Mitochondria – Cellular respiration
(d) Ribosome – Protein synthesis

Tripura JEE-2019

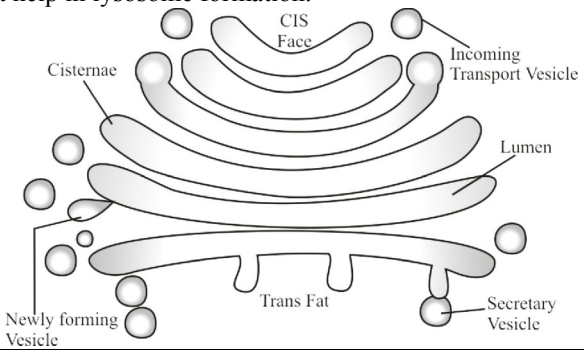
Ans. (b) :
Mitochondria — Cristae
Lysosome — Hydrolytic enzyme
Mitochondria — Cellular respiration
Ribosome — Protein synthesis

232. The Golgi complex participates in
(a) Fatty acid breakdown
(b) Formation of secretory vesicles
(c) Activation of amino acid
(d) Respiration in bacteria

NEET-2018

@apna_pdf

Ans. (b) : Formation secretary vesicle and secretion is the principal function of Golgi complex.
Golgi complex is organelle found in Eukaryotic cell.
It is a multiple compartment organelle with a double outer membrane.
It packages packets of proteins into the vesicle.
Other functions of Golgi complex is
It is a dispatch station for protein.
It identifies and labels the materials which are further distributed in the cells.
It is also a part of lipid transport.
It help in lysosome formation.



233. Study the following statements.
(A) Ribosomes and Nucleolus are not membrane bound structures.
(B) Tonoplast facilitates transport of ions against concentration gradient into the vacuole.
(C) Peroxysomes are membrane bound structures and play role in the synthesis of phospholipids.
(D) Lipids are converted into carbohydrates by Glyoxysomes.
From the above true statements are:
Options:
(a) A,B,C,D (b) B,C,D
(c) C,D (d) D only
AP EAMCET-28.04.2017 Shift-II

Ans. (a) Due to membraneless organelle ribosome free float in cytoplasm and nucleolus found in nucleus in all eukaryotic cell.
Tonoplast- Outer membrane of vacuole act as semi permeable membrane thus it maintain the balance of ions inside and outside of central vacuole.
Peroxysome- Glyoxylate cycle occurs in it which is a variant of citric acid cycle.
Glyoxysome- Plays role in germinating seed take part in β oxidation of fat in glyoxylate, found in plants and few filamentous fungi.

234. The organelles which occur external to cell membrane but internal to cell wall are:
(a) Peroxisomes (b) glyoxysomes
(c) sphaerosomes (d) lomasomes
VMMC-2006

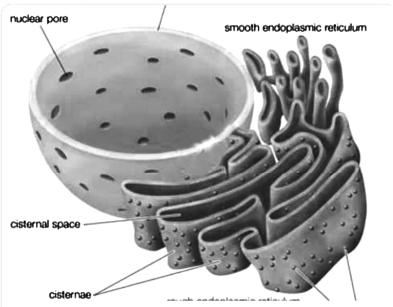
Ans. (d) : Lomasomes are vesicular and membranous structures usually present between cell wall and plasmalemma of plant cells their definite function is not known but probably they help in cell wall elaboration.

235. The term protoplasm was coined by:
(a) Virchov (b) Purkinje
(c) DuJardin (d) Kolliker
Manipal-2000

Ans. (b) : The term protoplasm was coined by parkinje. F Dujardin gave the term sarcode for protoplasm

236. A major site for synthesis of lipids is :
(a) Nucleoplasm (b) RER
(c) SER (d) Symplast
NEET-2013

Ans. (c) :



endoplasmic reticulum

Endoplasmic reticulum is the organelle which forms a interconnected network of the flattened sacs which are commonly known as cisternae. This is classified into two type-like rough endoplasmic reticulum and smooth endoplasmic reticulum. The cytoplasm's inner core is known as endoplasm.
- The smooth endoplasmic reticulum is the major site for the synthesis of the lipids and also it lacks the ribosome whereas the rough endoplasmic reticulum is decorated with ribosome and these are the site of protein synthesis.
- In smooth endoplasmic reticulum the lipid like hormones are synthesized. So it is clear that smooth endoplasmic reticulum is the major site in synthesis of lipid.

237. Mitochondria and chloroplasts are similar because
(a) both have 80S ribosomes
(b) both have nuclei
(c) both have single membrane envelope
(d) both have DNA
MGIMS Wardha-2013

Ans. (d) : Mitochondria and chloroplasts are similar because both have DNA which can function independently of the eukaryotic host cell.

238. A function of lysosomes is
(a) replication (b) hydrolysis
(c) respiration (d) None of the above
MGIMS Wardha-2013

Ans. (d) : Lysosome function as the digestive system of the cell, serving both to degrade material taken up from outside the cell and to digest absolute component of the cell itself.

239. DNA remains absent in :
(a) chloroplast (b) nucleus
(c) peroxisomes (d) chromosome
MGIMS Wardha-2003

@apna_pdf

Ans. (c) : Peroxisomes do not have DNA. DNA is present in nucleus and some cell organelles like chloroplast and mitochondria
Peroxisomes were discovered by Tolbert.

240. Which of the following is an epidermal cell containing chloroplast?
(a) Stomata (b) Hydathode
(c) Guard cell (d) None of these
JIPMER-2013

Ans. (c) : Guard cell are the specialized epidermis cells containing chloroplast and also regulate the opening and closing of stomata.

241. Which of the following organelles does not contain RNA?
(a) Plasmalemma (b) Ribosome
(c) Chromosome (d) Nucleolus
HP CET - 2012
JIPMER - 2013

Ans. (a) : The plasmalemma also known as the cell membrane is responsible for regulating the movement of substances in and out of the cell. It primarily consists of lipids and proteins and does not contain RNA.

242. In addition to absence of chlorophyll what is the other difference between fungi and higher plants?
(a) Type of nutrition and composition of cell wall
(b) Cell type
(c) Nucleus
(d) Reproduction
Haryana PMT-2006

Ans. (a) : Fungi lack chlorophyll, therefore heterotrophic in nature. Their cell wall formed of chitin (fungus cellulose). Type of nutrition and composition of cell wall is the difference between fungi and higher plants.

243. Lysosomes are not found in
(a) Leukocytes (b) Amoeba
(c) Hela cells (d) Mammalian erythrocytes
CG PMT-2010

Ans. (d) : Lysosomes are not found in mammalian erythrocytes.

244. Membrane is absent in
(a) Nucleus (b) Nucleolus
(c) Vacuole (d) Lysosome
Rajasthan PMT-2011

Ans. (b) : Nucleolus is not a membrane bound structure. It is a site for active ribosomal RNA synthesis.

245. Which one of the following percentage of inorganic salt in the protoplasm ?
(a) 5-7% (b) 2-3%
(c) 0.1-2.5% (d) 50-60 %
Rajasthan PMT-2000

Ans. (b) :2.3% of inorganic salt in protoplasm.

246. An antiviral substance known to prevent the synthesis of new virus in the cell is known as
(a) transferon (b) antibody
(c) inferon (d) interferon
AMU-1996
HP CET-2012
Punjab MET-2006

Ans. (d) : Interferon's are proteins that are part of your natural defenses. Interferon's are made in the body by white blood cells and other cells. An antiviral substance known to prevent the synthesis of new virus in the cell is known as interferon.

247
(a) Lysosome (b) Mitochondria
(c) Golgi body (d) Nucleolus
HP CET-2012

Ans. (a) : Non Autonomous cell organelles bounded by single unit membrane Lysosome, spherosomes.

248. The membrane less cell organelle is:
(a) Golgi body (b) Chloroplast
(c) Endoplasmic reticulum (d) Ribosome
Rajasthan PMT-2000

Ans. (d) : The membrane less cell organelle is Ribosome The double membrane bound organelles is Golgi body, Chloroplast, Endoplasmic Reticulum

249. Cell organelle are present in:
(a) nucleoplasm (b) cytoplasm
(c) hyluplasm (d) none of these
Rajasthan PMT-2000

Ans. (b) : Cell organelle are present in cytoplasm. Cytoplasm is the gel like substance present between the cell membrane and the nucleus. Various other components or organelles of cell are present in the cytoplasm.

250. Most of the hydrolytic enzymes of lysosomes function at
(a) acidic pH (b) basic pH
(c) neutral pH (d) any pH
CMC Ludhiana-2011
CG PMT-2009

Ans. (a) : Lysosomes are membrane bound vesicular structure formed by the process of packaging in the golgi apparatus. The isolated lysosomal vesicles, have been found to be very rich in almost all type of hydrolytic enzymes optimally active at the acidic pH.

251. Tonoplast is a membrane, which is found surrounding the
(a) vacuole (b) cytoplasm
(c) nucleus (d) None of the above
AMU-2009, 2001

Ans. (a) : The vacuole is the membrane-bound space found in the cytoplasm. It contains water, sap excretory product and other materials not useful for the cell. The vacuole is bound by single membrane called tonoplast. In plant cell vacuoles can occupy up to 90% of the volume of cell.

252. Identify the tumor suppressor genes form the following.
(a) Oncogenes (b) P^{53} genes
(c) Pseudogenes (d) SRY genes
AP EAMCET-2013

Ans. (b) : P^{53}genes- A gene that makes a DNA sequence that resembles a gene but has been mutated into an inactive form over the course of evolution. A **Pseudogene** shares an evolutionary history with a functional gene and can provide insight into their shared ancestry.

@apna_pdf

Example Drosophila Jingwei gene (PGAM4).

(a) Oncogenes- A gene that is a mutated (changed) from of a gene involved in normal cell growth. Oncogene may cause the growth of cancer cells. Mutations in genes that become oncogenes can be inherited or caused by being exposed to substances in the environment that cause cancer.

(Example- HER 2 oncogene)

(d) SRY gene- SRY, **the master sex-determining gene,** is most commonly trans located from the short arm of the Y chromosome onto the X, causing male-to-female 46, XX ovotesticular DSD. Mutations in the coding region of the gene are also responsible for a significant proportion of 46, XY DSD cases.

253. Interferons are

(a) Complex protein
(b) Anti-clotting protein
(c) Anti-bacterial protein
(d) Anti-viral protein

Karnataka CET-2007

Ans. (d) : Interferons are group of signaling produced by virus infected cell. They interfere with viral replication and hence named interferons. A virus infected cell released interfere induce antiviral state in the uninfected cell.

254. The protein products of tumour suppressor gene may:

(a) be present in non-cancerous cells
(b) cause signal cell death
(c) regulate the cell cycle
(d) All of the aobve

JIPMER-2015

Ans. (a) : Tumour, suppressor genes play a crucial role in regulating cell growth and preventing the formation of tumors. Their protein products are typically found in non-cancerous cells, and they help in regulate the cell cycle to ensure normal cell division and prevent uncontrolled growth.

255. Enveloped virus enters into host cells by

(a) injection own nucleic acid inside host cells
(b) by contact with cell receptor and endocytosis
(c) by phagocytosis
(d) fusion with the plasma membrane of host

UP CPMT-2006

Ans. (a) : Enveloped viruses are not stable outside of the human body and are typically transmitted by transfer of body fluid. In contrast, no enveloped viruses are much more stable and many can be transmitted by other mechanisms such as the injection own nucleic acid inside host cell, fecal oral route.

256. The Golgi complex plays a major role :

(a) in post translational modification of proteins and glycosidation of lipids
(b) in trapping the light and transforming it into chemical energy
(c) in digesting proteins and carbohydrates
(d) as energy transferring organelles

NEET-2013

Ans. (a) : The Golgi complex plays a major role in post translational modification of protein and glycosidation of lipid.

The golgi apparatus principally performs the function of packaging materials, to be delivered either to the intra-cellular targets or secreted outside the cell, materials to be packaged in the form of vesicles from the ER fuse with the cis face of the golgi apparatus and move towards the maturing face. Golgi apparatus is the important site of formation of glycoproteins and glycolipids.

257. In prokaryotic cells:

(a) internal compartments are absent
(b) nucleus is absent
(c) ribosomes are 70S
(d) all of the above

J&K CET-2004

Ans. (d) : Prokaryotic cells (greek pro-primitive + karyon - nucleus). Here primitive nucleus defined or incipient nucleus is present eg. Bacteria, blue-green algae and PPLO or mycoplasma, nucleus is absent.
Ribosomes are of 70S type (50S + 30S).

258. How many chromosomes are present in each of the following with respect to maize plant respectively ?

(1) Leaf epidermal cell
(2) Antipodal cell
(3) Endosperm cell
(4) Generative cell
(5) Egg cell
(6) Megaspore
(7) Microspore mother cell

(a) 10, 20, 10, 10, 10, 20, 30
(b) 20, 10, 30, 10, 10, 10, 20
(c) 20, 10, 10, 10, 20, 30, 10
(d) 30, 10, 20, 10, 20, 10, 10

TS EAMCET-2015

Ans. (b) : Maize and sorghum have same number of chromosomes 2n = 20
n = 10
Leaf epidermal (2n) = 20
Antipodal (n) = 10
Endosperm (3n) = 30
Generative cell = (n) = 10
Egg cell (n) = 10
Megaspore (n) = 10
Microspore mother cell = (2n) = 20

259. Study the following lists

	List-I		List-II
(A)	Golgi apparatus	(i)	Circular DNA molecule
(B)	Mitochondrion	(II)	synthesis of carbohydrates
(C)	Chromatophores	(III))	Modification of proteins
(D)	Cytoskeleton	(IV)	Pigments
		(V)	Proteinaceous structures

@apna_pdf

The correct match is

	A	B	C	D
(a)	(II)	(IV)	(V)	(I)
(b)	(III)	(I)	(IV)	(V)
(c)	(V)	(II)	(IV)	(III)
(d)	(III)	(V)	(IV)	(I)

TS EAMCET-2015

Ans. (b) :

(A) Golgi apparatus	Modification of protein
(B) Mitochondrion	Circular DNA molecules
(C) Chromatophores	Pigments
(D) Cytoskeleton	Proteinaeous structure

260. Golgi apparatus is absent in

(a) yeast (b) liver cells
(c) higher plants (d) blue-green algae

Uttarakhand PMT-2011

Ans. (d) : Golgi apparatus is a small, sac like structure mainly found in tubular vesicles in Eukaryotic cells.These organelles are exclusively absent in Bacteria, Blue Green Algae.

261. The plastids which store oil are

(a) Amyloplasts (b) Rhodoplasts
(c) Chloroplast (d) Elaioplasts

UP CPMT-2013

Ans. (d) : Leucoplasts is a colourless plastid that synthesis monoterpene and also get differentiated into more specialized plastids such as amyloplasts, elaioplasts and proteinoplasts etc.

Elaioplast (colour less plastides) is a plastid which stores oil

262. The cancer of the epithelial cells is called

(a) leukemia (b) lipoma
(c) sarcoma (d) emphysema
(e) carcinoma

Kerala PMT-2008

Ans. (e) : Carinoma is a category of types of cancer that develop from epithelial cells. Specifically, a carcinoma is cancer that begins in a tissue that lines the inner or outer surfaces of the body, and that arises from cells originating in the endoderm, mesoderm of ectoderm, mesoderm or ectodermal germ layer during embryogenesis. Carcinomas occur when the DNA of a cell is damaged or altered and the cell begins to grow uncontrollably and become malignant.

Leukemia- (liquid cancer) or blood cancer cancer of bone marrow,

Sarcoma- Cancer that originates in supporting and connective tissues as bone, tendon, muscle

Emphysema- Lung cancer shortness of breath

Lipoma- A lump under the skin.

263. Continued exposure of vinyl chloride may cause cancer of the

(a) Liver (b) WBCs
(c) Lymphoid tissue (d) Spleen

CMC Vellore-2013

Ans. (a) : Exposure to vinyl chloride may increase a person's risk of developing cancer. Human and animal studies show higher rates of liver lung and several other types of cancer. Being exposed to vinyl chloride can effect a person's liver, kidney, lung, spleen, nervous system and blood.

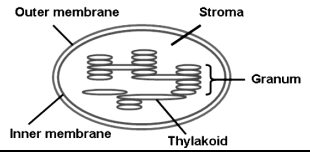
264. The structures that are formed by stacking of organized flattened membranous sacs in the chloroplasts are :

(a) Grana (b) Stroma lamellae
(c) Stroma (d) Cristae

AIPMT-2015

Ans. (a) : The structures that are formed by stacking of organized flattened membranous sacs (thylakoids) in the chloroplast are grana.

A chloroplast is a vesicle, bound by an envelope of two unit membranes and filled with a fluid matrix called **stroma**. The Lamellae, after separation from the Inner membrane, usually take the form of closed flattened, ovoid sacs, the thylakoids which lie closely packed in piles, the grana. Cristae are those twisted curving-shaped inner membranes in mitochondria where cellular respiration occur.



265. Identify the correct order of organisation of genetic material from largest to smallest

(a) Chromosome, genome, nucleotide,
(b) Chromosome, gene, genome, nucleotide
(c) Genome, chromosome, nucleotide, gene
(d) Genome, chromosome, gene, nucleotide

AIPMT (Re-Exam)-2015

Ans. (d) : The correct order of organization of genetic material from the largest to smallest.

Genome (haploid set of chromosome) → Chromosome (condensed chromatin)→ Gene (segment of DNA, unit of inheritance)→ Nucleotide (made up of pentose sugar, nitrogen base and phosphate).

A genome is an organism's complete set of DNA including all of its genes.

Each genome contains all of the information needed to build and maintain that organism.

This is the largest in the given options.

Chromosome are the thread like structures located inside the nucleic of animal and plant cells.

The building blocks of nucleic acids are the nucleotides.

A gene is the basic physical and functional unit of heredity.

266. Cellular organelles with membranes are

(a) Lysosomes, Golgi apparatus and mitochondria
(b) Nuclei, ribosomes and mitochondria
(c) Chromosomes, ribosomes and endoplasmic reticulum
(d) Endoplasmic reticulum, ribosomes and nuclei

AIPMT (Re-Exam)-2015

Ans. (a) : Lysosome. Golgi apparatus are single membrane bound organelles.

- Mitochondria, nucleic, chloroplast, are double membrane bound organelles.
- Ribosome is a non-membranous organelles. It is usually a aggregate form of r-RNA.
- Chromosome are the genetic material composed of nucleotides and histone proteins.

@apna_pdf

267. Which one of the following organelle in the figure correctly matches with its function?

(a) Rough endoplasmic reticulum, protein synthesis
(b) Rough endoplasmic reticulum, formation or glycoproteins
(c) Golgi apparatus, protein synthesis
(d) Golgi apparatus, formation of glycolipids

NEET-2013

Ans. (a) : The endoplasmic reticulum can either be smooth or rough, and in general its function is to produce protein for the rest of the cell to function, the rough endoplasmic reticulum has on it ribosomes, which are small, round organelles whose function it is to make these proteins.
Golgi apparatus is involved in the formation of glycolipid and glycoproteins.

268. Chlorenchyma found in: -
(a) Cytoplasm of Chlorella
(b) Mycelium of a green mould such as Aspergillus
(c) Spore capsule of a moss
(d) Pollen tube of Pinus

AIPMT-2003

Ans. (c): Chlorenchyma cells a type of living parenchymatous tissue, present only in plant cell, abundantly found in mesophyll of leaves and sometimes plants stem, possess abundant chloroplast. They are present in the spore capsule of moss, where they perform the function of photosynthesis.

269. Which of the following organelles contain DNA?
(i) Mitochondria (ii) Chloroplasts (iii) Golgi bodies (iv) Ribosomes
(a) (i) and (ii) (b) (ii) and (iii)
(c) (i) only (d) (iv) only

AIIMS-2013

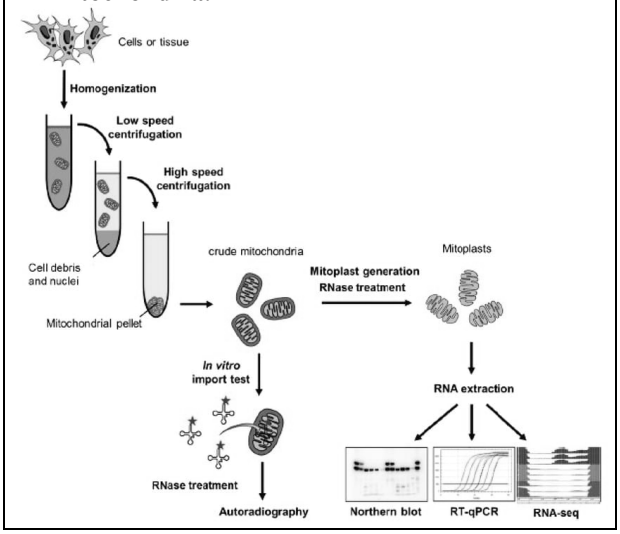
Ans. (a) : A eukaryotic cell has DNA in nucleus as well as cell organelles like mitochondria and chloroplasts. The DNA in cell organelles resembles prokaryotic DNA. The organelle DNA is present as a circular molecule while the DNA in nucleus is organized as linear structures, so they are called as semi autonomous organelle.

270. If a biochemical analysis of mitochondria has to done, the best procedure would be:
(a) Select cells which have a larger number of mitochondria
(b) Plasmolyse the cell and filter out the mixture an take the debris
(c) Grind the cells and filter out the mixture and take the debris
(d) Subject the cell to cell fractionation (centrifuge) and obtain mitochondria

AIIMS-2015

Ans. (d) : The best procedure would be to subject the cell to **cell fractionation** (centrifuge) and obtain mitochondria. Cell fractionation is a multistep process that subjects cells to centrifugal force in a spinning device called a **centrifuge**, which seperates organelles by their physical properties.

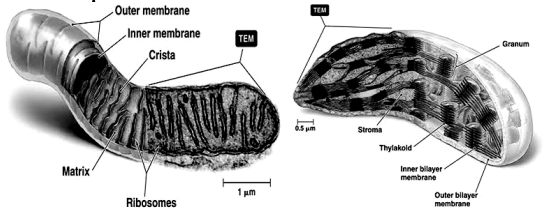
■ **Centrifugation of 5000 g, will sediment the mitochondria.**



271. DNA is present in
(a) Chromosomes and dictyosomes
(b) Chloroplasts and lysosomes
(c) Mitochondria and chloroplasts
(d) Mitochondria and endoplasmic reticulum.

AIIMS-2004

Ans. (c) : Mitochondria and **chloroplast** are both semi autonomous organelles with DNA.
• Mitochondria and Chloroplast are contain self DNA molecule. The DNA are small and circular double stranded. The mitochondrial DNA varies in size starting from 5 μm to 30 μm. Average length of **chloroplast DNA is 45 μm**.



Mitochondrial DNA vs Chloroplast DNA

272. The plant cell differs from the animal cell in:
(a) The presence of lysosomes
(b) The presence of large vacuole
(c) The absence of cellulosic cell wall
(d) The absence of chloroplast

Karnataka CET-2001

Ans. (b) : A plant cell has a rigid wall on the outside. It has plastids like chloroplasts, leucoplasts and chromoplasts and a centrally located large vacuole. All of these (cell wall, plastids vacuole) absent in an animal cell.

273. These type of vacuoles contain hydrolases:
(a) Sap (b) Contractile
(c) Food (d) Air

BCECE-2015

@apna_pdf

Ans. (c) : Food vacuoles contain hydrolyzing enzymes as they are formed by fusion with lysosomes. The food is digested by hydrolyzing enzymes. Food vacuole or digestive vacuole formed by engulfing the food particles found in protist.
Contractile vacuole- Take part in osmoregualation and excretion as in Amoeba.
Air vacuole- Help in buoyancy of cell.
Sap vacuole- Store and concentrate mineral salts and nutrients.

274. The non-membranous organelles are:
(a) centrioles (b) ribosomes
(c) nucleolus (d) all of these

DUMET-2004

Ans. (d) : The nucleolus is a small, dense and spherical structure (lack membrane) present in the nucleus of the cell that is visible during the inter phase of the cell. Centrioles (lack membrane) which are right angled to each other and is composed of a protein known as tubulin.
Ribosome is a non-membranous cell organelle and present in eukaryotes and prokaryotes cells.

275. Match the following organelles in Group I with the structures in Group II. Choose the correct combination.

Group I		Group II
P. Mitochondrion	i.	Cisternae
Q. Golgi	ii.	Cristae
R. Chloroplast	iii.	Thylakoids
S. Centrosome	iv.	Radial spokes

(a) P-ii, Q-i, R-iii, S-iv
(b) P-iii, Q-i, R-ii, S-iv
(c) P-iv, Q-i, R-ii, S-iii
(d) P-iv, Q-ii, R-i, S-iii

KVPY SB & SX-2016

Ans. (a) :

Mitochondrion	—	Cristae
Golgi	—	Cisternae
Chloroplast	—	Thylakoids
Centrosome	—	Radial spokes

276. In which cell organelles the genome system is autonomous?
(a) Ribosomes and chloroplasts
(b) Mitochondria and chloroplasts
(c) Mitochondria and ribosomes
(d) Golgi bodies and ribosomes

AMU-2014
Manipal-2014

Ans. (b) : Mitochondria and chloroplasts are semi-autonomus cell organelles since they possess their own DNA and ribosomes (Protein) synthesizing machinery They arise from preexisting organelles and their functions are partially controlled by the cell's nucleus and the organelles themselves. Their DNA is prokaryotic type of DNA circular and single strandand.

277. The pH of protoplasm is :
(a) 6.0 (b) 6.8
(c) 7.8 (d) 8.2

Rajasthan PMT-1999

Ans. (b) : Protoplasm is clear translucent ordourless colourless. Crystallo – colloid type of solution. size of colloidal particles is 0.001 to 0.1 mm.
Protoplasm is the mixture of chemical substance as-sugar, salt, acids, bases, protein, lipid etc. The PH of protoplasm is considered nearly as 7. i.e. 6.8 pH

278. The vacuole in the plant cell contains:
(a) tonoplast (b) cell sap
(c) stroma (d) matrix

Manipal-2005

Ans. (a) : The vacuolar membrane named the tonoplast separates the cytoplasm from the vacuole lumen.
The largest cell compartment are vacuoles that accounts for up to 90% of plant cell volume. Cell sap contain dissolved sugar and salt which helps in maintaining osmotic pressure and store useful and also waste substances.

279. Direction: In the given questions a statement of Assertion (A) is given and a corresponding statement of Reason (R) is given just below it of the statement, mark the correct answer as: Assertion: Microsome is the collective name for cytoplasmic cell organelle obtained after centrifugation of the cell.
Reason: These are present in all normal cells.
(a) If both (A) and (R) true and (R) is the correct explanation of (A)
(b) If both (A) and (R) are true but (R) is not correct explanation of (A)
(c) If (A) is true but (R) is false
(d) If both (A) and (R) are false
(e) If (A) is false but (R) is true

Haryana PMT-2001

Ans. (c) : Microsomes or vesicle-like artifacts reformed from pieces of the endoplasmic reticulum when eukarytic cells are broken up in the laboratory. Microsomes are not ordinarily present in living cell. Microsomes can be concentrated and separated from other cellular debris by differential centrifugation where fractionation of cell by ultrasound waves occurs. Unbroken cells, nuclei and mitochondria sediment out at 10,000 g. Whereas soluble enzymes and fragmented ER, which contains cytochrome P 450 (CYP) remain in solution. At 100,000 g achieved by faster centrifuge rotation.

280. Which of the following is not function of Golgi body?
(a) Protein synthesis
(b) Formation of cell wall
(c) Formation of fatty acids
(d) Formation of plasma membrane

MGIMS Wardha-2012

Ans. (a) : The function of golgi bodies is the packaging and secretion of proteins. It receives proteins from ER. Golgi body cell wall formation, fatty acid formation, plasma membrane formation, but not protein synthesis.
Ribosome protein synthesis in the cell is take place by Ribosome.

@apna_pdf

281. Role of carbohydrate in protoplasm

(a) as catalyst (b) for energy
(c) as enzymes (d) for synthesis

MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (b) : Protoplasm is a complex mixture of proteins carbohydrates, lipids and nucleic acid. The proteins are responsible for the cells structure the carbohydrate for its energy the lipids for its membrane and the nucleic acids for its genetic information.

282. Zone of exclusion surrounds

(a) Golgi apparatus (b) Centriole
(c) Nucleus (d) Iysosome

J&K CET-2011

Ans. (a) : Golgi apparatus is present in all ekaryotic cells except the RBC and sieve tube elements. Golgi apparatus is surrounded by a zone of exclusion in which ribosome's mitochondria, plastids, storage granules etc are absent.
Centrioles play a role in organizing microtubules that serve as the cells skeletal system.
Lysosome breakdown / digestion of macromolecules. Nucleus the brain of cell.

283. Sperm acrosome is derived from

(a) Golgi bodies
(b) Endoplasmic reticulum
(c) Iysosome
(d) Mesosome

J&K CET-2011

Ans. (a) : The sperm acrosome is derived from golgi bodies. It plays a important role in the fertilization process by containing enzymes that help the sperm penetrate and fuse with egg's outer layer.

284. Choose the matched ones.

(A) Vibrio – Rod like bacteria
(B) Mesosome – Helps in cell wall formation
(C) Smooth endoplasmic reticulum – Synthesis of lipid
(D) Vacuoles – Rich in hydrolytic enzymes

(a) (B) and (C) only
(b) (A) and (D) only
(c) (A), (B) and (C) only
(d) (B) and (D) only
(e) (B), (C) and (D) only

Kerala PMT-2014

Ans. (a) :
(a) Vibrio — Comma-shaped bacteria
(b) Mesosome — Helps in cell wall formation
(c) Smooth endoplasmic reticulum — Synthesis of lipid
(d) Vacuoles — Help maintain water balance

285. Engulfing of solid materials by cells is called?

(a) pinocytosis (b) phagocytosis
(c) active transport (d) autolysis

WB JEE-2015

Ans. (b) : Phagocytosis is a type of endocytosis that involves the engulfing of solid materials by cells.
• Active transport is the movement of molecules or ions across a membrane from a region of lower concentration to a region of higher concentration assisted by enzyme.
Autolysis more commonly known as self digestion.

286. Consider the following statements.

(a) The endomembrane system includes mitochondria, chloroplast and peroxisomes.
(b) Smooth endoplasmic reticulum is the major site for synthesis of lipid.
(c) Rough endoplasmic reticulum is actively involved in protein synthesis.
(d) Mitochondrial matrix possesses single circular DNA, a few RNA and 80S ribosomes.

Of the above statements

(a) (a) and (b) alone are correct
(b) (a) and (c) alone are correct
(c) (b) and (d) alone are correct
(d) (c) and (d) alone are correct
(e) (b) and (c) alone are correct

Kerala PMT-2013

Ans. (e) : Mitochondria, chloroplast and peroxisomes are not the part of Endomembrane system. it includes lysosome, ER, golgi complex vacuoles because their functions are coordinated with each-other.
Smooth E.R is major site for synthesis of lipid. Rough E.R is actively involved in protein synthesis. Mitochondrial matrix possess its own ribosomes. (The 70 S in nature) It synthesized some of its own structural protein.

287. Select the matched ones.

(a) Amyloplasts – store proteins
(b) Mitochondrion – 'powerhouse' of the cell
(c) Stroma – chlorophyll pigment
(d) Axoneme – 9 + 2 array

(a) (a) and (c) only (b) (b), (c) and (d) only
(c) (c) and (d) only (d) (a) and (d) only
(e) (b) and (d) only

Kerala PMT-2013

Ans. (e) :
(a) Amyloplasts — Synthesis and storage of starch
(b) Mitochondrion — Powerhouse of the cell
(c) Stroma — Help support organs and give structure
(d) Axoneme — 9 + 2 arrangement

288. I. It is a membrane bound space found in the cytoplasm
II. It is bound by a single membrane called tonoplast
III. It contains water, sap, excretory products and other materials not useful to the cell
IV. It has higher concentration of sap than the cytoplasm

The above statements apply to

(a) Golgi apparatus (b) Lysosomes
(c) Endoplasmic reticulum (d) Vacuoles
(e) Mesosomes

Kerala PMT-2013

@apna_pdf

Ans. (d) : Vacuoles are membrane-bound spaces found in the cytoplasm of eukaryotic cells. They are bound by a single membrane called tonoplast and contain water, sap, excretory products and other materials not useful to the cell.

* Vacuoles typically have a higher concentration of sap than the cytoplasm.

H. Cell Membrane and Cell Wall

289. Fluid mosaic model for cell membrane was proposed by

(a) Singer and Nicholson (b) Robert Brown
(c) Watson and Crick (d) Beadle and Tatum

Tripura JEE-2019, 2018
VMMC-2011 / CMC Vellore-2010
AMU-2009, 1999 / BCECE-2007
Rajasthan PMT-2006, 2003
DUMET-2006 / JCECE-2005
Manipal-2000

Ans. (a) : Fluid mosaic model of the cell membrane was proposed by Singer and Nicholson in 1972.

- Robert Brown Discovered nucleus
- Watson and Crick's Model stated that the two strands of the double helix DNA are held together by hydrogen bonds between nitrogenous bases on opposite strands.
- Beadle and Tatum hypothesis is known as the one gene one enzyme

290. The main components of plasma membrane are

(a) lipids and proteins
(b) lipids, proteins and carbohydrates
(c) lipids only
(d) proteins only

BVP-2008 / Uttarakhand PMT-2007
MGIMS Wardha-2005 / Rajasthan PMT-2003
UP CPMT-2005

Ans. (b) : The main components of plasma membrane are lipid, proteins and carbohydrates. It is the outer covering of animal cell but in plant cell it is situated below the cell wall.

291. In gram positive bacteria cell wall is made up of

(a) cellulose (b) protein
(c) murein (d) lipid

HP CET-2013 / Rajasthan PMT-2003
Punjab MET-1999 / Haryana PMT-2001
Karnataka CET-2001

Ans. (c) : In gram positive bacteria cell wall is made up of Peptidoglycan (NAM – N – Acetyl muramic acid) also known as mucopeptide or murein. Its thickness is about 20 to 80 nm.

292. The thickness of unit membrane is

(a) 20 Å (b) 35 Å
(c) 55 Å (d) 75 Å

BCECE-2014
BHU PMT (Screening)-2009
Uttarakhand PMT-2009
VMMC-2009

Ans. (d) : According to Robertson's concept of unit membrane, plasma membrane has a trilaminar structure in which transparent lipid bilayer is surrounded on either side by dense proteins. It has a thickness of about $75 \overset{0}{A}$ with a central lipid layer of $35 \overset{0}{A}$ in thickness and two peripheral layers of $20 \overset{0}{A}$ each.

293. The recent model for plasma membrane proposed by Singer and Nicolson is :

(a) molecular-lipid model
(b) lamellar model
(c) unit membrane mode
(d) fluid mosaic model

HP CET - 2011 /BCECE - 2006
VMMC - 2005 / AMU - 2004

Ans. (d) : The recent model for plasma membrane proposed by singer and Nicolson fluid mosaic model. According to this model they describes membranes as being bilayers of phospholipids in which the hydrophobic groups are turned inwards to face each-other and protein molecules are embedded in it.

294. Carrier proteins are involved in :

(a) transport of enzymes
(b) water transport
(c) active transport of ions
(d) passive transport of ions

BVP-2014, 2003 / BCECE-2006
VMMC-2005 / AMU-2004

Ans. (d) : Active transport is the movement of a substance across a membrane against its concentration gradient It requires energy for that process unlike channel proteins which only transport substances through membranes passively, carrier proteins can transport ions and molecules either passively through facilitated diffusion.

Carrier proteins are proteins that carry substances from one side of a biological membrane to the other. Many carriers proteins are found in a cells membrane, through they may also be found in the membranes of internal organelles such as the mitochondria, chloroplasts, nucleolus and others.

295. Fluid mosaic model exhibits amphipathy because of

(a) glycoproteins (b) phospholipids
(c) lipids (d) glycolipids

AMU-2011
MGIMS Wardha-2011
BHU PMT (Screening)-2011

Ans. (b) : Fluid mosaic exhibits amphipathy due to phospholipids as they have both hydrophobic and hydrophilic groups. Phospholipid consists of two parts i.e. head and the two tails. The head is composed of phosphate molecule that is attracted to water (hydrophilic in nature) and the two tails are made up of fatty acids that are repel water (hydrophobic in nature).

296. Identify the correct option

Statement - I : Excessive dosage of cocaine causes hallucinations.

Statement - II : Intake of cocaine does not causes euphoria

@apna_pdf

(a) Statement I is correct and II is wrong
(b) Statement I is worng and II is correct
(c) Statements I and II are wrong.
(d) Statement I and II are correct

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Hallucination is a perception of having seen, heard, touched tested or smelled something that was not actually there. Cocaine is also known as coke. It is a strong stimulant mostly used as a receational drug.

297. A specific organism [A] showing the lack of cell wall, survive without oxygen, pleomorphic. The other organism [B] has cell wall embedded with silica and indestructible. A and B respectively belong to

(a) Actinomyces. Diatoms
(b) Mycoplasma, Chrysophytes
(c) Cyanobacteria, Dinoflagellates
(d) Archaebacteria, Desmids

AP EAPCET-23.05.2023, Shift-II

Ans. (b) : Mycoplasma– The organism without a cell wall and can live without oxygen are mycoplasmas.
Mycoplasma is the simplest and the smallest of the free living prokaryotes.
Chrysophytes– Chrysophytes are protists that resemble plants and are typically found in freshwater and marine habitats with low calcium.
While some species are amoeboid without any cell walls, others have cellulose cell walls that are reainforced by silica compounds.

298. Which of the following sentences are true

A. The chromosome number of meiocyte in housefly is 6.
B. The chromosome number of gamete in Rat is 21.
C. The chromosome number of meiocyte of fruitfly is 8.
D. The chromosome number of a leaf cell in maize is 20.

(a) ABC (b) BCD
(c) CDA (d) ABCD

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : • The chromosome number of meiocyte in housefly is (2n) = 12.
• The chromosome number of gamete in Rat is 21.
• The chromosome number of meiocyte of fruitfly is 8.
• The chromosome number of a leaf cell in maize is 20.

299. Identify the incorrect statements regarding cell membranes

A. The hydrophilic head of lipids is present towards inner side of cell membrane.
B. The lipids of cell membrane are made of phosphoglycerides
C. Cell membranes may also contain carbohydrates
D. The quasi fluid nature of lipids does not enable lateral movement of proteins with in the bilayer

(a) AD (b) AB
(c) CD (d) BC

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : The hydrophilic head is composed of a choline structure (blue) and a phosphate (orange). This head is connected to a glycerol (green) with two hydrophobic tails (purple) called fatty acids.
• The lateral movement of proteins is caused by the quasi-fluid nature of lipids.

300. The movement of water through the cell wall is known as _____

(a) Tonoplast (b) Apoplast
(c) Plasmolysis (d) Symplast

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : The process of movement of water outside the plasma membrane and in the intercellular space is called as apoplastic pathway or apoplast.
Tonoplast is a single membrane that bounds the vacuoles and separates it from cytoplasm.
Plasmolysis is a process of contraction or shrinkage of the protoplasm of a plant cell and is caused due to the loss of water in the cell.
The symplast of a plant is the region enclosed by the cell membranes, within which water and solutes can diffuse freely.

301. The following enzymes are used to digest to the cell wall of a bacterium, green plant and fungi respectively

(A) Lysozyme
(B) Cellulose
(C) Chitinase
Options:

(a) B, A, C (b) A, C, B
(c) C, A, B (d) A, B, C

TS EAMCET-30.07.2022 Shift-I

Ans. (d) : Lysosome is an enzyme that cleaves peptidoglycan in bacterial cell wall.
The cell wall of all plants contain cellulose. Cellulose is a enzymes which is used to digest or break down of the cellulose.
Chitinases are generally found in organism that either need to reshape their own chitin or dissolve and digest the chitin of fungi.

302. Which of the following is not correct in relation to addiction and dependence?

(a) The TDA abuse leads to addiction and dependence.
(b) With the repeated use of TDA, the tolerance level of the receptors present in our body increases.
(c) Dependence leads the patients to implement all social norms.
(d) Dependence is the tendency of the body to manifest a characteristic and unpleasant condition, if the regular dose of drugs or alcohol is abruptly discountinued.

AP EAPCET-12.07.2022 Shift-I

Ans. (c) : Addiction is a neuropsychological attachment due to alcohol and drug effects. It consists euphoria and the temporary feeling of well being. It makes the people to have drug or alcohol even when there is no need dependence is the ability of the body to manifest the characteristics and unpleasant with drawl syndrome if regular does of drug or alcohol is discontinued.

@apna_pdf

Dependency can lead to feelings of depression, agitation, anger and anxiety.

Drug addiction includes → alcoholism, nicotine addiction, food addiction, opioid addiction.

303. Which type of substance would face difficulty to pass through the cell membrane?

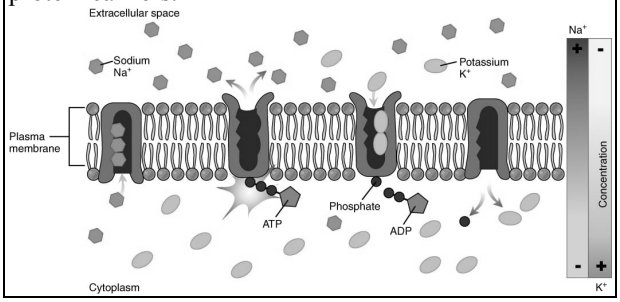
(a) Substance with hydrophobic moiety
(b) Substance with hydrophilic moiety
(c) All substance irrespective of hydrophobic and hydrophilic moiety
(d) Substance soluble in lipids

NEET (Re-Exam)-04.09.2022

Ans. (b) : Hydrophilic substance finds itself difficult to pass thought the membrane as it is not lipid soluble.

• Large polar or ionic molecules, which are hydrophilic, cannot easily cross the phospholipids bilayer.

Hydrophilic substances that dissolve in water can pass through the membrane only with the help of facilitating protein carriers.



304. Match the following lists.

List-I	List-II
A. Algal cell	**I. Protects and gives shape**
B. Pteridophyte cell	**II. Cellulose, galactans, mannans**
C. Calcium pectate	**III. Cellulose, hemicelluloses and pectin**
D. Cell wall	**IV. Holds as glue with neighbouring cells**

The correct match is:

	A	B	C	D
(a)	II	III	IV	I
(b)	III	II	I	IV
(c)	II	I	IV	III
(d)	IV	III	II	I

TS EAMCET-09.08.2021 Shift-II

Ans. (c) : Algal cells are made up of Cellulose, Galactans, Mannans and Calcium carbonate.

Cell wall is a rigid covering that protects the cell; provides structural support and gives shape to the cell. Eg-All plants cell wall.

The middle lamella is a layer mainly of calcium pectate which holds or glues the different neighbouring cells together.

Cell wall is made up of cellulose, pectin and hemicellulose.

305. What are the common characters of both prokaryotic and eukaryotic cells?

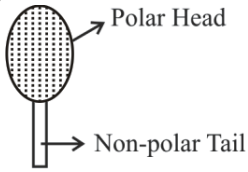
(A) Cytoplasm **(B) Plasma membrane**
(C) Mitochondria **(D) Cellulose cell wall**
(E) Meiotic cell division

(a) B, C, D (b) A, B
(c) C, D, E (d) B, E

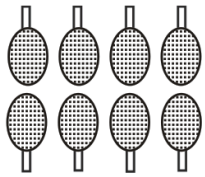
TS EAMCET-09.08.2021 Shift-II

Ans. (b) Prokaryotic cells are primitive cells mainly found in unicellular organism. Prokaryotic cells lack membrane bounded cell organelles and true nucleus is also absent. Cellulosic cell is absent in prokaryotes they possess a cell wall made up of peptidoglycan. Sexual reproduction is absent in prokaryotes so there is no meiotic cell division take place. Prokaryotes have plasma membrane and cytoplasm with scattered genetic material called nucleoid but eukaryotic cells have a true nucleus and all membrane bounded organelles, The cell organelles and nucleus is embedded in the cytoplasm the cell is covered with the plasma membrane which is covered by cell wall except animal cells.

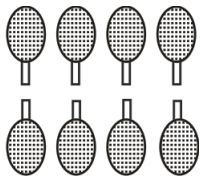
306. The lipid molecules present in plasma membrane have polar heads and non-polar tails (as shown in figure) which option represents the correct arrangement of lipids in lipid bilayer?



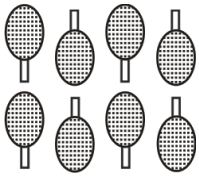
(a)



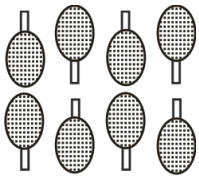
(b)



(c)



(d)



AP EAMCET-05.10.2021 Shift-I

@apna_pdf

Ans. (b) : Plasma membrane consists of lipids (phospholipids and cholesterol), proteins and carbohydrates. Lipid is amphipathic that is they have a hydrophilic (water-loving) polar end and a hydrophobic (water-fearing) or non-polar end. Lipid molecules consist of head and tail. The head is polar hydrophilic lies toward the protein and held by hydrogen and ionic bond. The tails lie towards the centre non-polar and hydrophobic held by Vander wall force it ensure that non-polar tails of saturated hydrocarbon protective from Aqueous environment.

307. Polyribosomes are _____.

(a) total number of ribosomes in the cell.
(b) devoid of r-RNA .
(c) number of ribosomes linked to m-RNA.
(d) not capable of helping in the synthesis of polypeptide chain.

MHT CET-07.10.2020 Shift-I

Ans. (c) : Polyribosomes are number of ribosomes linked to m-RNA. They consist of a complex of an mRNA molecule and two or more ribosomes that act to translate mRNA instructions into polypeptides.

308. Which one of the following groups of drugs is called cannabinoids ?

(a) Marijuana, hashish, charas
(b) Morphine, heroin, LSD
(c) Heroin, hashish, cocaine
(d) Barbiturates, amphetamines, benzodiazepines

MHT CET-06.10.2020 Shift-I

Ans. (a) : Marijuana, hashish, charas and ganja are obtained from the flower tops, leaves and the resin of cannabis plants. They contain chemicals called cannabinoids and are generally taken as inhalation or oral ingestion to effect cardiovascular system of the body.

309. A membrane that allows the passage of solvent molecules but not the passage of solute molecules is called _____ membrane.

(a) differentially permeable
(b) impermeable
(c) freely permeable
(d) semi-permeable

MHT CET-07.10.2020 Shift-I

Ans. (d) : Permeable or freely membrane is a membrane which allows the movement of both the solvent and solute across it. Semi permeable membrane permits the passage of pure solvent molecules to pass through it and not the solute particles. A differentially permeable membrane only allows certain substances to pass through it. An impermeable membrane is one through which no substance can pass.

310. Assertion (A) : Lipids are separated into the acid insoluble fraction along with other polymeric substances.
Reason (R) : Cell membranes are composed of lipids and are not water soluble.
Hence, form is vesicles along with acid insoluble pool.
The correct option among the following is.

(a) (A) is true, (R) is true and (R) is the correct explanation of (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-29.09.2020 Shift-I

Ans. (a) : Lipids are fatty compounds that perform a variety of functions in your body.
Lipids are separated into the acid insoluble fraction because when we grind a tissue in trichloroacetic acid, cell membrane and other membranes are broken into pieces and form vesicles which are not water soluble. Example – waxes, oils, fats, hormones etc.

311. Identify the incorrect matching:

(a) Crack-interferes with the transport of the neuro-transmitter dopamine
(b) Benzodiazepines-hypnotic(sleep-inducing), anxiolytic
(c) smack-addictive and considered most dangerous opiate
(d) Pethidine-Semisynthetic opiates

AP EAMCET-24.09.2020 Shift-I

Ans. (d) : Pethidine injection is a type of medicine called an opioid analgesic. Pethidine is a synthetic substance. Pethidine is employed in the treatment of postanesthetic shivering. Pethidine also known as meperidine is a worldwide analgestic for treating labor pain.

312. Match the column I and II

Column I	Column II
(A) K.C. Mehta	**(i) Fluid mosaic model**
(B) P. Maheshwari	**(ii) First recombinant plasmid**
(C) Cohen and Boyer	**(iii) Haploid culture**
(D) Singer and Nicolson	**(iv) Rust disease**

(a) (A) - i, (B) - iii, (C) - ii, (D) - iv
(b) (A) - iv, (B) - iii, (C) - ii, (D) - i
(c) (A) - i, (B) - ii, (C) - iii, (D) - iv
(d) (A) - ii, (B) - iii, (C) - iv, (D) - i

AIIMS-25.05.2019 Shift-I

Ans. (b) : K.C. Mehta:- He Investigated the effects of temperature on rust fungi growth. He performed his research in the field of fungus-induced plant rusting, which changes the colour of plant leaves from green to brown, red or orange.

- **P. Maheswari:-** He Discovered the production of haploid anther culture. Haploid cells are excellent tools to study gene function as they contain a single copy of the genome and are thus unable to mask the effect of mutations.
- **Cohen and Boyer:-** They Discovered recombinant DNA technology. A recombinant DNA molecules are produced by joining together two or more DNA segments usually originating from different organisms.
- **Singer and Nicolson:-** Proposed the fluid mosaic model of the cell membrane. According to this model membranes are made up of lipids, proteins and carbohydrates. The main lipid membrane components are phospholipids.

@apna_pdf

313. Plasma membrane is

(a) Semipermeable and symmetric
(b) Selectively permeable, elastic and asymmetric
(c) Permeable and asymmetric
(d) Selective permeable with monolayer phospholipids

SRM JEEE-2019

Ans. (b) : Plasma membrane, also called the cell membrane. Plasma membrane is selectively permeable, elastic and asymmetric. It is also selectively or differentially permeable. Semipermeable means half permeable because it regulates the movement of substances in and out of the cell i.e. plasma membrane will allow free transport of solvent like water across it but will not allow free transport of solute particles.

314. Assertion (A): Syncytium is the result of karyokinesis not followed by cytokinesis.
Reason (R): In plant cell. middle lamella formation starts from centre and grows outwards of the cell and leads to cell wall formation.
Options:

(a) (A) and (R) true and (R) is the correct explanation of (A).
(b) (A) and (R) true. but (R) is not the correct explanation of (A).
(c) (A) is true, (R) is false.
(d) (A) is false, (R) is true.

AP EAMCET-24.04.2019 Shift-II

Ans. (b) : Generally, cell division is completed by cytokinesis after karyokinesis in mitosis. Some times Karyokinesis is not followed by the process of cytokinesis that is nucleus division is not followed by cell division then a multinucleate condition occurs, which leads to the formation of syncytium. Coconut liquid endosperm is an example of a syncytium.
Middle lamella is a layer rich in pectin which cement the cell walls of adjacent plant cells and form plasmodesmata connections.

315. Match the following

	List-I		List-II
A.	**Morphine**	**1.**	**Atropa belladonna**
B.	**Hallucinogenic**	**2.**	**Erythroxylum**
C.	**Cannabinoids**	**3.**	**Papaver somniferum**
D.	**Cocaine**	**4.**	**Cannabis sativa**

The correct answer is

	A	B	C	D
(a)	(i)	(ii)	(iii)	(iv)
(b)	(iii)	(i)	(iv)	(ii)
(c)	(iv)	(i)	(iii)	(ii)
(d)	(iv)	(iii)	(ii)	(i)

TS EAMCET-02.05.2018 Shift-II

Ans. (b) :
Morphine is obtained from *Papaver somniferum.* It is the main opium alkaloid.
Atropa belladonna is a poisonous plant, also called deadly nightshade. Its toxic substances cause euphoria and hallucinations.
Canabinoids are obtained from inflorescences of the plant *Cannabis sativa*.
Cocaine is a powerfully addictive stimulant drug, it is obtained from *Erythroxylum coca*.

316. What is the role of sterol in cell membrane?

(a) Stability
(b) Communication with other cells
(c) Secretion
(d) Transport

JIPMER-2018

Ans. (a) : Sterols are known as steroid alcohols an example of which is cholesterol. Sterol are amphipathic lipids. The basic role of sterol in cell membrane is to provide stability, it also regulate biological processes and sustain the domain structure of cell membranes where they are considered as membrane reinforcers.

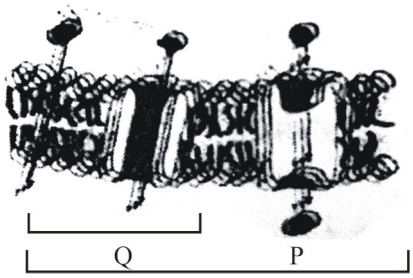
317. Assertion (A): The "Fluid Mosaic model" proposed by Singer and Nicolson indicated that the quasi-fluid nature of lipid enables lateral movement of proteins within the overall bilayer
Reason (R): In the cell wall of a young plant cell, the primary wall is capable of growth, which gradually diminishes as the cell matures and the secondary wall is formed on the inner side of the cell.
Which of the following is true?

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is false
(d) (A) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-I

Ans. (b) : Singer and Nicolson (1972) gave the modern concept about the structure of plasma membrane, fluid mosaic model according to which the quasi-fluid nature this ability to move within the membrane is measured as its fluidity. This ability to move within the membrane is called fluidity and is important for cell growth.

318. Identify 'P' and 'Q' in the given diagram.



(a) P = Facilitated diffusion
Q = Simple diffusion
(b) P = Facilitated diffusion
Q = Active Transport
(c) P = Simple diffusion
Q = Passive transport
(d) P = Simple diffusion
Q = Active transport

GUJCET-2018

@apna_pdf

Ans. (a):
(P) Facilitated diffusion:– Facilitated diffusion is the movement of hydrophilic molecules-or ions across the plasma membrane. The diffusion is facilitated by transport protein i.e. (carrier proteins or pore proteins).
(a) Simple diffusion:- Simple diffusion is when ion or molecule diffuse from an area of high concentration, to an area of low concentration.
Active transport:- Active transport is the process of moving molecules across a cellular membrane through the use of cellular energy.

319. Choose the correct group of organisms based on their cell wall materials respectively- Cellulose, Peptidoglycan, Algin, Mycolic acid and Pseudomurein.
(a) Claviceps, Bacillus, Ulothrix, Corynebacterium, Laminaria
(b) Ulothrix, Bacillus, Laminaria, Corynebacterium, Arechaebacteria
(c) Laminaria, Archaebacteria, Ulothrix, Bacillus, Corynebacterium
(d) Bacillus, Corynebacterium, Ulothrix, Laminaria, Archaebacteria

AP EAMCET-25.04.2018 Shift-II

Ans. (b) : Ulothrix is an example of green algae having barrel shaped or cylindrical cells. The cell wall of green algae is composed of propectin and cellulose.
Bacillus is a type of bacterial cell or bacteria. Bacterial cell is made up of peptidoglycan, often known as mureine.
Laminaria belongs to the phaeophyceae. The cell wall of Laminaria is made up of cellulose and algin.
The cell wall of **Corynebacterium** and **Mycobacterium** specieses are made up of mycolic acids.
Pseudomurein is present in the cell wall of **methanogenic archaebacteria**.

320. Energy is used in which of the following ?
(a) Active absorption
(b) Passive absorption
(c) Diffusion
(d) None of the above

Tripura JEE-2017

Ans. (a) : Active absorption is the absorption of water by roots using adenosine triphosphate produced by root respiration ; It is called active absorption because the roots cells actively participate in the process.
Diffusion- The movement of molecule from a region of higher concentration to a region of lower concentration.

321. Plant cell wall is made up of
(a) Cellulose, hemicelluloses and pectin
(b) Cellulose and Pectin
(c) Cellulose, hemicelluloses and chitin
(d) Cellulose only

SRM JEEE -2017

Ans. (a) : Cell wall is non-living, rigid structure forms an outer covering for plasma membrane of fungi & plant. Primary cell wall is a thin layer of the cell wall, composed of cellulose, pectin and hemicelluloses and secondary cell wall of the plant cell wall is made up of cellulose, xylan, glucomannan and lignin.

322. Which of the following is not a characteristic of facilitated transport?
(a) Uphill transport
(b) Highly selective
(c) Requires special membrane proteins
(d) Transport saturates

Karnataka CET-2017

Ans. (a) : Facilitated transport is the passive transport of the certain ions or the molecules through special membrane proteins called as channel proteins. The movement of molecule is therefore highly selective. The transport depends on the concentration gradient or the saturation limit. The uphill transport is an example of the active transport in which transport of molecules involves against to the concentration gradient .

323. lipids are insoluble in water, because lipid molecules are:
(a) neutral (b) Zwitter ions
(c) hydrophobic (d) hydrophilic

WB JEE-2006

Ans. (c) : Lipids are non-polar, bilayered, water insoluble molecules. High one hydrophobic in nature due to their non-polar ends i.e they are insoluble in water while water is a polar molecule, so there is no way for water to attach to lipid molecule. Instead, the non-polar lipids will bind to themselves which is why oils and fats form droplets on the surface of the water.

324. Nuclear membrane is continuous with
(a) rough endoplasmic reticulum
(b) smooth endoplasmic reticulum
(c) cell membrane
(d) Golgi bodies

Punjab MET-2009

Ans. (a) : Rough endoplasmic reticulum (RER) is frequently observed in the cells which are actively involved in protein synthesis and secretion they are exertive and continuous with the outer membrane of the nucleus. Smooth endoplasmic reticulum (SER) is a major site for synthesis of lipid. In animal cells lipid like steroidal hormones are synthesized in SER.

325. Teichoic acid is present in
(a) cell wall of Gram positive bacteria
(b) cell wall of Gram negative bacteria
(c) capsid of virus
(d) protoplasm of mycoplasma

Punjab MET-2009

Ans. (a) : Teichoic acid is present in the cell wall of the G^+ bacteria. It comprises a huge percentage in the cell wall of G^+ bacteria. The main function of teichoic acid is to provide flexibility to the cell-wall by attracting cations (calcium and potassium). It is sensitive to antibiotic like penicillin which attacks the cell wall.

326. Cell wall of fungi is made up of
(a) fungal cellulose (b) hemicellulose
(c) fungal chitin (d) Both (a) and (c)

Punjab MET-2009

Ans. (d) : The fungal cell wall is composed of fungal cellulose and mainly chitin. Chitin is a polymer of N-acetyl glucosamine. Cellulose is not present in the cell wall of fungi but a type of fungal cellulose may be present in their cell wall.

@apna_pdf

327. N–acetyl muramic acid is found in
(a) Cells wall component of plant
(b) Cell wall component of Gram positive bacteria
(c) Cell wall component of fungi
(d) Viral coat material

WB JEE-2012

Ans. (b) : N-Acetylmuramic acid (NAM) is a part of the peptidoglycan polymer of bacterial cell walls in gram positive bacteria. It is the structural component of the bacterial cell wall.

328. Lipid bilayer is present in:
(a) plasma membrane (b) ribosome
(c) chromosome (d) nucleolus

Punjab MET-2006
Rajasthan PMT-2004

Ans. (a) : Plasma membrane is a trilamellar layer. Trilamellar layer concept is based on the trilamellar modal for the plasma membrane which is suggested by Davson and Danielli, in 1935. According to that and other models a bilayer of lipid is present in the centre of the plasma membrane and are surrounded by single layer of protein to their each side. Lipid bilayer is a thin polar membrane made of two layers of lipid molecules.

329. Which of the following lacks cell wall?
(a) Gametes (b) Amoeba
(c) Mycoplasma (d) All of these

BHU PMT-2002

Ans. (d) : Cell wall is the outer covering of all plants, fungi and some bacterial cell, it surrounds the plasma membrane. Cell wall is not found in animal cell.
Like all prokaryotes mycoplasma lacks the cell wall, mycoplasma is a genus of bacteria.
Amoeba lacks a cell wall like other protozoans.
Cell wall absent in gametes also.

330. In middle lamella, which substance is present in large quantity:
(a) Cutin (b) Suberin
(c) Pectin (d) None of these

Rajasthan PMT-1996

Ans. (c) : The most abundant matter of the middle lamellas of the cell is calcium and pectin. The middle lamella is made up of pectin that joins the cell wall of the two neighboring cells together. It gives stability to the plants. Middle lamella contains **calcium** and **magnesium pectates**.

331. In 1994 Nobel prize for the discovery of protein in cell membrane was awarded to:
(a) Fischer and Krebs
(b) Martin Loother and Nelson
(c) Stuart and Bital
(d) Gilman and Rodbell

Rajasthan PMT-1996

Ans. (d) : The Nobel prize in physiology or medicine in 1994 was accorded jointly to Alfred G. Gilman and Martin Rod bell for their discovery of G- Proteins and the role of these proteins in signal transduction of cells. G proteins are also known as guanine nucleotide-binding proteins. They are located in the plasma membrane that binds the extracellular substances and transmits signal from these substances to an intracellular molecule that is G protein.

332. Who gave the term 'plasmalemma' ?
(a) C. Nageli (b) J. Q. Plower
(c) C. Kramer (d) Nicolson

UP CPMT-2010

Ans. (b) : The term 'plasmalemma' was given by J.Q. Plower in 1931. Plasmalemma is also known as cell membrane or plasma membrane. It protects the cell from external environment mediates cellular transport and transmits cellular signal.

333. Liquid food drinking is
(a) imbibition (b) pinocytosis
(c) phagocytosis (d) none of these

BVP-2008
Uttarakhand PMT-2007

Ans. (b) : Pinocytosis is a process by which liquid droplets are ingested by living cells by the cellular invagination whereas phagocytosis means intake of solid by an animal cell. Pinocytosis is also called cell drinking whereas phagocytosis is called cell eating.

334. The inward movement of ions into the cells is ..... and the outward movement is .....
(a) influx; efflux
(b) efflux; influx
(c) absorption; adsorption
(d) adsorption; absorption

AFMC -2009

Ans. (a) : Ions present in the cells are show movement and that type of movement of ions in the cell is called flux. It occurs via two types influx movement and efflux movement. The inward movement of ions inside the cell is called influx and the outward movement is called efflux.

335. Which of the following pairs is correctly matched –
(1) Stimulants - Benzedrine and methedrine
(2) Opiates - Ganja, charas
(3) Depressants - Nembutal and seconal
(4) Hellucinogens - Opium and heroin
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2009

Ans. (d) : Benzedrine and methedrine are stimulants
Nembutal and seconal are depressants.
Opiates are the derivatives of opium. Heroin is a synthetic opiate.
Ganja and charas are hellucinogens.

336. Primary wall of cell wall is composed of (1) cellulose (2) Hemicellulose (3) pectin (4) protein
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2011
AMU - 1999

Ans. (a) : Primary cell wall is composed of →
(1) Cellulose (25%), (2) Hemicellulose (50%), (3) Pectin (25%).
Cell wall provides structural support and protection to the cell. In secondary cell walls, lignin may be deposited. Secondary cell wall located between the primary cell wall and the plasma membrane.

@apna_pdf

337. Opiate narcotics drugs are

(a) Antianxiety (b) Analgesic
(c) Hypnotic (d) Antihistamine

J&K CET-2008

Ans. (b) : Opiate narcotics drugs are a type of analgestic drug. They bind to opioid receptors in the central nervous system. Narcotics are now called opioids. Opioids are a broad group of pain-relieving drugs that work by interacting with opioid receptors in your cells.

338. The drug useful to increase cardiovascular effects in human being is

(a) Cocaine (b) Barbiturate
(c) Benzodiazetine (d) Insulin

J&K CET-2008

Ans. (a) : Cocaine is drug which is use to increase cardiovascular effect in human being. When we take cocaine in small amount or at low doses then it induced sympathetic effects, increase heart rate, blood pressure and myocardial contractibility, leading to increased myocardial oxygen demand.

339. Heroin in extracted from

(a) Erythroxylum coca (b) Cannablis sativa
(c) Papaver somniferum (d) Atropa belladonna

J&K CET-2008

Ans. (c) : Heroin is obtained by the acetylation of morphine, which occurs as a natural product in opium: the dried latex of certain poppy species eg. *Papaver somniferum*. Heroin is a crude preparation of diamorphine.

340. Simultaneous movement of two molecules across a membrane in the same direction is known as

(a) antiport (b) symport
(c) uniport (d) biport

DUMET-2010

Ans. (b) : Simultaneous movement of two molecules across a membrane in the same direction is known as – symport. The movement of two molecules across the membrane in the opposite direction is called antiport.
The movement of an independent molecule across the membrane is called uniport.

341. Which of the following cell organelle remains enveloped by a single unit membrane ?

(a) Mitochondria (b) Lysosomes
(c) Nucleus (d) Chloroplast

HP CET-2011
MGIMS Wardha-2010

Ans. (b) : Lysosomes are single membrane bounded structure or cell organelles. Mitochondria, chloroplast and nucleus are double membranous structures.

342. Which of the following plant cells is not surrounded by a cell wall?

(a) Root hair cell (b) Stem hair cell
(c) Gamete cell (d) Bacterial cell

BHU PMT (Screening)-2009
VMMC-2009
Uttarakhand PMT-2009

Ans. (c) : The sex cells of the flowering plant are called gametes it is not surrounded by a cell wall. Root hair cells are surrounded by a thin and freely permeable cell wall and stem hair cell and bacterial cells are also possess cell wall.

343.

(i) They help in respiration
(ii) They help in cell wall formation
(iii) They help in DNA replication
(iv) They increase surface area of plasma membrane

Which of the following prokaryotic structures has all the above roles?

(a) Chromosome (b) Ribosome
(c) Mesosome (d) Lysosome
(e) Polysome

Kerala PMT-2015

Ans. (c) : Mesosomes aer formed by the infolding of the bacterial cell membrane. Mesosome is analogous to eukaryotic mitochondria. It helps in respiration, cell wall formation and increase the surface area of the cell membrane. It play a role in cell division. DNA replication and protein synthesis.

344. Cellulose is the major component of cell walls of

(a) Pythium (b) Xanthomonas
(c) Pseudomonas (d) Saccharomyces

BHU PMT (Screening)-2010

Ans. (a) : Pythium is a genus of the class oomycetes, which are also known as "water molds".
The cell wall of Pythium and most of the oomycetes are composed of cellulose and β-1, 3 glucan with minimal amounts of chitin.

345. A cell will experience the highest level of endosmosis when it is kept in

(a) distilled water (b) salt solution
(c) sugar solution (d) protein solution

KVPY SA-2012

Ans. (a) : When a cell is kept in distilled water the concentration of the solute inside the cell is more than outside and then due to endosmosis water will enter inside the cell. After the maximum amount of water enters the cell, the cell bursts as it can no longer absorb water.

346. Which one of the following is not a constituent of cell membrane?

(a) Cholesterol (b) Glycolipids
(c) Proline (d) Phospholipids

Rajasthan PMT-2010

Ans. (c) : Cell membrane is a biological membrane. Cell membrane is also known as plasma membrane or cytoplasmic membrane and historically referred to as 'plasmalemma'. Cell membranes are made up of lipids (that is Phospholipids, cholesterol and Glycolipids) and protein (that is Glycoproteins, enzymes and transport proteins). Proline is an amino acid that is generally not a constituent of any biological membrane.

347. Na^+/K^+ pump in a cell is an example of

(a) osmosis (b) diffusion
(c) passive transport (d) active transport

AMU-2010

@apna_pdf

Ans. (d) : The sodium-potassium pump goes through cycles of shape changes to help to maintain a negative membrane potential. The sodium – Potassium pump is an example of active transport because energy is required to move the sodium and potassium ions against the concentration gradient.

348. Cell wall is outer covering of plant cell made up of cellulose it is:
(a) semi permeable (b) permeable
(c) non permeable (d) all of these

HP CET-2013

Ans. (b) : The cell wall of plant cell is made up of cellulose, a linear polymer of glucose. Cell wall of the plant cell is permeable in nature because it allows both solvent and solute molecules to pass through it.

349. In many bacteria, the cell membrane becomes invaginated and folded to form
(a) pill (b) cristae
(c) fimbriae (d) mesosomes

AMU-2005

Ans. (d) : Bacteria are prokaryotic. Cell membrane of the bacterial cell wall invaginate to form a structure called mesosomes. Mesosomes are discovered by F. James. It is analogous to eukaryotic mitochondria. It play an important role in bacterial cell i.e. It help in respiration.

350. Chitin is present in the cell wall of
(a) Fungi (b) Bacteria
(c) Yeast (d) Algae

AMU-2009

Ans. (a) : The fungi had chitin in their cell walls while the green plants had a cellulosic wall. Chitin form a rigid cell wall. It provide structural stability to fungal cell walls.

351. Which is correct for the structure of cell wall of bacteria and fungi ?
(a) Both are made up of cellulose
(b) Both have mucopeptide
(c) Both are made up of N-acetyl glucosamine
(d) None of the above

AMU-2009

Ans. (c) : Cell wall is the outer covering of fungal cell wall and bacterial cell wall.
Fungal cell wall is made up of chitin, which is a polymer of N-acetyl glucosamine.
N- acetyl muramic acid and N-acetyl glucosamine are the repeating units that make up peptidoglycan, which is a component of the bacterial cell wall.

352. The membrane which allows passage of certain substances more readily than others is termed as
(a) permeable (b) selectively permeable
(c) semipermeable (d) impermeable

VMMC-2005
AMU-2004

Ans. (b) : A membrane which allows certain substances to pass through but does not allow other to pass through it is called a selectively permeable membrane (SPM). It allows the passage of only certain types of molecule through diffusion and occasionally by facilitated diffusion.

353. Diatomaceous earth is obtained from
(a) Bacillarophyceae (b) Xanthophyceae
(c) Rhodophyceae (d) Chrysophyceae

JIPMER-2013

Ans. (a) : Diatomaceous earth is obtained from Bacellariophyceae or diatoms or Golden Brown algae.
Diatomaceous earth most commonly used for polishing, filtration of drugs, oil and syrups and also in the manufacturing of toothpaste and bricks.

354. The secretion of macromolecules by fusing a transport vesicle to the plasma membrane is
(a) pinocytosis (b) phagocytosis
(c) endocytosis (d) exocytosis

BHU PMT (Screening)-2011

Ans. (d) : A process by which the secretion of Macromolecules by fusing a transport vesicle to the plasma membrane takes place is called exocytosis. Exocytosis is also known as cell vomiting or ephagy.

355. During endocytosis,
(a) the cell divides its cytoplasm during mitosis
(b) the cell digests itself
(c) the cell engulfs and internalises materials using its membrane
(d) the cell enables the extracellular digestion of large molecules

Manipal-2009

Ans. (c) : The term " Endocytosis" was coined by Christian deDuve in 1963. It is a cellular process in which substances are brought in to the cell. In this process material is transported into the cells by formation of vesicles. It include two essential similar processes i.e. phagocytosis and pinocytosis. Phagocytosis is the bulk ingestion of solid food while pinocytosis is the ingestion of liquid food materials.

356. Electroporation involves
(a) promotion of seed germination by induced imbibitions of water with electric current
(b) making transient pores in cell membrane to facilitate entry of gene constructs
(c) purification of saline water with the help of an artificial membrane
(d) passage of sucrose through sieve pores by electro-osmosis

DUMET-2009

Ans. (b) : Electroporation is a technique in microbiology where an electric field is applied to a cell to increase the permeability of its cell membrane and they allow the entry of the chemicals drug or DNA molecules into the cell. This versatile method can be used for all cell types and for transfection of DNA, RNA, mRNA, RNPs or proteins,.

357. L.S.D. is obtained from :
(a) Claviceps purpurea
(b) Rauwolffia serpentine
(c) Papaver somniferum
(d) Cannabis sativa

Haryana PMT-2003

Ans. (a) : Lysergic acid diethylamide (LSD) is synthetically derived from the fungus *Cleviceps purpuria*. LSD was first synthesized by Albert Hofmann

@apna_pdf

in 1938. LSD are powerful hellucinogens. That change mood, behavior and thoughts they may cause pleasant or unpleasant semation in the body, they effect cerebrum and sense organ and produce euphoria.

358. Stramonium is a drug obtained from the plant species of :

(a) Datura (b) Ocimum
(c) Rauwolffia (d) Asphodelus

Haryana PMT-2003

Ans. (a) : Stramonium drug is obtained from Datura and the drug stramonium was known as narcotic. **D. stramonium** is a plant with both poisonous and medicinal properties and has been proven to have great pharmacological potential with a great utility and usage in folklore medicine.

359. An enzyme carrier protein associated with cell membrane

(a) Lipase (b) Amylase
(c) Permease (d) Catalase

VMMC-2008
AMU-2008

Ans. (c) : Carrier protein and channel proteins are the two major classes of membrane transport proteins carrier proteins (also called carriers, permeases or transporters) bind specific solutes and transfer them across the lipid bilayer by undergoing conformational changes that expose the solute-binding site sequentially on one side of the membrane and then on the other.

360. Pits are formed on the cell wall is due to lack of

(a) Cell plate
(b) Primary wall material
(c) Secondary wall material
(d) Middle lamella

J&K CET-2007

Ans. (c) : Pits are formed on the cell wall due to lack, of secondary wall material. Pits are then connections seen on the plant cell walls the structure of pits includes-pit membrane, pit cavity and pit aperture. They allow the flow of water and nutrients from one element to another, linking water in roots with transpiration in leaves.

361. Lipid molecules in plasma membrane are arranged in which manner ?

(a) Scattered (b) Series
(c) Alternate (d) Head parallel

VMMC-2007

Ans. (d) : In the plasma membrane lipid molecular are arranged in head parallel manner i.e. head of both lipid layer towards the outside. Lipids are an essential component of the cell membrane. The structure is typically made up of a glycerol backbone, 2 fatty acid tails (hydrophobic) and a phosphate group (hydrophilic). It forms the lipid bilayer.

362. In Singer and Nicolson model of plasma membrane/the extrinsic proteins are:

(a) tightly associated with intrinsic protein and can be easily separated
(b) loosely associated with intrinsic protein and can be easily separated
(c) Loosely associated with intrinsic protein and cant be easily separated
(d) tightly associated with intrinsic protein and cant be easily separated

BCECE-2002

Ans. (b) : In singer and Nicolson model of plasma membrane the extrinsic proteins are loosely associated with intrinsic proteins and can be easily separate. They are situated entirely outside of the phospholipid bilayer. They are held by the cell membrane by weak molecular attraction.

363. Cell Adhesion and cell recognition occur due to biochemicals of cell membrane named

(a) lipids
(b) proteins
(c) glycoproteins and glycolipids
(d) proteins and lipids

AMU-2003

Ans. (c) : Glycoproteins and glycolipoids are proteins and lipids that are present on the outer surface of the cell membrane with carbohydrate group attached to them respectively. cell recognition is a cell's ability to distinguish one type of neighboring cell from another and cell adhesion is the ability of a single cell to stick to another cell or an extracellular matrix (ECM).

364. On which surface of cell Donnan equilibrium occur?

(a) Tonoplast (b) Cell wall
(c) Plasma membrane (d) Nuclear membrane

GUJCET-2015

Ans. (c) : Plasma Membrane – Plasma Membrane is selectively permiable membrane. The resting membrane potential occurs across plasma membrane. Due to selectively permeability there is a high concentration of anions present across the cell membrane. This creates donnan equilibrium. It is also called as Gibbs - Donnan equilibrium. In other words, it is an uneven distribution of ions on one side of semi permeable membrane.

Thus, the correct answer is option (c).

a) Cell wall– The cell wall is the protective, semi–permeable outer layer of plant cell. The major function of the cell work is to give the cell strength and picture and to filter molecules that pass in and out of the cell. A cell is the smallest part of an organism that still contain that organism's elements.

b) Tonoplasts– It is a semi permeable membrane surrounding a vacuole in a plant cell. It is mainly involve in regulating the movement of ions around the cell and isolating materials that might be harmful or a threat to the cell.

d. Nuclear Membrane– A nuclear membrane is a double membranous structure. It serves to separate the chromosomes from the rest of the cell. The nuclear membrane includes an array of small holes or pores that permit the passage of certain materials such as nucleic acids and proteins, between the nucleoplasm and cytoplasm.

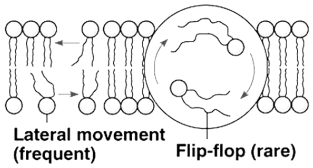
365. Keeping in view the "fluid mosaic model" for the structure of cell membrane, which one of the following statements is correct with respect to the movement of lipids and proteins from one lipid monolayer to the other (described as flip-flop movement)?

@apna_pdf

(a) While proteins can flip-flop, lipids cannot
(b) neither lipids, nor proteins can flip-flop
(c) Both lipids and proteins can flip-flop
(d) While lipids can rarely flip-flop proteins cannot

AIPMT-2008

Ans. (d) : Fluid mosaic model of membranes states that membrane components are free to diffuse in the plane of the membrane. Some of the membrane proteins are restricted to specific regions of the membrane by interactions with cytoskeletal proteins. The lipids in the bilayer can sometimes undergo transverse diffusion or "flip-flop movement" to go from one layer to the other that means rarely flip-flop of the phospholipids occur. This does not occur with the protein.

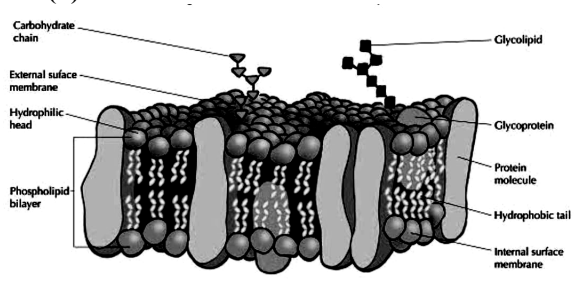


(a) Movement of phospholipids

366. Which one of the following is not a constituent of cell membrane ?
(a) Phospholipids (b) Cholesterol
(c) Glycolipids (d) Proline

AIPMT-2007

Ans. (d) :



Proline is the only proteinogenic secondary amino acid which is a secondary amine, as the nitrogen atom is attached both to the α- carbon and to a chain of three carbons that together form a five membered ring. It is not present in the cell membrane.

- Proline improves skin texture and aids collagen formation and helps to contain the loss of collagen during aging.
  The biological membranes are essentially made up of lipids and proteins. The three main lipid constituents of cell membranes are phospholipids, glycolipids and sterols.
- The phospholipids contain a phosphate moiety in the hydrophilic head. They can be distinguished into glycerophospholipids with a glycerol backbone and a sphingo-phospholipids based on 4 sphingosine.
- Glycolipids contain one or more monosaccharide residues and are based on 4-sphingosine or ceramide.
- The steroids are sterol alcohols which contain a cyclopentanone perhydrophenanthrene nucleus, cholesterol is the most common sterol in animal cell membranes.

367. The plasma membrane consists mainly of –
(a) phospholipids embedded in a protein bilayer
(b) proteins embedded in a phospholipid bilayer
(c) proteins embedded in a polymer of glucose molecules
(d) proteins embedded in a carbohydrate bilayer

AIPMT (Screening)-2010

Ans. (b) : S. J. Singer and G.L. Nicholson proposed fluid mosaic model of membranes in 1972. According to this model, the membranes are not a uniform depositition of lipids and proteins.
Protein molecules occur at both place inside and on the outer side of lipid bilayer –"Protein icebergs in a sea of lipids." i.e –Proteins embedded in the phospholipid bilayer.

368. Middle lamella is composed mainly of :
(a) Phosphoglycerides
(b) Hemicellulose
(c) Muramic acid
(d) Calcium pectate

AIPMT-2009

Ans. (d) : Middle lamella is a pectin layer. It is a cementing layer of the plant cell wall that holds together adjacent cells. It is usually made up of calcium and magnesium pectates. Plants need this to give them stability and so that they can form plasmodesmata between the cells. It is the first formed layers which is deposited at the time of cytokinesis. The cell plate that is formed during cell division itself develops into middle lamella.

369. Cell wall consists of
(a) Lignin, hemi cellulose, pectin and lipid
(b) Lignin, hemi cellulose, pectin and cellulose
(c) Lignin, hemi cellulose, protein and lipid
(d) Hemi cellulose, cellulose, tubulin and lignin

Karnataka CET-2007

Ans. (b) : Cell Walls consist of Lignin, hemi cellulose, pectin and cellulose.
Cellulose→ It is an important component of plant cell that provide rigidity to the plant stems leaves and branches. They are present in the cellulosic micro fibril walls.
Hemicellulose→Hemicellulose is a mixture of polymerised xylans, mannans,glucomannans, galactans xyloglucans and arabinogalactans.
It binds microfibrils with matrix.
Pectin → Pectin is the filler substance of matrix. It is mixture of polymerised and methylated, galacturonic acid and neutral sugars.

370. Keeping in view the structure of cell membrane, which one of the following statements is correct with respect to the movements of liquid and proteins from one liquid monolayer to the other (flip flop movement).
(a) While proteins can flip flop, liquids can not
(b) Neither lipids, nor proteins can flip flop
(c) Both lipids and proteins can flip flop
(d) While lipids can rarely flip flop, proteins can not

JIPMER-2015

@apna_pdf

Ans. (d) : The movement of lipid molecules from one monolayer to another is called flip-flop motion. The mobility of membrane proteins due to the fluid property of the lipid bilayer was demonstrated by the classical experiment of D Fry and M Edin (1970). Lipid molecules rarely transfer from one lipid monolayer to another monolayer of the lipid bimolecular layer. Hence flip-flop motion is rarely observed in lipid molecules whereas it is completely absent in proteins.

371. Select the correct statement from the following regarding cell membrane:

(a) Lipids are arranged in a bilayer with polar heads towards the inner part
(b) Fluid mosaic model of cell membrane was proposed by Singer and Nicolson
(c) Na^+ and K^+ ions move across cell membrane by passive transport
(d) Proteins make up 60 to 70% of the cells membrane

AIPMT (Screening)-2012

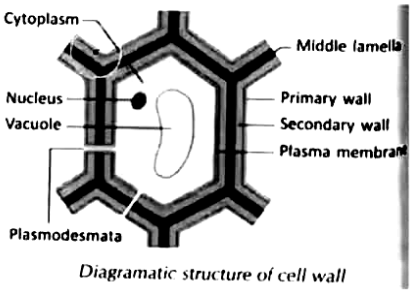
Ans. (b) : In 1972 Singer and Nicholson proposed fluid mosaic model for internal structure of plasma membrane.
This is most widely accepted model of plasma membrane.
According to this model a membrane consists of continuous bilayer of phospholipid molecules in which globular proteins are embedded.
The lipids are arranged in a bilayer with polar heads towards outside and non-polar tails towards Inside.

372. Element necessary for the middle lamella

(a) Ca (b) Zn
(c) K (d) Cu

AIPMT-2001

Ans. (a) :



Diagramatic structure of cell wall

- Middle lamella is a jelly-like substances made up of calcium and magnesium pectate. Middle lamella is the first formed layer, present between the two adjacent cells. It is situated outside of the primary cell wall.

373. The right sequence of carriers, which involve in the transport of excess Na^+ ions out of the cell in salt resistant plants, is

(a) Uniporter, Symporter
(b) Symporter, Antiporter
(c) Antiporter, Uniporter
(d) Uniporter, Antiporter

AP EAMCET-2010

Ans. (d) : The right sequence of carriers which involved in the transport of excess Na+ ion out of the cell in salt resistant plants are **Uniporter and Antiporter**.
Uniporter is a membrane transport protein that transports a single species of substrate (Charged or uncharged) across a cell membrane.
Antiporter is a membrane protein that transports two molecules at the same time in the opposite direction.

374. Cell membrane controls:

(a) exocytosis
(b) endocytosis
(c) both exocytosis and endocytosis
(d) not controles movement of substances

UP CPMT-2006
JCECE-2008

Ans. (c): The cell membrane or plasma membrane is a biological membrane that separates the interior of the cell from the outside environments. In this way, it is selectively permeable to ion and organic molecule. The plasma membrane is selectively permeable. It regulates what passes from one side to the other. A plasma membrane provides some protection to the inside of cell but its main function is to control the passage of substance into and out of cell.

375. Ultraphagocytosis (colloidopexy) is intake by cell of

(a) Chromagen particles
(b) Small colloidal particles
(c) Large colloidal particles
(d) It is very quick phagocytosis

VMMC-2008

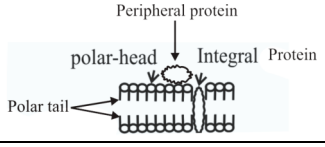
Ans. (b) : Phagoytosis or cell eating is the process by which a cell engulfs a solid particle and digests it .
Phagocytosis occurs in specialized cells in which plasma membrane ingests macrophages, neutrophils and other white blood cells (smaller colloidal particles).
Ultraphagocytosis is uptake of macromolecules and larger energy rich particles but intake by cell of small colloidal particle.

376. In fluid mosaic model of plasma membrane

(a) Upper layer is non-polar and hydrophilic
(b) Polar layer is hydrophobic
(c) Phospholipids form a bimolecular layer in middle part
(d) Proteins form a middle layer

AIPMT-2002

Ans. (c) : Fluid mosaic model of the plasma membrane was proposed by S. J. Singer and Garth L. Nicolson 1972.
According to this model, the plasma membrane is a phospholipid bilayer in which the proteins cholestrol and carbohydrates are incorporated which give it a mosaic like appearance. In Phospholipids layer upper or outer part like hydrophilic and polar heads of the lipid molecules are arranged on the outer side and inner side of the bilayer hydrophobic & non-polar tails are present. The lipid bilayer acts as a barrier to the passage of molecules and ions into and out of the cell.



@apna_pdf

377. According to widely accepted "fluid mosaic model" cell membranes are semi-fluid, where lipids and integral proteins can diffuse randomly. In recent years, this model has been modified in several respects. In this regard, which of the following statements are incorrect

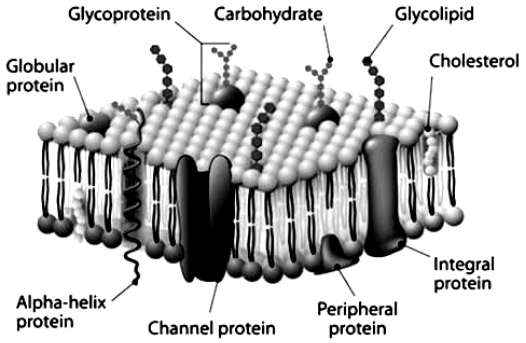
(a) Proteins can also undergo flip-flop movements in the lipid bilayer
(b) Many proteins remain completely embedded within the lipid bilayer
(c) Proteins in cell membranes can travel within the lipid bilayer
(d) Proteins can remain confined within certain domains of the membranes

AIPMT-2005

Ans. (a) : According to widely accepted "fluid mosaic model", the cell membranes are semi fluid, where lipid and integral proteins can diffuse randomly. In recent years this model has been modified in several aspect.

- Protein in cell membrane can travel within the lipid bilayer.
- Protein can remain confined within certain domains of the membranes
- Many proteins remain completely embedded within the lipid bilayer

The lipids in the bilayer can sometimes undergo transverse diffusion or "flip-flop movement" to go from one layer to the other. This does not occur within the protein.



378. What is true about fluid mosaic model

(a) Phospholipid layer is sandwiched between two protein layers
(b) Phospholipid monolayer is present on the top of a protein layer
(c) Phospholipid bilayer is present on the top of a protein layer
(d) Proteins are embedded at places in the phospholipid bilayer

J&K CET-2004

Ans. (d) : According to fluid mosaic model protein molecules occurs in mosaic pattern i.e. protein iceberg in the sea of lipid or Gulabjamun in the concentration solution of the sugar. In fluid mosaic model there is a lipid bilayer having proteins embedded in them. The protein molecules moves latterly in the lipid layer not flip flop motion i.e. not from one lipid layer to the other lipid layer but lipid molecule really exhibit flip flop movement.

379. Which of the following is present between cell wall of the plant cells?

(a) Lomasome (b) Microsome
(c) Lysosome (d) Middle lamella

AIIMS-1999

Ans. (d) : Middle lamella is a cementing layer between neighbouring cells and the primary walls. It originates from the cell plate that occurs during cell division. Middle lamella is present between the cell walls of adjacent cells. It is usually made up of calcium and magnesium pectates.

380. Which one of the following is wrongly matched?

(a) Fungi - Chitin
(b) Phospholipid - Plasma membrane
(c) Enzyme - Lipopolysaccharide
(d) ATP - Nucleotide derivative
(e) Antibody - Glycoprotein

Kerala PMT-2009

Ans. (c) : Fungal cell wall is mainly composed of glucans, chitin and glycoproteins. Plasma membrane is composed mainly of phospholipids. They are arranged in two layers, called the phospholipid bilayer. Enzymes are proteins that act as biological catalyst by accelerating chemical reactions.
A single molecule of Adenosine triphosphate (ATP) is a nucleotide derivatives.
Immunoglobulins (Ig) or antibodies are glycoproteins produced by plasma cells.

381. Consider the following statements with reference to facilitated transport.

1. Requires ATP energy
2. Transport saturates
3. Highly selective
4. Requires special membrane properties
5. Uphill transport
Of the above statements

(a) 1, 2 and 3 are relevant but 4 and 5 are irrelevant
(b) 2, 3 and 5 are relevant but 1 and 4 are irrelevant
(c) 3, 4 and 5 are relevant but 1 and 2 are irrelevant
(d) 1, 4 and 5 are relevant but 2 and 3 are irrelevant
(e) 2, 3 and 4 are relevant but 1 and 5 are irrelevant

Kerala PMT-2012

Ans. (e) : Facilitated diffusion is a type of passive transport, no require of ATP energy which requires special type of membrane proteins to carry different molecules or ions across the membrane along from high concentration to low concentration. These proteins tend to be selective and associated with a few select molecules or ions. Since there is a limited quantity of such transport proteins, the degree to which this can lead to saturation if the concentration of the molecules, or ions. to be transported is extremely high. Thus facilitated diffusion is highly selective.
Active transport is called an uphill transport because it occurs against the concentration gradient. So the facilitated diffusion involves downhill (higher to lower concentration) movement of molecules with the help of special membrane proteins.

@apna_pdf

382. The Singer model of plasma membrane differs from Robertson's model in the

(a) arrangement of proteins
(b) arrangement of lipid layers
(c) number of lipid layers
(d) absence of proteins in Singer model

AIIMS-1998

Ans. (a) : The Singer model of plasma membrane is differ from the Robertson's model in arrangement of protein Robertson proposed a trilaminar structure of plasma membrane according to which plasma membrane has a trilaminar structure in which transparent lipid bilayer is surrounded on either side by dense proteins with a difference in type for the outer and inner side while in fluid mosaic model which is given by Singer and Nicolson, proteins are of two types- integral or intrinsic and extrinsic. Intrinsic proteins are embedded in the phospholipid bilayer and extrinsic proteins are found on the surface of the membrane and are loosely associated with on layer of the phospholipid bilayer.

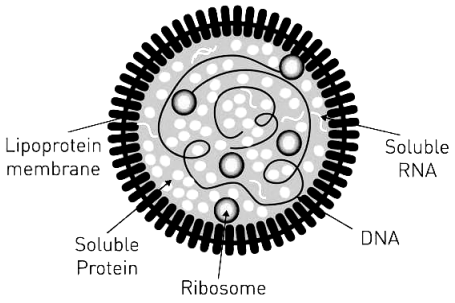
383. Cell wall is absent in

(a) Nostoc (b) Aspergillus
(c) Funaria (d) Mycoplasma

AIPMT (Re-Exam)-2015

Ans. (d) : Mycoplasma is a genus of bacteria that lack a cell wall around their cell membrane. They have the cell membrane as outermost layer.

Mycoplasma



- **Aspergillus** is a fungus having chitinous cell wall.
- **Funaria** is bryophyte having cellulosic cell wall.
- **Nostoc** is a cyanobacteria surrounded by cellulosic cell wall.

384. Cell membrane in animals is composed mainly of the molecule of :

(a) lipids (b) proteins
(c) lipids and proteins (d) carbohydrates

JIPMER-2006

Ans. (c) : Cell membrane consists of lipids, proteins and a small amount of carbohydrate. The ratio of protein and lipid varies considerably in different cell type.
Usually the ratio is 60% protein and 40% lipid.

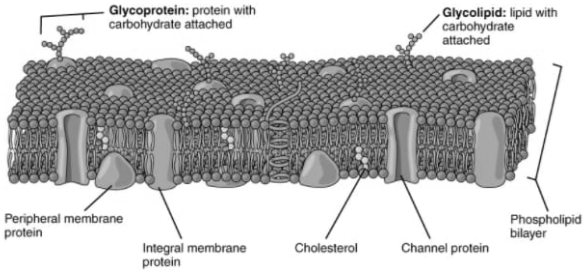
385. Which one of the following is correct for the transmembrane proteins in lipid bilayer of plasma membrane?

(a) They are absent in animal cells.
(b) They act as channel proteins
(c) They are absent in plant cells.
(d) They are only externally located.

AIIMS-2016

Ans. (b) : In the fluid mosaic model of plasma membrane, membrane protein can be classified as integral or peripheral.

- Integral membrane proteins are permanently embedded within the phospholipid bilayer of plasma membrane. They have a range of functions. Such functions include transporting molecules across the membrane.



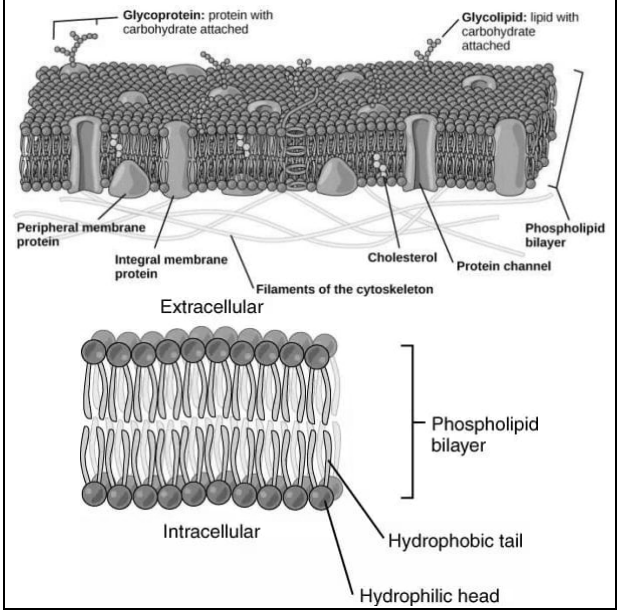
386. The property of semi permeability belongs to

(a) cell wall
(b) plasma membrane
(c) mitochondria only
(d) none of the above

AIIMS-2011

Ans. (b) : The cell membrane or the plasma membrane is the outer membrane present in all cells which separates the inside content of the cell from the external surroundings.

- It is semi-permeable in nature.
- A semipermeable membrane is a membrane that allows certain molecules or ions to pass through it by diffusion and occasionally specialized "facilitated diffusion" and prevents the entry or movement of other materials.



387. What are Singer and Nicolson known for?

(a) One-gene-one-enzyme hypothesis
(b) Plasma membrane modifications

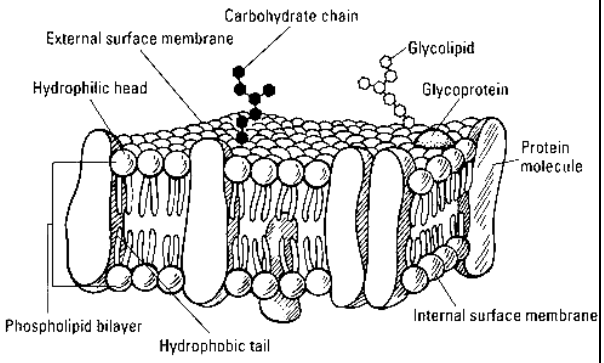
@apna_pdf

(c) Fluid-mosaic model of plasma membrane
(d) Structure of DNA

AIIMS-2010
BVP-2003

Ans. (c) : Fluid mosaic model which was proposed by singer and Nicolson in 1972.

- According to this model, the membrane does not have a uniform disposition of lipids and proteins. The phospholipid bilayer of plasma membrane is viscous and individual phospholipids can move position. The phospholipid bilayer is embedded with proteins, resulting in a mosaic of components.



Fluid Mosaic Model of Plasma membrane

388. According to fluid mosaic model, plasma membrane is composed of:
(a) Phospholipids and oligosaccharides
(b) Phospholipids and hemicellulose
(c) Phospholipids and integral proteins
(d) Phospholipids, extrinsic proteins and intrinsic proteins.

J&K CET - 2011
AIPMT-1989

Ans. (d) : According to the fluid-mosaic model the plasma membrane is composed of phospholipids, extrinsic proteins and intrinsic proteins. Intrinsic proteins are embedded in the phospholipid bilayer and extrinsic proateins are those proteins loosely bound to the membrane from outside in plasma membrane.

389. Addition of new cell wall particles amongst the existing ones is:
(a) Deposition (b) Apposition
(c) Intussusception (d) Aggregation

AIPMT-1991

Ans. (c) : Growth of cell wall involve the growth in surface area as well as growth in thickness. It occurs by two methods –
(1) Intussusception :– Intussusception is development or growth by the deposition of new materials between existing components of cell wall. Intussusception also involve cell elongation.
(2) Apposition :– Apposition is the addition of layers of cellulose to the inner surface of a plant cell wall, at its junction with the plasma membrane.

390. Cell recognition and adhesion occur due to biochemicals of cell membranes named:
(a) Proteins
(b) Lipids
(c) Proteins and lipids
(d) Glycoproteins and glycolipids

AIPMT-1993

Ans. (d) : Glycoproteins and glycolipids are proteins and lipids respectively. These are present on the outer surface of the cell membrane with a carbohydrate group attached to them and a responsible for cell recognition and adhesion. These are formed due to small carbohydrates molecules present on lipids and extrinsic proteins.

391. Active and passive transports across cell membrane differ in:
(a) Passive transport is nonselective
(b) Passive transport is along the concentration gradient while active transport is due to metabolic energy
(c) Active transport is more rapid
(d) Passive transport is confined to anions while active transport is confined to cations

AIPMT-1993

Ans. (b) : In biological system, there are two major phenomena – Passive transport and active transport. In active transport the movement of molecules occur across the cell membrane from a region of lower concentration to the region of higher concentration. It directly uses metabolic energy to transport molecules across the membrane. Passive transport is just opposite phenomena of active transport and there is no requirement of energy occurs. In passive transport molecules move along the concentration gradient.

392. The desmosomes are concerned with:
(a) Cell division (b) Cell adherence
(c) Cytolysis (d) Cellular excretion.

AIPMT-1995
VMMC-2002

Ans. (b) : Desmosomes are specialized and highly ordered membrane domains that mediate cell-cell contact and strong adhesion and in human and other vertebrates they are found in tissues exposed to intense mechanical stress.

393. Which of the following enzymes helps in crossing plasma membrane?
(a) protease (b) pepsin
(c) dehydrogenase (d) permease

JCECE-2006

Ans. (d) : The permease is an enzyme that facilitates diffusion of specific molecules across the plasma membrane passively and it increases the membrane porosity to support easy transport of the molecules and functions as an integral part of intercellular transport.
Pepsin is an aspartic protease using a catalytic as partate in its active site.
Protein is enzymes that break down protein.
Dehydrogenase is an enzyme belongs to class oxidoreductase act as catalyst.

@apna_pdf

394. Protoplast lacks

(a) cytoplasm (b) nucleus
(c) plasma membrane (d) cell wall

Uttarakhand PMT-2010

Ans. (d) : Plant protoplasts are somatic plant cells without cell wall. Exposure of the naked protoplast membrane allows us to investigate more easily fundamental aspects of cell physiology and cell surface interaction with toxins and pathogens.

Protoplast contains cytoplasm along with cell membrane and nucleus. Protoplasts can be generated by stripping the cell wall from plant, bacterial or fungal cells by mechanical, chemical or enzymatic means.

395. Fluid mosaic model of plasma membrane was given by

(a) Robertson
(b) Robert Hooke
(c) Singer and Nicholson
(d) Pantia and Mast

Punjab MET-2008

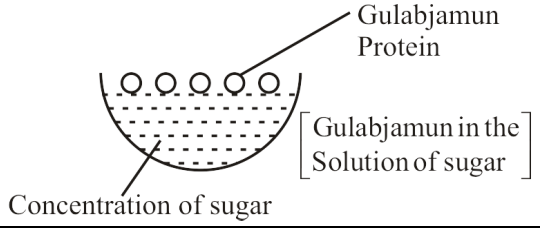
Ans. (c) : The fluid Mosaic model of the cell membrane was proposed by SJ singer and GL Nicolson in the year 1972. According to this model they describes membranes as being bilayers of phospholipids in which the hydrophobic groups are turned inwards to face each other and protein molecules are embedded in it Thus the proteins are seen as icebergs in the sea of lipids. It is the most acceptable model of the plasma membrane.

396. Identify the correct statement about the fluid mosaic model of cell membrane.

(a) It was proposed by J David Robertson in 1972
(b) Model resembles the iceberg (as proteins) floating in the sea (of phospholipids).
(c) Hydrophilic phosphate head of phospholipids face inwards.
(d) Hydrocarbon tails face out ward.

BCECE-2015

Ans. (b) : Fluid model proposed by – singer and Nicolson (1972) According this model proteins molecules occurs in mosaic pattern i.e. protein Iceberg in the sea of lipid or **Gulabjamun** in the concentration solution of the sugar. In fluid mosaic model there is a lipid bilayer having proteins embedded in them. The protein molecules moves latterly in the lipid layer not flip-flop motion i.e. not from 1 lipid layer to the other lipid layer but lipid molecules rarely exhibit flip-flop movement.



397. Desmosome is the modification of

(a) Golgi bodies
(b) endoplasmic membrane
(c) plasma membrane
(d) ER - nucleus complex

CG PMT-2005

Ans. (c) : Desmosmes are the modification of plasma membrane. These are just like welded areas between adjacent cells having intercellular thickening materials. They are trans-membrane linkers made up of disc-shaped intercellular thickening adjacent to each membrane. Protein processing within the golgi involves the modification and synthesis of the carbohydrate protein of glycoporteins. ER is composed of one completely continuous membrane bilayer.

398. Which part of the cell can contain N-acetyl glucosamine?

(a) Cell envelope (b) Cell wall
(c) Nucleus (d) Ribosomes

BCECE-2015

Ans. (b) : The cell wall of bacteria contains peptidoglycan which is made up of polysaccharide consisting of alternating N-acetylmuramic acid (NAM) and N-acetylglucosamine (NAG). N-acetylglucosamine is also present in the cell wall of fungi, which is the monomer of the polysaccharide chitin.

399. Structural lipids of cell membrane are

(a) simple lipid (b) chromolipids
(c) steroid (d) phospholipids

WB JEE-2011

Ans. (d) : Phospholipids are major constituents of cell number because they can form bilayar in water. It is made up of two hydrophobic fatty acid tail and a hydrophilic head consisting of phosphate group. The two constituents are joined by a glycerol molecule. It can easily form bilayer because of its amphiphilic nature. It has the hydrophobic fatty acid tail which does not interact with water and a hydrophilic phosphate + alcohol head which can interact with water. Phospholipids provide the basic structural organization of membrane.

400. Cystoliths are composed of:

(a) glucosides (b) calcium oxalate
(c) calcium carbonate (d) magnesium oxalate

DUMET-2003

Ans. (c) : Cystoliths are outgrowth of epidermal cell wall. They are visible as dots or variously shaped marks specially in pressed, dried leaves. They may serve as some kind of protection from leaf eating insects or other animals.

Cystoliths is the crystal of calcium carbonate that is formed in special cells called as lithocytes which is present in leaf of plants as *ficus elastica*. It helps in the regulation of calcium level in the plants.

@apna_pdf

401. Which of the following statements is INCORRECT regarding biological membrane?
(a) It is composed of lipids and proteins
(b) Peripheral proteins are loosely associated with the membrane
(c) Integral proteins span the lipid bilayer
(d) Lipids and membrane proteins do not provide structural and functional asymmetry

KVPY SB & SX-2016

Ans. (d) : Plasma membrane is asymmetric due to oligosaccharides which forms glycoprotein & glycolipid along with proteins and the components of biological membranes are asymmetrically distributed between the membrane surface.
In biological membrane protein is 2 type –
Peripheral proteins, which are loosely associated with membrane, & integral protein which is span in lipid.

402. The most abundant substance of middle lemella is:
(a) Suberin (b) Cutin
(c) Lignin (d) Pectin

MP PMT-2013

Ans. (d) : Middle lamella is the part of cell wall that is the outermost layer in between cells. It is a layer that cements together the primary cell walls of two adjoining plant cells. Middle lamella is made up of calcium and magnesium pectate.
Pectin present in this layer is a heteropolysaccharide which helps to bind the two cells together it also helps in cell growth and cell wall.

403. Each phospholipid molecule in a cell membrane consists of:
(a) one polar head and two non-polar tail
(b) one polar head and one polar tail
(c) one non-polar head and one polar tail
(d) one non-polar head and one polar tail

J&K CET-2003

Ans. (a) : Plasma membrane consists of lipids (phospholipids and cholesterol), proteins and carbohydrates.
Each phospholipid molecule in a cell membrane consists of one polar head and two non-polar tail. The head is polar hydrophilic lies toward the protein and held by hydrogen and ionic bond.
The tails towards the centre non polar and hydrophobic held by vander wall force it ensure that non polar tails of sachurated hydrocarbon protective from aqueous environment.

404. The primary cell wall is mainly made up of
(a) Lignin (b) Pectin
(c) Cellulose (d) Protein

WB JEE-2014

Ans. (c) : The primary cell wall is composed of the polysaccharides cellulose, hemicelluloses and pectin. the structural integrity of a cell it provides protection against mechanical stress. Cellulose is a polysaccharide consisting of a linear chain of D-glucose.
A secondary cell wall is formed by the deposition of lignin.

405. Glycocalyx is associated with
(a) Nucleolus (b) Plasma membrane
(c) Nucleus (d) Nucleosome

J&K CET-2011

Ans. (b) : Glycocalyx is a surface layer that covers the cell membrane of many bacteria, epithelial cells or other cells. It is made up of glycoproteins, glycolipids and proteoglycans. It modulates adhesion between cells and also surface characteristics that determine adhesion and flow properties. Glycocalyx is mainly used in the recognition of the cell and also regulates the endothelial vascular tissues.
Plasma membrane also known as plasma lemma it is a thick, sticky layer. It regulates the transport of materials entering and exiting the cell.

406. Which of the following is responsible for the mechanical support, protein synthesis and enzyme transport?
(a) Endoplasmic reticulum
(b) Mitochondria
(c) Cell membrane
(d) Dictyosome

Haryana PMT-2000

Ans. (a) : Endoplasmic reticulum provides mechanical support to the cell, by maintaining its shape. Rough endoplasmic reticulum contains ribosomes on its surface, which are involve in protein synthesis. It facilities transport of materials from one part of the cell to another.

407. In which method of transport, in plasma membrane does not require carrier molecule?
(a) Active transport (b) Facilitated diffusion
(c) Simple diffusion (d) $Na^+ - K^+$ pump

WB JEE-2008

Ans. (c) : Simple diffusion occurs according to the differences in the concentration of molecules or along the concentration gradient. Diffusion means the transport of materials form a region of higher concentration to a region of lower concentration It does not require carrier molecules.
Simple diffusion can be disrupted if the diffusion distance is increases.
Facilitated diffusion is helped along a membrane transport channel. These channels are glycoproteins that allow molecules to pass through the membrane.
Active transport – it requires energy.
Na^+ P^+ pump is type of active transport that helps maintain resting potential in the cell.

408. What is the structural element of cell wall?
(a) Matrix (b) Microtubules
(c) Microfibrils (d) Arabinogalactans

WB JEE-2008

Ans. (c) : A microfibril composed of cellulose arranged in orthogonal layers. Cellulose is a straight chain polysaccharide composed of β(14) linked glucose subunits. It is a major component of plant cell walls, that makes the plant stems, leaves and dranches rigid, they are present in the form of cellulosic microfibrils in the inner layer of primary wall.

@apna_pdf

I. Endomembrane System

1. Which of the following cell organelles stores hydrolytic enzymes which act as acidic pH?

(a) Lysosome (b) Centriole
(c) Chloroplast (d) Nucleus

NEET-2016 Phase-II
BHU-PMT (Screening)-2011, 2009
VMMC-2011, 2002, 2007, 2009
Uttarakhand PMT-2009
CMC Vellore-2008 / CMC Ludhiana-2007
WB JEE-2006
Rajasthan PMT-2005, 2004, 1995
JIPMER-2004, 2012 / UP CPMT-2001, 2002
AMU-1999, 2006/ Punjab MET-2003, 1999
AIIMS - 2000 / AIPMT – 1993, 1996, 1994
BVP-2004, 2009 / Manipal-2001

Ans. (a) : Lysosomes contains a variety of acid hydrolases that are active at the acidic PH maintained with the lysosome.

2. The cell organelle covered by single unit membrane is:

(a) Lysosome (b) Mitochondria
(c) Chloroplast (d) Ribosome

TS EAMCET-30.07.2022 Shift-II
NEET-2016 Phase-I
MGIMS Wardha-2005 / VMMC-2005
UP CPMT-2005 / AMU-2004
AP EAMCET-2001 / Punjab MET-1999
Rajasthan PMT-1998, 1996,1995

Ans. (a) : The cell organelle covered by single unit membrane is lysosomes and vacuole.
→ Double unit membrane bound organelles Mitochondria + chloroplast.
→ Non- membrane bound organelle → Ribosomes.

3. Tonoplast is a membrane, which surrounds

(a) ribosome (b) Mitochondria
(c) Vacuole (d) Cytoplasm

UP CPMT-2012 / DUMET-2009
Kerala PMT-2009 / JIPMER-2009
CG PMT-2008
BHU PMT (Screening)-2009, 2006
Uttarakhand PMT-2009, 2005
BVP-2014, 2009, 2000

Ans. (c) : Tonoplast is membrane surrounds – vacuole.
→ The vacuole is the membrane- bound space found in the cytoplasm. It contains water, sap, excretory product and other material not useful for the all.

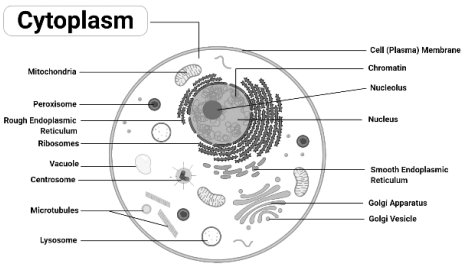
4. Synthesis of lipids and carbohydrates is regulated by-

(a) SER (b) RER
(c) Ribosomes (d) Lysosomes

AIIMS-25.05.2019 Shift-I
AIIMS-27.05.2018 Shift-I
AIIMS-26.05.2018 Shift-II
Rajasthan PMT-2006, 2001
CG PMT-2005 / J&K CET-2003 / JCECE-2003

Ans. (a) : The SER (Smooth Endoplasmic Reticulum) is involved in several process including lipid and carbohydrates synthesis steroid secreting cells are characterized by abundant smooth endoplasmic reticulum (SER) as well as metabolism of exogenous substances, such as drugs or toxins.

- Rough Endoplasmic Reticulum (RER) synthesis by protein and enzymes.
- Ribosome- provide site for protein synthesis.
- Lysosome contains digestive enzyme which cause autolysis.



5. Membrane that covers the vacuole in a plant cell is called

(a) tonoplast (b) tonoplasm
(c) jacket (d) cell membrane

UP CPMT-2012 / Punjab MET-2009
Rajasthan PMT-2009 / CMC Vellore-2009
AP EAMCET-1997 / Rajasthan PMT-2004, 1996
AMU-1998

Ans. (a) : Vacuole of a plant cell is covered with a membrane, called tonoplast.
The membrane of the Vacuoles is composed of phospholipids molecules and trans membrane proteins called Tonoplast.

6. Cell respiration is carried out by

(a) ribosome (b) mitochondria
(c) chloroplast (d) Golgi bodies
(e) None of these

CMC Vellore-2010 / AMU – 2009
WB JEE-2009 / Punjab MET - 2008
VMMC-2007 / Rajasthan PMT–2005, 2003, 1995
Punjab MET - 2004 / UP CPMT-2002
Manipal-2000

Ans. (b) : Cell respiration is carried out by mitochondria. Kreb's cycle occurs in mitochondrial matrix and ETS occurs in the inner membrane of mitochondria. Ribosome is known as protein factory. Chloroplast is site for photosynthesis. Main function of Golgi bodies is the packaging and secretion of proteins.

7. The site of protein synthesis is:

(a) smooth E.R (b) rough E.R
(c) plasmalemma (d) nucleus

JCECE-2006 / Haryana PMT-2006
BVP-2005 / Haryana PMT-2004
Manipal-2003 / DUMET-2001
Rajasthan PMT-1998

Ans. (b) : The site of protein synthesis in a cell is ribosomes. These ribosomes on the rough E.R. are involved in synthesizing proteins that are either destined for secretion, incorporation into the cell's plasma membrane, or transport to various organelles within the cell.

@apna_pdf

8. Rough endoplasmic reticulum differs from smooth walled endoplasmic reticulum due to the presence of:

(a) DNA (b) ribosome
(c) Ergastic substance (d) nucleus

DUMET-2011 / UP CPMT-2011
Uttarakhand-2005 / Punjab MET-1999

Ans. (b) : RER is frequently observed in the cells actively involved in protein synthesis and secretion. They are extensive and continuous with the outer membrane of the nucleus. The smooth endoplasmic reticulum is the major site for synthesis of lipid. In animal cells lipid-like steroidal hormones are synthesis SER.

9. Acrosome is formed by:

(a) mitochondria (b) golgi body
(c) ribosomes (d) lysosome

CG PMT - 2011 / Rajasthan PMT-2004
J&K CET-2003 / VMMC-2002

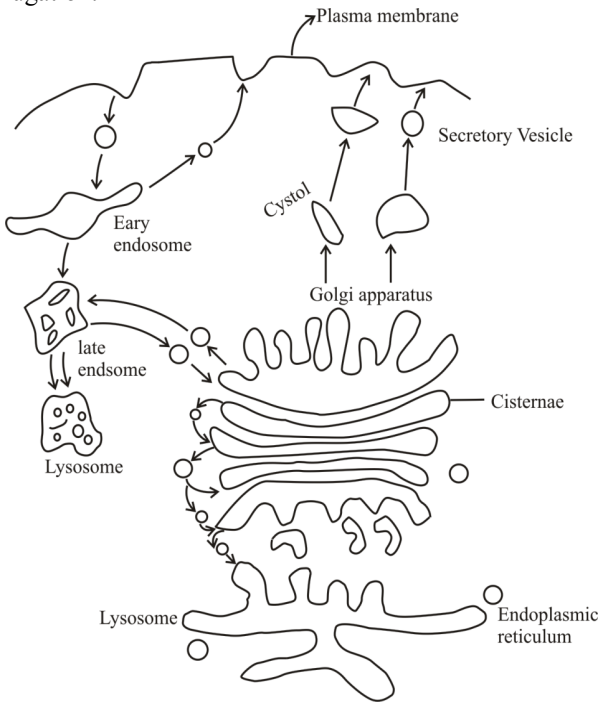
Ans. (b) : The acrosome is a membrane bound structure formed from the Golgi apparatus located most anteriorly in the head of the sperm. It is a cap like structure.

10. Which of the following is responsible for the origin of lysosome?

(a) Chloroplast (b) Mitochondria
(c) Golgi body (d) Ribosome

BVP-2009 / VMMC-2009
Uttarakhand PMT-2009
BHU-PMT (Screening)-2009

Ans. (c) : Golgi body is responsible for the origin of lysosome formation - The primary lysosomes are formed by golgi complex.
Lysosome discovered by de Duve in 1949. Biochemically in rat liver homogenate by ultracentri fugation.



11. The main function of lysosome is in

(a) only extracellular digestion
(b) only intracellular digestion
(c) Both [a] and [b]
(d) None of the above

AMU - 2005 / CG PMT-2005
Manipal-2004 / Uttarakhand PMT-2004

Ans. (c) : In the cell digestive enzymes are contained in Lysosomes. Lysosomes are involved in intra cellular digestion and are responsible for breakdown of parts of the cell and foreign particle in the cells.
Lysosomes function as the digestive system of the cell serving both to degrade material taken up from outside the cell and to digest absolute components of the cell itself.

12. Golgi body originates from

(a) lysosome (b) endoplasmic reticulum
(c) mitochondria (d) cell membrane

Karnataka CET-2018
VMMC-2007
Rajasthan PMT - 2005 , 1998
AFMC-2003

Ans. (b) : Golgi body originates from endoplasmic reticulum.

13. Which products of cell wear and tear get accumulated in lysosomes with age in the cell body of neuron?

(a) Lipofuscian granules (b) Histamine
(c) Bradykinin (d) Hemozoin

AP EAPCET-12.07.2022 Shift-I

Ans. (a) : Lipofuscian is a fluorochrome and may sensitize lysosomes to visible light a process potentially important for the pathogenesis of age-related macular degeneration. Lipofuscin is a fluorescent pigment that accumulates with age in the lysosomal compartment of post mitotic cell in several tissues such as neurons, heart and skeleton muscle. Life span is inversely correlated with rate of Lipofuscin accumulation in heart muscle.

14. Which of the following contains the enzyme lysozyme?

(a) Gastric juice (b) Bile juice
(c) Saliva (d) Pancreatic juice

TS EAMCET-30.07.2022 Shift-I

Ans. (c) : Lysozyme Enzyme found in the secretions (tears) to the lacrimal glands of animals and in nasal mucus gastric seretions and egg white. Saliva contains salivary amylase also contain lysozyme.

- Pancreatic juice consists of Alkaline Chief bicarbonate fluid and enzymes such as trypsin, lipase, and Amylase are essential for the digestion of most of the protein, fat and carbohydrate in the meal.
- Gastric juice are liquids found in the stomach.
- Bile juice secreted by liver does not contain any enzyme.

@apna_pdf

15. Match the following lists:

List-I		List-II	
(A)	Tonoplast	(I)	Modification of proteins
(B)	Stroma	(II)	Enzymes for catabolism
(C)	Cisternae of golgi apparatus	(III)	Connection between adjacent cells
(D)	Plasmodesmata	(IV)	Osmoregulation
		(V)	Enzymes for anabolism

The correct match is
Options:

	A	B	C	D
(a)	IV	V	I	III
(b)	IV	III	II	I
(c)	V	II	I	III
(d)	II	V	IV	I

TS EAMCET-30.07.2022 Shift-I

Ans. (a) : Tonoplast → The differentially permeable membrane that surrounds the vacuole. Cell sap is a non living content of vacuole. Turgar pressure is generated by the high osmotic pressure of the vacuole hence main function of tonoplast is osmoregulation

- Plasmodesma is the fibrillar plasma connecting through cell wall and briges Adjacent cells.
- Stroma → Each chloroplast is covered with a double membrane containing a protein across matrix called stroma.

Stroma is the ground substance of chloroplast and contains a small circular double helical DNA ribosomes and several enzymes.

- Cisternae of Golgi apparatus is modification of protein.

16. Assertion (A) : Endoplasmic reticulum divides the intercellular space into luminal and extraluminal compartments.
Reason (R): The tiny tubular structures scattered in the cytoplasm is responsible for this partition.
The correct option among the following is:
(a) (A) is true. (R) is true and (R) is the correct explanation for (A)
(b) (A) is true. (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-31.07.2022 Shift-II

Ans. (a) : Endoplasmic reticulum divides the intercellular space into luminal and extraluminal compartment The ER is a network of membranous tubules within the cytoplasm of a eukaryotic cell, continuous with outer nuclear membrane.
The endoplasmic Reticulum is a network of tiny tubular structure scattered in the cytoplasm.

17. Identify the correct statements regarding chemiosmotic hypothesis:
(A) Splitting of the water molecule takes place on the inner side of the membrane.
(B) Protons accumulate within the lumen of the thylakoids.
(C) Primary acceptor of electron transfers the electrons to an electron carrier
(D) NADP reductase enzyme is located on the stroma side of the membrane
(E) Protons increase in number in stroma.
Choose the correct answer from the options given below:
(a) (A), (B) and (E)
(b) (A), (B) and (D)
(c) (B), (C) and (D)
(d) (B), (C) and (E)

NEET (Re-Exam)-04.09.2022

Ans. (b) : Chemiosmosis or Chemiosmotic theory is given by **Peter Mitchell** explains the synthesis of ATP in the chloroplast.

- During the process of photosynthesis, the synthesis of ATP causes proton gradient to develop due to the accumulation of protons in thylakoid lumen that are formed by splitting of water. As the electron moves through the photosystem, proton are transported across the membrane. Now NADP reductase (enzyme) in stroma along with the electron acceptor remove protons along with the reduction of NADPH + H^+.
- This cause proton gradient across the thylakoid membrane. The ATPase enzyme has a channel which allows the flow of proton through it and during this process the ATP is synthesised.

Protein increase in lumen of thylakoid.
Primary acceptor of electron transfer its electron to H^+ carrier. Pheophytin acts as the first electron carrier intermediate in the electron transfer pathway of PS-II.

18. Energy rich macromolecules are digested by the following cell organelle
(a) Mitochondrion
(b) Lysosome
(c) Endoplasmic Reticulum
(d) Golgi bodies

AP EAMCET-11.07.2022 Shift-II

Ans. (b) : Lysosome, is a single membrane bound structure found in nearly all type of eukaryotic cells and contains hydrolytic enzyme which is responsible for the digestion of macro-molecules, old cell part etc.
It is also called 'suicidal bag of cells'

19. Assertion (A) : In vacuole the concentration of ions and other material will be less than the cytoplasm.
Reason (R) : Tonoplast facilitates the transport of ions and other material against concentration to the vacuole.
The correct option among the following is
Options:
(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false

@apna_pdf

(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-I

Ans. (d) : (A) is false but (R) is true

The concentration of ions and other materials will be higher in the vacuole than in the cytoplasm. Because the vacuole is surrounded by a membrane called the tonoplast, which allows the transport ions and other materials into the vacuole against their concentration gradient. This means that the concentration of ions and other materials in the vacuole will be higher than in the cytoplasm.

Tonoplast is selectively permeable membrane which facilitates the transport of ions and other material against less than the cytoplasm.

20. The organelles that are included in the endomembrane system are

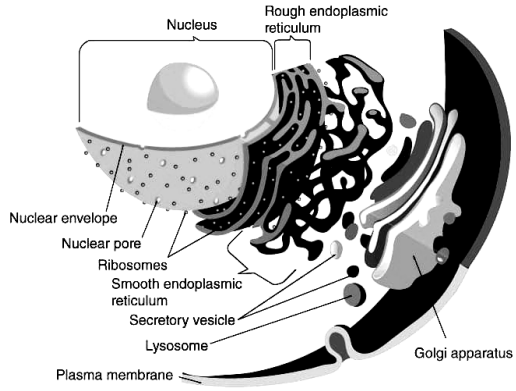
(a) Golgi complex, Endoplasmic reticulum, Mitochondria and Lysosomes
(b) Endoplasmic reticulum, Mitochondria, Ribosomes and Lysosomes
(c) Endoplasmic reticulum, Golgi complex, Lysosomes and Vacuoles
(d) Golgi complex, Mitochondria, Ribosomes and Lysosomes

NEET-2021

Ans. (c) : The system of membranous components whose functions are coordinated is called Endomembrane system. It consist of endoplasmic reticulum, Golgi complex, Vacuoles and lysosomes.

- Mitochondria is semi-autonomous cell organelle.
- Ribosome is non-membranous cell organelle.

ENDOMEMBRANE SYSTEM



21. The name endomembrane system to the membranous organelles because _____

(a) Their memberanes are attached
(b) Their functions are coordinated
(c) They have only interconnected membrane
(d) Their functions are not coordinated

AP EAMCET-05.10.2021 Shift-I

Ans. (b) : The name endomembrane system to the membranous organelles because their function are coordinated. The endomembrane system is a membranous component of the eukaryotic cell. The Endomembrane system include ER, golgi apparatus, lysosome and vacuole.

22. The middle lamella of cell wall is mainly composed of _____

(a) Pectin
(b) Calcium Carbonate
(c) Calcium Magnesium Pectate
(d) Lignin

AP EAMCET-25.09.2020 Shift-II
Haryana PMT-2006

Ans. (c) : The middle lamella of cell wall in mainly composed of calcium and magnesium pectate which helps in adhesing different neighbouring cells.

23. Phospholipids with phosphorylated organic compound in plasma membrane is

(a) Lecithin (b) Thymine
(c) Lysine (d) Glycolipid

AP EAMCET-25.09.2020 Shift-II

Ans. (a) : Phosphorus and a phosphorylated organic compound are found in some fatty acids. There are phospholipids found in cell membranes. Lecithin is an example of phospholipids.

24. The fluidity of membranes in a plant in cold weather may be maintained by

(a) Increasing the number of phospholipids with unsaturated hydrocarbon tails
(b) Increasing the proportion of integral proteins
(c) Increasing concentrations of cholesterol in membrane
(d) Increasing number of phospholipids with saturated hydrocarbon tails

AP EAMCET-25.09.2020 Shift-II

Ans. (a) : In colder conditions, the cell membrane's unsaturated fatty acid chains become more tightly packed. This compact arrangement causes the surrounding phospholipids molecules to be pushed away from one another. As a result, the cell membrane maintain its fluidity and flexibility, ensuring essential cellular processes can continue despite the lower temperature.

25. Lysosomes are A dense bodies, and originate from B

(a) A-single membrane bound, B-Golgi apparatus
(b) A-double membrane bound, B-Golgi apparatus
(c) A-double membrane bound, B-endoplasmic reticulum
(d) A-single membrane bound, B- nucleus

MHT CET-08.10.2020 Shift-I

Ans. (a) : Lysosome was discovered by de Duve in 1949 biochemically in rat liver homogenate by ultracentrifugation.

Single cell membrane organelle – vacuole, E.R, Golgi body, Lysosome.

Double membrane – mitochondria, nucleus, chloroplast.

Membrane-less cell organelle – Ribosome, centrosome.

26. Match the following:

(a)	**Protein**	**(i)**	**SER**
(b)	**Lipid**	**(ii)**	**Golgi body**
(c)	**Glycoprotein**	**(iii)**	**Lysosome**
(d)	**Hydrolytic enzyme**	**(iv)**	**RER**

@apna_pdf

(a) a – i, b – ii, c – iii, d – iv
(b) a – iv, b – ii, c – i, d – iii
(c) a – iv, b – i, c – ii, d – iii
(d) a – i, b – iii, c – ii, d – iv

AIIMS-26.05.2019 Shift-I

Ans. (c) :

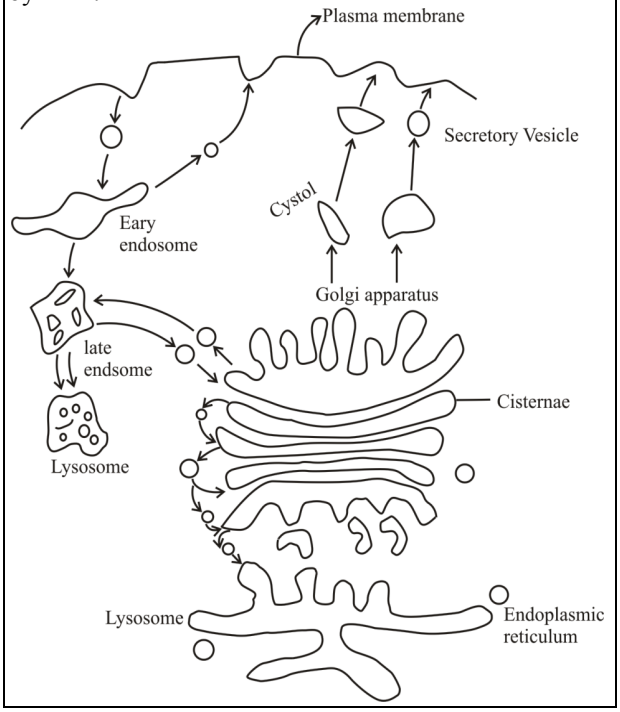
- Rough ER are attached with ribosomes and helps in protein synthesis.
- Smooth ER are not connected with ribosome and they are function as lipid formation, detoxification, various hormones and steroid formation.
- Golgi bodies function as a modification and synthesis of carbohydrate, which is a major part of Glycoproteins.
- Lysosomes contain hydrolytic enzyme helps in degrade various biomolecules.

27. Which of the following statements is not correct?

(a) The hydrolytic enzymes of lysosomes are active under acidic pH
(b) Lysosomes are membrane bound structures
(c) Lysosomes are formed by the process of packaging in the endoplasmic reticulum
(d) Lysosomes have numerous hydrolytic enzymes

NEET-2019

Ans. (c) : Lysosome are actually formed by budding off/from the trans fall of Golgi bodies. These membrane bound structure contain hydrolytic enzymes, which are active under acidic PH. The precursors are synthesized by RER.

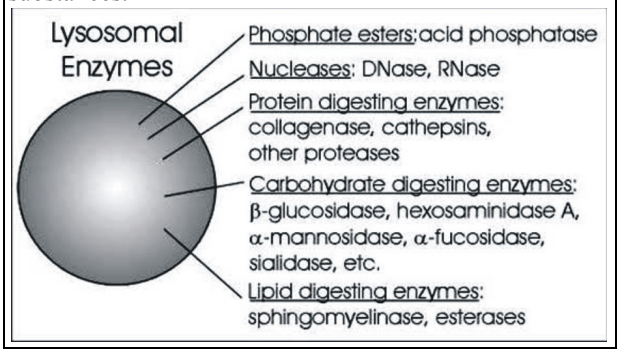


28. All the digestive enzymes like carbohydrase, protease, lipase, DNase, RNase are found in:

(a) Lysosome (b) peroxisome
(c) Glyoxysome (d) Vacuole

AIIMS-27.05.2018 Shift-II

Ans. (a) : Lysosomes are small vesicles like structure formed by Golgi apparatus. Lysosome contains/store hydrolytic enzymes (carbohydrase, protease, lipase, DNase, RNase etc). These enzymes are responsible for breaking down various hydrolytic biomolecules and these enzymes are also engulfed or digest the foreign substances.



29. Which of the following events does not occur in rough endoplasmic reticulum?

(a) Protein folding
(b) Protein glycosylation
(c) Phospholipids synthesis
(d) Cleavage of signal peptide

NEET-2018

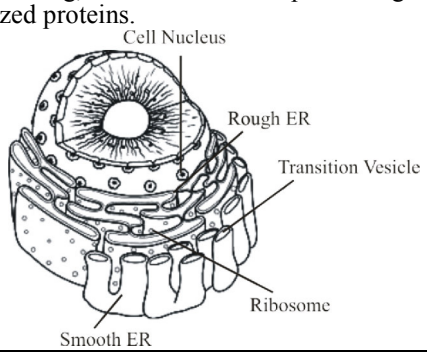
Ans. (c) : Phospholipids synthesis does not take place in rough endoplasmic reticulum.

The phospholipids synthesis occur in smooth endoplasmic reticulum. It can synthesis the lipid like cholesterol and phospholipids.

It also synthesis and secrete steroid hormones from cholesterol.

SER (Smooth endoplasmic reticulum) perform detoxification in liver.

RER involved in the synthesis of protein. Function of RER – folding, modification and processing of newly synthesized proteins.



30. Which of the following organelle is involved in xenobiotic detoxification?

(a) Golgi
(b) Lysosome
(c) SER
(d) RER

HP CET-2018

Ans. (c) : Smooth endoplasmic reticulum is involved in xenobiotic detoxification. It plays a vital role in the metabolism of various substances, including drug, pollutant and other xenobiotics (only foreign compounds).

@apna_pdf

31. Which of the following organelle is known a traffic police of the cell?
(a) Golgi body
(b) Mitochondria
(c) Endoplasmic reticulum
(d) Nucleus

HP CET-2018

Ans. (a) : Golgi bodies discovered by camillogolgi 1898 in the nerve cell of the out.
Up processing chemicals received by cisternae inters within and the median regions processing occurs as glycosidation i.e. formation of Golgi protein. Glycosylation is formation of glycolipid and sent to outside of the cell by the process exosytosis. Therefore called traffic police of the cell or principal director of macromolecular traffic in cell mitochondria.

32. Which one of the following is not included under endomembrane system?
(a) Endoplasmic reticulum
(b) Mitochondria
(c) Lysosome
(d) Vacuole

Karnataka CET-2017

Ans. (b) : Mitochondria help in oxidative phosphory lation and generation of ATP
Mitochondria, chloroplast and peroxisome are not the part of endomembrane system because the function are not coordinated with the same.
Endomembrane system includes the endoplasmic reticulum (ER), Golgi apparatus, Lysosomes and vacuole.

33. Vesicles of Smooth Endoplasmic Reticulum (SER) are most likely on their way to:
(a) plastids (b) lysosomes
(c) nucleous (d) Golgi apparatus

WB JEE-2006

Ans. (d) : The Golgi apparatus receives vesicles from the smooth E.R. the Golgi apparatus modifies contents of vesicles.

34. Golgi complex works for:
(a) excretion (b) respiration
(c) secretion (d) reduction

Rajasthan PMT-2004

Ans. (c) : Functions of Golgi apparatus:-
(i) secretion
(ii) Cell plate formation
(iii) Cell wall formation
(iv) Production of hormones
(v) formation of acrosome during spermatogenesis
(vi) Glycosidation of lipids and proteins.

35. Golgi complex is specialised for
(a) energy transduction
(b) glycosidation of lipids
(c) digestion
(d) conversion of energy

BVP-2010

Ans. (b) : The Golgi complex plays a major role in the glycosidation of lipids and proteins to produce glycolipids and glycoproteins.

36. Enzymes for autolysis are found in :
(a) nucleus (b) mitochondria
(c) chloroplast (d) lysosome

Rajasthan PMT-1996

Ans. (d) : Function of Lysosomes :-
(i) Intracellular digestion
(ii) Digestion of extracellular material
(iii) Autolysin :- In case of disease the lysosomes destroy the cells.
(iv) Trigger of cell division

37. The area where brown fats are maximum in infant neck will have more:
(a) Golgi bodies (b) Mitochondria
(c) Chromophill (d) Smooth E.R

Rajasthan PMT-1996

Ans. (b) : The area where brown fats are maximum in infant neck will have more mitochondria. Brown adipose tissue, also known as brown fat is known for generating heat in mammals, especially in infants. This heat generation is essential for maintaining body temperature in newborns.

38. E.R. is non-Continuous with:
(a) Nuclear membrane (b) Plasma lemma
(c) Golgibody (d) Mitochondria

Rajasthan PMT-1996

Ans. (d) : Endoplasmic Reticulum non- continuous with mitochondria due to different in structure and functions.

39. Endoplasmic reticulum was discovered by
(a) K. R.Porter (b) Robinson
(c) Brown (d) Moore

UP CPMT-2010

Ans. (a) : Endoplasmic reticulum was discovered by K.R porter in 1948.

40. Lysosomes are formed by
(a) endoplasmic reticulum (b) mitochondrion
(c) golgi membrane (d) both [a] and [c]

BVP-2008
Uttarakhand PMT-2007

Ans. (d) : Lysosomes are formed by endoplasmic reticulum + Golgi membrane.

41. Which of the following maintains continuity between the water and lipid phases inside and outside the cells ?
(a) Cell wall
(b) Lecithin
(c) Cell vacuole
(d) Cell membrane of woody plants

Manipal-2004

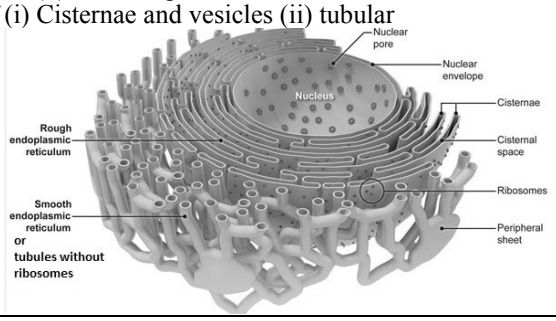
Ans. (b) : Lecithin maintains continuity between the water and lipid phases inside and outside the cells. Lecithin is also known as phosphotidyl-choline.

42. Endoplasmic reticulum occurs in the forms of (1) cistenae and vesicles (2) Tubules (3) Myeloid bodies (4) vacuoles
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2011

@apna_pdf

Ans. (b) : : Endoplasmic reticulum occurs in the forms of (i) Cisternae and vesicles (ii) tubular



43. Dictyosomes are also known as :
(a) ribosomes (b) golgi bodies
(c) lysosomes (d) mesosomes

BHU PMT-2001

Ans. (b) : Dictysome are also known as lipochondria or Golgi bodies.

44. Which of the following organelles provides cytoskeletal support to the cell?
(a) Golgi bodies (b) Endoplasmic reticulum
(c) Mitochondria (d) Peroxisomes

JIPMER-1998

Ans. (b) : Endoplasmic Reticulum provides cytoskeleton support to the cell.

45. Long flattened usually unbranched units arranged in parallel stacks in endoplasmic reticulum are called
(a) cisternae (b) cristae
(c) vesicles (d) tubules

J&K CET-2009
Rajasthan PMT-1998

Ans. (a) : Endoplasmic Reticulum composed of three parts–
(i) **Cisternae**:- Which are chief constituents of E.R. they occur in long flattened usually unbranched tubules arranged in parallel stocks in endoplasmic reticulum.
(ii) Vesicles:- large rounded spherical bodies of various sized.
(iii) Tubules:- Branched or un-branched small structure.
Functions:- (i) Mechanical support (ii) Intra-cellular circulation (iii) Protein – synthesis (iv) Lipid synthesis (v) Glycogen synthesis

46. Axoneme is a structure associated with
(a) golgi bodies
(b) only cilia
(c) only flagella
(d) Both cilia and flagella

J&K CET-2014

Ans. (d) : The axoneme is the axial filament made of microtubule forming the cilia and flagella. It consists of 9 periphere microtubule doublet and 2 central single microtubule pair. Axoneme acts as the skeleton of the organism that have cilia and flagella.

47. Cisternae have a diameter of
(a) 0.5 μm to 1.0 μm (b) 1.0 μm to 1.5 μm
(c) 1.5 μm to 2.0 μm (d) 2.0 μm to 2.5 μm

J&K CET-2014

Ans. (a) : Cisternae have a diameter of 0.5 μm to 1.0 μm. The diameter of cisternae in the Golgi apparatus can vary depending on the specific cell type, development stage and functional state.

48. Perinuclear space is present in
(a) cytoplasm
(b) nucleus
(c) ER(Endoplasmic Reticulum)
(d) Golgi apparatus

J&K CET-2014

Ans. (c) : Perinuclear space is present in E.R. It is a space present between nucleus and cytoplasm and separate them. It's act as a barrier for entering of any substance between the nucleus and cytoplasm.

49. Rough endoplasmic reticulum is actively involved in
(a) protein synthesis
(b) hormone synthesis
(c) lipid synthesis
(d) carbohydrate synthesis

J&K CET-2014

Ans. (a) : Rough endoplasmic reticulum is actively involved in protein synthesis because it contain ribosomes.

50. Lysosome along with the food content is called:
(a) primary lysosmoe
(b) secondary lysosome
(c) residual bodies
(d) cytosome

JIPMER-1997

Ans. (b) : Lysosomes are of four types-
(a) primary Lysosomes = storage granular:-
Produced from the Golgi bodies these are vesicles like structure. They contain one or another type of acid hydrolase enzyme.
(b) Secondary Lysosomes = heterophagosomes = digestive vacuole. These contain full complement of acid hydrolyses enzymes. These lysosomes are formed by the fusion of primary lysosome with the phagosome.
(c) Residual bodies = Tertiary lysosomes
Residual bodies are formed if digestion (inside the digestive vacuole) is incomplete.
(d) Autophagic vacuoles = autophagosome = Autolysosomes
They are formed by the fusion of a number of primary lysosomes around worn-out or degenerated and digested intercellular organelles.

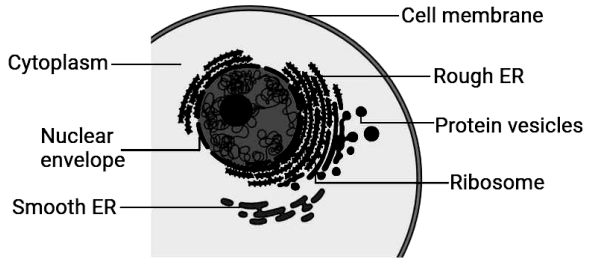
51. Which of the following is responsible for the mechanical support, protein synthesis and enzyme transport?
(a) Endoplasmic reticulum (b) Mitochondria
(c) Cell membrane (d) Dictyosome

AIIMS-2007
VMMC-2002

Ans. (a) : The endoplasmic reticulum is responsible for the mechanical support, protein synthesis and enzyme transport in eukaryotic cells. ER provides structural support to the cell and maintain its shape.

@apna_pdf

Rough endoplasmic reticulum (RER) contain ribosome (protein factory) are responsible for protein synthesis. Smooth endoplasmic reticulum (SER) helps in transport necessary enzymes for synthesis of lipids, detoxification of drug etc.



52. Lysozyme that is present in perspiration, saliva and tears, destroys
(a) certain fungi
(b) certain types of bacteria
(c) all viruses
(d) most virus-infected cells

JCECE - 2012
Rajasthan PMT-2010

Ans. (b) : Lysozyme that is present in perspiration, saliva and tears, destroys- certain types of bacteria

53. Protein packaging is done in
(a) Golgi apparatus (b) ribosomes
(c) ER (d) nucleolus

AMU-2011
DUMET - 2002

Ans. (a) : Functions of Golgi apparatus →
Glycosidation of lipids and protein – the golgi complex plays a major role in the glycosidation of lipid and proteins to produce glycolipids and glycoproteins.
→ Lysosomes originate from Golgi apparatus.

54. Golgi apparatus is absent in
(a) higher plant
(b) yeast
(c) bacteria and blue-green algae
(d) liver cells

AIPMT – 1993
BCECE-2014
BHU-PMT (Screening)-2008

Ans. (c) : The Golgi apparatus is absent in bacteria and cynobacteria because these organisms belong to a group of simple, single-celled organisms known as prokaryotes which lack membrane bound organelles.

55. Dictyosomes were discovered in 1989 by
(a) Robert Brown (b) Rudolf Virchow
(c) Robert Hooke (d) None of these

AMU-1999

Ans. (d) : Dictyosomes were discovered by Italian cytologist Camillo Golgi in 1898 for this, he was got nobel prize in 1906.
Robert Hook:- English botanist (1665)
(i) Coined the term cell
(ii) Discovered cell wall in cork cell.
Robert Brown:-
(i) Discovered nucleus
(ii) Discovered Brownian movement which is a colloidal property of protoplasm.
Rudolf Virchow :- Father of modern pathology.
(i) Gives famous statement about cell "Omnis cellula e cellula".
(ii) Virchow's Triad

56. The two cell organelles not enclosed by a membrane are
(a) chloroplast and mitochondria
(b) nucleus and nucleolus
(c) golgi apparatus and microbodies
(d) none of the above

AMU-1999

Ans. (d) : Single membrane bound organelle-vacuole, lysosome, golgi apparatus, E.R, micro bodies.
Double membrane bound organelle- nucleus, mitochondria, chloroplast.
Ribosomes, Cytoskeleton, Centrioles (in animal cells), nucleoid, nucleolus are the non-membrane bound cell organelles.

57. Lysosomes were discovered by de Duve accidently. Who gave the term lysosomes and examined under electron microscope?
(a) Fitz James (b) Novikoff
(c) Palade (d) Robertson

VMMC-2006

Ans. (b) : Lysosomes were discovered by Christian de Duve in 1955 but were named and observed under on electron microscope by Novikoff (1956).

58. When a lysosome fuses with a phagosome, it results in the formation of:
(a) Secondary lysosomes (b) Primary lysosome
(c) Autophagic vacuole (d) Residual body

Karnataka CET-2003

Ans. (a) : Secondry lysosomes = heterophagosomes = digestive vacuole :-
These contain full complement of acid hydrolyses enzymes these lysosomes are formed by the fusion of primary lysosome with the phagosome or pinosome.

59. Hurlers disease is caused by the absence of:
(a) mitochondria (b) lysosomes
(c) lomosomes (d) mesosomes

Uttarakhand-2005
BVP - 2000

Ans. (b) : Hurlers disease areas formerly known as gargoylism. It is an inherited lysosomal disorder caused by the absence of alpha-L-iduronidase an enzyme responsible for the degradation of glycosamino-glycans or muco-polysaccharides. It is genetic inherited disease which is inherited in autosomal recessive pattern.

60. Which of these may cause hypothermia in humans?
(a) Smoking (b) LSD
(c) Dopamine (d) Alcohol consumption

AMU-2005

Ans. (d) : Hypothermia is a medicinal condition in which body's temperature dangerously drop (35° C) and in prolonged cooler condition body is not able to produce enough heat for the maintaining essential physiological processes. This condition is occurs due to high consumption of alcohol, which dilate the blood.

@apna_pdf

61. Constituents of plasma membrane are

(a) Protein-lipid-protein (b) Lipid-protein-lipid
(c) Protein-phosphorus (d) Lipid-sugar-protein

CG PMT-2006

Ans. (a) : Most plasma membranes consists of approximately 50% lipid and 50% protein by weight with the carbohydrate portions of glycolipids and glycoprotein's constituting 5 to 10 % of the membrane mass and helps in various intricate functions including cell signaling, transport, and maintain cell integrity.

62. Out of the given substances which one is present in abundance in lysosomes?

(a) Isomerase (b) Heme
(c) Acid phosphate (d) Cytochrome

Manipal-2006

Ans. (c) : Acid phosphate is present in abundance in lysosomes. Lysosomes are abundant in hydrolytic enzymes such as proteases, salfatiases, nucleases, lipases, phosphates, glycosidases and nucleaeases, all of which degrade complex macromoleculer. These enzymes are used for the controlling intracellular digestion of macromolecules. Lysosomal enzymes have optimal activity at PH = 5.

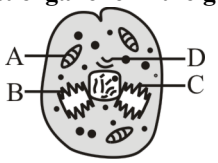
63. The chemical substances found most abundantly in the middle lamella are released into the phragmoplast by

(a) endoplasmic reticulum
(b) golgi complex
(c) spindle fragments
(d) interzonal fibres

Manipal-2009

Ans. (b) : The chemical substances found most abundantly in the middle lamella and released into the phragmoplast by golgi complex. It's helps in protein packaging. The Golgi complex synthesizes polysaccharides which bring about formation of a cell plate between daughter nuclei during cytokinesis.

64. The RER in the cell synthesized protein which would be later used in building the plasma membrane. But it is observed that the protein in the membrane is slightly different from the protein made in the RER. The protein was probably modified in another cell organelle. Identify that organelle in the given diagram.



(a) D (b) A
(c) B (d) C

Manipal-2009
Karnataka CET-2009

Ans. (a) : Protein synthesized by the rough endoplasmic reticulum and lipid synthesized by smooth endoplasmic reticulaum reach the cisternae of the golgi apparatus. Here they combine with carbohydrates to form glycoproteins and glycolipids. The Golgi apparatus or Golgi complex, functions as a factory in which protein received from the ER are further processed and sorted for transport.

65. Cells which are secretory in function have abundant :

(a) lysosomes (b) E.R.
(c) dictyosomes (d) osteosomes

DUMET-2001, 2002
Haryana PMT-2008

Ans. (c) : Dictyosome is a cup-shaped structure of flattened membranous vesicles found in plant cell. They modify protein from the ER, and may also polymerize sugars to polysaccharides. It ensures the transport of substances produced by the secretary cells to target areas. Therefore dictyosomes are secretary in function.

66. Protoplast lacks:

(a) cytoplasm (b) nucleus
(c) plasma membrane (d) cell wall

AP EAMCET-2002

Ans. (d) : Protoplasts are osmotic plant cells that lack cell walls. Plant cell-cell wall = protoplast.

67. RNA is not found in

(a) chromosome (b) plasmalemma
(c) nucleolus (d) ribosome

Haryana PMT-2008

Ans. (b) : RNA is not found in plasma lemma. Plasma lemma is also known as the plasma membrane. These are found inside the cell wall of a cell. These are made up of proteins, phospholipids, and carbohydrates and do not contains RNA.
The telomerase in chromosome contains RNA for the protection of chromosome from being cut. Ribosome and Nucleolus also contain protein and RNA.

68. In plant cell wall

(a) secondary wall is always present
(b) may be absent
(c) there cannot be intercellular spaces
(d) bear pores through which cytoplasm can pass

CG PMT-2011

Ans. (d) : Plant cell wall- bears pores through which cytoplasm can pass. It act as selective permeable membrane.

69. Assertion : Dope test is used to estimate the level of blood alcohol by analyzing the breath of persons drinking alcohol.
Reason : a drunken person usually feels tense and less talkative.

(A) Both A and R are true, R is correct explanation of A.
(B) Both A and R are true but, R is not correct explanation of A.
(C) A is true but, R is false.
(D) Both A and R are false.
(E) A is false but R is true

(a) A (b) B
(c) C (d) D
(e) E

HP CET-2012

Ans. (d) : A dope test in a test to determine whether an athlete is taking drugs to enhance one's performance.
A breathalyzer is a device for estimating blood alcohol content by analyzing the breath of a person is drink, in the initial stages the nervous system is stimulated, and the person becomes hyperactive and talks more.

@apna_pdf

70. Protein synthesis takes place in
(a) ribosomes (b) chloroplasts
(c) mitochondria (d) Golgi bodies
BHU-PMT (Screening)-2008
AIIMS-2000

Ans. (a) : Protein synthesis takes place in ribosomes.

71. The organelles, which take part in photo respiration are
(a) Chloroplast, mitochondria, nucleus
(b) Chloroplast, mitochondria, lysosome
(c) Mitochondria, chloroplast, peroxisome
(d) Mitochondria, lysosome, peroxisome
CMC Ludhiana-2008

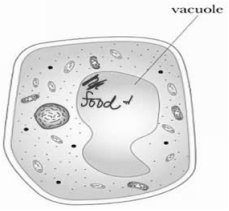
Ans. (c) : Photorespiration takes place → Mitochondria + chloroplast + peroxisome.

72. An interconnecting membranous network of the cell composed of vesicles flattened sacs and tubules is :
(a) Nucleus (b) Mitochondrion
(c) Endoplasmic reticulum (d) Lysosome
Karnataka CET-2012

Ans. (c) : The endplasmic reticulum (ER) is a network of membranous tubes and canals winding through the interior of the cell. It is a network of membranous tubules within the cytoplasm of a eukaryotic cell, continuous with the nuclear membrane. It has flattened sacs and tube-like structures also. It usually has ribosome attached and is involved in protein and lipid synthesis.

73. Vacuole in a plant cell:
(a) lacks membrane and contains air
(b) Lacks membrane and contains water and excretory substances
(c) is membrane-bound and contains storage proteins and lipids
(d) is membrane-bound and contains water and excretory substances
AIPMT-2008

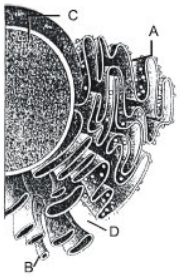
Ans. (d) : Vacuoles are membrane bound organelles present in cells. The membrane of the Vacuoles is composed of phospholipids molecules and trans membrane proteins called Tonoplast.
Functions of vacuoles –
- **Maintains the turgidity** of the cell.
- Helps to isolate substances that are harmful.
- Contains water that helps to keep the plant cell rigid.
- **Maintains the acidity of the cell cytoplasm** and creates an effective environment for proteins to act.
- Take part in storage vacuole contain water, minerals, enzyme and excretory waste.



74. Which one of the following group of cell organelles lack its own DNA?
(a) Nucleus and chloroplast
(b) Lysosome and dictyosomes
(c) Mitochondria and chloroplast
(d) Nucleus and mitochondria
UP CPMT-2014

Ans. (b): Lysomoes, single membrane and dictyosomes, well known as Golgi apparatus are devoid of its own DNA molecules.
While chloroplast Nucleus and mitochondria possess their own DNA. Mitochondria and chloroplast are called as semi autonomous cell organelles.

75. Identify the components labelled A, B, C and D in the diagram below from the list (i) to (viii) given with



(i) Cristae of mitochondria
(ii) Inner membrane of mitochondria
(iii) Cytoplasm
(iv) Smooth endoplasmic reticulum
(v) Rough endoplasmic reticulum
(vi) Mitochondrial matrix
(vii) Cell vacuole
(viii) Nucleus

The correct components are

	A	B	C	D
(a)	(v)	(i)	(iii)	(ii)
(b)	(v)	(iv)	(viii)	(iii)
(c)	(i)	(iv)	(viii)	(vi)
(d)	(vi)	(v)	(iv)	(vii)

AIPMT (Mains)-2010

Ans. (b) :
A - Rough endoplasmic reticulum- The RER, studded with millions of membrane bound ribosomes, is involved with the production, folding, quality control and dispatch of some proteins.
B- Smooth endoplasmic reticulum- The SER function in many metabolic processes. It synthesizes lipids, phospholipids in plasma membranes.
C- Nucleus- The primary functions of the nucleus are the store the cell's DNA, maintain its integrity, and facilitate its transcription & replication.
D- Cytoplasm- The cytoplasm is responsible for holding the components of the cell and protects them from damage. It stores the molecules required for cellular processes and is also responsible for giving the cell its shape.

76. Which cell organelle is concerned with glycosylation of protein:
(a) Ribosome (b) Peroxisome
(c) Endoplasmic reticulum (d) Mitochondria
AIPMT-2000

@apna_pdf

Ans. (c) : Endoplasmic reticulum bears enzymes in the region of pores for modifying polypeptides synthesized by attached ribosomes, e.g. **glycosylation.**

- **Peroxisomes** are organelles that sequester diverse oxidative reactions and play important roles in metabolism, reactive oxygen species detoxification and signaling.
- **Ribosome** is an intercellular structure made of both RNA and protein and it is the site of protein synthesis in the cell.
- **Mitochondria** are membrane-bound cell organelles that generate most of the chemical energy needed to power the cell's biochemical reactions.

77. Important site for formation of glycoproteins and glycolipids is

(a) Lysosome (b) Vacuole
(c) Golgi apparatus (d) Plastid

AIPMT (Screening)-2011

Ans. (c) : Golgi bodies are cell organelles found in Eukaryotic cells. The newly synthesized proteins are handed over to the Golgi apparatus which is catalyzed by the addition of carbohydrates, lipid or sulphates moieties to the protein. Golgi apparatus is the important site of formation of glycoproteins and glycolipids.

78. Peptide synthesis inside a cell takes place in :

(a) Ribosomes (b) Chloroplast
(c) Mitochondria (d) Chromoplast

AIPMT (Screening)-2011

Ans. (a) : Peptide synthesis inside of a cell take place in Ribosome. Ribosomes are found in all cells and are involved in protein synthesis. The major constituents of ribosomes are RNA & proteins present in approximately equal amounts. Protein or peptide synthesis is carried out with an mRNA templete.

79. Read the following statements and identify the correct options given.

I. Sap vacuoles – Contain digestive enzymes with the help of which nutrients are digested
II. Contractile vacuoles – Take part in osmoregulation and excretion
III. Food vacuoles – Store and concentrate mineral salts as well as nutrients
IV. Air vacuoles – Store metabolic gases and help in buoyancy of cells

(a) I and II are correct (b) I and III are correct
(c) I and IV are correct (d) II and IV are correct

Kerala PMT-2008
AP EAMCET-2011

Ans. (d) : Contractile vacuoles–Take part in osmoregulation and excretion.

Air vacuoles – Store metabolic gases and help in buoyancy of cells.

- A sap vacuole are large, fluid filled that function as storage of various substances, primarily water, minerals and nutrients.
- Food vacuoles are contain digestive enzymes with the help of which nutrients are digested.

80. Difference between rough and smooth endoplasmic reticulum

(a) Rough has ribosomes
(b) Smooth has ribosomes
(c) Smooth takes part in protein synthesis
(d) Both has F_1 Particles

UP CPMT-2010, 2006

Ans. (a): On rough endoplasmic reticulum the ribosome are attached to the surface by ribophorin-I and ribophorin II. The ribosomes are meant for protein synthesis smooth endoplasmic reticulum lack ribosome and take take part in synthesis of lipid. The F_1 particles are found in the crystae (inner membrane) of mitochondria. The F_1 particles has ATPase activity.

81. Golgi body originates from

(a) Lysosome (b) Endoplasmic reticulum
(c) Mitochondria (d) Cell membrane

UPCPMT-2002

Ans. (b): The formation of Golgi bodies starts with assembly of flattened membrane sacs (cisternae), which are derived from the ER. These membrane sacs stack together to form distinctive structure of the Golgi apparatus. So the Golgi bodies originate from the endoplasmic reticulum during the process of cell organelle formation.

82. Which of the following is responsible for mechanical support and enzyme transport?

(a) Dictyosome (b) Cell membrane
(c) E.R. (d) Mitochondria

J&K CET-2001
AIIMS-1999

Ans. (c) : The endoplasmic reticulum is responsible for both mechanical support and enzyme transport within the cell. The extensive network of membrane provides mechanical support. RER is responsible for protein synthesis. SER is responsible for lipid synthesis.

83. Which of the following statements is true for lysosome?

(a) Suicidal bag
(b) Stain for acid phosphatase
(c) Some cystolic protin contains signals directing them to lysosome
(d) All of the above

CMC Vellore-2013

Ans. (d) : Lysosome discovered by Belgians scientist De. Duve 1949 in liver cell early called Pericanolicular bodies but in 1955 use the term lysosome. If the cell gets damaged, then one of the lysosomes bursts and releases some digestive enzymes and digest their own cell and ultimately the cell dies. Hence lysosomes are called suicides bag of the cell.

Lysomes are called suicidal bages because of their hydrolytic activity. Lysosome contain lysosomal acid phosphatase enzymes. Lysosomal enzymes are capable of breaking down all type of biological polymers.

84. Which of the following cell organelle remains enveloped by a single unit membrane?

(a) Mitochondria (b) Lysosomes
(c) Nucleus (d) Chloroplast

BVP-2003

@apna_pdf

Ans. (b) : Lysosome, Golgi body, E.R is a single membrane organelle.
Mitochondria chloroplast is double membrane organelle.
Ribosome and centrosome is membrane less organelle.

85. The endoskeleton of cell is made up of:
(a) Deutoplasm (b) Protoplasm
(c) Endoplasmic reticulum (d) Cell wall

BVP-2004

Ans. (c) : Endoskeleton is also refer as cytoskeleton of cell.
The endoskeleton of cell is made up of endoplasmic reticulum which forms basic framework of the cell. Porter and Thompson discovered the endoplasmic reticulum in 1945.

86. In plants vacuole contains:
(a) soil
(b) water and dissolved substance
(c) cytoplasm
(d) all of the above

Haryana PMT-2004
Manipal-2003
BVP-2005

Ans. (b) : The vacuole contain water and dissolved substance, as salt, minerals, nutrients, proteins & pigments. The differentially permeable membrane that surrounds the vacuole is called tonoplast. Cytoplasm is the fluid substance inside of a cell. The cytosol is the watery portion of the cytoplasm that all organelles float in.

87. The cell organelle associated with intracellular digestion of macromolecules is
(a) Lysosome (b) Peroxisome
(c) Polysome (d) Dictyosome
(e) Glyoxysome

Kerala PMT-2009

Ans. (a) : Cell organelle connected with intra cellular digestion of macro-molecules is Lysosomes. Lysosome contain/store hydrolytic enzymes. These enzymes are responsible for breaking down various biomolecules and these enzymes are also engulfed and digest foreign substance. This process is called autolysis.

88. Match the following lists

(A) Golgi apparatus	**(I) Conversion of lipids to carbohydrates**
(B) Glyoxysomes	**(II) Catabolism of long chain fatty acids**
(C) Peroxisomes	**(III) Formation of glycoproteins and glycolipids**
(D) Endoplasmic reticulum	**(IV) Osmoregulation**
	(V) Synthesis of lipids

	(A)	**(B)**	**(C)**	**(D)**
(a)	(II)	(III)	(V)	(I)
(b)	(IV)	(V)	(I)	(II)
(c)	(V)	(IV)	(II)	(III)
(d)	(III)	(I)	(II)	(V)

AP EAMCET-2014

Ans. (d) : Golgi apparatus – formation of glycoprotein's and glycolipids
Glyoxysomes is conversion of lipids to carbohydrates peroxisomes is catabolism of long chain fatty-acids.
ER synthesis the lipids.

89. Endoplasmic reticulum is in continuation with
(a) Golgi body (b) nuclear wall
(c) mitochondria (d) cell wall

JIPMER-2010

Ans. (b) : The endoplasmic reticulum is in continuation with nuclear wall. Specially, the rough ER is physically connected to the outer membrane of the nuclear envelope, and ribosomes or its surface and involved in protein synthesis. On the other hand, the smooth ER, is not directly connected to the nuclear envelope.

90. Select the correct matching in the following pairs:
(a) Smooth ER - Synthesis of lipids
(b) Rough ER - Synthesis of glycogen
(c) Rough ER - Oxidation of fatty acids
(d) Smooth ER - Oxidation of phospholipids

AIPMT-2015
MGIMS Wardha-2014

Ans. (a) : Smooth Endoplasmic Reticulum (SER) is a system of smooth membrane (membrane not having ribosome) within the cytoplasm of plant and animal cell. It is the site of important metabolic reaction. It also includes phospholipid and fatty acid synthesis.
In animal cell, lipid-like steroidal hormone are also synthesized by smooth endoplasmic reticulum.
Function of RER-protein synthesis.
Synthesis of glycogen takes place in SER.
Oxidation of fatty acids are take place in peroxisome and mitochondria

91. Nuclear envelope is a derivative of :-
(a) Membrane of Golgi Complex
(b) Microtubules
(c) Rough endoplasmic reticulum
(d) Smooth endoplasmic reticulum

AIPMT-2015

Ans. (c) : The nuclear envelope is a derivative of the endoplasmic reticulum, as it produced by rough endoplasmic reticulum, (RER) in telophase. The nuclear envelope, also known as the **nuclear membrane** is found surrounding the genetic material and nucleolus in eukaryotic cell. Nuclear envelope is a highly regulated membrane barrier that separates the nucleus from the cytoplasm in eukaryotic cell.

92. The osmotic expansion of a cell kept in water is chiefly regulated by:
(a) Mitochondria (b) Vacuoles
(c) Plastids (d) Ribosomes

AIPMT-2014

Ans. (b) : Vacuoles are non-cytoplasmic areas present inside cytoplasm. They are believed to be formed by expansion and pinching off from ER. There occurs a large central vacuole and some small vacuoles in plant cells. They play a major role in osmotic expansion of cell.

@apna_pdf

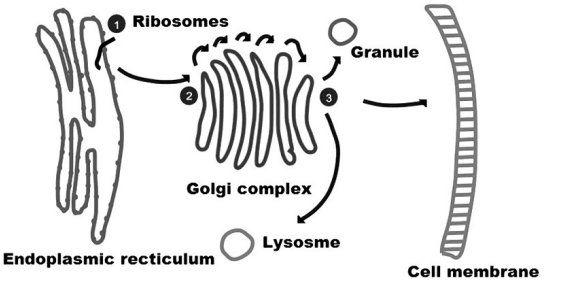
93. The main organelle involved in modification and routing of newly synthesized proteins to their destinations is –

(a) Endoplasmic Reticulum
(b) Lysosome
(c) Mitochondria
(d) Chloroplast

JIPMER-2007
AIPMT-2005

Ans. (a) : The main organelles involved in modification and routing of newly synthesized protein to their destination is endoplasmic reticulum.

- Inside the ER, the protein modification is occurs, such as folding into its proper shape and adding specific chemical tags like sugars. ER packed and transport the modified protein into transport vesicles, these vesicles transport the protein to its specific destination.



94

(a) On ribosomes presents in cytoplasm as well as in mitochondria
(b) On ribosomes present in the nucleolus as well as in cytoplasm
(c) Only on ribosomes attached to the nuclear envelope and endoplasmic reticulum
(d) Only on the ribosomes present in cytosol

AIPMT-2005

Ans. (a) : Ribosome are the organelles, present in the cytoplasm, composed by rRNA and a set of specific protein. The synthesis of protein occur in cytoplasm as well as mitochondria. In an eukaryotic cell ribosome are present in cytoplasm or mitochondria and chloroplast, so, in these places protein synthesis occur.

- Protein biosynthesis is a core biological process occurring inside cells balancing the loss of cellular protein through the production of new protein.

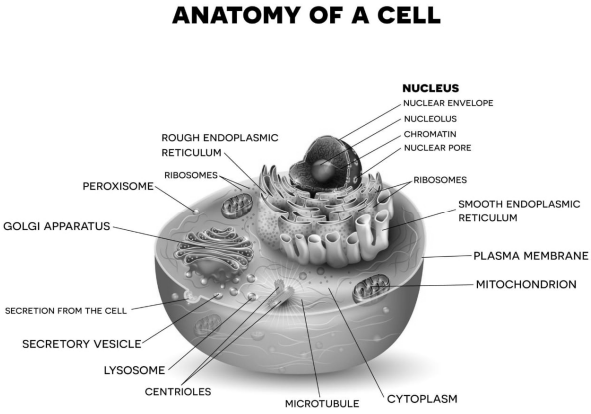
95. Which one of the following structures is an organelle within an organelle

(a) ER (b) Mesosome
(c) Ribosome (d) Peroxisome

AIPMT (Mains)-2012

Ans. (c) : The ribosome are the cell organelle that is present inside the other cell organelles like endoplasmic reticulum mitochondria and chloroplast. They are known as an organelle within an organelle.

- Ribosome are a organelle in a cell where protein synthesis occurs and it is composed of both RNA and protein.
- They manufacture amino acids and are present side other cell organelles like mitochondria, chloroplast and E.R.

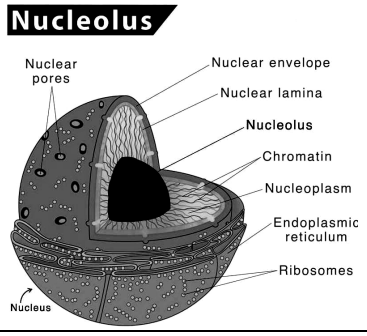


96. Ribosomes are produced in :

(a) Nucleolus (b) Cytoplasm
(c) Mitochondria (d) Golgibody

AIPMT-2002

Ans. (a) : A portion of the cell's nucleus called the nucleolus where ribosomes are made. The two primary components of ribosomes are ribosomal RNA (rRNA) and ribosomal protein are synthesized within the nucleolus. These two ribosomal parts combines to each other and create functional ribosomes.



97. Acrosome is formed by :

(a) nucleus (b) Golgi apparatus
(c) mitochondria (d) none of these

JIPMER-2006

Ans. (b) : Acrosome present in the spermatozoa is derived from Golgi bodies. Contain digestive enzyme as- hyaluronidase and acrosin that help in piercing the ovum. Acrosome derived from secretory vesicle of golgi body.

- Mitochondria - Benda (1898) stained these organelles with crystal violet and renamed them mitochondria.
- Robert brown discovered the nucleus in 1831. It is the center of the cell, it has genetic information and perform a vital role for cell.

98. Three of the following statements regarding cell organelles are correct while one is wrong. Which one is wrong?

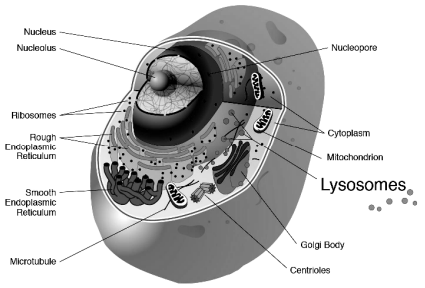
(a) Lysosomes are double membraned vesicles budded off from Golgi apparatus and contain digestive enzymes.
(b) Endoplasmic reticulum consists of a network of membranous tubules and helps in transport, synthesis and secretion.

@apna_pdf

(c) Leucoplasts are bound by two membranes, lack pigment but contain their own DNA and protein synthesizing machinery.
(d) Sphaerosomes are single membrane bound and are associated with synthesis and storage of lipids.

AIIMS-2005

Ans. (a) : Lysosomes budded off or formed from the Golgi apparatus and contain digestive enzymes, but they are enclosed by single membrane. Lysosomes are small vesicles like structure which functions as degradation of several biomolecules. It contain hydrolytic enzyme.



99. Which of the following is related to glycosylation of protein?
(a) Lysosome
(b) Mitochondria
(c) Peroxisome
(d) Rough endoplasmic reticulum.

AIIMS-2002

Ans. (d) : Rough ER is related to Glycosylation of protein or addition of sugar moleculeS.
Two types of Glycosylation held by ER.
• N-linked Glycosylation – The Endoplasmic reticulum carefully attaches sugar molecules to certain or specific parts of the protein. This process helps the protein fold correctly and work properly.
• O-linked Glycosylation – In this addition of sugar is not specific, sugar are added on different proteins.

100. Which one is apparato reticolare?
(a) Golgi apparatus
(b) Endoplasmic reticulum
(c) Microfilaments
(d) Microtubules

AIPMT-1992

Ans. (a) : Apparato reticolare interno is a an anatomical term in Italian language, which mean "internal reticular apparatus. It refers to a part of the brainstem known as the reticular formation, a complex network of nerve cells (nervous) that play a important role in regulating various functions, such as consciousness, sleep, arousal, and attention.

101. Besides giving out secretory vesicles, the Golgi apparatus is also concerned with the formation of:
(a) Lysosomes
(b) Plastids
(c) Grana of chloroplasts
(d) Cell plates after cell division in plants

AIPMT-1994

Ans. (a) : Endoplasmic reticulum and Golgi body are involved in the formation of lysosomes. Enzymes of the lysosomes are synthesized in the rough endoplasmic reticulum. Golgi apparatus is also involved in the synthesis of cell wall, plasma membrane and lysosome. Golgi apparatus gives rise to primary lysosome by budding from trans face of cisternae. Golgi apparatus is also involved in synthesis of cellulose, hemicelluloses and lipid transport.

102. Which one of the following organelles is located near the nucleus and contains a collection of flattened membrane bound cisternae?
(a) Nucleolus (b) Mitochondrion
(c) Centriole (d) Golgi apparatus

AIPMT-1994

Ans. (d) : Golgi apparatus is an organelle found in all plant and animal cells. But absent in PPLO, Bacteria, blue green algae, mature RBC, It consists of flattened disc- like structures called cisternae located close the endoplasmic reticulum. The Golgi apparatus is responsible for transporting modifying and packaging proteins and lipids and for delivered to targeted destinations.

103. Golgi apparatus is found in:
(a) prokaryotic cell
(b) eukaryotic cell
(c) male gametes of bryophytes
(d) near mitochondria

J&K CET-2000

Ans. (b) : Golgi complex is found in all Eukaryotic cells except RBCs (Mature).
• The first electron microscope studies on the structure of Golgi complex have been done by Dalton and Felix (1954) in the epididymis of the Rat.

104. Mechanical support, enzyme circulation, protein synthesis and detoxification of drugs are function of
(a) ER (b) ribosomes
(c) dictyosomes (d) chloroplast

JCECE-2007

Ans. (a) : Mechanical support enzyme circulation protein synthesis and detoxification of drugs are function of ER.
- Dictyosomes → Golgy complex of plants is usually called as dictyosomes.
- Ribosomes → was discovered by palade in 1955 and the term Ribosome, has been introduced by Roberts in 1958 which is membrane less organelle.
- Chloroplast is a photosynthetic region in plant cell.

105. Enzymes found attached to inner membrane of mitochondria instead of matrix is/are
(a) succinic dehydrogenase
(b) cytochrome oxidase
(c) both (a) and (b)
(d) malic dehydrogenase

JCECE-2007

Ans. (c) : The end product of glycolysis is pyruvic acid which enters mitochondria and takes part in Krebs cycle in the mitochondria matrix. Within the cell the site of respiration or oxidative phosporylation is mitochondria. Enzymes found attached to inner membrane of

@apna_pdf

mitochondria instead of matrix are succinic dehydrogenate and cytochrome oxidase. SDH is placed in the inner mitochondrial membrane because it has an immensely important role of catalyst in both citric acid cycle and in ETS. In citric acid cycle, SDH helps in catalyzing succinate into fumarate. It is also included in complex II of electron transport chain, linking citric acid cycle with electron transport chain.

106. Choose the incorrect match:

(a) nucleus-RNA
(b) lysosome-protein synthesis
(c) mitochondria-respiration
(d) cytoskeleton-microtubules

JCECE-2006

Ans. (b) : Lysosome was discovered by de-Duve in 1949 biologically in Rat liver homogenate by ultracentrifugation. De Duve (1963) also coined the name suicidal bag to lysosomes as they contain hydrolytic enzymes.
Lysosomes are covered by one lipoprotein unit membrane (double membranes are absent).
Protein synthesis is occurs by rough ER.

107. Which is not true about sphaerosomes ?

(a) Arise from ER
(b) Related to fat
(c) Single membrane bound structure
(d) Involved in photorespiration

Punjab MET-2008

Ans. (d) : Sphaerosomes were discovered by Hanstein in 1880 who called them as microsomes.
• Sphaerosomes are associated with synthesis and storage of lipids. Sphaerosomes in plant cell may also possess lysosomal activity sphaerosomes develop from the ER and contain about 40% fat so they have affinity for fat stain. Sphaerosomes are plant cell organelles that are involved in lipid synthesis and storage. Sphaerosomes are micro-organelles, single membrane bound also known as lipid droplets and oleosomes.

108. Consider the following statements and choose the correct option :

(A) The endomembrane system includes plasma membrane, ER, golgi complex, lysosomes and vacuoles.
(B) ER helps in the transport of substances, synthesis of proteins, lipoproteins and glycogen.
(C) Ribosomes are involved in protein synthesis.
(D) Mitochondria help in oxidative phosphorylation and generation of ATP.

(a) B, C and d are correct (b) A – alone is correct
(c) B – alone is correct (d) C – alone is correct
(e) D – alone is correct

Kerala PMT-2011

Ans. (a) : Endomembrane system includes ER, Golgi complex, lysosomes and vacuole because their functions are coordinated. ER helps in the transport of substances, synthesis of proteins, lipoproteins and glycogen,
Ribosomes are involved in protein synthesis,
Mitochondria help in oxidative phosphorylation and generation of ATP.

109. Cisternae are a part of:

(a) golgi apparatus (b) mitochondria
(c) chloroplasts (d) none of these

JIPMER-1996

Ans. (a) : The Golgi apparatus also called Golgi complex or Golgi body is a membrane bound organelle found in Eukaryotic cells (cells with clearly defined nuclei) that is made up of a series of flattened staked pouches called cisternae.
• Chloroplast was coined by A.J.W. Schrimper in 1883. In the higher plants there are 20 to 40 chloroplast per cell, chloroplast covered with a double membrane containing a proteinaceous matrix called stroma
• Benda in 1898 stained these organelles with crystal violet and renamed the mitochondria. Mitochondria is also known as power-house of the cell.

110. Which organelle of plant secretes polysaccharide and protein to make cell walls?

(a) Golgi bodies (b) Lysosome
(c) Mitochondria (d) Chloroplast

CG PMT-2005

Ans. (a) : Golgi mediated synthesis and secretion of matrix polysaccharides of the primary cell wall of higher plants. The Golgi apparatus of Eukaryotic cells is known for its central role in the processing sorting and transport of proteins to intra and extra cellular compartments.
• Lysosomes shows Autolysis.
• Mitochondria is known as power house of cell.
Chloroplast also called kitchen of cell it contain chlorophyll pigment which is the key component of photosynthesis.

111. These can be surrounded by a single layer membrane:

(a) Sulfur granules
(b) Glycogen granules
(c) Phosphate granules
(d) Cyanophycean granules

BCECE-2015

Ans. (a) : Sulphur granules are the cell organelle which is bounded with single unit layer membrane. Bacterial cell organelles are also single non-unit layer membraned bound.
• Glycogen granules or glycosome is considered as an independent metabolic unit composed of a highly branched polysaccharide and various proteins involved in its metabolism.
• Phosphate granules (Acidocalcisomes) polyphosphate granules or acidocalcisomes are membrane-bounded organelles that are conserved from bacteria to higher organism and whose main function is the Accumulation of poly p and cation.
• Cyanophycean granules are composed of various compounds, such as polysaccharides or polyphosphates, and they serve as storage sites for energy or phosphorous within the cells.

112. The surface of the Endoplasmic Reticulum (ER) is covered with :

(a) ribosome (b) DNA
(c) RNA (d) glucose

J&K CET-2005

@apna_pdf

Ans. (a) : The surface of the endoplasmic reticulum (ER) is covered with ribosomes.
Ribosomes attached on the surface of endoplasmic reticulum by two glycol protein (1) Ribophorin molecular weight 65000 Dalton.
(2) Ribophorin II molecular weight 64000 Dalton large sub unit 60 'S'of the 80 'S'. Ribosome attached on the surface of endoplasmic reticulum on the basis of presence or absent of ribosome ER are two types.
(1) Rough ER and (2) Smooth ER. The surface of ER covered with ribosome that kind of ER is called rough endoplasmic reticulum. RER is present about 2/3 part of ER out remaining 1/3 part of ER ribosome is not found on the surface so it is called smooth endoplasmic reticulum.

113. Endoplasmic reticulum is studied with :
(a) ribosomes (b) lysosomes
(c) glyoxisomes (d) microsomes

DUMET-2002

Ans. (d) : Endoplasmic reticulum is studied with microsomes. Microsomes consist of heterogeneous collection of similar sized vesicles formed from endoplasmic reticulum and Golgi complex.
Microsomal fraction is isolated by differential centrifugation after the nucleus and mitochondrial fraction. Microsomes are related to ER. It is not found in intact cells.

114. The Golgi apparatus
(a) is found only in animals
(b) is found in prokaryotes
(c) is a site of rapid ATP production
(d) modifies and packages proteins

DUMET-2011

Ans. (d) : The Golgi apparatus modifies and packages protein. Golgi body also called a Golgi apparatus is a cell organelle that helps in process and package proteins and lipid molecules especially protein destined to be exported from the cell.
Dictyosomes serve as temporary storage place for proteins and other compounds synthesized by ER.
Glycosylation with the enzymes glycosyltransferase characteristic of Golgi complex proteins and lipid are glycosidated to form glycoprotein and glycolipids.

115. Cell organelle responsible for autolysis:
(a) distyosome (b) lysosome
(c) peroxisome (d) glyoxysome

DUMET-2003

Ans. (b) : Cell organelle responsible for autolysis in lysosomes.
Autolysis is related to lysosomes and when a cell dies the lysosomes membrane breaks and the enzymes are released resulting in the digestion of cellular materials.
- Two types of microbodies related to lysosomes are peroxisomes and glyoxysomes.
- Golgi complex of plants is usually called dictyosomes the turn dictyosomes was coined by perroncito 1910.

116. The principal function of Golgi apparatus is
(a) producing enzymes
(b) protein synthesis
(c) synthesis of lipids
(d) packaging materials

AMU-2014

Ans. (d) : The principle function of Golgi apparatus is the packaging and secretion of protein.
Function of golgi complex.
(1) Secretion
(2) Storage
(3) Glycosylation
(4) Cell wall formation
(5) Acrosome formation
(6) Plasma membrane formation
(7) Lysosome formation.

117. Golgi apparatus is specialised for
(a) energy transduction
(b) digestion of protein
(c) glycosidation of proteins and lipids
(d) digestion of carbohydrates

J&K CET-2013

Ans. (c) : Golgi apparatus is specialized for-
glycosidation of proteins and lipid
Glycosidation is the process of forming a glycosidic containing a glycosidic bond, protein and lipids are glycosidation to form glycoprotein and glycolipid.

118. Which of the following is not the function of 'golgi body ?
(a) Protein synthesis
(b) Formation of cell wall
(c) Formation of fatty acids
(d) Formation of plasma membrane

Rajasthan PMT-1999

Ans. (a) : Protein synthesis is not the function of Golgi body. Protein synthesis is take place in Ribosome.
The Golgi apparatus is an essential organelle found in eukaryotic cells, and it play a vital role in the processing, packaging, distribution of protein and lipids in the cell.
Function of golgi body - (1) Secretion, (2) Storage, (3) Glycosylation, (4) Cell wall formation, (5) Acrosome formation, (6) Plasma membrane formation, (7) Lysosome formation

119. Endoplasmic reticulum is absent in which ?
(a) Monocytes of Human
(b) WBC of Human
(c) Embryonic cells
(d) RBC of mammals

Rajasthan PMT-1999

Ans. (d) : Endoplasmic reticulum is absent in RBC of mammals. ER was discovered by porter in 1945.
ER consist of a complex membrane system in the cytoplasm of eukaryotic cells.
ER is absent in Prokaryotic and mature erythrocytes of mammals.

120. Golgi body is :
(a) organ for protein synthesis
(b) secretory organ
(c) both 'a' and 'b'
(d) none of these

Rajasthan PMT-1999

@apna_pdf

Ans. (b) : Golgi body is secretory organ.
Secretion–The Golgi material is primarily associated with secretary activities of the cell.Golgi apparatus received proteins from ER and further processed and sorted for transport to their destination. Organelle of protein synthesis is ribosome.

121. Golgi bodies are absent in:
(a) RBC (b) Sieve tubes
(c) Prokaryotes (d) All of these
J&K CET-2001

Ans. (d) : Golgi body are absent in RBCs, Prokaryotes and sievetube.
Golgi complex is found in all Eukaryotic cells except RBCs.

122. Read the statements given below with regard to the functions performed by Golgi apparatus?
(A) Transport and chemically modify the materials contained within it
(B) Secrete mucin in the respiratory tract
(C) Secrete slime in the insectivorous plants which of the following is the correct answer?
(a) A is wrong but B and C correct
(b) B is wrong but A and C correct
(c) B and C wrong but A is correct
(d) All A, B and C are correct
J&K CET-2003

Ans. (d) : Option (d) All A, B and C are correct,
The Golgi apparatus is involved in transport modification, and secretion of various materials within the cell. It also play a role in the secretion of substances like mucin in the respiratory tract and slime in insectivorous plants.

123. Which of the following cellular organelles is/are bound by a single membrane? peroxisomes, lysosomes, mitochondria
(a) Only peroxisomes but not lysosomes and mitochondria
(b) Both peroxisomes and lysosomes but not mitochondria
(c) all of the three organelles
(d) None of the three organelles
J&K CET-2003

Ans. (b) : Lysosome, peroxisomes, Golgi bodies ER are a single membrane cell organelles.
- Mitochondria and chloroplast is a double membrane cell organelles.
- Ribosome and nucleoli is membrane-less cell organelle.

124. Which of the following is not present in cell vacuoles?
(a) Hydrolytic enzymes
(b) Latex of the rubber plant
(c) DNA
(d) Anthocyanins of the flowers
J&K CET-2003

Ans. (c) : DNA is not present in cell vacuoles. Cell vacuole contain water and dissolved substance (anthocyanin). Vacuoles serve as a temporary store house for many of the cells solutes and macromolecules. Including ions, sugar, amino acid, proteins and carbohydrates. Vacuole do not possess its own DNA.

125. Suicidal bags are
(a) lysosomes (b) golgi bodies
(c) ribosomes (d) chloroplast
Rajasthan PMT-2006, 2003

Ans. (a) : Suicidal bage are lysosome.
• De Duve in 1963 also coined the name suicide bags to lysosome as they contain hydrolytic enzymes.
Lysosome are covered by one lipoprotein unit membrane single unit membrane.
Lysosome exhibit polymorphism.

126
(a) Synthesis of protein
(b) Synthesis of lipid
(c) Synthesis of carbohydrate
(d) Oxidative phosphorylation
Rajasthan PMT-1995

Ans. (d) : Function of Golgi body in formation of oxidative phasphorylation.
- Glycosylation with the enzymes glycosyl transferase characteristic of Golgi complex, protein and lipids or glycosidated to form glycoprotein and glycolipids.
- Synthesis of protein in ribosome.
- Synthesis of lipid in smooth ER.

Synthesis of carbohydrate is take place in chloroplast through photosynthesis.

127. Action of lysozyme is
(a) physiological (b) anatomical
(c) morphological (d) none of these
DUMET-2007

Ans. (a) : Action of lysosomes is physiological. In the cell digestive enzyme are contained in lysosomes. Lysosomes are involved in intracellular digestion and are responsible for breakdown of parts of the cell and foreign particle of the cell.

128. Out of the given following disease, which disease results due to disorder in lysosomes?
(a) Arthritic joints
(b) Hurles syndrome
(c) Tay Sachs disease
(d) All of these
BVP-2006

Ans. (d) : Disorder in Lysosomes disease–
(1) Arthritic joints
(2) Hurles syndrome
(3) Tay sachs disease
All disease is lysosomal disorder disese.
Lysosomal storage disease are a group of over 10 rare inherited metabolic disorders that result from defects in lysosomal function.
- Tay-saches disease - also called GM_2 gangliosidosis is a rare inherited disorder that destroys nerve cell in the brain and spinal cord. Tay saches disease is typically found in people with certain ancestry, such as eastern European jews.

@apna_pdf

- Hurler syndrome is caused by a deficiency of a lysosomal enzymes IUDA, which acid in the breakdown of dermatan sulfate and reparin sulfate [GAG]
- Arthritis also called joint Inflammation is an auto-immune disease.

129. Endoplasmic reticulum is in continuation with:
(a) Golgi body (b) Nuclear wall
(c) Mitochondria (d) Cell wall

BHU PMT (Screening)-2005

Ans. (b) : The ER is in continuation with the outer nuclear wall. The reason behind this is whenever a cell makes proteins, it transcribe mRNA from DNA that is present inside the nucleus.
The mRNA that is formed is then carried out of the nucleus into the rough endoplasmic reticulum (ER), Golgi body and lysosome are all membrane of a network of membrane but they are not continuous with one another.
• Mitocondria → Is double membrane structure and used aerobic respiration.

130. Golgi apparatus is absent in
(a) Higher plants
(b) Yeast
(c) Bacteria and blue-green algae
(d) Liver cells

BHU PMT (Mains)-2007
CGPMT - 2004

Ans. (c) : Golgi apparatus is absent in Bacteria and blue green algae because they are belongs to prokaryotes and lack Golgi apparatus.
• Golgi complex is found in all eukaryotic cells except RBCs.

131. The main function of lysosomes is
(a) digestion (b) replication
(c) translation (d) translocation

CG PMT-2004

Ans. (a) : The main function of lysosome is intra-cellular and extra cellular digestion and are responsible for breakdown of parts of the cell and foreign particle of the cell.

132. Endoplasmic reticulum is more developed in
(a) green cells (b) young cells
(c) mature cells (d) bacteriophage

CG PMT-2004

Ans. (b) : Endoplasmic Reticulum is more developed in young cell because in young cell during s phase produces enzymes (protein) and prepare cell form division and thus, requires more developed ER.
ER discovered by Porter in 1945
ER consist of a complex membraneous system in the cytoplasm of eukaryotic cell.
ER absent in prokaryotic and matured erythrocytes of mammals.

133. Which of the following organelle does not contain RNA?
(a) Chromosome (b) Plasmalemma
(c) Nucleolus (d) Ribosome

VMMC-2004

Ans. (b) : Plasmalemma does not contain RNA.
Plasma lemma is a thin membrane which is composed of lipid and protein and it surround the cytoplasm of the cell.
• Nucleolus - RNA and Protein
• Ribosome – rRNA and protein
• Chromosome – Each chromosome is made up of DNA highly coiled many times around proteins called histones that support its structure.

134. Fluid mosaic model was given by :
(a) Knoll and Ruska
(b) Singer and Ruska
(c) Singer and Nicolson
(d) Bateson and Punnet

Punjab MET-2004

Ans. (c) : Fluid mosaic model of plasma membrane given by singer and Nicolson. According these model there is a bilayer of lipid molecule with globular protein molecule.
- Knoll and Ruska – German engineer max knoll and physicist Earnest Ruska discovered electron microscope 1932.
- Bateson and Punnet _ Published the first account of genetic linkage in sweet peas and punnet developed the punnett square to depict the number and variety of genetic combination.

135. The fluidity of membranes in a plant in cold weather may be maintained by :
(a) increasing the number of phospholipids with unsaturated hydrocarbon tails
(b) increasing the proportion of integral proteins
(c) increasing concentration of cholesterol in membrane
(d) increasing the number of phospholipids with saturated hydrocarbon tail

BVP-2013
Punjab MET-2005

Ans. (a) : The fluidity of membrane in a plant in cold weather may be maintained by increasing the number of phospholipids with the presence of cholesterol tail.
Cholesterol can have both positive and negative effects on the fluidity of the cell membrane. At cold temperatures, cholesterol can help to keep the cell membrane more fluid. At higher temperature, cholesterol can help to stabilize the cell membrane and prevent it from becoming too fluid. The fluidity of a membrane increases as the percentage of unsaturated fatty acids in the phospholipid goes up.
Integral protein play critical role in movement of molecules across them.

136. Which type of membrane is most abundant within a cell?
(a) ER membrane (b) Nuclear membrane
(c) Golgi membrane (d) Plasma membrane

WB JEE-2008

Ans. (a) : The most abundant type of membrane within a cell is the endoplasmic reticulum. The ER is a membranous tubules that is found in the cytoplasm of eukaryotic cells. It consist of 30-60% of total cell membrane.

@apna_pdf

137. Two membrane envelops is found in
(a) mitochondria, Golgi apparatus and chloroplast
(b) mitochondria, nucleus and chloroplast
(c) nucleus, Golgi apparatus and endoplasmic reticulum
(d) nucleus, ribosome and chloroplast

WB JEE-2015

Ans. (b) : Two membrane envelope is found in – mitochondria and chloroplast.
- Single membrane cell organelles – ER, Golgi body, Lysosome
- Membrane less cell organelles–Ribosome and centriole.

138. Structure of nuclear membrane helps in:
(a) organization of the spindle
(b) synapsls of homologous chromosome
(c) nucleo-cytoplasmic exchange of material
(d) anaphasic sepration of daughter chromosome

Rajasthan PMT-2005

Ans. (c) The nuclear membrane has a large number of pores with a diameter of 200-800 Å. Nuclear pores contain water soluble molecules and behave as shuttle between nuclear and cytoplasm. Nuclear pore also contain protein called unceloplasmic which is fascilitate nucleo-cytoplasmic exchange of material. The nuclear membrane is present in both the plant and animal cells. Cells carry out multitude of function such as protein building, conversion of unnecessary products.

J. Mitochondria

139. Which of the following is called power house of the cell?
(a) Protein (b) Mitochondria
(c) Lysosome (d) Karyolymph

UP CPMT-2010 / Karnataka CET-2004
MGIMS Wardha-2003 / AFMC-2001
J&K CET - 2000 / Rajasthan PMT - 1995

Ans. (b) : Mitochondria is called power house of the cell or kitchen of cell because they formed ATP, as a major energy source.

140. Extranuclear chromosomes are found in
(a) peroxysomes and mitochondria
(b) chloroplast and mitochondria
(c) mitochondria and ribosomes
(d) chloroplast and ribosome

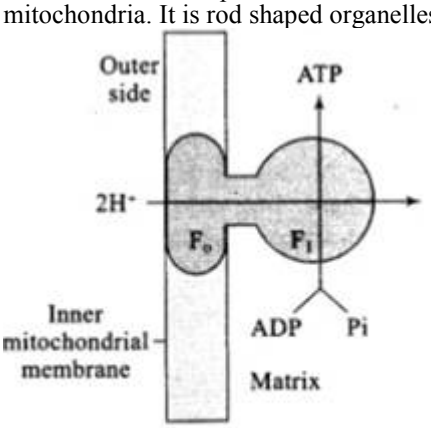
KVPY SA-2014 / Manipal-2013
Haryana PMT-2004
Rajasthan PMT-1996, 1995, 2001
AIPMT-2000,2001

Ans. (b) : Extranuclear chromosomes are found in chloroplast and mitochondria.
Chloroplast is an organelles that contains the photosynthetic pigment chlorophyll that captures sunlight and change it into useful energy, thereby releasing oxygen from water.
Mitochondria is known as powerhouse of the cell". It is an organelles found in the cell of most eukaryotes, such as animals plants and fungi.

141. Oxysomes or F_0–F_1 particles occur on
(a) Thylakoids
(b) Mitochondrial suffer
(c) Inner mitochondirial membrane
(d) Chloroplast surface

CMC Vellore-2010 / AMU-2009
Punjab MET - 2008
AIPMT-1992

Ans. (c) : Oxysomes or F_0–F_1 particles are spherical on knob like structures present in the inner membrane of the mitochondria. It is rod shaped organelles.



Diagrammatic presentation of ATP synthesis in mitochondria

142. In mitochondria, enzyme cytochrome oxidase is present in
(a) outer membrane
(b) perimitochondrial space
(c) inner membrane
(d) matrix

BVP – 2014
VMMC – 2009,2011
BHU PMT(screening) -2009
Uttarakhand PMT-2009

Ans. (c) : The enzyme cytochrome oxidase is present in inner membrane of mitochondria.
It is essential for aerobic energy generation in the form of ATP.

143. Who coined the term mitochondria?
(a) C.Benda (b) Altman
(c) Kollciker (d) None of these

JCECE-2005
Manipal-2000
Rajasthan PMT-1996
Punjab MET-2004

Ans. (a) : C. Benda → Introduced the term mitochondria in 1898.

144. Cristae are associated with which of the following ?
(a) Mitochondria
(b) Cytoplasm
(c) Protoplasm
(d) Endoplasmic reticulum

BCECE-2015
JCECE-2008
UP CPMT-2007

@apna_pdf

Ans. (a) : The cristae are the folds of the inner membrane in mitochondria. The cristae increase the available surface area to enhance the Productivity of cellular respiration. and make mitochondria more efficient. Cristae create a large surface area for chemical reactions of oxidative phosphorylation.

145. Energy currency (reservoir) of the cells is :

(a) AMP (b) ATP
(c) RNA (d) DNA

UP CPMT-2012
BVP-2012
MGIMS Wardha-2006

Ans. (b) : ATP (adenosine triphosphate) is the energy currency of the cell. It is molecule that stores energy in its chemical bonds. When these bonds are broken, the energy is released and can be used by the cell to power its activities.

- AMP (adenosine monophosphate) is a less energy-rich molecule than ATP. It is a breakdown product of ATP, and it can be used to regenerate ATP.
- RNA (ribonucleic acid) and DNA (deoxyribonucleic acid) are nucleic acids that store genetic information.

146. What is mitoplast?

(a) Membraneless mitochondria
(b) Another name of mitochondria
(c) Mitochondria without outer membrane
(d) Mitochondria without inner membrane

WB JEE-2010
CMC Vellore-2007
VMMC-2006

Ans. (c) : Mitoplast is the isolated inner membrane-bound fraction of a mitochondrion, obtained by removing the outer membrane. It helps to study in various mitochondrial processes.

147. Which of the following are NOT considered as the part of endomembrane system ?

A. Mitochondria
B. Endoplasmic Reticulum
C. Chloroplasts
D. Golgi complex
E. Peroxisomes

Choose the most appropriate answer from the options given below :

(a) A, D and E only (b) B and D only
(c) A, C and E only (d) A and D only

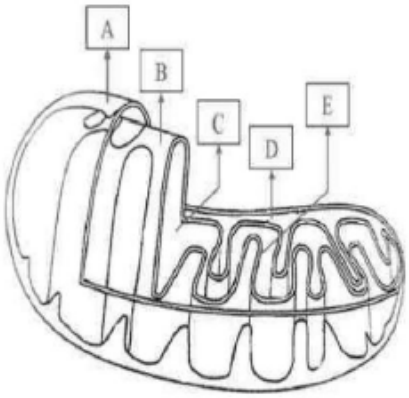
NEET (UG) 07.05.2023

Ans. (c) : The endomembrane system does not include mitochondria, chloroplasts or peroxisomes.

- Functions of mitochondria, chloroplast and peroxisomes are not coordinated with ER, golgi complex, lysosomes and vacuolas.

Hence, these are not considered as a part of the endomembrane system.

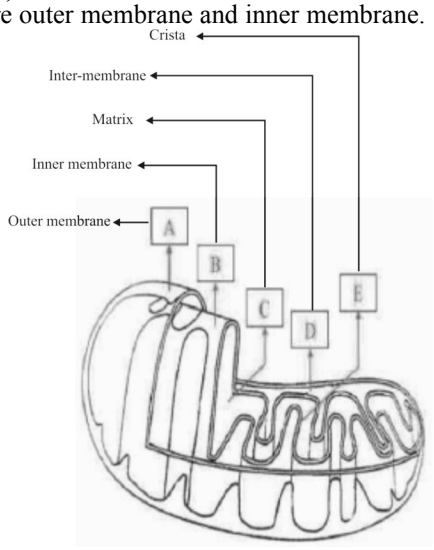
148. Go through the sectional view of a mitochondrion showing the different parts and identify the structures A to E?



(a) A–Outer membrane, B–Inner membrane, C–Matrix, D–Inter membrane space, E–Crista
(b) A–Outer membrane, B–Inner membrane, C–Inter membreans space, D–Matrix, E–Crista
(c) A–Outer membrane, B–Inner membrane, C–Matrix, D–Crista, E–Inter membrane space
(d) Outer membrane, B–Inner membrane, C–Crista, D–Matrix, E–Inter membrane space

AP EAPCET-07.09.2021 Shift-I

Ans. (a) : Mitochondria is double membrane bound structure outer membrane and inner membrane.



- Outer is smooth permeable and protein are porins.

Inner membrane is rough. Inner membrane folded inwards and form finger like projection called the cristae in animal cell. Mitochondria divided in a two chamber.
(1) outer chamber
(2) Inner chamber
Inner chamber is called matrix.

149. Inner mitochondrial membrane is differentiated from outer mitochondrial membrane in presence of _____

(a) Cristae
(b) Porins
(c) Porins and cholesterol
(d) Less protein and more lipid

AP EAMCET-05.10.2021 Shift-I

@apna_pdf

Ans. (a): Inner mitochondrial membrane is differentiated from outer mitochondrial membrane in presence of cristae. These cristae increases surface area for ATP synthesis.
The inner membrane forms numerous folds (cristae), which extend into the interior (matrix) of organelle.

150. Match List-I with List-II.

List-I		List-II	
(A)	**Cristae**	**(i)**	**Primary constriction in chromosome**
(B)	**Thylakoids**	**(ii)**	**Disc-shaped sacs in Golgi apparatus**
(C)	**Centromere**	**(iii)**	**Infoldings in mitochondria**
(D)	**Cisternae**	**(iv)**	**Flattened membranous sacs in stroma of plastids**

Choose the correct answer from the options given below.

	(A)	(B)	(C)	(D)
(a)	(ii)	(iii)	(iv)	(i)
(b)	(iv)	(iii)	(ii)	(i)
(c)	(i)	(iv)	(iii)	(ii)
(d)	(iii)	(iv)	(i)	(ii)

NEET-2021

Ans. (d) : (a) **Cristae** - Infoldings in mitochondria (Inner membrane)
(b) **Thylakoids** - Flattened membranous sacs in stroma of plastids.
(c) **Centromere** - Primary constriction in chromosome.
(d) **Cisternae** - Disc shaped sacs in golgi apparatus.

151. Chondriosome was discovered by ———
(a) Benda (b) Sutton
(c) Tatum (d) Palade

AP EAMCET-24.09.2020 Shift-I

Ans. (a) : Chondriosome were discovered by Benda in 1888, as it is resembled with cartilage hence it is termed as chondriosome.
- Sutton- discovered chromosomes in 1902.
- Tatum- discovered genes in 1941.
- Palade- discovered the endoplasmic reticulum in 1955.

152. Which is wrong about mitochondria?
(a) Site of aerobic respiration
(b) Supported by double unit membrane
(c) Infolding of inner membrane forms cristae
(d) Many circular DNA and few ribosomes are found in matrix.

AIIMS-26.05.2019 Shift-I

Ans. (d) : Mitochondria have circular DNA, but they have also a lot of ribosomes. So the statement (d) that there is few ribosomes in the matrix is wrong. All other statements are correct about mitochondria. They are the site of aerobic respiration, they are supported by a double unit membrane, and the infolding of the inner membrane forms cristae

153. Which one of the following explained by the endosymbiotic theory?
(a) The interaction between bacteria and viruses
(b) The symbiosis between plants and animals
(c) The origin of mitochondria and chloroplast
(d) The evolution of multicellular organisms from unicellular ones

KVPY SB & SX-2019

Ans. (c) : The endosymbiotic theory states that the mitochondria and chloroplast in eukaryotic cells once a separate prokaryotic microbes. This theory explain the origin of eukaryotic cells. This theory is given by Hilman.

154. Which of the following structures is found on the inner surface of the inner mitochondrial membrane?
(a) Microsome (b) Oxysome
(c) Sub-unit of Parson (d) Quantasome

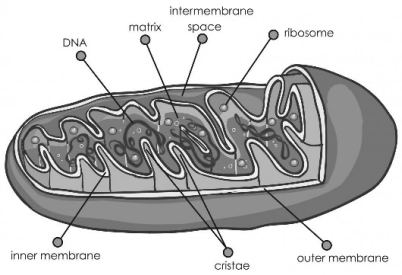
Tripura JEE-2019
AMU-2001

Ans. (b) : Oxysome structures is found on the inner surface of the inner mitochondrial membrane. They are also called - F_1 Particles or ATP syntheses. They play important role in the formation of energy for the functioning of the cell.
- **Microsome :** It is a heterogeneous set of vesicular 20-200 nm in diameter and formed from the endoplasmic reticulum when cells are distrupted.
- **Quantasome :** It is particle found in the thylakoid membrane of chloroplasts in which photosynthesis takes place.
- **Sub-unit of Parson**–Stalk less mitochondrial particles present on outer membrane.

155. Choose the incorrect about mitochondria -
(a) Has 80S ribosome
(b) Naked circular DNA
(c) ETS on inner mitochondrial membrane
(d) Power house of the cell

AIIMS-26.05.2018 Shift-II

Ans. (a) : Mitochondria have single circular naked DNA molecule along with lots of ribosomes. These ribosomes are 70S type, which are further involved in mitochondrial protein synthesis, so the option (a) is incorrect about mitochondria.



156. Protein molecules that form huge pores in the membranes of the plastids, mitochondria and some bacteria are called as
(a) Stomata (b) Porins
(c) Coherin (d) Subarins

TS EAMCET-12.05.2017

@apna_pdf

Ans. (b) : The porins are proteins that form huge pore in the outer membrane of mitochondria, plastids and some bacteria. These act as channels to specific substance.

- Subarins is chiefly deposited in the cell of cark.
- Stomata are tiny pores through which plants breathe. They are found on the upper and lower side of leaves, on flower, petals and stem.
- Coherin is a peptide isolated from the bovine posterior pituitary gland.

157. Fernandez-Moran subunit can be observed in

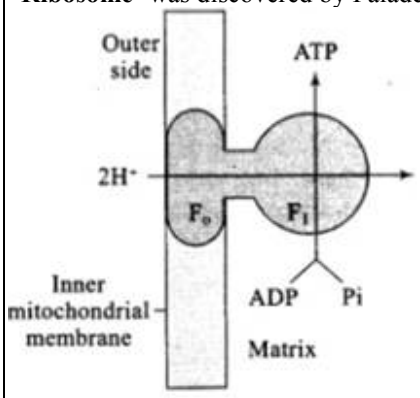
(a) lysosome (b) endoplasmic reticulum
(c) mitochondria (d) ribosome

Tripura JEE-2017

Ans. (c) : Fernandez-Moran subunit can be observed in mitochondria. On the inner face towards the matrix of the cristae there are $F_0 - F_1$ particle also called oxysome, are an elimentory particle or electron transport particle. Discovered by Fernandez-Moran therefore also called as sub-unit of the moron. The number of such mitochondria is 104 - 105

•**Lysosomes**- was discovered by de Duve 1949

•**Ribosome**- was discovered by Palade in 1955



Diagrammatic presentation of ATP synthesis in mitochondria

158. Extranuclear inheritance is a consequence of the presence of genes in:

(a) ER and mitochondria
(b) lysosomes and ribosomes
(c) ribosomes and chloroplast
(d) mitochondria and chloroplasts

WB JEE-2006

Ans. (d) : Extra nuclear inheritance is a consequence of the presence of genes in mitochondria and chloroplast. These organelles have their own DNA, which is separate from the DNA in the nucleus.

The genes in mitochondria and chloroplasts are responsible for a variety of cellular functions, including energy production, photosynthesis and cell signaling. These organelles are regarded as semi-autonomous organelle.

159. Cristae help in :

(a) respiration (b) transpiration
(c) photosynthesis (d) photo-oxidation

Manipal - 2002
AFMC-2000

Ans. (a) : Cristae is a inner membrane of mitochondria which is folds like a projection of finger. The cristae increase the surface area. Mitochondria are the site of aerobic respiration. They produce cellular energy in the form of ATP, hence they are called power house of cell.

160. Which of the following is the phosphorylating unit?

(a) Oxysome (b) Mesosome
(c) peroxisome (d) Mitochondria

AFMC-2000

Ans. (a) : Oxysome also known as F_1 particles, are the phosphorylating unit of mitochondria. They contain enzyme ATP synthase and located in the inner membrane of mitochondria, which are responsible for the synthesis of ATP.

161. At what speed the mitochondria can be separated out by differential centrifugation?

(a) 200 xg (b) 500 xg
(c) 800 xg (d) 8000 xg

AMU-2015

Ans. (d) : Separation of mitochondria by differential centrifugation is done at a speed of 8000 xg. This is because the mitochondria is more dencer than other cell organelle.

162. Which one is main barrier in transportation in mitochondria that maintains composition of matrix?

(a) Inner membrane
(b) Outer membrane
(c) Perimitochondrial fluid
(d) All of these

Rajasthan PMT-1996

Ans. (a) : Inner membrane is main barriers in transportation in mitochondria that maintains composition of matrix. It is a functional barrier to the passage of small molecules between the cytosol and matrix and maintain the proton gradient that drises oxidative phosphorylation. Matrix function are used at numerical methods for ordinary differential equations and statisties.

163. Mitochondria will be found in abundance in cells of tissues having

(a) minimum activity (b) average activity
(c) maximum activity (d) None of these

Manipal-2011

Ans. (c) : Mitochondria will be found in abundance in cells of tissues having maximum activity because they require lot of energy for perform their metabolic activity.

164. Which part of the sperm has the aggregation of Golgi bodies?

(a) Middle piece (b) Tail
(c) Axial filament (d) Acrosome

JIPMER-1999

Ans. (d) : During sperm formation Golgi apparatus forms the acrosome.

Acrosome contain a number of hydrolytic enzyme which helps in penetration of egg's coat through sperm.

@apna_pdf

165. Which of the following cell organelle is excluded from endomembrane system?
(a) Endoplasmic reticulum
(b) Mitochondria
(c) Golgi complex
(d) Lysosomes
(e) Vacuoles

Kerala PMT-2015

Ans. (b) : Endoplasmic reticulum (ER), Golgi complex, lysosomes and vacuoles are considered together as an endo-membrane system because their functions are co-ordinated but mitochondria is not considered as part of the endo-membrane system.

166. Which one of the following organelles can synthesize some of its own proteins
(a) lysosome (b) vacuole
(c) Golgi apparatus (d) mitochondrion

KVPY SA-2012

Ans. (d) : Mitochondria have their own independent genetic material and protein synthesis machinery, which allows them to produce some of their proteins within the organelle itself.

167. In which compartment of a cell does the process of glycolysis takes place?
(a) Golgi complex (b) mitochondria
(c) cytoplasm (d) ribosomes

KVPY SA-2012

Ans. (c) : Glycolysis takes place in the cytoplasm.Glycolysis is the series of reactions that convert glucose into pyruvate. It is oxygen- independent reaction.

168. The size of mitochondria in plant cell is
(a) 0.1-10 µm long (b) 1.0-4.0 µm long
(c) 2.0-4.0 µm long (d) 3.0-4.0 µm long

AMU-2010

Ans. (b) : Mitochondria are typically round to oval in shape and size from 1.0-4.0 µm long.

169. The catalase-containging vesicles present in liver and leaf cells are called
(a) glyoxisomes (b) lysosomes
(c) peroxisomes (d) polyribosomes

AMU-1999

Ans. (c) : The catalase-containging vesicles present in liver and leaf cells are called peroxisomes. The presence of catalase in peroxisomes allow these organelles to effectively deal with reactive oxygen species and protect the cell from oxidative damage.

170. The percentage of proteins in the mitochondrial membrane is
(a) 20 (b) 50
(c) 80 (d) 100

AMU-1999

Ans. (b) : Mitochondria have the following chemical composition:-

Protein	50-70%
Phospholipid	25-35%
RNA	0.50%
DNA	Traces

171. The inner membrane of mitochondria bears folding / finger like projections called cristae, these cristae:
(a) increases thickness of wall
(b) increases surface area
(c) increases ATP supply
(d) keep external substance away

VMMC-2006

Ans. (b) : The inner membrane of mitochondria bears folding finger like projections called cristae. These cristae increases surface area to enhance the productivity of cellular respiration .

172. Which of the following cell organelle is related to respiration?
(a) Nucleus (b) Vacuole
(c) Chloroplast (d) Mitochondria

UP CPMT-2001

Ans. (d) : The primary function of mitochondria is to perform cellular respiration.

173. The organelle which bear anthocyanins is:
(a) cholroplast (b) chromoplast
(c) vacuole (d) itioplast

Manipal-2000

Ans. (c) : Vacuole contains colors pigment 'anthocyanin which is water soluble in nature responsible for colour of fruits and flowers.

174. Which of the following observations most strongly support the view that mitochondria contain electron transport enzymes aggregated in compact association?
(a) Mitochondria have highly folded inner wall
(b) Disruption of mitochondria yields membrane fragments, which are able to synthesis ATP
(c) A contractile protein capable of utilise ATP, which has been otained from mitochondria
(d) Mitochondria is animal embryos have tendency to concentrate in cells, which are to become locomotory strucrures

Manipal-2015

Ans. (b) : The observation which most strongly support the view that mitochondria contain electron transport enzymes aggregated into compact association is that the disruption of mitochondria yields membrane fragment which are able to synthesis ATP.

175. Oxysomes are located inside :
(a) Golgi body (b) lysosomes
(c) plastids (d) mitochondria

JIPMER-2001

Ans. (d) : Oxysomes are. the structure which are present on the surface of inner membrane of mitochondria. Also called f_0 F_1 particles. They are responsible for ATP synthesis.

176. Maternal inheritance is due to the genes present in :
(a) lysosome (b) nucleoplasm
(c) nucleus (d) mitochondria

JIPMER-2001

@apna_pdf

Ans. (d) : Maternal inheritance is due to the genes present in mitochondria. It is generally observed in many eukaryotes.

Nucleoplasm It is a clear fluid medium in which all the contents of the nucleus are embedded.

Lysosome It is membrane-enclosed organelles that contain an array of enzymes capable of breaking down all types of biological polymers-proteins, nucleic acids, carbohydrates, and lipids.

Nucleus It is membrane-enclosed organelle within a cell that contains the chromosomes.

177. ATP synthesis occurs on the

(a) outer membrane of mitochondria
(b) inner membrane of mitochondria
(c) matrix
(d) None of the above

Manipal-2013

Ans. (b) : ATP synthesis takes place in the ATP synthase complex of the electron transport chain, by the process of oxidative phosphorylation which is found in the inner mitochondrial membrane. It is fuelled by the proton gradient created by oxidation of high energy molecules such as NADH and $FADH_2$. The enzyme which is required for ATP synthesis is ATP synthatase which convert the ADP and Pi to ATP.

178. Which is substitution of mitochondria in E. coli?

(a) Golgi body (b) Mesosome
(c) Ribosome (d) Glyoxysomes

JIPMER-2013

Ans. (b) : Mesosome is substitution of mitochondria in E. Coli. Mesosomes are folded invaginations in the plasma membrane of bacteria that are produced by the chemical fixation techniques used to prepare samples for electron microscopy.

E. Coli is a type of bacteria that normally lives in our intestines.

179. Amount of DNA present in the mitochondria of Neurospora is

(a) 10% (b) 40%
(c) 1% (d) nil

BHU PMT (Screening)-2011

Ans. (c) : Amount of DNA present in the mitochondria of Neurospora is 1%

Neurospora is a genus of widespread species, produces bakery mold or red bread mold. It has been used extensively in genetic and biochemical investigations.

Neurospora is used as model organism because it is a easy to grow and has a haploid life cycle that makes genetic analysis simple.

180. The function of glyoxysome is :

(a) protein metabolism
(b) carbohydrate metabolism
(c) fat metabolism
(d) protein synthesis

DUMET-2001

Ans. (c) : The function of glyoxysomes is to convert fats into carbohydrates in certain plant tissues. The primary function of glyoxysomes is to perform glyoxylate cycle which enables plant to use stored fats as a source of carbon and energy when other carbohydrates are limited or unavailable.

Glyoxysomes are found in abundance in germinating seeds.

181. The cell organelle involved in the glycosylation of proteins is

(a) ribosome
(b) peroxisome
(c) mitochondria
(d) endoplasmic reticulum

Haryana PMT-2010

Ans. (d) : The cell organelle involved in the glycosylation of proteins is endoplasmic reticulum. It forms a series of flattened sacs inside the cytoplasm of eukaryotic cells.

- **Glycosylation :** The bonding of sugar residues to another organic compound is glycosylation.
- **Peroxisomes :** Peroxisomes are small vesicle , single membrane-bound organelles found in the eukaryotic cells. They do not have their own DNA.
- **Ribosome** – Protein factory.
- **Mitochondria** – Power-house of the cell.

182. Enzymes found attached to inner membrane of mitochondria instead of matrix is/are :

(a) succinic dehydrogenase
(b) cytochrome oxidase
(c) both (a) and (b)
(d) malicdenhydrogenose

AFMC-2006

Ans. (c) : Enzymes found attached to inner membrane of mitochondria instead of matrix is /are succinic dehydrogenase and cytochrome oxides.

Cytochrome take part in redox reaction and electron transport.

The succinate dehydrogenase act as catalyst.

183. Which cell organelle show polymorphism?

(a) Lysosomes
(b) Ribosomes
(c) Peroxisomes
(d) Endoplasmic reticulum

BVP-2013

Ans. (a) : Lysosomes show polymorphism. This means that they exist in multiple forms within the cell. There are four main type of lysosomes:

(i) Primary lysosomes
(ii) Secondary lysosomes
(iii) Residual bodies
(iv) Autophagic vacuoles.

- **Endoplasmic reticulum :** It is network of sac-like structures and tubes in the cytoplasm (gel - like fluid) of a cell. Proteins and other molecules move though the endoplasmic reticulum.
- **Peroxisomes :** They are small vesicles, single membrane -bound organelles found in the eukaryotic cells. They contain digestive enzymes for breaking down toxic materials in the cell.
- **Ribosomes** are protein factory where protein is synthesize. It is small granular structure found in both prokaryotes and eukaryotes.

@apna_pdf

184. Pyruvate dehydrogenase complex needed for the conversion of pyruvic acid to Acetyl Co-A is located in

(a) Intermembranal space of mitochondria
(b) Matrix of mitochondria
(c) Cytoplasm
(d) Grana of chloroplast

Karnataka CET-2010

Ans. (b) : In eukaryote, the pyruvate dehydrogenase complex Catalyzes the reaction of the formation of acetyl Coenzyme from the pyruvates . It is found in the matrix of mitochondria.
It catalyzes the irreversible oxidative decarboxylation of pyruvate into acetyl-coA and CO_2.

185. The powerhouse of cell is first discovered by

(a) C Benda in 1897 (b) Kolliker in 1850
(c) Claude in 1880 (d) Kingsburg in 1882

JIPMER-2016

Ans. (b) : The power house of cell is first discovered by kolliker in 1850. Later the term mitochondria is given by C. Benda in 1897.

186. Read the two statements A and B

Statement A : The number of mitochondria in a cell do not correspond to the function of the cell.

Statement B : Mitochondria are common to both plant and animal cells.

Choose the correct option from those given.

(a) Statement A is Correct, B is wrong
(b) Statement B is Correct, A is wrong
(c) Both the Statements A and B are correct
(d) Both the Statements A and B are wrong

Karnataka CET-2006

Ans. (b) : Mitochondria are common to both plant and animal cells. Mitochondria have double membrane bound structure with own circular DNA. The number of mitochondria is corresponding to the function of cell due to the amount of energy required by the cells. Different cells functions requires different amount of energy, for example: Brain cells require more energy in comparison to skin cell. Mitochondria also called 'powerhouse of the cell due to storage of energy in form of ATP.

187. Mitochondria and chloroplast are

A. Semi-autonomous organelles
B. formed by division of pre-existing organelles and they contain DNA but lack protein synthesizing machinery

Which one of the following options is correct?

(a) Both (A) and (B) are false
(b) Both (A) and (B) are correct
(c) (B) is true but (A) is false
(d) (A) is true but (B) is false

NEET-2016 Phase-I

Ans. (d) : Mitochondria and chloroplast are called semi-autonomous cell organelles. They both contain their own double-stranded circular DNA and ribosomes called mitoribosomes.
They formed by division of pre-existing organelles and they contain DNA as well as their own protein some of their protein themselves.

188. Which one of the following has its own DNA?

(a) Mitochondria (b) Dictyosome
(c) Lysosome (d) Peroxisome

AIPMT (Screening)-2010

Ans. (a) : Mitochondria and chloroplast are double membrane, semiautonomous organelle, having their own circular DNA and ribosome. Mitochondria are also known as semi-autonomous cell organelles because they can self-duplicate and makes protein by the presence of DNA.

189. Genes for cytoplasmic male sterility in plants are generally located in

(a) Mitochondrial genome (b) Cytosol
(c) Chloroplast genome (d) Nuclear genome

JIPMER-2007

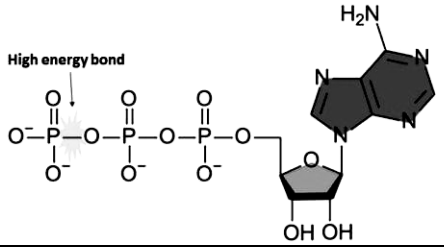
Ans. (a) : The genes for cytoplasmic male sterility in plants are generally located in the mitochondrial genome. This phenomenon is known as cytoplasmic male sterility (CMS) and is commonly utilized in plant breeding and hybrid seed production. CMS is a genetic condition in plants where the stamen of plant fail to produce functional pollen due to certain gene located in the mitochondrial genome of the plant.

190. ATP is:

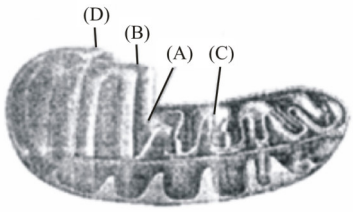
(a) Nucleotide (b) Nucleoside
(c) Nucleic acid (d) Vitamin

AIPMT-2000

Ans. (a) : ATP or Adenosine triphosphate is a **nucleotide** as it is composed of **adenine, ribose sugar and phosphoric acid**. There are three additional phosphate groups attached to the phosphate group of Adenosine monophosphate (AMP). The last two phosphate molecules are connected by high energy bonds.



191. The figure below shows the structure of a mitochondria with its four parts labelled (A), (B), (C) and (D) Select the part correctly matched with its function



(a) Part (A) : Matrix – major site for respiratory chain enzymes
(b) Part (D) : Outer membrane – gives rise to inner membrane by splitting
(c) Part (B) : Inner membrane – forms infoldings called cristae

@apna_pdf

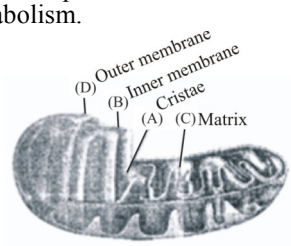
(d) Part (C) : Cristae – possess single circular DNA molecule and ribosome

CMC Vellore-2015
AIPMT (Mains)-2011

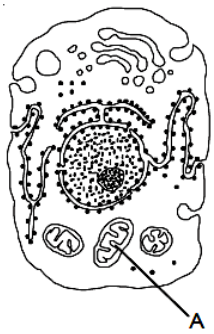
Ans. (c) : Mitochondria are double membrane - bound structure with the outer membrane and the inner membrane dividing its lumen distinctly into two aqueous compartments, i.e, the outer compartment and the inner compartment.

- The inner membrane forms a number of infolding called the **cristae** towards the matrix. The cristae increase the surface area.

The matrix contains the mitochondrial genetic system as well the enzyme responsible for the central reactions of oxidative metabolism.



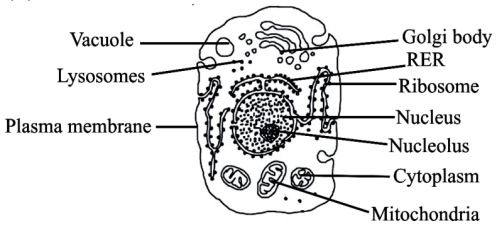
192. Select the alternative giving correct identification and function of the organelle 'A' in the diagram



(a) Endoplasmic reticulum-synthesis of lipids
(b) Mitochondria-produce cellular energy in the form of ATP
(c) Golgi body-provides packaging material
(d) Lysosomes - secrete hydrolytic enzymes

NEET (Karnataka)-2013

Ans. (b) :



- Mitochondria are the sites of aerobic respiration. They produce cellular energy in the form of ATP.

193. Mitochondria and chloroplast are regarded, endosymbionts because:

(a) they do not have de-novo origin
(b) they both possess nucleic acids
(c) their membranes are like those: prokaryotes
(d) all of the above

J&K CET-2002

Ans. (d) : Mitochondria and chloroplasts are considered endosymbionts of cells because they fulfill all three criteria mentioned:

(a) They do not have a de-novo origin, meaning they are not formed from scratch within the host cell. Instead, they are believed to have originated from free-living prokaryotic organisms that were engulfed by ancestral eukaryotic cells.

(b) Mitochondria and chloroplast have their own DNA.

(c) Their membranes are similar to those of prokaryotes. Both organelles have a double-membrane structure, which resemble the membrane found in many prokaryotic cells.

194. Assertion:Mitochondria help in photosynthesis.
Reason: Mitochondria have enzymes for dark reaction.
(A) If both (A) and (R) are true and the (R) is correct explanation of the (A).
(B) If both (A) and (R) are true but the (R) is not correct explanation of the (A).
(C) If the (A) is true but the (R) is false.
(D) If both the (A) and (R) are false.
(E) If (A) is false, but (R) is true.

(a) A (b) B
(c) C (d) D
(e) E

AIIMS-1999

Ans. (d) : Mitochondria play a critical role in the generation of metabolic energy in eukaryotic cell. As they are responsible for most of the useful energy derived from the breakdown of Carbohydrate and fatty acids which is converted to ATP by the process of oxidative phosphorylation.

The mitochondrial matrix contains a large variety of enzymes including those that convert pyruvate and fatty acid to Acetyl. CoA to CO_2 through the citric acid cycle. Large amounts of NADPH [And $FADH_2$] are produced by these oxidation reaction.

195. Animal cells after removal of nuclei still contained DNA The source of this DNA is

(a) nucleosomes (b) mitochondria
(c) peroxisomes (d) lysosome

KVPY (SA)-2013

Ans. (b) : Animal cells after removal of nuclei still contained DNA The source of this DNA is mitochondria this genetic material is k/a mitochondrial DNA or mt DNA. Thus, after the removal of nuclei the cell still have mt DNA.

- **Peroxisomes** – contains many enzymes for peroxide biosynthesis two importance enzyme in peroxisomes are urate oxidize and catalase.
- **Lysosomes** – The simplest definition of a lysosomes is body rich in acid hydrolase.
- **Nucleosome** – is the basic structural unit of DNA Packaging in eukaryotes.

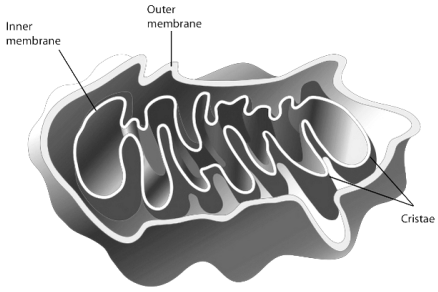
196. Foldings of inner membrane of mito-chondria are called

(a) sacs (b) endoplasm
(c) cristae (d) grana

AIIMS-1998 / AIPMT-1994

@apna_pdf

Ans. (c) : Foldings of inner membrane of mito-chondria are called cristae.



Cristae cause an increase in the total surface area, cristae bears subunits called oxysomes. It enhance the productivity of cellular respiration.

Elementary particles, F_1 particles electron transport particles inner membrane subunit or Fernandez Moran particles.

- **Grana** – Photophosphorylation is the process in which light energy is converted into chemical energy through the production of ATP it is the process of formation of ATP from ADP and inorganic phosphate (P_1) utilizing light energy. It occur in grana of chloroplast during photosynthesis.
- **Endoplasm-** The endoplasm refers to the inner dense part of the cytoplasm and is often granulated.

197. Chemiosmosis hypothesis given by Peter Mitchel proposes the mechanism of .....

(a) synthesis of NADH
(b) Synthesis of ATP
(c) Synthesis of $FADH_2$
(d) Synthesis of NADPH

Karnataka CET-2011

Ans. (b) : The chemiosmotic hypothesis explains how ATP is formed in the process of oxidative phosphorylation during cellular respiration. It involves the movement of proton (H+) across a membrane, creating an electrochemical gradient, and the flow of these protons back through the membrane via ATP synthase, which leads to the synthesis of ATP.

198. Which of the following statements regarding mitochondrial membrane is not correct ?

(a) The outer membrane is permeable to all kinds of molecules
(b) The enzymes of the electron transfer chain are embedded in the outer membrane
(c) The inner membrane is highly convoluted forming a series of infoldings
(d) The outer membrane resembles a sieve

AIPMT-2006

Ans. (b) : The enzymes of the electron transfer chain are not embedded in the outer mitochondrial membrane. Instead, they are embedded in the inner mitochondrial membrane. In inner membrane various cellular respiration and ATP production takes place, while the outer membrane serve as boundary, and allows the passage of various molecules into the inter-membrane space.

199. In which part of mitochondria does ATP synthesis occur?

(a) F_1
(b) F_0
(c) Cristae
(d) Inner membrane of mitochondria

JIPMER-2005

Ans. (d) : The inner membrane of the mitochondria contains the component of the electron transport chain oxidation / reduction reactions along the components of the electron transport chain generate a proton gradient that is used by ATP syntheses to phosphorylase ADP, there by producing ATP.

200. Genes present in the cytoplasm of eukaryotic cells are found in

(a) Mitochondria and inherited via egg cytoplasm
(b) Lysosomes and peroxisomes
(c) Golgi bodies and smooth endoplasmic reticulum
(d) Plastids and inherited via male gamete

AIIMS-2006

Ans. (a) : The cytoplasm of eukaryotic cells contains organelles such as Mitochondria, Chloroplasts, Golgi bodies, Lysosomes, Peroxisomes etc.

- Mitochondria and chloroplasts contain DNA and genes, genes are found on the chromosomes, chromosomes are made up of DNA and associated proteins.
- During fertilization, the sperm contributes genetic material to the nucleus of the egg, while the cytoplasm, including mitochondria with their genes, is mainly derived from the egg. As a result, mitochondrial DNA is inherited from the mother, and any mutations or variations in these genes are passed down to the offspring through the maternal line. This known as maternal inheritance of mitochondrial DNA.
- Hence, organelles that are present in egg's cytoplasm, also inhibit to the offspring's.

201. Which of the following organelie is common in plants and animals?

(a) Mitochondria (b) Chloroplast
(c) Tonoplast (d) Centrioles

DUMET-2003
J&K CET-2000

Ans. (a) :

Organelle	Plant cell	Animal cell
Mitochondria	Present	Present
Tonoplast	Present	Absent
Chloroplast	Present	Absent
Centrioles	Absent	Present
Cell wall	Present	Absent

202. Both oxysomes and quantasomes are found in:

(a) chloroplasts (b) mitochondria
(c) both (a) and (b) (d) none of the above

J&K CET-2000

@apna_pdf

Ans. (c) : Oxysomes are the structures which are present on the surface of inner membrane of mitochondria.
Quantasomes are the photosynthetic units present in the thylakoides of chloroplast. so,
Both oxysomes and quantasomes are found in mitochondria and chloroplast.

203. Which of the following cell organelles is rich in catabolic enzymes?
(a) Chloroplast (b) Mitochondria
(c) Golgi complex (d) Ribosomes

MP PMT-2013
Punjab MET-2007

Ans. (b) : Mitochondria contain membrane catabolic enzymes that are involved in breaking down complex molecules, such as carbohydrates and fatty acids, through a process called cellular respiration. In contrast, chloroplast are involved in photosynthesis, Golgi complex in involved in protein modification & transport and ribosomes are cellular structure involved in protein synthesis. None of the organelle play a significant role in catabolic processes.

204. The mechanism of ATP formation both in chloroplast and mitochondria is explained by
(a) relay pump theory of Godlewski
(b) Choldny-Wents model
(c) chemiosmotic theory
(d) Munchs mass-flow hypothesis

JCECE-2012

Ans. (c) : The mechanism of ATP formation both in chloroplast and mitochondria is explained by chemiosmotic theory by Peter D. This theory proposes that ATP synthesis occurs through the establishment of a proton gradient across the inner membrane of mitochondria and the thylakoid membrane. The flow of proton (H^+) back into the matrix of stroma through ATP synthase leads to the production of ATP.

205. The organelle associated with aerobic respiration is:
(a) chloroplast (b) centriole
(c) nucleus (d) mitochondria

J&K CET-2005

Ans. (d) : Mitochondria is called power house of the cell. The energy is released in it through cellular respiration within the cell is the site of respiration.
- The organelles in which aerobic respiration (cellular respiration) occurs in the cell are mitochondria
- Mitochondria are present in the aerobic organism only.

206. The prokaryotic cell does not contain :
(a) chromosome (b) mitochondria
(c) plasma membrane (d) ribosome

J&K CET-2005

Ans. (b) : Mitochondria are organelles founds in the cytoplasm of plants and animals. The prokaryotic cells lack membrane bounded cell organelles like mitochondria, chloroplast, ER etc.
mesosomes of prokaryotes (bacteria) is analogues to mitochondria in eukaryotes.
chromosome, plasma membrane, Ribosome are present in both prokaryote.

207. Which of the following is a component of electron transport chain in mitochondria?
(a) Phytochrome (b) Cytochrome oxidase
(c) Plastocyanin (d) Carotenoids

DUMET-2002

Ans. (b) : ETC is a stepwise process of electron transfer that carries out final oxidation to produce energy as ATP on the related enzymes.
Enzymes in ETC is cytochrome oxidase which forms a complex and caries electrons down the energy level. The released energy is cytochrome oxidase. Cytochrome oxidase or complex IV is the last enzyme in the respiratory electron transport chain. It receives an electron from each of 4 cytochrome molecule and transfers them to one oxygen and 4 protons producing 2 molecule of H_2O.

208. The cisternae that make up the Golgi complex are:
(a) rough (b) polarized
(c) non-polarized (d) reticulate

MP PMT-2013

Ans. (b) : Cisternae are flat disc shaped, sac like structure. Cristae are polarized with 2 face-
(i) The convex surface of the cisternae is called cis or forming face.
(ii) Concave surface of the cisternae is called trans or maturing face.
Cis is present near rough ER and trans is present near plasma-membrane. Some cisternae may form reticulate structure instead of flattened disc.

209. In active lead cells, the double membrane is absent in:
(a) Mitochondira (b) Chloroplast
(c) Nucleus (d) Lysosomes

MP PMT-2013

Ans. (d) : Lysosomes is a single membrane cell organelle.
- Double membrane cell organelle- Mitochondria, nucleus and chloroplast.

210. Mitochondrial porins are located in
(a) the outer membrane
(b) the inner membrane
(c) inner-membrane space
(d) both outer and inner membranes

AMU-2014

Ans. (a) : Mitochondrial porins are found in the outer membrane of mitochondria. They play a crucial role in regulating the transport of molecules between the cytosol and the inter-membrane space of the mitochondria.

211. Where does the synthesis of ATP mitochondria takes place?
(a) In matrix (b) In intercristal space
(c) Upon cristae (d) At outer membrane

J&K CET-2013

Ans. (c) : Synthesis of ATP does takes place in cristae of mitochondria.
- The function of ATP synthesis is to synthesize ATP from ADP and inorganic phosphate [P_1] in the F_1 sector.
- Matrix is the site of TCA cycle a series of enzymes reaction initiated by the conversion of pyruvate and

@apna_pdf

fatty acid to acetyl coenzymes A [acetyl CoA] pyruvate and fatty acid are transported into mitochondria from the cytoplasm by membrane – bound permeases.

- Outermembrane is smooth and more permeable and protein are porins.

212. Major function of mitochondria in a cell is

(a) secretion (b) excretion
(c) osmoregulation (d) fat synthesis

Punjab MET-2011

Ans. (d) : Mitochondria store ATP and take part in elongation of fatty acids and synthesis of phospholipids. Major function of mitochondria in the cell is oxidation of fat, synthesis of protein, cytoplasmic inheritance, synthesis of homeoport of hemoglobin.
Aerobic respiration occurs in mitochondria.

213. The significance of mitochondria was given by:

(a) Flemming (b) Meves
(c) Mendel (d) Altman

MGIMS Wardha-2012
Rajasthan PMT-1999

Ans. (d) : Altman 1890 observed these structure and named the bioblasts (life germs).
The significance of mitochondria was given by Altman.

- Flemming 1882 described these organelles as filia.
- Mendel known for their contribution in genetics.
- Meves known for his studies on spermatozoa.

214. Mitochondria contains :

(a) only DNA (b) DNA and RNA
(c) only RNA (d) none of these

MGIMS Wardha - 2012
Rajasthan PMT-1999

Ans. (b) : Mitochondria contains is circular double stranded DNA and RNA.
Due to the presence of DNA polymerase, RNA polymerase, 70s Ribosome's, mitochondria synthesis occurs. Mitochondria also possess small amount of mRNA, tRNA and mRNA. Some protein, remaining proteins synthesized under the control of nuclear DNA therefore, called as semiautonomous organelles.

215. Which of the following is common in chloroplast and mitochondria?

(a) Both are not a component of endomembrane system
(b) Both contain small amount of DNA
(c) Both are found in animal cells
(d) Both involved in respiration
(e) (a) and (b) both

UP CPMT-2012

Ans. (e) : Both chloroplast and mitochondria contain a small amount of DNA, RNA and ribosomes (70S type) thus involved in protein synthesis and both are not a component of endomembrane system.

- Chloroplast is exclusively present in plant cells responsible for photosynthesis.
- Only mitochondria involved in respiration.

216. Which of the following statement is not true with reference to mitochondria?

(a) They contain DNA
(b) They divide in synchrony with cell cycle
(c) They store and release chemical energy
(d) They contain cristae

Karnataka CET-2005

Ans. (b) : Mitochondria is a double membrane bound structure. It contain DNA, so called 'semi–autonomous cell organelle. Mitochondria store and release chemical energy, called 'power house of the cell'. It also contain cristae, which is folds in the inner mitochondrial membrane. These folds increases the surface area of inner membrane, where energy (ATP) production occurs.

217. Mitochondria are absent in :

(a) red algae (b) green algae
(c) brown algae (d) bacteria

J&K CET-2001

Ans. (d) : Mitochondria are not found in prokaryotes and mature RBC in human. Hence, mitochondria absent in bacteria. Algae are mostly eukaryotes organism with only a few exception. Blue green algae are prokaryotes, do not possess mitochondria.

218. Which of the following statements is correct?

(a) Mitochondria contain circular DNA, but chloroplasts lack it
(b) Chloroplasts contain circular DNA, but mitochondria lack it
(c) Neither mitochondria nor chloroplasts contain any DNA
(d) Both mitochondria and chloroplasts contain circular DNA

J&K CET-2003

Ans. (d) : Chloroplast and mitochondria are very similar organelles. In both organelles a double layered membrane encloses a circular DNA and protein synthesis machinery present.
Mitochondria and chloroplast are semi autonomous organelles. They are capable of self duplication.

219. Which of the following process takes place in mitochondria?

(a) photolysis
(b) photophosphorylation
(c) carboxylation
(d) oxidative phosphorylation

Rajasthan PMT-2003
AMU-1995

Ans. (d) : F_1 particle have an enzymes ATP synthatase which help in the synthesis of ATP are oxidative phosphorylation occurs.
Electron transport system (ETS) occurs in the F_1 particle.
Hence, oxidative phosphorylation process present in mitochondria.

220. DNA is also present in following :

(a) Golgi body (b) Lysosome
(c) Mitochondria (d) Ribosome

Rajasthan PMT-1995

Ans. (c) : Mitochondrial DNA are circular double stranded and naked. They have own protein synthesizing machinery.

@apna_pdf

221. The cell organelles involved in energy transformation are :
(a) chloroplast and mitochondria
(b) chloroplast and leucoplast
(c) golgi body and mitochondria
(d) mitochondria and leucoplast

Rajasthan PMT-2001

Ans. (a) : The cell organelles involved in energy transformation are chloroplast and mitochondria.
- Mitochondria the process of that conversion produces energy in the form of ATP. because the phosphate is a high energy bond and provides energy for other reaction within the cell so the mitochondria purpose is to produce that energy
- The chloroplast converts energy from sun light into chemical energy because in photosynthesis process plant chloroplast capture energy from the sun and use in to turn carbon into sugar.

Plastid without pigments found in the underground part like tuber, deep seated tissue, sex cells, Embryonic cell.

222. Which of the following statements regarding mitochondrial membrane is not correct?
(a) The outer membrane is permeable to all kinds of molecules
(b) The enzymes of the electron transfer chain are embedded in the outer membrane
(c) The inner membrane is highly convoluted forming a series of infoldings
(d) The outer membrane resembles a sieve

BCECE-2013

Ans. (b) : The enzymes of the electron transfer chain are not embedded in the outer mitochondrial membrane. Instead, they are embedded in the inner mitochondrial membrane. In inner membrane various cellular respiration and ATP production takes place, while the outer membrane serve as boundary, and allows the passage of various molecules into the inter-membrane space.

223. Mitochondria are related to
(a) prokaryotes (b) plasmids
(c) plastids (d) viruses

CG PMT-2004

Ans. (a) : mitochondria are thought to have originated from a symbiotic relationship between a prokaryotic cell and a eukaryotic cell. The prokaryotic cell was eventually engulfed by the eukaryotic cell, but it was able to survive and thrive within the eukaryotic cell. The prokaryotic cell eventually evowed into mitochondria, which are now essential organelles in eukaryotic cells.
- Plastids are also related to prokaryotes, but they are not as closely related to mitochondria as prokaryotes are.

224. Synthesis of ATP in mitochondria requires
(a) NADP (b) FMN
(c) Oxygen (d) Pyruvic acid

CMC Vellore-2011

Ans. (c) : ATP is synthesized in mitochondria by a process called oxidative phosphorylation. These process requires oxygen, which is used to generate a proton gradient across the mitochondrial membrane. This proton gradient is then used to drive the synthesis of ATP.
- NADP, FMN and pyruvic acid are involved in the process of glycolysis, which is first step in cellular respiration.

225. Quantasomes are present in
(a) Chloroplast (b) mitochondria
(c) Golgi body (d) lysosome

UPCPMT-2002
BVP-2009

Ans. (a) : Quantasomes are present in thylakoids of chloroplast. Quantasomes are photosynthetic units present on the surface of grana. Quantasomes were discovered by Park and Biggis in 1954, the term quantasome was introduced by Park and Pon in 1954.

226. The organelle which bear anthocyanins is :
(a) chloroplast (b) chromoplast
(c) vacuole (d) etioplast

Punjab MET-2004

Ans. (c) : The plant vacuoles consist of various water-soluble pigments such as carotenoids, anthocyaonin and xanthophylls etc. Anthocyanin are water-soluble pigments that are found in the vacuoles of plant cells. They give fruits and vegetables their red, purple, and blue colors.
- Chloroplasts contain chlorophyll, which is a green pigment that is used for photosynthesis.
- Chromoplasts contain other pigment such as carotenoids, which give fruits and vegetables their yellow, orange and red colors.
- Etioplasts are colorless plastids that are found in etiolated plants, which are plants that have been grown in dark.

227. Which of the following is not a function of vacuole in plant cell ?
(a) Storage
(b) Waste disposal
(c) Cell elongation and protection
(d) Production of hydrogen peroxide

Punjab MET-2005

Ans. (d) : Cell vacuoles contain water and dissolved substances. vacuoles serve as a temporary store house for many of the cells solutes and macromolecules, including ions, sugars, amino acids, proteins carbohydrates.
H_2O_2 – as a value added chemical, can be produced by a two-electron reaction in the process of water cracking in photochemical cells.

228. Small particles projecting from the inner membranes and cristae of mitochondria are known as
(a) Myeloid bodies (b) Microsomes
(c) Infonnosomes (d) Oxysomes

WB JEE-2008

Ans. (d) : Small particles projecting from the inner membranes and cristae of mitochondria are knows as oxysomes.
They are also called $F_0 - F_1$ particles or ATP synthase. They play the most important role in the formation of energy for the functioning of the cell.
F_0-F_1 which has a rotational motor mechanism allowing for ATP production.

@apna_pdf

229. ATP synthesis in cell requires

(a) H^+ gradient across the membrane
(b) K^+ gradient across the membrane
(c) PO_4^{3-} gradient across the membrane
(d) Ca^{2+} gradient across the membrane

WB JEE-2015

Ans. (a) ATP synthesis in cell requires a H^+ protron gradient across the membrane. The H^+ proton gradient is created by the electron transport chain, which pumps protons out of the mitochondrial matrix. The protons then diffuses back into the matrix through ATP synthase, which uses the energy released to synthesize ATP.

K. Plastid

230. The colourless plastids that store starch are called

(a) Amyloplast (b) Elaioplast
(c) Proteinoplast (d) Pheoplast

Tripura JEE-2021
JIPMER-1996

Ans. (a) : The colorless plastids that store starch are called Amyloplast.

Amyloplasts as specifically a type of leucoplast that is colorless, non pigment, containing plastids. Amyloplast found in root & storage tissue and store starch polymer of glucose.

It is found in plants that is responsible for starch storage and synthesis.

Elaioplast – Elaioplast are synthesis and storage of fatty acids terpenes and other lipids.

Proteinoplast - It is found only in plant cells. It plays a crucial role in the storage of food and the metabolism of energy in the plant cells.

231. Assertion (A) : Chromatographic separation of leaf pigments shows that leaves has four different pigments

Reason (R) : Pigments absorb light at specific wavelengths and help in the process of photosynthesis. The major leaf pigments are chlorophyll-a, chlorophyll-b, xanthophylls and carotenoids.

The correct option among the following is

Options:

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Chromatographic separation of leaf pigments shows that leaves has four different pigments.

Pigments absorb light at specific wavelengths and help in the process of photosynthesis. The major leaf pigments are chlorophyll-a, chlorophyll-b, xanthophylls and carotenoids. Paper chromatography is a analytical technique used to separate pigments according to their relative solubility and molecular weight. Chromatographic separation of the leaf pigments Chlorophyll a, (appears bright or blue-green in the chromatogram), chlorophyll b (yellow-green), Xanthophylls (yellow). Carotenoids (yellow to yellow-orange). Thus four pigment found.

232. Chl -b differs from chl -a by

(a) —CH_3 group (b) CHO group
(c) COOH group (d) CH_2OH group

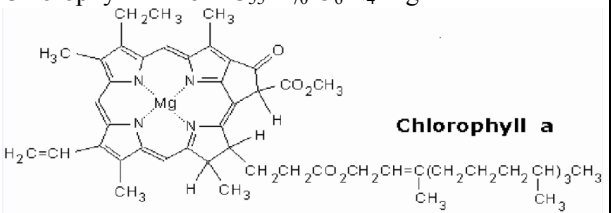
JIPMER-2019

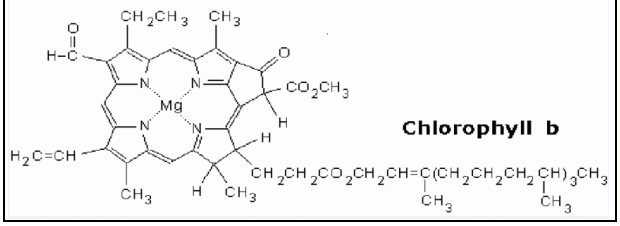
Ans. (b) : Chlorophyll-b structurally differs from chlorophyll-a by the presence of aldehyde (CHO) group at 3rd carbon in the porphyrin ring.

Chlorophyll-a possess methyl (CH_3) group in this place.

Chlorophyll a = $C_{55}\ H_{72}\ O_5\ N_4\ Mg$

Chlorophyll b = $C_{55}\ H_{70}\ O_6\ N_4\ Mg$





233. Match the Column I and II

(i) Etioplast	**(A) Storage of starch**
(ii) Aleuroplast	**(B) Storage of fat**
(iii) Amyloplast	**(C) Storage of protein**
(iv) Chromoplast	**(D) Colored pigments**

(a) i– A, ii – C, iii – D, iv – B
(b) i– D, ii – D, iii – C, iv – A
(c) i– D, ii – C, iii – D, iv – A
(d) i– B, ii – C, iii – A, iv – D

AIIMS-25.05.2019 Shift-I

Ans. (d) : Leucoplasts are colourless plastids that contain stored nutrients.

They are of 3 types :-

(1) **Etioplast** :- Stores oils and fats.

Ex.:- Endosperm cells of castor seed.

(2) Aleuroplast :- Stores proteins.

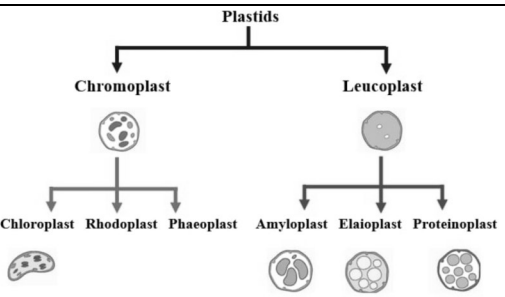
Ex.:- Aleurone cells of maize grain.

(3) Amyloplast:- Stores starch.

Ex.:- Potato tubers. wheat grains.

- **Chromoplast:-** Contains carotene and xanthophylls. They impart a specific colour of flowers and fruits and help in pollination and dispersal of seeds.
- Chloroplasts are plastids that contain chlorophyll and carotenoid pigments that are necessary for photosynthesis.

@apna_pdf



234. Match the following lists :

List-I	List-II
A. Amyloplasts	I. Colour less plastids of varied shapes, sizes with stored nutrients
B. Elaioplasts	II. Store proteins
C. Aleuroplasts	III. Store carbohydrates (Starch)
D. Leucoplasts	IV. Store oils and fats
	V. Store carotene and xanthophylls

The correct match is

	A	B	C	D
(a)	III	IV	II	I
(b)	IV	III	I	II
(c)	II	I	V	III
(d)	III	IV	V	II

TS EAMCET-08.05.2019 Shift-I

Ans. (a) : Amyloplasts They are contain the starch as potato tuber, wheat grains.
Elaioplasts or loeosomes – They stored the fat or lipids endosperm cells caster seed .
Leucoplast–Colourless plastids without pigment found in the underground part like tuber.
Aleuroplast–They are store in proteins as maize, beat Rise.

235. Cup-shaped chloroplast is the characteristic of

(a) Chlamydomonas (b) Spirogyra
(c) Ulothrix (d) Chlorella

Tripura JEE-2019

Ans. (a) : Cup -shaped chloroplast is the characteristic of chlamydomonas. It is a genus of green algae consisting of about 150 species of unicellular flagellates, found in stagnant water and on damp soil, in freshwater and even in snow algae.

- **Spirogyra** - They are free - floating green algae present in freshwater habitats such as ponds, lakes etc. Chloroplast is spiral and ribbon shaped
- **Chlorella** - It is a genus of about thirteen species of single called green algae of the division chlorophyta.
- **Ulothrix** - It is generally found in fresh water and marine water. They thrive in the low temperature of spring and winter. The shape of chloroplast in ulothrix is girdle shaped.

236. Plastids contain which one of the following structures ?

(a) Microtubule (b) Thylakoid
(c) Cristae (d) Plasmodesmata

Tripura JEE-2018

Ans. (b) : Thylakoids are found commonly in Plastids. Plastids are double membrane bound organelles inside plants and algae which are primarily responsible for activities related to manufactures and storage of important chemical compounds.

- **Microtubule:** They are microscopic, hollow tubes made of alpha and beta tubline that are a part of the cells's cytoskeleton.
- **Cristae :** They are sub-compartments of the inner membrane of mitochcondria and are essential to mitochondrial function.
- **Plasmodesmata :** Plasmodesmata are the micro scopic channels that transverse the cell walls of plant cells and allow transport and communication between the adjacent cells.

237. Assertion (A): In all green plants, each cell shows one chloroplast
Reason (R): The ratio between the number of chloroplasts and the number of cells in chlamydomonas is 1 : 1

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-25.04.2018 Shift-I

Ans. (d) : Chloroplast are present in the cells of all green tissues of plants and algae chloroplast are also found in photosynthesis tissue that do not appear green. Such as the brown blades of giant kelp or the red leaves of certain plants.
In higher plant 20-40 chloroplast each cell have been reported but in number of also variable lower plant like Chlamydomonas, ulothrix, chlorella single chloroplast are found.
Zygnema – 2 chloroplast per cell.
Spirogyra 2-14 chloroplast per cell.

238. Chromoplast is found in:

(a) Stem
(b) Leaf
(c) Root
(d) Fruit and corolla of flower

Rajasthan PMT-1996

Ans. (d) : Chromoplast is found in fruit and corolla of flower. They are pigmented plastids. They impart a variety of colours to plant cells. They contain carotenoids. They lack chlorophyll. The transition of chloroplasts to chromoplasts is much evident in fruit ripening. There is an extensive synthesis of carotenoids. Chromoplast development is irreversible in plant like pepper and tomato light, temperature and nutrients are important factors in the formation of chromoplasts.

239. Anthocyanin pigment is found in:

(a) Cell sap (b) Chloroplast
(c) Mitochondria (d) None of the above

Rajasthan PMT-1996

@apna_pdf

Ans. (a) : Anthocyanins pigments are found in cell sap. They are found abundant in plants, including red-purplish or red to blue-colored fruits, leaves flowers roots and grains.

Cell sap : It is the liquid inside the large central vacuole of a plant cell. It serves as the storage of materials and provides mechanical support, especially in non-woody plants.

240. Which of the following pigment is responsible for flowering and germination?

(a) Phytohormone (b) Phytochrome
(c) Photochrome (d) Photohormone

UP CPMT-2010

Ans. (b) : Phytochrome pigment is responsible for flowering and germination. They are class of photorecepter in plants bacteria, and fungi used to detect light.

- **Phytohormone** are known as plants hormones they are chemicals produced by plants that regulate their growth, development reproductive processes longevity and even death.The role of phytoharmones in controls of plant development and architectures.

241. Plastocyanin contains

(a) copper (b) iron
(c) calcium (d) potassium

UP CPMT-2010

Ans. (a) : Plastocyanin is a copper containing protein that mediates electron transfer. It is found in a variety of plants , where it participates in photosynthesis the protein is a prototype of the blue copper proteins plastocyanin is the long range electron carrier in plants.

- **Iron** is an essential mineral that helps the body transport oxygen throughout the body. It is also involved in the production of Red blood cells.
- **Potassium –** It is an essential mineral that is needed by all tissues in the body.
- **Calcium –** It is a mineral most often associated with healthy bones and teeth, although is also plays an important role is blood clotting.

242. Which one of the following is not a plastid?

(a) Mitoplast (b) chromoplast
(c) chloroplast (d) Leucoplast

DUMET-2008

Ans. (a) :A mitoplast is a mitochondrion that has had its outer membrane removed, leaving the inner membrane and matrix intact.(Mitochondria-outer membrane = mitoplast).

Chromoplast, chloroplast and leucoplast are example of plastid

- **Chloroplast:** A chloroplast is a type of membrane bound organelle known as a plastid that conducts photosynthesis mostly in plant and algal cells.
- **Chromoplast:** It is pigmented plastids. It imparts a variety of colours to plant cells.
- **Leucoplast :** It is colourless cell organelles that store reserve food for later uses.

243. Abcisic acid is primarily synthesized in

(a) Lysosomes (b) Golgi complex
(c) chloroplast (d) ribosomes

J&K CET-2009

Ans. (c) : Abcisic acid is primarily synthesized in chloroplast. It is a plant hormone that regulates numerous aspects of plant growth, development and stress responses.

- **Lysosomes** are a single unit membrane bound structure found in cells. It contains hydrolytic enzymes which is helps in cellular digestion.
- **Ribosome:** It is an intercellular structure made of both RNA and Protein, and it is the site of protein synthesis in the cell.
- **Golgi complex :** It is also called Golgibody. It prepares proteins and fat molecules for use in other places inside and outside the cell.

244. From the following, select the statement that is true.

(a) All cells have a cell wall
(b) Animals cells contain microtubules but plant cells do not contain microtubules
(c) The Golgi apparatus is found only in animal cells.
(d) Chloroplasts are found in plant cells but not in prokaryotic or animal cells

J&K CET-2012

Ans. (d) : Chloroplasts are found in plant cells but not in prokaryotic or animal cells.

- Animal cell do not bounded with cell wall.
- Both animal and plant cells contain microtubules.
- The Golgi apparatus is found in both plant and animal cells.

245. Camouflage of chamaeleon is associated with

(a) chromosome (b) chromomere
(c) chromoplast (d) chromatophore

AIIMS-1995
AMU-2011

Ans. (d) : Chromatophores are referred to as pigment containing cells or groups of cells that produce colour. They are present in various creatures including fish, amphibian, reptiles, crabs and cephalopods. Chameleons have the ability to change color because they have special skin cells called chromatophores.. These are different kinds of chromatophores. Some contains yellow red or black pigments and some contain transparent crystals which reflect light and can produce blue or which reflect light and can produce blue or white colours. Chameleon have multiple layers of these chromatophores.

246. Aleuroplasts in a cell stores

(a) starch (b) oil
(c) protein (d) nutrients

AMU-2010

Ans. (c) : Aleuroplasts in a cell stores protein. They are colourless plastids. It is one of the forms of leucoplast in plant cells that is responsible for the storage proteins plant cells particularly seeds contain aleuroplasts.

- **Starch:** It is found in plants. It contains sugar molecules joined chemically. It is found high level in foods such as potatoes, rice, corn and wheat. Amyloplasts store carbohydrate (starch).
- **Nutrients :** They are chemicals substances found in every living thing on earth. They are used in every process of an organism's body.

@apna_pdf

247. The chemical formula of chlorohyll-b is:

(a) $C_{55}H_{72}NN_5Mg$ (b) $C_5H_{72}O_5N_4Mg$
(c) $C_{55}H_{70}O_6N_4Mg$ (d) $C_{55}H_{70}O_5N_5Mg$

HP CET-2013

Ans. (c) : The chemical formula of chlorophyll-b is $C_{55}H_{70}O_6N_4Mg$

248. The largest cell organelle is:

(a) mitochondria (b) chloroplast
(c) Golgi body (d) chromosome

Uttarakhand-2005
AMU -1998.

Ans. (b) : The largest cell organelle is chloroplast. It is responsible for photosynthesis.

- **Golgi body:** It is involved in the transport of lipids around the cell.
- **Mitochondria:** 2nd largest organelle, it makes energy available to the cell. they are also called powerhouse of the cell.
- **Chromosomes:** Chromosomes are thread-like structure located inside the nucleus of animal and plant cells.

249. Which of the following reaction does not take place in the cell organelle, that is referred to as "Power house of the cell" ?

(a) Glycine decarboxylation
(b) Glyceraldehyde 3-phosphate de hydrogenation
(c) Fumaric acid hydration
(d) Cytochrome oxidation

AP EAMCET-2003

Ans. (b) : Glyceraldehyde 3-Phosphate dehydrogenation does not take place in the cell organelle that is referred to as "power house of the cell" It is found in cytoplasm during glycolysis other three reactions take place in mitochondria.

- Cytochrome oxidation is the process by which cytochrome oxidase, the last enzyme in the electron transport chain, reduces molecular oxygen to water. This process help in the translocation of proton across the mitochondrial membrane, which creates a proton gradient that is used synthesize ATP.
- **Glycine decarboxylation** : It is a metabolic oncogene that links glycine metabolism with tumerigenesis.
- **Fumaric acid hydration** : The monoanion of fumaric acid has been shown to undergo hydration uncatalyzed by any external agents, while crotonic acid anion does not undergo such a reaction.

250. Which one type of plastids contain oil as reserve food?

(a) Elaioplast (b) Amyloplast
(c) Chloroplast (d) Chromoplast

VMMC-2014
AMU-2002

Ans. (a) : Elaioplast contains oil as reserve food. They are lipids storage plastids. Elaioplast is the leucoplast specialized in storing lipids, proteins, fats and oil. Leucoplasts are colourless non-photosynthetic plastids.

- **Amyloplasts** are double enveloped organelles responsible for starch storage and synthesis.
- **Chloroplasts** contain chlorophyll, which is a green pigment that is used for photosynthesis.
- **Chromoplasts** contain other pigment such as caretenoids, which give fruits and vegetables their yellow, orange and red colors.

251. Plastids of an etiolated plant possess

(a) phycobilins
(b) carotenoids and xanthophyll
(c) chlorophylloid and carotenoids
(d) chlorophyll and carotenes

AMU-2008
VMMC-2008

Ans. (c) : Plastids of an etiolated plant possess chlorophylloid and carotenoids. Etiolation of a plant is the elongation and weakening of the plant stem and development of yellowish white color in its leaves.

- **Phycobilins** : Phycobilins are water soluble pigments that are fairly joined to a protein
- **Carotenoids**: The carotenoids are an important group of pigments in plants where they function as accessory light- harvesting pigments in photosynthesis.
- **Xanthophyll** : They are photochemical cooling agents that deal with the active state of chlorophyll or triplet chlorophyll.

252. Which of the following organelles contain circular DNA?

(a) Peroxisomes and Mitochondria
(b) Mitochondria and Golgi complex
(c) Chloroplasts and Lysosomes
(d) Mitochndria and Chloroplast

Ans. (d) : Mitochondria and Chloroplast organelles contain circular DNA. Mitochondria and chloroplast have endo-symbiotic origin prokaryotic type. So have ds circular DNA as that of prokaryotes.

Peroxisomes - Peroxisomes are abundant in the liver where they produce bile salts, cholesterol and break down fats.

253. In chloroplasts, chlorophyll is present in the

(a) outer membrane (b) inner membrane
(c) thylakoids (d) stroma

Manipal-2007
J&K CET-2000

Ans. (c) : The thylakoids are flattened sacs that are filled with a fluid called the stroma. The chlorophyll molecules are embedded in the thylakoid membrane.

Stroma - It provides nutrients to the tissue or organ and removes waste and extra fluid. Dark reaction of photosynthesis occurs in stroma of chloroplast.

254. In higher plants, the shape of the chloroplast is

(a) discoid (b) cup-shaped
(c) girdle-shaped (d) reticulate

UP CPMT-2013
DUMET-2009

Ans. (a) : The shape of the chloroplast in higher plants is discoid. This is due to the discoid shape has ability to increase photosynthesis efficiency by exposing more chlorophyll to light.

@apna_pdf

255. Which of the following is responsible for red colour of tomato?
(a) Chlorophyll (b) Phycoerythrin
(c) Phycocyanin (d) Lycopene
VMMC-2010
Punjab MET-2008

Ans. (d) : Most tomatoes are red when they are ripe because of the presence of lycopene, which is a phytochemical (A biologically active compound produced by plant.
Lycopene is organic compound of β-carotene. It is a natural pigments that gives some vegitables and fruits their red colour. Lycopene in tomato products could have protective effects against prostate cancer and cardiovascular disease.
Phycocyanin → It is an accessory pigments of chlorophyll. They are water soluble so, they cannot exist within the membrane.
Phycoerythrin → It is widely used as a fluorescent probe or as a colorant industries for labeling antibodies.

256. Highest number of enzymes are found in
(a) lysosome (b) chloroplast
(c) mitochondria (d) peroxisome
Haryana PMT-2008

Ans. (c) : Highest number of enzymes is found in mitochondria. Enzymes are produced by a living organism that acts as a catalyst to bring about a specific biochemical reaction (ETS, Kreb's cycle).
Peroxisome - Small vesicles single membrane organelle eukaryotic cell and main function is lipid metabolism and conversion of reactive oxygen species. It is abundant in the liver where it produces bill salts and cholesterol and break down fats.
Chloroplasts are chlorophyll containing organelles in plant cells that are involved in energy storage and synthesis of metabolic materials.
Lysosome contain hydrolytic enzymes which are acidic in nature.

257. In mitochondria, enzymes responsible for Krebs cycle are present in :
(a) matrix (b) inner membrane
(c) outer membrane (d) both (b) and (c)
Haryana PMT-2006

Ans. (a) : In mitochondria enzymes responsible for krebs cycle are present in mitochondria matrix. Matrix is a ground substance that occupies spaces, especially between the cells or that inside the organelles. It fills the space present within the mitochondria. Matrix is a specific part of the mitochondria where oxidation of organic molecules takes place.

258. Coupling factor F is found in
(a) Stroma (b) Matrix
(c) Thylakoids (d) Ribosomes
J&K CET-2007

Ans. (c) : Coupling factor F is found in thylakoids. Coupling factor F is present in chloroplast. It is embedded in the membrane and forms a trans membrane. Thylakoid is an internal system of inter connected membrane that carry out the light reactions of photosynthesis. ATPase complex is also known as the coupling factor. It is present in chloroplasts, mitochondria and the plasma membrane of bacteria.

259. Which of the following has their own DNA ?
(a) Ribosome (b) Dictyosome
(c) Microsome (d) Chloroplast
Rajasthan PMT-2000

Ans. (d) : Chloroplast have their own DNA, RNA and Proteins. They can multiply when the energy needs of a cells increases.
Not only chloroplast but mitchondria has its own DNA. That is why they are called semi autonomous.

260. Aleuroplast is a type of leucoplasts which stores
(a) lipid (b) carbohydrates
(c) starch (d) protein
CMC Ludhiana -2013

Ans. (d) : Aleuroplast is a type of leucoplast which stores protein. It is one of the forms of leucoplast in plant cells that is responsible for the storage proteins e.g. aleurone cell of seed.
Lipid - It is part of cells membranes about 50% of membrane mass and helps control what goes in and out of cells. Elaioplast store lipids.
Carbohydrates (starch) are stored by amyloplast.

261. Elaioplast store
(a) starch (b) proteins
(c) fats (d) essential amino acids
CMC Ludhiana-2012
DUMET - 2011

Ans. (c) : Elaioplast store fats and oil. They are generation and storage of fatty acids, terpenes and other lipids. It is a leucoplast that is primarily involved in storing fats.

262. Proteinaceous nature of enzyme was suggested by :
(a) Sumner (b) Kuhne
(c) E. Buchner (d) Northrop
BCECE-2003

Ans. (a) : Proteinaceous nature of enzyme was suggested by Sumner in 1926 who found pure urease and crystalline.
Northrop produce pure crystals of pepsin, trypsin and chymotrypsin enzymes.
E. Buchner fermented sugar in laboratory without living cells. kuhne coined the term enzyme in 1878.

263. Thylakoids are present in
(a) nucleus (b) mitochondria
(c) chloroplast (d) cytoplasm
AMU-2002

Ans. (c) : Thylakoids are membrane bound compartments inside chloroplasts. Thylakoide is the site of photochemical or light - dependent reactions of photosynthesis. Chlorophyll present in the thylakoid membrane absorbs energy from the sunlight and is involved in the formation of ATP. In thylakoid membranes, chlorophyll pigments are found in packets called quantasomes.

264. Grana are present inside the
(a) mitochondria (b) chloroplast
(c) endoplasmic reticulum (d) ribosome
AMU-2001

@apna_pdf

Ans. (b) : Grana is present inside the chloroplast. The grana and stroma are the parts of the which is also known as the kitchen of the cell. It is a double membraned cell organelle.

Chloroplast the light reaction take in grana and dark reaction take place in stroma.

265. Which one of the following cellular parts is correctly described

(a) Ribosomes - those on chloroplasts are larger (80s) while those in the cytoplasm are smaller (70s

(b) Lysosomes-optimally active at a pH of about 8.5

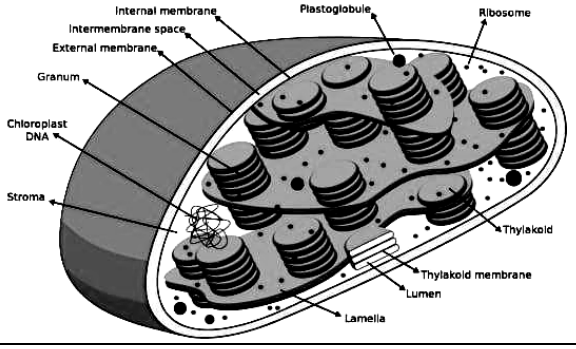
(c) Thylakoids-flattened membranous sacs forming the grana of chloroplasts

(d) Centrioles - sites for active RNA synthesis

AIPMT (Mains)-2012

Ans. (c) : The structure that are fromed by stacking of organised flattened membranous sacs (Thylakoids) in the chloroplast of grana an resembles a stack of coins.

- It is made up of three layers like structrue in thylakoid system which is surrounded by the stroma and grana.
- Chlorophyll and other photosynthetic pigments are situated in the theylakoid membrane which are site for the light dependent reaction of photosynthesis.
- Centriole are a membranous hallow micro-cylinders occurs in pair and play Important role in cell division.
- Ribosome in chloroplast are 70s type while those cytoplasm in eukaryotic it is of 80s type.
- The enzyme of lysosome (called suicidal bag) function at acidic pH (pH 4.5-5.0).



266. Select the wrong statement from the following:

(a) The chloroplasts are generally much larger than mitochondria

(b) Both chloroplasts and mitochondria contain an inner and an outer membrane

(c) Both chloroplasts and mitochondria have an internal compartment, the thylakoid space bounded by the thylakoid membrane

(d) Both chloroplasts and mitochondria contain DNA

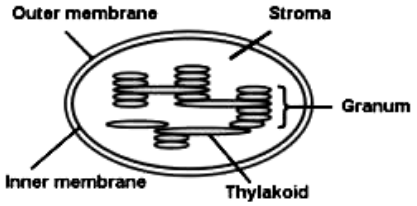
AIPMT-2007

Ans. (c) : Chloroplasts and mitochondria have an internal compartment.

- The thylakoid space, bounded by the thylakoid lumen membrane in chloroplast only.
- Chloroplast is largest organelle of cell and mitochondria is 2nd largest organelles of cell.

Both mitochondria and chloroplast have inner and outer membrane.

Both mitochondria and chloroplast contain DNA and RNA thus they are called as semiautonomous organelle.



267. Which factor is responsible for inhibition of enzymatic process during feed back:

(a) Substrate (b) Enzymes

(c) End product (d) Temperature

AIPMT-2000

Ans. (c) : Feedback inhibition or **end product** is the inhibition of the activity of an enzyme catalysing some early reactions of the series by the end product of the metabolic pathway. For example a substrate A is converted into a product F through B, C, D and E intermediate products. As the concentration of end product F increases, it diffuses to allosteric enzyme (E), causing a reduced synthesis of the product B which in turn lowers the rate of enzymatic reactions in rest of the pathway.

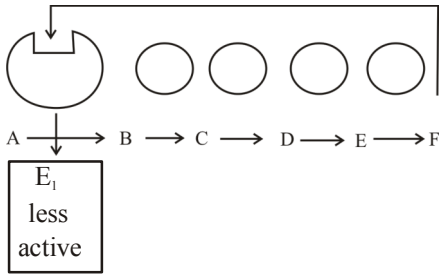


Fig: Feedback inhibition: Product inhibits the action of enzyme E

268. Which of the following type of plastids does not contain stored food material?

(a) Amyloplasts (b) Chromoplasts

(c) Elaioplasts (d) Aleuroplasts

Assam CEE-2014

NEET (Karnataka)-2013

Ans. (b) : Chromoplasts are yellow or reddish in colour because of the presence of carotenoid pigments.

- **Chromoplasts** are formed either from leucoplasts or chloroplasts. Chromoplasts provide colour to many flowers for attracting pollinating insects. They provide bright red or orange colour to fruits for attracting animals for dispersal.Chromoplast is responsible for the colour not for food storage.
- **Amyloplasts** e.g. potato tuber,

  Elaioplasts or lipidoplasts or oleoplasts are colourless plastids which store lipids e.g endosperm cells of castor seed .
- **Aleuroplasts** or proteioplasts or proteinoplasts are protein storing plastids, eg. aleurone cells of maize grain.

@apna_pdf

269. A pigment concerned with both floral induction and seed germination is :

(a) anthocyanin (b) phytochrome
(c) phycocyanin (d) xanthophylls

BVP-2006

Ans. (b) :Phytochrome is a kind of pigments which absorbs red and for red light and its light absorbing region in closely associated with protein. Pytochrome exists in two forms.

- The Pr form- It absorbs red light and gets converted into its active form i.e. pfr form.
- The Pfr form- It absorbs for red light and gets converted into Pr form

Ativity of phytochrome.

Elongation of leaf, stem and petiole, germination of pollen, fern spores, and seed etc.

270. A pigment, which absorbs red and far red light, is

(a) cytochrome (b) phytochrome
(c) xanthophyll (d) carotene.

AIIMS-1994

Ans. (b) : Phytochrome occurs in two form Pr and Pfr an absorbs red and for red light.

Phytochrome is a light sensitive pigment in plants and some bacteria and fungi. It exist in two inter convertible form. Pr and Pfr. If Pfr absorbs for red light of 730 nm wavelength when it absorbs for red light convert to its original form. Pr Thus Pfr is a active form of phytochrome which inhibited flowering.

carotene - These are the hydrocarbon.

Insoluble in water and soluble in organic solvent.

xanthophylls – is insoluble in water as the long hydrocorban tail attached to the porphyrin ring makes then fat soluble.

271. Analyze the following pairs and identify the correct options given

(A) Chromoplasts	**Contain pigments other than chlorophyll**
(B) Leucoplasts	**Devoid of any pigments**
(C) Amyloplasts	**Store proteins**
(D) Alueroplasts	**Store oils and fats**
(E) Elaioplasts	**Store carbohydrates**

(a) B and C are correct
(b) C and D are correct
(c) D and E are correct
(d) A and B are correct
(e) A, B and C are correct

Kerala PMT-2009

Ans. (d) : Chromoplasts Contain pigment other than chlorophyll chromoplasts coloured plastids other than green may we orange, red, blue, yellow.

Leucoplast - Are colourless plastids without pigments found in the underground part like tuber, etc.

Amyloplast – Starch they store the starch as potato tuber.

Alueroplasts – Store protein.

Elaioplast – They store the fats and oil.

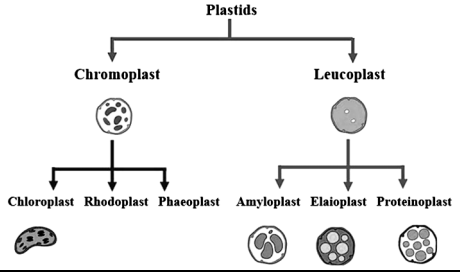
272. What is common between chloroplasts, chromoplasts and leucoplasts ?

(a) Presence of pigments
(b) Possession of thylakoids and grana
(c) Storage of starch, proteins and lipids
(d) Ability to multiply by a fission-like process

AIIMS-2006

Ans. (d) : Chloroplast, Chromoplast and Leucoplast are plastids and have the ability to multiply by a fission like process before they are fully mature.

- **Leucoplast** is colorless plastid, involved in the storage of starch lipid and proteins. (i) e.g underground root and stem.
- **Chloroplast** are green colored plastids containing thylakoids and photosynthetic pigment chlorophyll. They are involved in the photosynthetic production of carbohydrates. (ii) In higher plant chloroplast may be ovoid, spheroid or dish-shaped but mostly they are lance shaped.
- **Chromoplast** are plastids responsible for pigment synthesis. They give distinctive to different fruits, flowers and ageing leaves in plants.

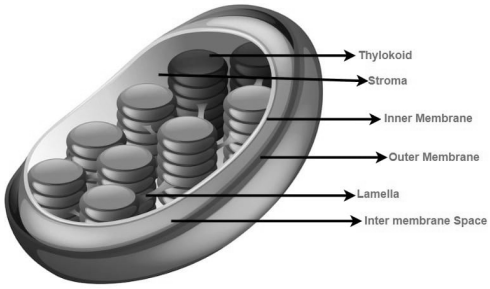


273. Many cells function properly and divide mitotically even though they do not have

(a) plasma membrane (b) cytoskeleton
(c) mitochondria (d) plastids.

AIIMS-2005

Ans. (d) : Plastids are specific for plant cell and absent in animal cells. Main function of plastids is, synthesis and storage of food. Therefore mitosis will occur even in the absence of plastids. Hence, cell can function properly and divide mitotically even in the presence or absence of plastids.



274. All types of plastids possess essentially the same structure because they:

(a) Perform the same function
(b) Store food materials like starch, fat and protein
(c) Occur in aerial parts
(d) Can transform from one form to another.

AIPMT-1992

@apna_pdf

Ans. (d) : All the plastids have a common origin and one type of plastid change into another plastids considered as sac like organelles, generally involved in the formation or storage of food.
Schimper divided the plastic into three part according to presence or absence of their pigment.
1. Chloroplasts (chloro - green + plast - living)
2. Leucoplasts (Leukos - white + plast - living)
3. Chromoplasts (chromo - colour + plast - living)

275. Pyrenoids are centre of
(a) Fat storage (b) Starch storage
(c) Protein formation (d) Enzyme formation
CMC Vellore-2012

Ans. (b) : Pyrenoids are found in chloroplast of algae and bryophyta, center of starch storage. The centers of pyrenoids of proteinaceous and they are responsible for the formation of starch.
Fat storage – Elioplast as Tuberose
Protein storage – Aleurone cell maize grain endosperm cell of caster.

276. Elementary particles occur:
(a) in mitrochondria (b) in the cytoplasm
(c) in chloroplast (d) in all of these
JIPMER-1996

Ans. (a) : Elementary particle occur inner mitochondrial membrane bears subunits minute regularly spaced particles known as the inner membrane subunits or elementary particles (FP) or oxysomes.
Elementary particles have three part a rounded head piece or F_1 subunit, a short stalk, a base piece or F_o subunit located in the inner membrane.
These particles are present in matrix side of mitochondria inner membrane.

277. Which one of the following is not found in animal cells?
(a) Nucleus (b) Golgi bodies
(c) Chloroplast (d) Mitochondria
CG PMT-2005

Ans. (c) : Chloroplast mostly occurs in a plant and certain algae that is the size of photosynthesis cell of the leaves. Sepals of the flower pericarp of unripe fruit also have chloroplast and other hand nucleus, Golgi body and mitochondria mostly found in both cells.

278. In which, plastids are not found?
(a) Blue-green algae (b) Bacteria
(c) Fungi (d) All of the above
CG PMT-2005

Ans. (d) : Plastids are the characteristic feature of photosynthetic eukaryotes.
Plastids are double membrane organelle found in the cells of plant and algae. But not found in prokaryotes such and bacteria, blue green algae and saprophytic fungi.

279. Example of water soluble plant pigment is
(a) chlorophyll-a (b) chlorophyll-b
(c) anthocyanin (d) xanthophylls
NEET-2016 Phase-I
WB JEE-2011

Ans. (c) : Anthocyanin is water soluble plants pigment .
The pigment are present in the vacuoles of plant cells and appear in different colour like red, blue or purple depending on the pH.
Fat soluble pigment is carotenoids and chlorophyll.
Xanthophylls is carotenoids. Chlorophylls about 10 different type - Chl -a , b, c, d, e, bacterial chlorophyll.

280. Chlorophyll-b is not present in
(a) green algae (b) bryophytes
(c) Spirogyra (d) blue-green algae
DUMET-2006

Ans. (d) : It is found all like green plant in green Algae bryophytes, pterdophytes, Gymnosperm and Angiosperm.
except diatoms, red algae, brown algae and blue green algae.
Red algae (Rhodophyta) contain chlorophyll a, d and phycoerythrin.
Diatoms and Brown algae (Phaeophyceae) have pigments like chlorophyll a, c and fucoxanthin.
Blue green algae (Cyanobateria) contain chlorophyll a, carotenoids and phycobiliproteins.

281. Mesosomes are analogous to:
(a) chloroplast (b) mitochondria
(c) lysosome (d) none of these
Rajasthan PMT-1997

Ans. (b) : Mesosomes are characteristic structure of bacterial cell. The mesosomes participates in energy production, DNA replication nucleoli separation, cell division, nitrogen fixation etc. and analogous to eukaryotes of mitochondria.
Lysosome – are involve in intracellular digestion lysosome are generally found in the cytoplasm of animal cell.
Chloroplast – Are mostly occur in mesophyll cell of the leaves.

282. Showy and attractive colour of fruits is due to the presence of:
(a) chloroplasts (b) leucoplasts
(c) chromoplasts (d) amvloplasts
J&K CET-2001

Ans. (c) : Chromoplast attractive colour of fruits chromoplast plastids than the green may be orange, red blue yellow.
These are found in the ripping pericarp of fruits as tomato, chili and carrot root.
Chloroplast – These are mostly occurs is a mesophyll cell of the leaves. It gives green colour.
Leucoplast – Leucoplast are colourless plastids without pigment found in the underground parts like tuber.

283. Who discovered thylakoid?
(a) Menke (b) Nageli
(c) Hanstein (d) Schmidt
Rajasthan PMT-1995

Ans. (a) : Thylakoid discovered Menke, 1961 about 20-50 thylakoids are placed one above other like a stack of coins to form a granum or they may be unstanked called stroma thylakoids.

@apna_pdf

Nageli and Hafmeister give Apical cell theory give according to this theory there is single tetrahedral apical cell in the root apex.
Schmidt – Tunica corpus concept. According 1924 to this concept there are two portion in shoot apex tunica and carpus.
Hanstein – 1868- Histogen concept According to this concept there are group of initials or histogen in the apical meristem plerome, priblem and dermatogen respectively.

284. Fat storing granules are
(a) elaioplast (b) amyloplast
(c) aleuroplast (d) none of these
DUMET-2007

Ans. (a) : Elaioplast store the fat and lipid granules such as endosperm custur seed.
Amyloplast – Store the starch
Aleuroplast – Store the protein.

285. Which of the following absent in chloroplast ?
(a) DNA (b) Carotene
(c) Anthocyanin (d) Xanthophyll
BVP-2011

Ans. (c) : Anthocyanin water soluble pigment absent in chloroplast found in fruits, leaves, flowers roots and grains.
Carotene - these are hydrocarbon insoluble in water and soluble in organic solvent they trap the energy from the sun and then transfer it to the chlorophyll molecule therefore called necessary pigment.
Xanthophyll are yellow pigments that are one of the important divisions of the carotenoid group.
DNA (deoxyribonucleic acid) is the molecule that carries the genetic information.

286. The ATP synthase of chloroplasts is like that of
(a) peroxisomes (b) golgi body
(c) micro somes (d) mitochondria
Punjab MET-2005

Ans. (d) : The ATP synthase of chloroplast is like that of mitochondria enzyme ATP synthase utilized when movement of protons than ADP to ATP.
Perxysomes are round to oval bodies that have a diameter ranging between o.1 to 0.5 pm.
Golgi bodies :- complex functions primarily as a processing plant where proteins nearly synthesized in endoplasmic reticulum in specific ways.

L. Ribosome and Cytoskeleton

287. Ribosomes of bacteria, mitochondria prokaryotes and chloroplasts are of:
(a) 30S type (b) 70S type
(c) 80S type (d) 50S type
MHT CET-08.10.2020 Shift-I
Tripura JEE-2017
BCECE-2015 / JCECE- 2010
AMU-2009 / Punjab MET – 2008
J&K CET-2007, 2002
JIPMER-1997, 2000

Ans. (b) : Ribosome of bacteria, mitochondria Prokaryotes and chloroplasts are of 70S type.

288. Protein synthesis takes place in
(a) ribosomes (b) chloroplasts
(c) mitochondria (d) golgi bodies
Punjab MET-2010
Uttarakhand PMT-2008
Manipal – 2008
DUMET-2003,2008
BVP - 2007, 2001
UP CPMT-2007
Rajasthan PMT-1999, 2006
CGPMT - 2006
BHU PMT-2004
AIPMT-1992

Ans. (a) : Protein synthesis takes place in ribosomes with the help of mRNA and tRNA. Ribosomes are large ribonucleo proteins contains RNA's & protein. It can translate genetic information stored in mRNA into polypeptides & thus synthesize Proteins cell active in Protein synthesis take place in ribosomes
The process by which genetic information is transferred from the nucleus to the ribosome is called transcription.
Mitochondria and chloroplast contain double layered membrane. Golgi body and Lysosome contain unit membrane.

289. Which of the following pair lack the unit membrane?
(a) Nucleus and ER
(b) Mitochondria and chloroplast
(c) Ribosome and nucleolus
(d) Golgi body and lysosome
AIIMS-25.05.2019 Shift-II
J&K CET-2011, 2006, 2005
DUMET-2003
JCECE-2003
Rajasthan PMT-1995, 2002

Ans. (c) : Ribosome and nucleolus are cell organelles that lack the unit membrane. Ribosome can be Present in the cytoplasm and also line the rough endoplasmic reticulum's membranes. It is made up of ribosomal proteins and RNA.

290. Ribosomes are made up of
(a) t RNA and protein (b) r RNA and protein
(c) m RNA and protein (d) m RNA and DNA
KVPY (SA) – 2018
UPCPMT – 2004
BVP - 2002 / AMU-1999,1995

Ans. (b) : Ribosome are made up of protein and RNA. The ribosome is a cytoplasmic structure that is minute and sphere shaped. It is composed of protein and ribonucleic acid (RNA).
It has 2 subunits – The small ribosomal subunits. Which reads the RNA, and the large subunit which joins amino acid to form polypeptide chain.

291. Which of the following cell organelle is associated with protein synthesis?
(a) Ribosome (b) Microsome
(c) Lysosome (d) Glyoxysome
J&K CET-2012 / DUMET-2008
VMMC-2002 / AMU-1998

@apna_pdf

Ans. (a) : A cell active protein synthesis will rich in ribosome cytoplasm or found attached to the endoplasmic reticulum.
Ribosome is synthesizing the protein with the help of mRNA and tRNA.

292. Nucleolus is the site for the synthesis of
(a) DNA (b) mRNA
(c) tRNA (d) ribosomes

BVP-2008
AMU-2007
Uttarakhand PMT-2007
UP CPMT-2001

Ans. (d) : Nucleolus is the site for the synthesis of ribosome. It is the distinct structure present in the nucleus of eukaryotes cells.
tRNA - It is a small RNA molecule that in protein synthesis of tRNAs from the A site (Aminoacyl) to the P site (Peptidyl site) to E site (Exit) is coupled with movement of their associated codons in the mRNA.
It acts as an adapter molecule for linking amino acids to specific codon.
mRNA - It is a type of RNA that is necessary for protein synthesis. It is a largest RNA molecules.
DNA (deoxyribonucleic acid) is the molecule that carries the genetic information.

293. Which of the following statements are correct regarding ribosomes?
A. 70S ribosomes have two sub units 50S and 30S.
B. 80S ribosomes are present only in Eukaryotes.
C. 70S ribosomes are present both in Eukaryotes and Prokaryotes.
D. Ribosomes are not bound by any membrane.
(a) ABC (b) ABC
(c) BCD (d) ABCD

TS EAMCET-11.05.2023, Shift-II

Ans. (d) :
- 70S ribosomes have two sub units 50S and 30S.
- 80S ribosomes are present only in Eukaryotes.
- 70S ribosomes are present both in Eukaryotes and Prokaryotes.
- Ribosomes are not bound by any membrane.

294. The metal ions required for the association of the two subunits of the prokaryotic ribosomes
(a) Sodium (b) Magnesium
(c) Calcium (d) Potassium

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : Magnesium– Magnesium is essential for two vital processes as in for stabilization of the secondary structure of rRNA and binding of the ribosomal proteins to the rRNA. So the ion required to keep the two ribosomal units together during synthesis is Mg^{+}.

295. How many different proteins does the ribosome consist of ?
(a) 20 (b) 80
(c) 60 (d) 40

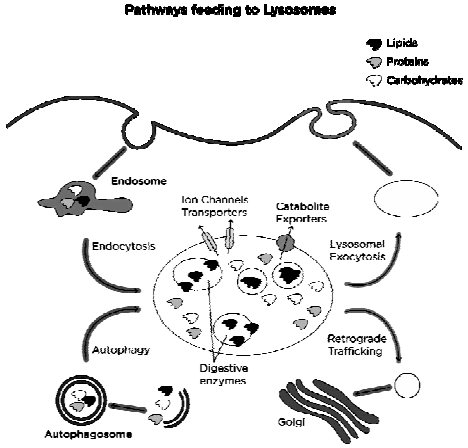
NEET (UG) 07.05.2023

Ans. (b) : Ribosome's are the sites in a cell in which protein synthesis takes place. Ribosome's are the complexes of RNA molecules and proteins. Ribosome's are visible as clusters in eukaryotic but not in prokaryotes.
• Only a few rRNA molecules are present in each ribosome, these molecules make up about half of the ribosomal mass. The remaining mass consists of 60 protein in prokaryotes cells and over 80 in eukaryotic cells.

296. If the pH in lysosomes is increased to alkaline, what will be the outcome?
(a) Hydrolytic enzymes will function more efficiently
(b) Hydrolytic enzymes will become inactive
(c) Lysosomal enzymes will be released into the cytoplasm
(d) Lysosomal enzymes will be more active

NEET (Re-Exam)-04.09.2022

Ans. (b) : Lysosomes maintain cellular homeostasis by generating a highly acidic environment of pH 4.5-5.0 and get deactivated at alkalin pH. It can also lead to the accumulation of undigested material in the lysosomes which can cause various diseases.



297. Assertion (A): Cytoskeleton in eukaryotic cells is made up of a network of filamentous lipids and polysaccharide structure.
Reason (R): Cytoskeleton is composed of microfilaments. intermediate filaments and microtubules.
The correct options among the following is
(a) (A) is true.(R) is true and (R) is the correct explanation for (A)
(b) (A) is true. (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-31.07.2022 Shift-I

Ans. (d) : Cytoskeleton are fundamental components of all eukaryotic cell which consist of filamentous protein and they are three type.
1- Intermediates filament
2- Actin filament
3- Micro tubulen

@apna_pdf

Intermediate filament are the fast skeleton in nature provide cytoplasm mechanical strain. Actin filaments and micro filaments are not only cytoskeleton but also responsible for movement of cytoplasm and organelle.
Microtubules are made of protein called tubulin.
Micro filament consist of actin protein. It is mainly found in plasmamembrane and extant for the movement of cell.

198. Which of the following structure is found in all prokaryotic cells?
(a) Mitochondria (b) Golgi complex
(c) Ribosomes (d) Lysosomes

TS EAMCET-31.07.2022 Shift-I

Ans. (c): Prokaryotic organisms lacks the nucleus and nuclear associated organelles like they lack nuclear membrane, mitochondrion, lysosomes, golgi body, microbodies, vacuoles etc. But they are present in eukaryotic cells. Ribosomes are non-membrane bound organelles present in prokaryotes as well as eukaryotes. Bacterial Ribosomes have half of amount of r RNA & few ribosomal proteins. mRNA is translated by Ribosomes into protein.

299. Peptide synthesis inside a cell takes place in ————
(a) Chloroplast (b) Mitochondria
(c) Chromoplast (d) Ribosomes

AP EAMCET-03.09.2021 Shift-I

Ans. (d) : Peptide systhesis inside a cell takes place in ribosomes by transcription and translation. The translation is take place cytoplasm of the cell.

300. Ribosomes were first observed by_____
(a) Robert Hook (b) K.R. Porter
(c) George Palade (d) Robert Brown

AIPMT-1991
AP EAPCET-07.09.2021 Shift-I

Ans. (c) : In 1955 George E. Palade discovered ribosomes described by using an election microscopes. It is small particles in the cytoplasm that preferentially associated with the endoplasmic reticulum membrane.

301. Polysome is formed by:
(a) a ribosome with several subunits
(b) ribosomes attached to each other in a linear arrangement
(c) several ribosomes attached to a single mRNA
(d) many ribosomes attached to a strand of endoplasmic reticulum

MHT CET-07.10.2020 Shift-I
BHU PMT (Screening)-2010
AIPMT-2008

Ans. (c) : Polysome is formed by several ribosomes attached to a single mRNA. It consists of a complex of an mRNA molecule and two or more ribosomes that act to translate mRNA instructions into polypeptides.

302. Which of the following elements helps in maintaining the structure of ribosomes?
(a) Molybdenum (b) Magnesium
(c) Zinc (d) Copper

NEET-2020 Phase-II

Ans. (b) : Magnesium help to stabilizer the interaction between the rRNA and proteins in the ribosomal subunit and also help to maintain the conformation of the decoding center, where the codon-anticodon pairing occurs. Magnesium ion also involved in translation like tRNA selection and GTP hydrolysis and maintaining the structure of ribosome.

303. Which is the correct sequence of modification and transport of secretary vesicles?
(a) RER → Cell membrane → Secretary vesicles → Golgi body
(b) RER → Secretary vesicles → Golgi body→ Cell membrane
(c) RER → Golgi body → Secretary vesicles → Cell membrane
(d) SER → Golgi body → Cell membrane → Secretary vesicles

JIPMER-2019

Ans. (c) : The correct sequence of modification and transport of secretary vesicles is –
RER → Golgi body → Secretary vesicles → Cell membrane

304. Choose the functions of Cytoskeleton
I. Formation of cell plate during cell division
II. Mechanical support
III. Cell motility
IV. Intercellular transport
The correct answer is
Options:
(a) I, III (b) II, IV
(c) III, IV (d) II, III

AP EAMCET-25.04.2018 Shift-II

Ans. (d) : Cytoskeletal are extremely minute, fibrous and tubular structure which forms the structural frame work inside the cell.
Cytoskeletal structure maintain shape of the cell and its extensions, regulate orientation and distribution of cell organelles, intracellular transport and movement of cells.
They are three types-
1. Microfilaments
2. Intermediate filaments
3. Microtubules.

305. The movement of ribosome along the length of mRNA is called
(a) transcription (b) transfection
(c) transformation (d) translocation

Tripura JEE-2018

Ans. (d) : Ribosome attaches to the mRNA, reads the triplet codon and adds the amino acid to the chain and move along the mRNA to read the next codon. this movement of ribosome along the length of mRNA is called translocation.
Transcription - It is the process in which a DNA sequence is transcribed into an RNA molecule with the help of enzyme RNA polymerase.

306. Statement I Microtubules are formed only in animal cells.
Statement II Microtubules are made up of a protein called myosin.

@apna_pdf

Choose the correct option

(a) Statement I is correct and statement II is incorrect.
(b) Statement II is correct and statement I is incorrect.
(c) Both statements are correct.
(d) Both statements are incorrect.

JIPMER-2017

Ans. (d) : Microtubules are polymers of tubulin that form part of cytoskeleton & provide shape to eukaryotic cells. They are formed by polymerization of globular proteins & tubulin into protofilaments that can associate to from hollow tube called microtubule. If is made up of proteins called tubulin.

307. A cell organelle which lacks membrane, consists of 65% rRNA, 35% proteins and helps in protein synthesis is____

(a) Nucleus (b) Nucleoid
(c) Ribosome (d) Nucleolus

MHT CET-2017

Ans. (c) : Ribosomes non-membrane organelles. Ribosome also known as Protein factory Ribosomes are 70S in Prokaryotes while 80S in eukaryotes. It has 2 Subunits small subunit and large subunit. It consists of 65% RNA and 35% protein. It helps in translation of mRNA to protein.

308. Which of the cell organelle lacks membrane

(a) Mesosome (b) Mitochondria
(c) Ribosome (d) Liposome

AIPMT (Re-Exam)-2015
WB JEE-2010
Rajasthan PMT-1996

Ans. (c) : Ribosome is the spherical structure that originate in nucleus and attached to endoplasmic reticulum.
They composed of ribonucleic acid and protein.
Liposome - It is an aqueous compartment enclosed by a bimolecular membrane typically of phospholipids, a lipid vesicles. Mesosomes are found in bacterial cells. These are similar to the eukaryotic mitochondria.

309. Tubulin protein occur in

(a) enzymes of kreb's cycle
(b) rough endoplasmic reticulum
(c) microtubules
(d) microfilaments

BVP-2010
AMU-2003

Ans. (c) : Tubulin protein occur in microtubules. A tubulin subunit contain one α-tubulin molecule and one β-tubulin. This αβ dimmer is 80-100 Å long assemble into dynamic microtubules and perform multiple important cellular function such as structural support, pathway for transport and force generation in cell division.
Microfilaments → They are implicated in the transport of various viral proteins and complexes also known as actin filament.

310. What used to described as Nissl's granules in a nerve cell are now identified as

(a) cell metabolites (b) fat granules
(c) ribosomes (d) mitochondria

Uttarakhand PMT-2007

Ans. (c) : Nissl's granules in a nerve cell are now identified as ribosome. They are found in the neurons which are nerve cells. It is specially found in nervous tissue. It is absent in sarcoplasm which is muscle cell. Their function is to synthesize the protein.

311. The primary function of intermediate filament is

(a) generate movement
(b) provide mechanical stability
(c) transport organelles within the cell
(d) stabilize microtubules against disassembly

Manipal-2011

Ans. (b) : The primary function of intermediate filament is provide mechanical stability. It contrast actin filament and micro tubules.

312. The cytoskeleton in plant cell is composed of

(a) microtubules
(b) microfilaments
(c) intermediate filaments
(d) All of the above

UP CPMT-2012

Ans. (d) : Cytoskeleton is a microscopic network of protein filament and tubules the cytoplasm.
The cytoskeleton in plant cells is composed of microtubules, microfilaments and intermediate filaments.
Microtubules - It is formed of tubulin protein which helps in chromosomal movement during cell division.
Intermediate filaments - These are cytoskeletal structure components present in the cell of vertebrates and many invertebrates.

313. In an animal cell, protein synthesis takes place

(a) only on the ribosomes protein in the cytosol
(b) only on the ribosomes attached to nuclear an envelope and endoplasmic reticulum
(c) on ribosomes present in the nucleolus as well as in cytoplasm
(d) on ribosomes present in the cytoplasm as well as in the mitochondria

AFMC-2007

Ans. (d): In an animal cell, protein synthesis takes place on ribosome present in the cytoplasm as well as in the mitochondria.
Protein are synthesized in the cytoplasm.

314. Which of the following is the site of translation of the mRNA?

(a) Nucleus (b) Nucleolus
(c) Golgi body (d) Ribosomes

J&K CET-2012

Ans. (d) : Ribosome is the site of translation of the mRNA. mRNA is a type of single stranded RNA involved in protein synthesis. The role of mRNA is carry protein information from the DNA in a cell's nucleus to the cell's cytoplasm.
Translation is the process in which proteins are produced using mRNA molecules as templates. It takes place in 3stpes initiation elongation and termination.

@apna_pdf

315. The plane of cell wall formation in a dividing cell is determined by

(a) Golgi apparatus
(b) Microfilaments
(c) microtubules
(d) endoplasmic reticulum

J&K CET-2012

Ans. (c): Microtubule of phragmoplast spreads in the cytoplasm as the cell plate expands.
Cell plate form centre to periphery (centrifugal) cell plate forms during telophase and cytokinesis in plants.

316. Normal pH of protoplasm

(a) 7.8 (b) 6.8
(c) 5 (d) 6.5

CG PMT-2007

Ans. (b) : In plant cell pH of protoplasm is considered 6.8 protoplasm is explained as the organic and inorganic substances that constitute the living the nucleus, cytoplasm, plastids, and mitochondria of the cell.

317. The thylakoid in chloroplast are arranged as :

(a) Interconnected disc (b) interconnected sacs
(c) stacked discs (d) none

Haryana PMT-2005

Ans. (c) : The thylakoid membrane forms a network of flattened discs called thylakoid, which are frequently arranged in stacks called grana. It is arranged in stacked discs. It also involved in the water oxidation or photolysis of water resulting in the release of oxygen during photosynthesis.
On the inner face of thylakoid membrane, there are present minute granular structures called quantasomes.

318. Site of formation of ribosomal precursor or ribosomal sub-units in a cell

(a) nucleus (b) nucleolus
(c) nucleus body (d) stroma

Manipal-2013

Ans. (b) : In a cell nucleolus is the site of the formation of ribosomal precursor or ribosomal subunits. It consists of RNA and proteins which form around specific chromosomal regions.
Nucleolus is called store house of RNA and play important role in cell division.

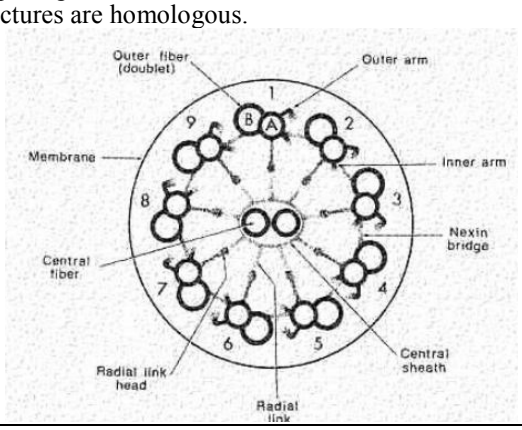
319. The usual axonemal arrangement of microtubules is

(a) 6 pairs of doublets radially arranged at periphery with a pair of centrally located microtubules
(b) 6 pairs of doublets radially arranged at periphery with a single centrally located microtubule
(c) 9 pairs of doublets radially arranged at periphery with a pair of centrally located microtubules
(d) 9 pairs of doublets radially arranged at periphery with a single centrally located microtubule

AMU-2012

Ans. (c) : The usual a axonemal arrangement of microtubules is 9 Pairs of doublets radically arranged at periphery with a pair of centrally located microtubules.

Axonemal - An axoneme, also called an axial filament axonems arise from a basal granule, the blepharoplast or kinetosome.
Blepharoplasts are derived from centrioles as the two structures are homologous.



320. Cell organelle common in Monera and Protista.

(a) Lysosome (b) Chloroplast
(c) Ribosome (d) Vacuole

VMMC-2010
AMU-2003

Ans. (c) : Cell organelle common in Monera and protista is Ribosome.
Monera - It is a biological kingdom that is made up of prokayotes. It is composed of single celled organisms that lack of a nucleus but have 70s type is Ribosome.
Protista – It is simple eukaryotic organism that are neither plants nor animals or fungi. Protista is unicellular in nature and have 80s type Ribosome.

321. Ribosomes are attached to endoplasmic reticulum through

(a) Ribophorin (b) Ribophorin I & II
(c) Peptidyl transferase (d) tRNA

J&K CET-2007

Ans. (b) : Ribosomes are attached to endoplasmic reticulum through glycoproteins know as Ribophorin I and II
Ribophorin - It is the ribosomes receptor protein or the transmembrane glycoprotein which has a dome like shape which is not protein in the smooth endoplasmic-reticulum but is situated in the rough endoplasmic reticulum.

322. Which is more important for photosynthesis?

(a) Chloroplast (b) Chlorophyll
(c) Plastid (d) Radiant energy

CG PMT-2011

Ans. (a) : Chloroplast is more important for photosynthesis. It is found in all green plant and algae. They are the food producers of plants. These are found in mesophyll cells located in the leaves of the plants. They contain a high concentration of chlorophyll that traps sunlight. This cell organelle is not present in animal cells.

323. Chromoplast contains pigment other than.

(a) Chlorophyll (b) Anthocyanin
(c) β – carotene (d) Xanthophylls

CG PMT-2010

@apna_pdf

Ans. (d) : Chromoplast contains pigment other than chlorophyll. It is a kind of plastid. It lacks chlorophyll and has carotenoids and xanthophylls they impart specific colours to fruits and flowers.
Anthocyanin- It is water soluble vacuolar pigments that depending on their pH value. It is a red bluish in colour.

324. Which of the following helps in maintenance of cell shape
(a) Plasmalemma (b) Endoplasmic reticulum
(c) Cytoskeleton (d) Mesosome
Rajasthan PMT-2011

Ans. (c) : The cytoskeleton is a structure that helps cells maintain their shape and internal organization, and it also provides mechanical support that enables cells to carry out essential functions like division and movement there is no signal cytoskeleton component.

325. In Euglena, the proteinaceous substance that surrounds the slender part of chromatophore:
(a) pyrenophore (b) pyrenoid
(c) paramylem (d) pyrethroid
AP EAMCET-1999

Ans. (b) : In Euglena have proteinaceous substance is made up of pyrenoid that surrounds the slender part of chromatophore.
Pyrethroid-It is chemicals that kill insects including mosquitoes.

326. The Sub-units of 80S ribosome will be
(a) 40S, 40S (b) 60S, 40S
(c) 60S, 20S (d) 55S, 25S
JIPMER-2016, 1996
DUMET-2008
CG PMT-2005

Ans. (b) : A prokaryotic ribosome (70S) is made up of two subunits 50S and 30S while an eukaryotic ribosome (80S) is made up of two subunits 60S and 40S.
Both smaller and larger subunits are attached to presence of mg ion.

327. The two subunits of ribosome remain united at a critical ion level of :
(a) magnesium (b) calcium
(c) copper (d) manganese
BHU PMT (Screening)-2010
AIPMT-2008

Ans. (a) : The two subunits of ribosomes unite only during the process of translation. **Magnesium ion** is essential for binding the ribosome subunits. The value is 1 to 2 millimoles for eukaryotes and 0.5 millimoles for prokaryotes. The subunits separate below this concentration.

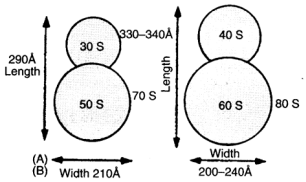


Fig. Ribosomes : (A) Prokaryotic, (B) Eukaryotic

Disintegration of ribosome units occurs at a magnesium ion value of 0.5 millimoles in eukaryotes and below 0.3 millimoles in prokaryotes. The ribosome form dimers when magnesium concentration is higher.

328. The smallest cell organelles, known as protein factories, discovered by George Palade in animal cell in 1953 are
(a) Sphaerosomes (b) Endoplamic reticulum
(c) Ribosomes (d) Dictyosomes
UP CPMT-2014

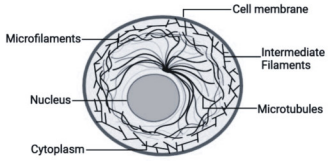
Ans. (c): Geoge palade (1953) discovered smallest cell organelles in animal cell under electron microscope and called paladie's particles . These are Ribosomes which occur either cytoplasm or remain attached with the membrane of endoplasmic reticulum and nucleus. These are referred as protein factories.

329. A complex of ribosomes attached to a single strand of RNA is konwn as
(a) OKazaki fragment (b) Polysome
(c) Polymer (d) Polypeptide
NEET-2016 Phase-I

Ans. (b) : Single strand of ribosome on mRNA molecule during translation is known as **Polysome**. Polysomes are connected by a single molecule of mRNA that is being translated simultaneously by many closely spaced ribosomes.
Polymers are large molecules composed of many monomer units.
Polypeptide is large linear polymer of amino acids bonded together by **peptide linkage.** During DNA replication fragments present on lagging strand called Okazaki fragments.

330. An eleborate network of filamentous proteinaceous structures present in the cytoplasm which helps in the maintenance of cell shape is called.
(a) Cytoskeleton
(b) Thylakoid
(c) Endosplasmic Reticulum
(d) Plasmalemma
AIPMT (Mains)-2010

Ans. (a) : The cytoskelton are fundamental components of all Eukaryotic cell. It is made up of protein which helps in the maintenance of cell shape is called cytoskeleton.
They are of three type -
1. Intermediate filament
2. Actin filament
3. Microtubules.



- Thylakoid are membrane blound compartments inside chloroplast and cynobacteria. It is the site of the light dependent reactions of photosynthesis.
- Plasmalemma is a very thin membrane, composed of lipids and protein that surrounds the cytoplasm of a cell, and control the passage of substance.
- The endoplasmic reticulum is tubular network of membranes found within the cytoplasm of the eukaryotic cell.

@apna_pdf

331. Cytoskeleton is made up of :
(a) Proteinaceous filaments
(b) Calcium carbonate granules
(c) Calluse deposits
(d) Cellulose microfibrils

AIPMT-2009

Ans. (a) : Cytoskeleton is made up of proteinaceous filaments. It is a network of filamentous structures which constitute the supportive structures of the cell. The term cytoskeleton was first coined by **Koltzoff in 1928**. Cytoskeletal structures are of three in types microtubules, microfilaments and intermediate fibers. They are made up of proteins like tubulin, actin, desmin protein myosin etc.

332. In which cell orgenelles a lipoprotein covering is absent?
(a) Ribosomes (b) Lysosomes
(c) Mitochondria (d) Peroxisomes

UP CPMT-2006

Ans. (a) : Ribosomes is one of the cell organelles in which lipoprotein covering is absents**.** It are large non–membranous RNA protein complexes which are necessary for protein synthesis. These are dense granules of 150to 200 A^o diameters (as revealed by electron microspore) and found either in free state or attached to the outside of cytoplasmic membrane just like that of ER or nuclear membrane etc. through ribophorins.
These are also called **Palade particles** as in animal cell first of all observed by Palade in 1955. In plant however these are reported two year early i.e in 1953 by **Robinson and Brown** in bean root.

333. Ribosome may also be called
(a) Microsome (b) Dictyosome
(c) Ribonucleo protein (d) Oxysomes

VMMC-2007
Rajasthan PMT-1999, 2006
UPCPMT-2002

Ans. (c) : Ribosome is also called as Ribonucleoprotein. It is protein manufacturing naked granular nucleo protein organelles made up of rRNA and proteins. Oxysomes are found within mitochondria and are concerned with synthesis of ATP through oxidative phosphorylation.
In plant cell and lower invertebrates Golgi complex called dictyosomes .
■ Microsomes refer to cellular membrane which is recovered through differential centrifugation.

334. Site of formation of ribosomal precursor or ribosomal subunits in cell is
(a) nucleus (b) nucleolus
(c) nucleus body (d) stroma

BVP-2010

Ans. (b) : Nucleolus is spherical structure found in cells nucleus. Its primary function is to produce and assemble cells ribosome. It is the site of ribosomal RNA genes. Its main function is synthesis of RNA ribosome biogenesis.
But exact mechanism of biogenesis of 70S type of ribosomes is less know. Perhaps the cell membrane and genophore play importance role in biogenesis.

335. A non-proteinaceous enzyme is
(a) lysozyme (b) ribozyme
(c) ligase (d) deoxyribonuclease

NEET-2016 Phase-II

Ans. (b) : All enzyme are protein except ribozyme. Ribozyme is the only non proteinaceous enzyme, while lysozyme, deoxyribonuclease, ligase and all other enzymes are proteinaceous enzyme.
• Ribozyme is a form of ribosomal RNA (23S r-RNA) which acts as a catalyst in splicing of RNA during protein synthesis.

336. DNA is not present in :-
(a) Ribosomes (b) Nucleus
(c) Mitochondria (d) Chloroplast

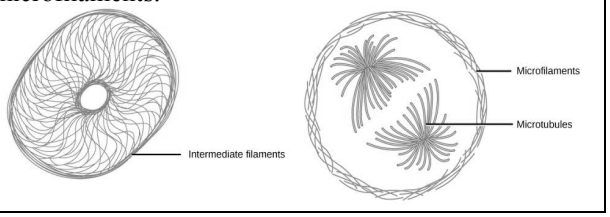
AIPMT-2015

Ans. (a) : Ribosomes do not contain DNA. It is organelles that are responsible for protein synthesis.
DNA is mainly found in the nucleus, however, extra nuclear DNA is found in certain organelles. Mitochondrial DNA is significant in maternal Inheritance, where as chloroplast DNA consists of gene important for photosynthesis.

337. The solid linear cytoskeletal elements having a diameter of 6 nm and made up of a single type of monomer are known as:
(a) Microtubules (b) Microfilaments
(c) Intermediate filaments (d) Lamins

AIPMT-2014

Ans. (b) : The solid linear cytoskeletal elements having a diameter of 6nm and made up of a single type of monomer are known as microfilaments. They are ultramicroscopic long, narrow, cylindrical rods or protein filaments which occur in eukaryotic plant and animal cells.
Microfilament are made up of actin constituting 10-15% of total cell protein. Cyclosis is caused by the activity of microfilaments.



338. Which of the following ions are necessary for assembly of microtubules?
(a) Na^+ and K^+ (b) Ca^{2+} and Cl^+
(c) Ca^+ and Mg^{2+} (d) Na^+ and Ca^{2+}

AIIMS-2011

Ans. (c) : Microtubules is a polymers of tubulin protein. Microtubules are unbranched hollow tubules of indefinite length about 25 nm in thickness with 15 nm core and boundary formed 13 helically arranged photo filaments of globular molecules of α and β tubules.The assembly is accompanied by the hydrolysis of GTP to GDP. The phosphorylatoin of tubulin by a cyclic Amp dependent kinase favors the polymerization. GTP, Ca^{2+} ions and Mg^+ are necessary for assembly of microtubules.

@apna_pdf

339. Which one of the following structure is an organelle within an organelle?
(a) Ribosome (b) Peroxysome
(c) ER (d) Mesosome

AIIMS-2015

Ans. (a) : Ribosomes, are smalls dances rounded and granular partical of Ribonucleo protein.
Ribosomes are found in matrix, cytoplasm and chloroplast and also attached with R.E.R and Nuclear membrane.
Ribosomes are present in both prokaryotic and eukaryotic cell.
In eukaryotic cells 80S ribosome (organelles) are attached to rough Endoplasmic Reticulum (ER) which is an organelle. It is also present in the organelles chloroplast (in plant cells) and mitochondria.

340. Polyribosomes are aggregates of:
(a) ribosomes and rRNA
(b) only rRNA
(c) peroxisomes
(d) several ribosomes held together by string of mRNA

AIPMT-1989

Ans. (d) : During protein synthesis several ribosomes held together by string of mRNA ribosomes are the side of protein synthesis.

341. Main component of ribosome are
(a) DNA and RNA (b) RNA and protein
(c) DNA and protein (d) protein and lipids

JCECE-2007
DUMET-2004
Rajasthan PMT - 1995

Ans. (b) : Ribosome first observed by Robinson and Brown [1953] in bean roots. They are present freely in cytoplasm in prokaryotes while present in cytoplasmic matrix in eukaryotes. It is composed of rRNA and Proteins. Ribosomes are also known as Protein factory as they synthesize Proteins in cell. Ribosomes attached to E.R for synthesis of protein.

342. Protein synthesis in an animal cell occurs
(a) only on the ribosomes present in cytosol
(b) on ribosomes present in cytoplasm as well as in mitochondria
(c) only on ribosomes attached to the nuclear envelope and endoplasmic reticulum
(d) on ribosomes present in the nucleolus as well as in cytoplasm

JIPMER-2007
Uttarakhand PMT-2010

Ans. (b) : Protein synthesis takes place in ribosomes in cytoplasm as well as in mitochondria in animal cell. Mitochondrial protein synthesis is essential for oxidative phosphorylations. The process of protein synthesis is known as translation mRNA synthesis occurs in nucleus get transported to cytoplasm where synthesis takes place.

343. Golgi apparatus : (A) Transports and modifies material. (B) Secrete mucin in respiratory tract. (C) Secretes slime in insectivorous plants. What is correct ?
(a) Wrong A, correct B and C
(b) Wrong B, correct A and C
(c) Wrong B and C, correct A
(d) Wrong none, correct all

J&K CET-2005
Punjab MET-2007

Ans. (d) : Golgi complex functions as a factory in which proteins received from ER. They processed and sorted for transport to destinations like lysosomes, plasma membrane. Golgi body secrete mucin in respiratory tract secretes slime in insectivorous plants.

344. Ribosomes that occur exclusively in mitochondria is:
(a) 70S (b) 55S
(c) 30S (d) 50S

DUMET-2004

Ans. (b) : Organellar ribosome from mitochondria and chloroplast are smaller than Cytoplasmic ribosomes. Mitochondrial Ribosomes are 55S. Proteins that are imported into mitochondria, are synthesized in ribosomes. Ribosome are cell organelles that responsible for protein synthesis.

345. The cytoskeleton in plant cell is composed of
(a) microtubules (b) microfilaments
(c) intermediate filaments (d) All of the above

UP CPMT-2012

Ans. (d) : Cytoskeleton is an intracellular network of protein filaments present in cytoplasm. There are three types of cytoskeletal fibres microtubules, intermediate filaments and micro filaments.

346. Ribosomes are essential for protein synthesis, but they are present in Mitochondria and plastids, the sites of respiration and photosynthesis. What is the role of ribosomes in these cell organelles
(a) Ribosomes transport ATP formed in Respiration and photosytnesis to cytoplasm through E.R.
(b) Sub units of some required proteins are synthesised in these organelles
(c) Ribosomes transpors RNA and DNA to cytoplasm
(d) All the above are correct

AP EAMCET-2015

Ans. (b) : Ribosomes are known as protein factory & contains large Riboncleoprotein consisting of RNA& Protein that translate mRNA into polypeptides. Ribosome contains rRNA and r-proteins which are termed as large subunit or small subunit.

Chloroplast	70S	5S, 23S/16S
Mitochondria	55S	16S/12S

347. In ribosomes letter S signifies:
(a) sedimentation coefficient
(b) Svedbergs constant
(c) both (a) and (b)
(d) none of the above

J&K CET-2001

Ans. (c) : In Ribosomes Letter S signifies (svedberg's unit stands for the sedimentation coefficient. It is indirectly a measure of density and size.

@apna_pdf

348. Number of protofilament in microtubule is

(a) 13 (b) 12
(c) 5 (d) 10

DUMET-2007

Ans. (a) : Number of protofilament in microtubule is 13. These 13 protofilaments arranged parallel with same polarity singlet microtubule is common in cytosol but specialized microtubule exists as doublets or triplets microtubule structure.

349. Formation of polysome does not require

(a) rRNA (b) mRNA
(c) tRNA (d) snRNA

WB JEE-2014

Ans. (d) : Polysomes are formed during elongation of protein synthesis. Multiple Ribosomes move along the coding region of mRNA, creating a Polysomes. The ability of multiple Ribosomes to function on an mRNA molecule explains limited abundance of mRNA in cell. In this process, mRNA is used as strand and tRNA , rRNA are also used but snRNA doesn't required.

350. Calmodulein is a calcium protein complex in microtubules and microfilaments. It is involved in :

(a) cell- differenciation (b) synthesis of ATP
(c) breakdown of ATP (d) cell motility

BVP-2006

Ans. (d) : Calcium ions are mediated by Calmodulin protein. Calmodulin plays an role in excitation contraction, coupling, cell motility, shape and division.

351. Who among the following discovered microtubules ?

(a) de Robertis and Franchi
(b) Watson and Crick
(c) Ziner and Lederberg
(d) Boveri and Van Beneden

BVP-2006

Ans. (a) : " De Robertis & franchi" in 1953 discovered microtubules in Axoplasm of nerve Fibres. Microtubules are hollow, cylindrical structures & fibres. It is an important role in cell motility microtubule is made up of tubulin heterodimer composed of 250 Kda Sbunits known as α-Tubulin & β-Tubulin.

352. Microfilaments are long, thin, contractile rods(solid) of 6-10 nm diameter. These help in :

(a) movement of cell membrane during mobility and endocytosis
(b) contraction of muscles, functioning of microvilli and undulation of cell membrane
(c) cytoplasmic streming, cleavage of animal celt formation of pseudopodia
(d) all of the above

BVP-2006

Ans. (d) : Microfilament or Actin filament is long, thin contractile rods of 6-10 nm diameter. It is made up of actin binding protein called cross linking protein. It has binding site for nucleotide. It helps in movement of cell membrane during Endocytosis & cell motility, contraction of muscles, functioning of microvillis and undulation of cell membrane, cytoplasmic streaming cleavage of animal cell, formation of Pseudopodia are its functions.

353. Out of the given following cell structure which show polarity is :

(a) microtubules (b) mitochondria
(c) endoplasmic reticulum (d) microbodies

BVP-2006

Ans. (a) : The polarity of the microtubule exists not only at the two ends of filament, but all along the length of its lattice. Microtubules are intrinsically polar fibers, polar microtubules overlap near equatorial plane of Spindle. Microtubules have two distinct ends fast growing plus end slow growing plus end.

354. Which type of ribosomes are found in Nostoc cells?

(a) 50S (b) 60S
(c) 70S (d) Eukaryotic

CMC Vellore - 2011 / CG PMT-2004

Ans. (c) : Nostoc is a cyanobacteria (Prokaryotes) Hence, Ribosomes of Nostoc is prokaryotic which is 70S type Ribosomes in which smaller subunit is 30S and larger submit is 50S.

355. Which among the following can be seen only under the electron microscope?

(a) Chloroplast (b) Ribosome
(c) Leucoplast (d) Nucleus

CG PMT-2004

Ans. (b) : Ribosome is the only structure seen under electron microscope whereas chloroplast leucoplast and nucleus are seen compound microscope.

356. Microtubule is involved in the

(a) cell division
(b) DNA recognition
(c) muscle contraction
(d) membrane architecture

Punjab MET-2010

Ans. (a) : Microtubules are made of alpha and beta tubulin protein that bind together to form chain called protofilament. 13-Protofilament arrange into a cylindrical pattern to form a microtubule.
Microtubules main function is - cell movement cell division, cell transport.

M. Cilia and Flagella

357. Which are the sites of ATPase activity in the cilia and flagella?

(a) Base of cilia and flagella
(b) Doublets
(c) Basal granules of cilia and flagella
(d) Dynein arms

AP EAMCET-11.07.2022 Shift-II
TS EAMCET-09.05.2019 Shift-I
TS EAMCET-02.05.2018 Shift-II
AP EAMCET-28.04.2017 Shift-II
BCECE-2010 / AP EAMCET-2007/ DUMET-2007

Ans. (d) : Dynein arms are the sites of ATPase activity in the cilia and flagella. Dyneins are a family of cytoskeletal motor proteins that move along microtubules in cells. They convert the chemical energy stored in ATP to mechanical work.
Doublet is formed by tubuline protofilaments and other structural proteins such as actins.

@apna_pdf

358. Match the following

List -I		List-II	
A	Stichonematic	I	Monas
B	Pantonematic	II	Urceolus
C	Acronematic	III	Astasia
D	Anematic	IV	Polytoma
		V	Cryptomonas

The correct match is

	A	B	C	D
(a)	I	V	III	II
(b)	III	I	IV	V
(c)	II	III	I	IV
(d)	IV	II	III	I

TS EAMCET-08.05.2019 Shift-II
TS EAMCET-29.09.2020 Shift-II
TS EAMCET-15.05.2016
TS EAMCET-12.05.2017

Ans. (b) : On the basis of arrangement of mastigonemes and nature of axial filament, there are five types of flagella:-
Stichonematic:- Mastigonemes are present on one side of flagella. eg. Astasia
Pantonematic:- Two or more rows of mastigonemes are present on both sides of flagellum eg. Monas
Acronematic:- Mastigonemes absent & distal end of flagellum. eg. Polytoma
Anematic:- Flagellum is simple without mastigonemes. eg cryptomonas

359. Flagella of prokaryotic and eukaryotic cells differ in
(a) Type of movement and placement in cell
(b) Location in cell and mode of functioning
(c) Micro-tubular organization and type of movement
(d) Micro-tubular organization and function

CMC Ludhiana-2009
Manipal-2007
AIPMT-2004
MANIPAL-2014
AFMC-2008

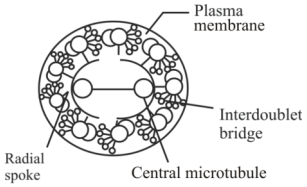
Ans. (c) : Flagella of prokaryotic and eukaryotic cells differ in micro-tubular organisation and type of movement.
Prokaryotic- They are in single-celled microganism. They are known to be the earliest on the earth. They also included Bacteria and arechaea. There microtubule organization is (9 + 0)
Eukarytotic- They have nuclear membrane. It has mitochondria, Golgi bodies and cell wall. There microtubule organization is (9 + 2)

360. The sequential movement of cilia, in a longitudinal row, one after the other in one direction is called
(a) Undulation movement
(b) Synchronous movement
(c) Metachronous movement
(d) Effective stroke

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Metachronous movement the sequential movement of cilia in a longitudinal row, one after the other in one direction is called Metachronous movement.
Synchronous-Movement cilia in a raw beat sequentially.

361. In the below diagram, identify the part which connects the peripheral microtubules to the central sheath.



(a) Plasma membrane (b) Interdoublet bridge
(c) Central microtubule (d) Radial spoke

Karnataka CET-2020

Ans. (d) : Radial spokes connected peripheral microtubules to the central sheath of cilia and flagella of eukaryotic cells. There are nine radial spokes. Radial spokes are made up of protein and least 23 proteins that works as a mechanochemical transducer between central - pair apparatus and peripheral microtubule.

362. Cross bridges between peripheral microtubules of cilia and flagella are made up of motor protein _____.
(a) myosin (b) actin
(c) dynein (d) keratin

MHT CET-06.10.2020 Shift-I

Ans. (c) : Cross bridges between peripheral microtubules of cilia and flagella are made up of motor protein dynein. It is cytoskeleton motor protein which Dynein arms convert the chemical energy stored in ATP to mechanical work.
Actin-It is the main cytoskeleton components of dendritic spines. It has abundant protein in eukaryotic cells.

363. If the flagellum is provided with two or more rows of lateral appendages and the axoneme ends in a terminal naked filament, then it belongs to this type
(a) Pantonematic (b) Stichonematic
(c) Pantacronematic (d) Acronematic

TS EAMCET-02.05.2018 Shift-I

Ans. (c) : On the basis of arrangement of mastigonemes the flagella are five type. Stichonematic, Acronematic, Anematic, Pantonematic, Pantacronemati. There is presence of two or more rows of lateral appendages and axonemes ends in terminal naked filament, then it belongs to pantocronematic type.

364. Choose the correct statements with reference to flagella
(A) Do not unite to form cirri
(B) Found all over the body
(C) Perform undular movements
(D) Perform pendular movements
(a) A & D (b) A & C
(c) B & C (d) C & D

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Flagella are microscopic hair- like structure involved in locomotion of a cell. They do not unite to form cirri that know as undulating, membrane and perform undulation movements in Paragoans. Protozoans while cilia show rowing type movement.

@apna_pdf

365. What is common between a eukaryotic and prokaryotic flagella?
(a) Same structure
(b) Both are used for locomotion
(c) Composed of same proteins
(d) Both are extension of cell membrane

JIPMER-2018

Ans. (b) : Prokaryotic flagella are made up of flagellin while eukaryotic flagella are made up of tubulin. Flagella of prokaryotes is proton driven whereas eukaryotic flagella is ATP driven. But both are used for locomotion.

366. The cell organelle involved in the formation of a flagellum / cilium
(a) Mitochondria (b) Lysosome
(c) Basal granula (d) Golgi complex

TS EAMCET-12.05.2017

Ans. (c) : Basal granule also known as kinetosome. It is a protein structure found at the base of a eukaryotic cilium or flagellum. Basal body serves as a site for growth of the axonem function. Basal bodies arises from central of the centrosome.

367. Electron microscopic study of cilium and flagellum revealed that they are covered with plasma membrane and the core structure is called "axoneme", possesses a number of microtubules running parallel to the long axis. How many number of microtubule arrays are arranged peripherally and centrally
(a) 9 + 2 (b) 8 + 4
(c) 9 + 3 (d) 8 + 2

TS EAMCET-12.05.2017

Ans. (a) : Flagella is locomotory organ in prokaryotes and eukaryotes but it is different in Prokaryotes & Eukaryotes.
The core of flagellum called Axoneme, Possesses of number of microtubules running parallel to the long axis. The axoneme usually has nine doublets of radially arranged peripheral microtubules and pair of centrally located microtubules. Such an arrangement of axonemal microtubules is referred to as the 9 + 2 array.

368. The number of microtubules in a flagellum including those sharing three protofilaments with each other is
(a) 11 (b) 20
(c) 22 (d) 10

DUMET-2010

Ans. (b) : Number of microtubules in a flagellum including those sharing three protofilaments with each other are 20.
Microtubules are made of alpha and beta tubulin protein that bind together to form chain called protofilament. It can cooperate with other proteins or function independently.

369. The filaments present in cilia and flagella are composed of:
(a) microtubules (b) microfilaments
(c) microfibrils (d) microvilli

VMMC-2006

Ans. (a) : The filaments present in cilia and flagella are composed of microtubules they are and autonomically made up of microtubules which are arranged in a 9 + 2 pattern. Their core, called the axoneme possesses a number of microtubles running parallel to the long axis
Microvilli are small finger-like projections found in same cells which help in increasing the surface area of absorption.
Micofibrils are small fimbrae found in the cytoplasm. They are normally made up of glycoproteins and cellulose.

370. An organism exclusively with 70 S type of ribosomes contains one of the following:
(a) DNA enclosed within a nuclear membrane
(b) Circular naked DNA
(c) Double stranded DNA with Protein coat
(d) Single stranded DNA with Protein coat

AP EAMCET-2004

Ans. (b) : An organism exclusively with 70 s type of ribosomes found in prokaryotic and contains circular naked DNA. It can form a closed loop DNA that has no ends. such types of DNA is only found in the cytoplasm of most prokaryotic cells.

371. Ribosomal RNA (rRNA) is synthesized in
(a) nucleolus (b) nucleosome
(c) cytoplasm (d) ribosome

CG PMT-2009

Ans. (a) : Ribosomal RNA (rRNA) is synthesized nucleolus. It appears a dense area within the nucleus. The site of rRNA, transcription and processing and of ribosome assembly is nucleolus. They are most important organelles that are found in both prokaryotic cells and eukaryotic cells.
Nucleosome is a basic structural unit of DNA.
Its structure consist of a segment of DNA wound around eight histone proteins and resemble thread wrapped around a spool.

372. The number of RNA molecules in 60S sub – particles of 80 S ribosomes are
(a) five (b) four
(c) three (d) two

CG PMT-2009

Ans. (c) : The number of RNA molecules in 60S sub particles of 80S ribosome are three 60S subunit:- 28S rRNA, 5S rRNA, 5.8S rRNA.
RNA is Ribonucleic acid and helps in the synthesis of proteins It also responsible for the production of new cells in the body. RNA also have genetic nature like DNA. This is called genetic RNA.

373. Bacterial flagella do not show ATPase activity and 9 + 2 organization. These are chemically :
(a) Flagellin (b) pilin
(c) tubulin (d) bacterin

AFMC-2006
Uttarakhand PMT-2007

Ans. (a) : Bacterial flagella do not show ATPase activity and 9+2 organization. These are chemically Flagellin.
Pilin are hair like appendages structure and found on archaea and bacteria. They are also known as long Fimbriae protein.

@apna_pdf

374. Term basal body is associated with the development of

(a) cilia and flagella (b) cell plate
(c) phragmoplast (d) kinetochore

VMMC-2007

Ans. (a) : Term basal body is associated with the development of cilia and flagella. It is a protein structure found at the base of cilium or flagellum. It is formed from several protein structures.

Kinetochore - They have assemble of large protein that connect chromosomes to microtubules of the meiotic spindles in order to separate the replicated genome from a mother cell to their daughter.

Phragmoplast - It builds a cell wall between daughter cells. It is a plant cell definite structure that forms during late cytokinesis.

375. The spindle microtubules are polar, their orientation is

(a) + and – both ends toward the equator
(b) + end towards the poles
(c) – ends towards the poles
(d) + and – both ends towards the poles

AMU-2003

Ans. (c) : The spindle microtubules are polar, their orientation is '–' ends towards the poles and '+' end toward kinetochores. Their poles dictate where duplicated chromatids are transported at anaphase of mitotic cell division.

376. Cilia are:

(a) short (5-10μm) hair like narrow protoplasmic processes
(b) with sweeping or pendular movements
(c) more numerous
(d) all of the above

J&K CET-2004

Ans. (d) : Cilia are small membrane bound organelle found on most types of eukaryotic cell Known as cilia. Cilia are absent in bacteria & archaea. Cilia are small, (5-10μm) slender, hair-like structure present on surface of all mammalian cells. But Infusoria (Protozoa) cilia made appendices or cirri that know as undulating, membranes. They play major role in locomotion. They are involved in mechanoreceptors.

There are 2 types of cilia-Motile cilia and non-motile cilia.

377. Flagella with single strand and composed of flagellin is found in:

(a) prokaryotes (b) eukaryotes
(c) both (a) and (b) (d) none of the above

J&K CET-2002

Ans. (a) : Prokaryotic flagellum spins, creating forward movement by corkscrew shaped filament. Prokaryotes have one or several flagella, localized to one pole. It is composed of flagellin proteins. ATP synthase not required in prokaryotic because. flagellum protein utilize the energy by proton process power.

378. Prokaryotic flagella are having

(a) unit membrane-enclosed fibre.
(b) helically arranged protein molecule
(c) microtubular 9+2 membrane enclosed structure
(d) protein membrane enclosed fibre.

AMU-1995

Ans. (b) : Prokaryotic flagella are composed of protein "flagellin" arranged in helical chains. That intertwine and form a helix around at to identify certain pathogenic bacteria unlike eukaryotes, the filaments are not covered by membranes or sheath. Each filament has rotator motor at its base which turn clockwise or counterclockwise it provides motility to bacteria.

379. Male gemetes are flagellated in :

(a) Anabaena (b) Ectocarpus
(c) Spirogyra (d) Polysiphonia

AIPMT-2015

Ans. (b) : Male gametes are flagellated in Ectocarpus. Ectocarpus is a filamentous marine brown algae which is heterotrichous in nature. Motile reproductive cell have two lateral or sub apical flagella one directed forward and other backward.

In Spirogyra the male gametes are non flagellated and show amoeboid movement.

Polysiphonia is a small upright bushy marine algae that also produces non-flagellated spermatia.

Anabaena is a cynobacteria, they mostly reproduce asexually by Binary fission, fragmentation, endospore formation.

380. The motile bacteria are able to move by

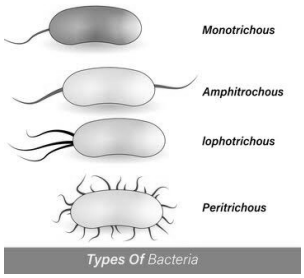
(a) Fimbriae (b) Flagella
(c) Cilia (d) Pili

AIPMT-2014

Ans. (b) : Flagella is a whip-like appendage present on the surface of the bacteria. It is made up of a **flagellin protein.** Locomotion are three types of movement in bacteria.

(a) Flagellar movement- Prokaryotic flagellum move from base body either clockwise or counter clockwise.
(b) Spirocaetial movement such as flexing, spinning free swimming.
(c) Gliding movement found in cyanobacteria and mycoplasma show gliding movement

- Cilia are small hair-like protuberances on the outside of eukaryotic cells. They are primarily responsible for locomotion, either of the cell itself or of fluids on the cell surface.



- Pili are hair like proteinaceous, filamentous polymeric organelles expressed on the surface of bacteria and involved in bacterial conjugation.

381. The filament in flagellum can rotate by:

(a) 360º (b) 60º
(c) 120º (d) 80º

BCECE-2015

@apna_pdf

Ans. (a) : Bacterial flagella are helical filament, a proximal at its base associated with the cell wall and cytoplasmic membrane and structures contains flagellin. Flagellum rotates in clockwise or anticlockwise direction. Flagella rotate clockwise as bacteria rotate flagella clockwise at 360°.

382. Principle protein of cillia and flagella is :

(a) globulin (b) fibrin
(c) flagellin (d) tubulin

BVP-2014/MGIMS Wardha-2006/AP EAMCET-2001

Ans. (d) : There are two principle cytoskeletal and motor proteins i.e. tubulin & dyenein these were found & first described in cilia & flagella. Eukaryotic cilia & flagella is composed of 9 + 2 arrangement. Tubulin protein forms a core structure of microtubules. Major function of these structure are in cell motility.

N. Centrosome and Centrioles

383. Arrange the types of chromosomes based on length of the arms and centromere from the given characteristics respectively.
Terminal centromere, one long arm
Extreme short arm, two equal arms

(a) Metacentric, submetacentric, Telocentric, Acrocentric
(b) Telocentric, Submetacentric, Acrocentric, Metacentric
(c) Acrocentric, Metacentric, Submetacentric, Telocentric
(d) Telocentric, Metacentric, Acrocentric, Submetacentric

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : The types of chromosomes based on the length of the arms and centromere are–

- **Telocentric–** It have one arm and one centromere. It gives terminal appearance along centromere.
- **Submetacentric–** It have two unequal arms. It contain one shorter and one longer arm.
- **Acrocentric–** In this position, centromere is located close to one end of the chromosome, resulting one very short and one very long arm.
- **Metacentric–** It have two equal arms. Centromere located in the middle of the chromosome, dividing it into two identical arms.

384. Match List-I with List-II.

	List-I		List-II
(A)	**Metacentric chromosome**	**(i)**	**Centromere situated close to the end forming one extremely short and one very long arms**
(B)	**Acrocentric chromosome**	**(ii)**	**Centromere at the terminal end**
(C)	**Submetacentric**	**(iii)**	**Centromere in the middle forming two equal arms of chromosomes**
(D)	**Telocentric chromosome**	**(iv)**	**Centromere slightly away from the middle forming one shorter arm and one longer arm**

Choose the correct answer from the options given below :

(a) (A)-(i), (B)-(ii), (C)-(iii), (D)-(iv)
(b) (A)-(iii), (B)-(i), (C)-(iv), (D)-(ii)
(c) (A)-(i), (B)-(iii), (C)-(ii), (D)-(iv)
(d) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)

NEET-2022

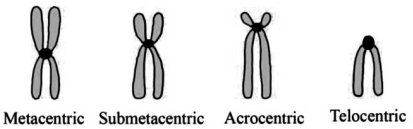
Ans. (b) : Metacentric - Chromosome have a Centromere in the middle of chromosome and divided the chromosome into two equal arms the shape of the metacentric chromosome is X shape.

Acrocentric - The centromere is present near the end of chromosomes one extremely short and one very long arms. J chromosomes are acrocentric in human.

Submetacentric Chromosome - Centromere slightly away from the middle or forming one shorter arm and one longer arm. It is an L or J - shaped chromosome most chromosomes in humans are submetacentric, and X chromosome also found.

Telocentric Chromosome - It is not observed in human. They have centromere present at the terminal of the chromosome. The shorter arm is rarely visible, shape of the chromosome at anaphase is like the letter i.

Types of Chromosomes



385. Study the following statements and find correct answer.

(A) In centriole the peripheral fibril is a triplet and are connected with central part by protein materials.
(B) Large and more numerous nucleoli are present in the cells of active protein synthesising cells as they are membrane bound structures.
(C) The density and size of ribosomes are represented by their Svedberg units which indicate their sedimentation coefficients.
(D) The carotenoid pigments are yellow or orange and not soluble in water.

Options:

(a) A,B,C (b) A,C,D
(c) B,C,D (d) B,D

AP EAMCET-28.04.2017 Shift-II

Ans. (b) : In centriole, peripheral fibril is triplet & connected with central part by proteinaceous material called "Hub". Hub and spoke is part of centriole.

Density and size of ribosomes are represented by their sevederg units which indicate their sedimentation coefficients.

@apna_pdf

Carotenoids pigments are yellow or orange and not soluble in water.

Large and more numerous nucleoli are present in the cells of active protein synthesising cells as they are not membrane bound structures.

386. Which is not a intracellular compartment in the cell?

(a) Nucleus (b) Mitochondria
(c) Chloroplast (d) Centriole

BVP-2010

Ans. (d) : Centriole are not considered intracellular compartment because they do not form any compartment in a cell. Their structure are paired barrel-shaped organelles situated in the cytoplasm of animal cells near the nuclear envelope. They also play an important role in determine the locations of the nucleus and other organelles within cell.

387. Plants cell differs from an animal cell in the absence of

(a) endoplasmic rericulum
(b) mitochondria
(c) ribosomes
(d) centrioles

AMU-2012
BHU PMT (Mains)-2011
UP CPMT-2007

Ans. (d) : Plant cell differs from an animal cell in the absence of centrioles. They are cylindrical in structure. They involve in cell division. Plant cells lack centrioles where as animal cells possess centrioles.

Animal cell have lysosomes but plant cell lack lysosomes.

388. When the centromere of a chromosome is located near the tip of the chromosome, the position is described as :

(a) acrocentric (b) metacentric
(c) telocentric (d) acentric

JIPMER-1999

Ans. (c) : When the centrosome of a chromosome is located near the tip of the chromosome then, the position is discribed as telocentric. Due to the above condition, it has only one arm. It is not present in human.

Metacentric- It is a chromosome that centromere is centrally located. As a result, its arms are almost equal in length there are 'v' shaped, chromosome.

Acrocentric – Acrocentric chromosome the centromere is situated close to its end forming one extremely short and one very long arm.

Acentric– centromere is absent.

389. Replication of centriole occurs during

(a) interphase (b) prophase
(c) late prophase (d) late telophase

Manipal-2008
BCECE-2014
Uttarakhand PMT-2008

Ans. (a) : Replication of centriole occurs during interphase, They also help in the formation of spindle fibers that separate the chromosomes during cell division. They always found in pairs and move towards the poles of the nucleus when occur time for cell division, During 'S' phase of the interphase, they separate and produce two pairs of centriols and DNA also replication.

390. The flagellumin Astasia is:

(a) pantonematic (b) acronematic
(c) pantacronematic (d) stichonematic

AP EAMCET-2002

Ans. (d) : The flagellumin Astasia and euglena is stichonematic type. The structure of Astasia is a hair like structure that works primarily as an organelle of locomotion in the cells of living organism.

Pantonematic - Two rows or more than two rows of mastigorenes are present on both sides of the flagellum is called pantonematic e.g pyronema.

391. Astral rays are formed of

(a) Micro-filaments (b) Microtubules
(c) Intermediate filaments (d) Microvilli

VMMC-2008

Ans. (b) : Astral rays are formed of microtubules. It is composed of radiate, microtubule from the centrosphere and appear like a cloud. It bodies are produced by centriole during cell division and attach with centromere of the chromosome.

Microvilli - They are small finger like projections that are present on the surface of select epithelial cells. They are setelled in parallel bundles. They are located in some areas of both body cell.

392. Human sperm cells move by means of a

(a) Dlium (b) Flagellum
(c) Basal body (d) Hair

CG PMT-2010

Ans. (b) : Human sperm cells move by means of a basal body. When sperm cells are formed, this process known as spermatogensis. During sparmiogenesis the spermaties develop into mature sperm having head and tail. Tail of sperm is consist of complex axial filament and their arrangement is (9+2) tail consist of neck middle piece. Principle piece and end piece. This process takes place in the male body mature cells can survive for up to 5 day in the female reproductive system after ejaculation sperm cell cannot segregate and have a limited lifespan, but after fusion with egg cells during fertilization, a new organism begins developing.

393. Microtubules are the constituents of

(a) Centrosome, Nucleosome and Centrioles
(b) Cilia, Flagella and Peroxisomes
(c) Spindle fibres, Centrioles and Cilia
(d) Centrioles, Spindle fibres and Chromatin.

NEET-2016 Phase-I

Ans. (c) : Microtubules is structural component of spindle fibre, cillia, Flagella, centriole etc.

Microtubules are tubuline polymers, part of cytoskeleton, which provide structure and shape of eukaryotic cells. **Spindle Fibres** from the protein structure which helps of mitosis and meiosis.

Centrioles are the two cylindrical structures of a cell organelle called centrosome.

Cillia and **Flagella** are fine hair like outgrowths of the membrane.

While peroxisomes are microbodies.

@apna_pdf

394. Centrioles (imicrocentrosoem or cell centre) is :
(a) microtubuler and membraneles
(b) absent in Amoeba, red algae, blue-green algae, conifers and angiosperm and made up of a peripheral implet microtubular
(c) basically locomotary and their role in spindle formation is secondary
(d) all of the above

Uttarakhand PMT-2006

Ans. (d) : Centriole is barred shaped polarized structure made up of microtubules. Present in animal cells, fungi and some algae Absent in plant cells. Composed of nine triplet microtubule (9 + 0) arrangement. Central part is proteinaceous & called hub. They are basically locomotory in function & their role is spindle fibre formation is secondary.

395. The following structure is NOT found in plant cells
(a) vacuole (b) nucleus
(c) centriole (d) endoplasmic reticulum

KVPY (SA)-2011

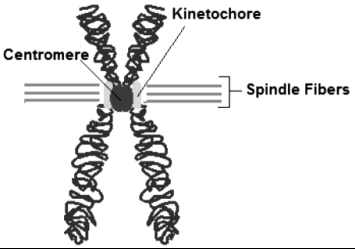
Ans. (c) : Centriole is present in animals but absent in plant cells. Hence it is a characterstic of animal cell. It plays important role in cell division, movement and spindle fibre formation during cell cycle.

396. Centromere is required for –
(a) Movement of chromosomes towards poles
(b) Cytoplasmic cleavage
(c) Crossing over
(d) Transcription

JIPMER-2007
AIPMT-2005, 1994

Ans. (a) : The centromere is the part of the chromosomes, where two sister chromatid are attached and it is site for attachment of spindle fiber.

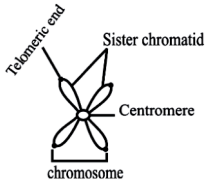
- Centromere help in proper alignment and segregation of the chromosomes during the process of cell division in eukaryotic cell.
- Their physical role is to act as the site of assembly of the kinetochore, a highly complex multi protein structure that is responsible for actual events of chromosome segregation. On the basis of centromere location, chromosomes are four type such as metacentric, submetacentric, acrocentric, telocentic.



397. Which of the following occurs more than one and less than five in a chromosome
(a) Chromatid (b) Chromomere
(c) Centromere (d) Telomere

Jipmer-2002
AIPMT-2002

Ans. (d) : Each chromatid have one telomeric end. Telomere are present both ends of each chromosome and protect genome from nucleolytic degradation.
Telomere is a cap like structure present at the end of each strand of DNA. It protects the chromosomes from sticking to another chromosome.



398. The modified cell organelle involved in the formation of cilia and flagellum
(a) Golgi complex (b) Centriole
(c) Stigma (d) Nucleolus

AP EAMCET-2016

Ans. (b) : The modified cell organelle involved in the formation of cilia and flagellum are Centriole. It is barrel- shaped polarized structure made up of microtubules present in animal cell. It is composed of nine triplet microtubules in (9 + 0) arrangement. Pair of centrioles present in MTOC (microtubule organizing centre) known as centrosome. It is modified cell orgnelle involved in cilia & flagella formation.

399. Organelle important in spindle formation during nuclear division is:
(a) Golgibody (b) chloroplast
(c) centriole (d) mitochondrion

J&K CET-2005

Ans. (c) : Centrioles play an important role in spindle fibre formation during cell division. When cell is going to divide those centrioles go to opposite ends of the nucleus. Centrioles form areas that mitotic spindle forms & in completion of cytokinesis centrioles can self replicate during cell division at S -phase.

400. A cell organelle lacks its own DNA, however it is able to replicate. It is
(a) centriole (b) ribosome
(c) nucleolus (d) peroxysomes

BVP-2014, 2013

Ans. (a) : Centriole lacks its own DNA but is able to replicate itself by centrosome cycle. Process of centrosome duplication & separation is known as centrosome cycle. During interphase of each cell cycle, centrioles & other components of centrosomes are duplicated. It also uses semiconservative mechanism of duplication.

401. In cells, centrioles occur:
(a) singly (b) in duplets
(c) in triplets (d) none of these

J&K CET-2001

Ans. (c) : Centrioles is barrel shaped structure made up of microtubule the wall of each centriole are composed of nine triplet mierotubule (9 + 0) arrangement. In animal cells centrioles organize the pericentriolar material to produce microtubules including mitotic spindle fibres.

@apna_pdf

O. Nucleus and Microbodies

402. L-shaped chromosomes are also called

(a) acrocentric (b) telocentric
(c) sub-metacentric (d) None of the above

JIPMER-2009 / Haryana PMT-2011
UP CPMT-2012, 2008 / VMMC-2012
Uttarakhand PMT-2008
BHU PMT (Screening)-2008
CGPMT-2008, 2004
Manipal–2008 / BVP - 2007
BHU PMT-2004 / UP CPMT-2003
UP CPMT-2012 / CG PMT – 2008 / BVP - 2007

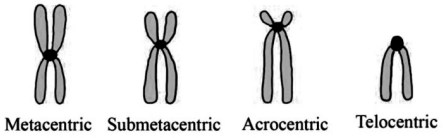
Ans. (c) : Submetacentric Chromosome - Centromere slightly away from the middle forming one shorter arm and one longer arm. it is an L - shaped chromosome most chromosomes in humans are submetacentric, and X chromosome also found.

Metacentric - Chromosome have a Centromere in the middle of chromosome and divided the chrosome into two equal arms the shape of the metacentric chromosome is V shape.

Acrocentric - The centromere is present near the end of chromosomes one extremely short and one very long arms. J chromosomes are acrocentric in human.

Telocentric Chromosome - It is not observed in human. They have centromere present at the end of the chromosome. The shorter arm is rarely visible, shape of the chromosome at anaphase is like the letter i.

Types of Chromosomes



403. The nucleus is separated from surrounding cytosplasm by a nuclear membrane, which is

(a) single layered with pores
(b) single layered without pores
(c) double layered with pores
(d) double layered without pores

Punjab MET-2004 / VMMC-2004
HP CET-2012 / Manipal-2000
Manipal-2012

Ans. (c) : Nuclear membrane, which is double layered with pores that separates the nucleus from cytoplasm of cell. The nuclear pore complex are very specific and made up of 30 different protein called nucleoprotein. The nuclear pore complex is help in transport of material from nucleus to cytoplasm and vice-versa.

404. Balbiani rings are the structural features of

(a) allosomes
(b) autosomes
(c) polytene chromosomes
(d) Lampbrush chromosomes

JIPMER – 2008 / Punjab MET – 2006
Karnataka CET-2004
Manipal-2011, 2002

Ans. (c) : Balbiani rings are the structural features of polytene chromosomes. Balbiani rings are locations for RNA synthesis, Which are found on the polytene chromosome in the form of large puffs in the diptera *Chironomus tentans*. These puffs help to studies of the structure of active genes, and transport of structure of active genes, and transport of specific RNA-protein (RNP) particles.

405. If centromere is the middle, the chromosome is called :

(a) sub-metacentric (b) metacentric
(c) acentric (d) telocentric

CG PMT-2007
MGIMS Wardha-2005
UP CPMT-2005
AMU-2002

Ans. (b) : If centromere is the middle, the chromosome is called metacentric. It is a chromosome whose centromere is centrally located and divide the chromosome into two equal parts arms.

406. Giant chromosomes are found inside

(a) nucleus of man
(b) oocytes of frog
(c) salivary glands of silk moth
(d) salivary glands of Drosophila

BCECE-2014
DUMET-2006
CG PMT-2004
AMU-2002

Ans. (d) : Giant chromosomes are found inside salivary glands of drasophila. They have only two pair chromosomes. Female Drosophila have two 'X' chromosomes and male drosophila have one 'X' and one 'Y' chromosomes.

407. Centromere is a part of:

(a) ribosomes
(b) mitochondria
(c) chromosome
(d) endoplasmic reticulum

HP CET-2013
VMMC-2003
BHU PMT-2002
Haryana PMT - 2000

Ans. (c) : Centromere is a part of chromosome where sister chromatids are attached. This constricted region of chromosome connects the sister chromatids, creating a short arm (p) and a long (q) on the chromatias. It plays an important role in the cell division.

408. A non - staining secondary constriction at a constant location of few chromosomes is called

(a) Centromere (b) Short arm
(c) Satellite (d) Kinetochore

AP EAPCET-22.05.2023, Shift-I

Ans. (c) : A satellite is a repetitive DNA sequence located near the centromere of certain chromosomes. It appears as a small extension from the main chromosome body when stained and observed under a microscope. It helps in stabilizing chromosome and proper division during cell replication but it's exact function is still not known.

@apna_pdf

409. Match the following?

Chromosomes		Centromere		Chromatids	
A.	Metacentric	i.	Nearer to one end	P.	Extremely short and long
B.	Telocentric	ii.	Middle	Q.	One arm
C.	Submetacentric	iii.	Close to its end	R.	Two equal arms
D.	Acrocentric	iv.	Terminal	S.	One short one long

Options:

(a) (A-i-P), (B-ii-R), (C-iii-Q), (D-iv-S)
(b) (A-ii-R), (B-iii-Q), (C-iv-P), (D-i-S)
(c) (A-ii-R), (B-iv-Q), (C-i-S), (D-iii-P)
(d) (A-iv-Q), (B-i-P), (C-ii-R), (D-iii-S)

MHT CET-08.10.2020 Shift-I
AP EAMCET-03.09.2021 Shift-II

Ans. (c) : The metacentric chromosome has middle centromere forming two equal arms.

- The sub-metacentric chromosome has centromere slightly away from the middle of the chromosome resulting into one shorter arm and one longer arm.
- Acrocentric chromosome, the centromere is situated close to its one end forming one extremely short and long arm.
- Telocentric chromosome has terminal centromere.

410. Fill in the blanks with suitable words respectively.

Each chromosome has a _____ or _____ on the sides, disc shaped structure is called _____ . The _____ chromosome has two equal arms, _____ chromosome has one shorter and one long arm. _____ chromosome has no second arm. The secondary constriction develop small fragment called _____.

(A) metacentric
(B) telocentric
(C) centromere
(D) primary constriction
(E) submetacentric
(F) satellite
(G) kinetochore

Options:

(a) A, C, B, D, G, E, F
(b) D, C, G, A, E, B, F
(c) B, A, C, D, G, E, F
(d) B, A, D, G, C, E, F

TS EAMCET-09.08.2021 Shift-I

Ans. (b) : Each chromosome has a primary constriction or centromere on the sides, disc shaped structure is called kinetochore. The metacentric chromosome has two equal arms, submetacentric chromosome has one shorter and one long arm. Telocentirc chromosome has no second arm. The secondary constriction develop small fragment called satellite.

411. Telomere has a unique property of _____.

(a) condensation of chromatin network.
(b) prevention of ends of the chromosomes from sticking together.
(c) attaching to spindle fibres.
(d) regulation of protein synthesis

MHT CET 5.10.2020 Shift-I

Ans. (b) : Telomere has a unique property of prevention of ends of the chromosomes from sticking together. These are nucleotide sequences found at both ends of each chromosome which protect the genetic information.

412. In prokaryotes both transcription and translation take place in cytoplasm as there is no _____.

(a) chromosome (b) nucleus
(c) ATP (d) ribosome

MHT CET-07.10.2020 Shift-I

Ans. (b) : In prokaryotes both transcription and translation take place in cytoplasm as there is no nucleus.
Transcription is continuous process and occurs in the cytoplasm. In prokaryotes only single type of RNA polymerase is used to synthesize RNA molecules.

413. The nuclear size does NOT depend on _____.

(a) volume of the cell
(b) shape of the cell
(c) amount of proteins
(d) amount of DNA

MHT CET-08.10.2020 Shift-I

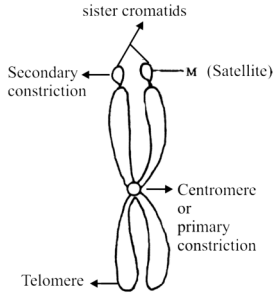
Ans. (b) : Nuclear size depends on mass, volume of cell amount of proteins & DNA but not on shape of the cell.

414. Identify the part labelled as 'M' in the diagram given below :

(a) Kinetochore (b) Satellite
(c) Chromatid (d) Centromere

Karnataka CET-2019

Ans. (b) : The Labelled part 'M' in the diagram is satellite.
Besides primary constriction or centromere a chromosome may have or more secondary constriction. a secondary constriction present near the distal part of an arm may develops a small out growth or fragment called satellite.
A chromosome having satellite is called sat chromosome. Sat chromosomes are called marker chromosomes.



@apna_pdf

415. Nucleolus is an organelle responsible for the production of

(a) carbohydrates (b) messenger RNA
(c) lipids (d) ribosomal RNA

NEET-2018
UPCPMT-2013
KVPY SB & SX-2013

Ans. (d) : Nucleolus is an cell organell responsibal for the production of ribosomal RNA. Nucleolus described by F. Fontana. It is a non-membrane bound structure which disappears in late prophase & reappears in Telophase stage of cell division. Each nucleolus is produced by a Nucleolar organizing Region (NOR) of a chromosome. In humans chromosome 13, 14, 15, 21 & 22 contain rRNA genes in a region called Nucleolar organizing region (NOR).

416. A chromosome in which the centromere is situated close to its end so that one arm is very short and the other very long is

(a) acrocentric (b) metacentric
(c) sub-metacentric (d) telocentric

JIPMER-2017
DUMET-2009

Ans. (a) : A chromosome in which the centromere is situated close to its end so that are arm is very short and the other very long is acrocentric.

- Metacentric chromosome is present in the middle of the chromosome and divides the chromosome into p and q arms in equal parts.
- Telocentric chromosome has a terminal centromere.

417. The____is a primary constriction

(a) Telomere (b) Sarcomere
(c) Chromomere (d) Centromere

MHT CET-2017

Ans. (d) : Centromere is the site of primary constriction of a chromosomes. It play a key role in helping the cell division. It the region where the spindle fibers attach.

418. What is the approximate size of nucleus in a typical mammalian cell?

(a) 2.2 meter (b) 1.2 meter
(c) 10^{-4} meter (d) 10^{-6} meter

MHT CET-2017

Ans. (d) : In a mammalian cell, nucleus is largest organelle Approximate size of nucleus in mammalian cell is 10μ i.e. 10^{-6}m. The size of nucleus is variable. In metabolically active cell size of nucleus is larger than metabolically inactive cell.

419. Spindles are formed by:

(a) microtubules (b) endoplasmic reticulum
(c) golgi body (d) peroxisomes

Rajasthan PMT-2004

Ans. (a) : Spindles are formed by microtubule. They are bipolar fibrous in structure that are composed mainly of microtubule. They are composed of tubulin protein. Spindles arise from centriole in animal cell. Spindles forms during cell division to divide sister chromatids between daughter cells. They include the spindle microtubles, associated proteins.

420. Balbiani rings are the centre for

(a) DNA synthesis (b) RNA synthesis
(c) Both (a) and (b) (d) None of the above

AIPMT-1993 / BCECE-2011

Ans. (b) : Balbiani rings are the centre for RNA and Protein synthesis. Polytene chromosomes were fist observed by Balbiani (1881) chironomus (dipteran larva) and also called salivary chromosomes because have been seen salivary gland of larvae. They are large puffs on the polytene chromosome. These puffs are suited to studies of the active gene and transport of specific RNA protein particles. They are ring like in the structure.

421. The point at which polytene chromosome appear, to be attached together is called

(a) centriole (b) centromere
(c) chromomere (d) chromocentre

AMU-2006 / Karnataka CET-2006
Punjab MET-2003

Ans. (d) : The point at which polytene chromosome appear, to be attached together is called chromocentre. They contain pecentromeric regions of DNA. Proteins are also present in Chromocentre region.
Chromomere is also known asidiomere Beads like structure appear on a chromosome during prophase of meiosis' and mitosis. They car be use in genetic and evolution any studies .

422. Connecting link of characters between one generation to another generation is :

(a) nucleus (b) nucleic acid
(c) chromosome (d) none of these

Rajasthan PMT-1996

Ans. (c) : Connecting link of characters between one generation to another generation is chromosome. Chromosomes are thread like in structure that made of protein and single DNA. They help to carry the genomic information from cells to cell. chromosome are stained by acetocarmine some colorful dyes.

423. Genes are present on

(a) chromosomes (b) lamellae
(c) plasma membrane (d) mesosomes

UP CPMT-2003

Ans. (a) : Genes are present on chromosomes. It carry hereditary from parents to offspring. They direct the synthesis of structure protein and thus help the cell grow, divide and maintain itself. Chromosomes play important role is sex determination, heredity mutation, and evolution.

- **Plasma membrane** - It is the outermost covering of the cell. It is also called cell membrane. It is found in all cells that separate interior cell from the outside cell.
- **Mesosomes** - It is a special membranous structure which is form by extensions of plasma membrane. They help in cell wall formation, DNA replication and distribution of daughter cell.

424. The shape of chromosome is determined by

(a) centrosome (b) centromere
(c) chromomere (d) telomere]

BVP-2008
Uttarakhand PMT-2007
UP CPMT-2001

@apna_pdf

Ans. (b) : The shape of chromosome is determined by location of centromere. Chromosomes are the area of chromatin that have been compacted during cell division thread like structure of chromatin reticulum become visible as independent structure through localized contraction.
Telomere-They found at both ends of each chromosome, and protect genome from nucleolytic degradation.

425. The long and short arms of chromosome are designated respectively as
(a) p and q arms (b) q and p arms
(c) m and p arms (d) *l* and s arms
DUMET-2010

Ans. (b) : The long and short arms of chromosome are designated respectively as q and p arms. Here, 'p' refers to 'Petit' which is small arm and 'q' refers to long arm. Both are separated by centromere.

426. Nucleus of Monocystis is :
(a) Bilobed (b) Spherical
(c) Multilobed (d) Bean shaped
Uttarakhand PMT-2004

Ans. (b) : Nucleus of monocystis is spherical. Monocytis is a genes of parasitic protozoa that belongs to the phylum Apicoplexa. They are primarily found in the digestive system of earthworm, where they live as endoparasites.

427. Which of the following is stained using carmine?
(a) Bacteria (b) Diatoms
(c) Chromosomes (d) Viruses
BHU PMT (Screening)-2009
Uttarakhand PMT-2009

Ans. (c) : Chromosome is stained using carmine. carmine is a red-purple in colour. That is obtained from an insect called cochineal belonging to the family Dactylopious due to the aluminium complex, present in the carminic acid, is red in colour. It is used in the production of artificial flowers, paints, cosmetics, medications and inks.

428. Microsatellites are
(a) Repetitive DNA sequences (b) ESTs
(c) YAC (d) BAC
(e) UTR
Kerala PMT-2015

Ans. (a) : Microsatellites are repetitive DNA sequences found in the genome of various organisms. These are sequence of non-coding DNA. The repeating units consists of 1-6 base-pairs of DNA. They are widely used as genetic markers in paternity tests and population genetics studies.

429. Lampbrush chromosomes are seen in which typical stage:
(a) mitotic anaphase (b) mitotic prophase
(c) mitotic metaphase (d) meiotic prophase
JIPMER-2003

Ans. (d) : Lampbrush chromosomes are seen in meiotic prophase stage. Lamp brush chromosomes are found in the nuclei of oocyte of vertebrates like fish, reptiles and amphibians. They appear like a lamp cleaning brush. They are found in the developing occytes of most animals, with the exception of mammals. They were described in 1882 by 'Walther Flemming and Ruckert'.

430. Nucleolus is a :
(a) round structure present near the nucleus in cytoplasm
(b) round structure composed of r-RNA situated in the nucleus
(c) rod-shaped structure present near the nucleus in cytoplasm
(d) none of the above
Punjab MET - 2007
Rajasthan PMT-1998

Ans. (b) : Nucleolus is round structure composed of r-RNA situated in the nucleus. It is found in the nucleus of cell whose primary action is to produce and assemble the cell's ribosomes. It is best known as the site of ribosome biogenesis.

431. Two homologous chromosome are connected at
(a) telomere (b) chromomere
(c) centromere (d) sineptonemal mixture
Rajasthan PMT-1998

Ans. (c) : Two homologous chromosome connected at centromere. It is a constricted region of DNA. Centromere plays an essential role in the segregation of chromosome during the process of the cell cycle in eukaryotic cells. Centromere is the site for attachment of spindle fibre. They play important role in the production of new cell.

432. The space separating the two membranes around the nucleus is called
(a) Endonuclear space (b) Exonuclear space
(c) Matric space (d) Perinuclear space
AMU-1999

Ans. (d) : The space separating the two membranes around the nucleus is called perinuclear space, it describe the distance between the nuclear envelope's inner and outer membranes. It's cells space is about 10-50 nm shape(100Å - 500 Å).

433. Haploid number of chromosomes in a cell are 10, what will be the number of pairs of homologous chromosomes:
(a) 5 (b) 10
(c) 15 (d) 20
Rajasthan PMT-1998

Ans. (b) : Haploid number of chromosomes in a cell are 10, while the number of pair of homologous chromosomes are 10. Two chromosomes of homologous in pair are normally one inherited from the mother and one from the father.

434. The haploid complement of chromosomes of an organism constitutes
(a) genome (b) genotype
(c) phenotype (d) genetic system
CG PMT-2007

Ans. (a) : The haploid complement of chromosomes of an organism is genome. It shows the complete information of an organism which encoded in its DNA. Human have 23 different type of chromosome out of these 22 pair are autosomal chromosomes in addition. There are X and Y chromosomes. Chromosome determines the sex of human.

@apna_pdf

A phenotype is described as the observable trait of an organism which is the result of the interaction of genes and environmental factors. It is defined as the sum of observable characteristics of an organism.

435. Micro bodies differ from lysosomes in that

(a) micro bodies are surrounded by a single unit membrane, while lysosome membrane is double
(b) micro bodies are surrounded by double membrane, while lysosome membrane is single unit
(c) micro bodies contain lytic enzymes, while lysosomes do not
(d) lysosomes contain lytic enzymes, while micro bodies do not

CG PMT-2007

Ans. (d) : Microbodies differ from lysosomes because lysosomes contain lytic enzymes, while micro bodies do not contain lytic enzymes. Lysosome show polymorphism.

436. The function of centrosome is

(a) to inhibit cell division
(b) to initiate cell division
(c) to increase protein synthesis
(d) None of the above

BVP-2008
CG PMT-2007

Ans. (b) : The function of centrosome is to initiate cell division. It made up of two perpendicular centrioles a mother and daughter centrioles. They help in cell division and maintain the chromosome number during cell division. Fungi and plants do not relate centrosomes.

437. The chromosomes as thread like structures in nucleus was first described by

(a) Mendel (b) Strasburger
(c) Darwin (d) Levitzky

CG PMT-2007

Ans. (b) : The chromosomes as thread like structures in nucleus was first described by Strasburger (1875).

438. Lamp brush chromosomes are found inside

(a) salivary glands of drosophila
(b) salivary glands of silk moth
(c) oocytes of frog
(d) nucleus of man

CG PMT-2007
JIPMER-2001

Ans. (c) : Lampbrush chromosomes are found inside oocytes of frog, lamp brush chromosomes do not present in mammals. They are largest chromosomes found in the yolk rich oocytes nuclei of certain vertebrates such as fishes, amphibians and reptiles etc. This name is given to it because it is similar in appearance to the brushes used to clean lamp, chimneys in centuries past. It was first observed by Fleming in 1882.

439. Export firm of the body is

(a) Golgi bodies (b) ER
(c) Nucleus (d) Mitochondria

Haryana PMT-2007

Ans. (a) : Export firm of the body is Golgi bodies. Golgi bodies have a factory in which protein received and further processed and sorted for transport to their eventual destinations. Their main function is the packaging and secretion of proteins. It is found in all the eukaryotic cells, plants as well as animals. Golgi complex is also called as traffic police of cell because it performed the direction of movement of substance.

440. The terminal end of chromosomes is called

(a) centromere (b) telomere
(c) chromomere (d) metamere

CG PMT-2009
Manipal-2002

Ans. (b) : The terminal end of chromosomes is called telomere. Telomeare is the polar port of chromosome it prevent the fusion of chromosomal segment to other chromosome.
Cancer cell maintain the telomere length for unlimited growth by telomerase reactivation or a recombination based mechanism.

441. When centromere is present at one end, the chromosome is

(a) metacentric (b) excentric
(c) telocentric (d) apocentric

CMC Ludhiana-2008
J&K CET-2007
AMU-2006

Ans. (c) : When centromere is present at one end, the chromosome is called telocentric or centromere position is terminal and short arm absent. The structure of telocentric chromosomes are rod shaped present in humans. They are found in dense and constricted region in a chromosome. It contains repetitive DNA sequences.

442. The exchange of one part of a chromosome to the other part of same or another chromosomes is called :

(a) linkage (b) translocation
(c) mutation (d) inversion

JIPMER-2001

Ans. (b) : The exchange of one part of a chromosome to the other part of same or another chromosomes is called translocation. When chromosomal segment is transferred from one place to another then chromosomal translocation occurs such types exchanging from one place to another is cause of infertility or cancer. Schizophrenia, muscular dystrophy and Down syndrom.

443. A nucleus pulposus is found in:

(a) skull (b) pelvic girdle
(c) neuron (d) intervertebral disc

Haryana PMT-1999

Ans. (d) : A nucleus pulposus is found in inter-vertebral disc. This disc act as cushions in between vertebrae. The spinal canal that contain spinal nerve, is directly behind the disc and the vertebral bodies.
Pelvic girdle – It's structure is ring like bony structure. It is located in the lower part of the trunk. It connects the arial skeleton to lower limbs.
Skull – The bones that surround and protect the brain is called skull. It is composed of 22 bones.
Neuron– It is responsible for receiving and sending neuro-transmitters. It is a functional unit of nervous system.

@apna_pdf

444. Four different types of chromosomes but of the same size are sequenced as:
(a) telocentric, metacentric, acrocentric submetacentric
(b) metacentric, acrocentric, submetacentric telocentric
(c) metacentric, submetacentric, acrocentric telocentric
(d) metacentric, telocentric, acrocentric, submetacentric

Haryana PMT-1999

Ans. (c) : Four different types of chromosomes but of the same size are sequenced as metacentric, sub-metacentric, acrocentric, and telocentric

445. When the chromosome has a centromere nearer to one end of the chromosome resulting into one shorter and one longer arm, the chromosome is termed as
(a) metacentric (b) sub-metacentric
(c) acrocentric (d) telocentric

AMU-2012

Ans. (b) : When the chromosome has a centromere nearer to one end of the chromosome resulting into one shorter and one longer arm, the chromosome is termed as sub-metacentric. It is a chromosome whose centromere is little away from the middle of the chromosome. The arms of chromosomal are unequal in length.

446. The controlling centre of cell is
(a) Nucleus (b) Nucleolus
(c) Mitochondria (d) Ribosome

MGIMS Wardha-2011

Ans. (a) : The controlling centre of cell is Nucleus. Nucleus contain the chromosomes. Nucleus as a cell organelle was first described by Robert Broun as early as 1831. Later the material of the nucleus stained by the basic dyos was given the name chromatin by flemming.

447. The longest chromosome is seen in
(a) Allium (b) Lilium
(c) Trillium (d) Zea mays

J&K CET-2007

Ans. (c) : The longest chromosome is seen in Trillium. It is measured 30 mm in length.
Lilium : It is a flower plants that is a genus of herbaceous flowering plants belonging to family liliaceae.
Allium : It is a flower plants that is a genus of monocotyledonous flowering plants with hundreds of species belonging to family Amaryllidaceae.

448. Nuclear membrane is continuous with
(a) rough endoplasmic reticulum
(b) smooth endoplasmic reticulum
(c) cell membrane
(d) Golgi bodies

Rajasthan PMT-2009

Ans. (a) : Nuclear membrane is continuous with rough endoplasmic reticulum. The inner and outer nuclear membrane is directly connected with the lumen of the endoplasmic reticulum. Nuclear membrane have pore which attached to RER and pass ribosomal subunits.

449. Structure of nuclear membrane helps in
(a) organisation of the spindle
(b) synapsis of homologous chromosome
(c) nucleo - cytoplasmic exchange of material
(d) anaphasic separation of daughter chromosome

UPCPMT-2002
VMMC-2007

Ans. (c) : Structure of nuclear membrane helps in nucleo-cytoplasmic exchange of material. It separates the nucleoplasm from the cytoplasm. The nuclear pore complex are very specific and made up of 30 different protein called nucleoprotein. The nuclear pore complex is help in transport of material from nucleus to cytoplasm and vice-versa.

450. Centromere is also called :
(a) chromomere
(b) secondary constriction
(c) primary constriction
(d) chromocentre

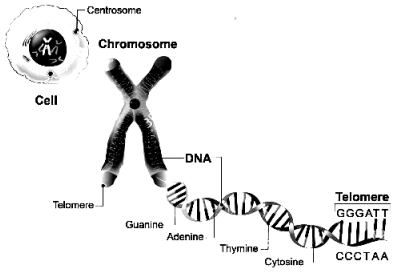
BCECE-2003

Ans. (c) : Centromere is also called primary constriction, from a mitotic chromosome structure. Where two identical sister chromatids are most closely in contact. In primary construction sister chromatids appear most tightly paired.
Secondary constriction : It is not present in all chromosomes. It plays an important role in karyology and cytology.

451. Telomere repetitive DNA sequences control the function of eukaryote chromosomes because they:
(a) Prevent chromosome loss
(b) Act as replicons
(c) Are RNA transcription initiator
(d) Help chromosome pairing

AIPMT-2007

Ans. (a) : • Telomeres are region of repetitive nucleotide sequence associated with specialized protein at the end of linear chromosomes.
They are wide spread genetic feature most commonly found in eukaryotes.
Telomeres act as cap that protect the internal regions of the chromosomes, and they are worn down round of DNA replication.



452. The part of chromosome beyond the secondary constriction is known as
(a) Telomere (b) Centromere
(c) Chromomere (d) satellites

VMMC-2014
AP EAMCET-2001
UP CPMT-2014

@apna_pdf

Ans. (d): Satellite chromosome are chromosome that contain secondary constructs that serve as identification. They are observed in arocentric chromosomes

Terminal part of chromosome, i.e., end of chromosome is known as telomere.

Centromere - The two chromatids are attached to each other by a narrow area called centromere or primary constriction.

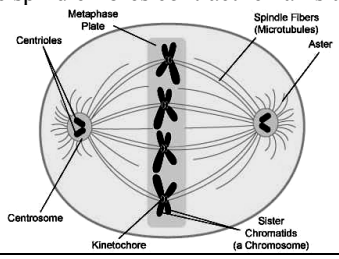
Chromomere is one of the small bead- shaped and heavily staining masses of coiled chromatin that are linearly arranged along the chromosome.

453. Spindle fibre unite with which structure of chromosomes:

(a) Chromocentre (b) Chromomere
(c) Kinetochore (d) Centriole

AIPMT-2000

Ans. (c) : Kinetochore is a protein like structure that occur on a chromatid during cell division and allows to attached a spindle fiber on chromosome. Chromosomes being attached to the J shaped spindle fibres by their centromeres. Two types of spindle fibres can be distinguished as the interpolar fibre, which stretches from the pole to the centromers (kinetochore) of an individual chromosome. The mechanism, by which the chromosomes move and the spindle fibres contract remains unclear.



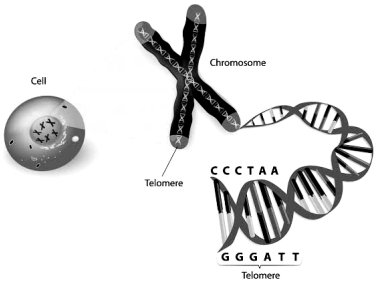
454. Function of telomeres in nucleus:

(a) Pole ward movement
(b) To initiate the RNA synthesis
(c) To seal the ends of chromosome
(d) To recognize the homologous chromosome

AIPMT-2000

Ans. (c) : Telomeres are controlled by the presence of the enzyme telomerase. A telomere is a repeating DNA sequence (for example, TTAGGG) at the end of the chromosomes.

Telomeres act as cap that protect the internal regions of the chromosomes, and they are worn down round of DNA replication. They also stop chromosomes from fusing with each other.

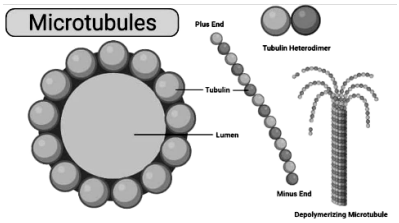


455. Role of microtubules :

(a) To help in cell division
(b) Cell membrane formation
(c) Respiration
(d) Pinocytosis

AIPMT-1998

Ans. (a) :



Microtubules are thread like structures and part of cytoskeletion that provide structural support to the cell

- They are made up of tubulin protein.
- They also help in cellular movements and movements of chromosomes during cell division by forming spindle and astral ray. They play role in cell differentiation and determination of polarity

456. Microtubules absent in : -

(a) Mitochondria (b) Flagella
(c) Spindle fibres (d) Centriole

AIPMT-2001

Ans. (a) : Microtubules are absent in mitochondria. Mitochondria are double membrane, semiautonomous eukaryotic cell organells whose function is cellular respiration.

Microtubules are present in centriole, flagella and spindle fibers.

457. The scientific term which is not related to the primary constriction of a chromosome is:

(a) centromere (b) kinomere
(c) kinetochore (d) chromomere

AP EAMCET-1999

Ans. (d) : Centromere, Kinomere Kinetochore all are the site of primary constriction of a chromosomes.

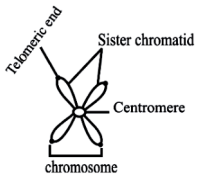
Chromomer are regions of chromatin that have been compacted through localized constriction.

458. Which of the following occurs more than one and less than five in a chromosome

(a) Chromatid (b) Chromomere
(c) Centromere (d) Telomere

AIPMT-2002

Ans. (d) : Two sister chromatids are joint by the centromere to form one chromosome



- One chromosome have one centromere.
- Each chromatid have one telomeric end. According to the question telomere is correct answer. The telomere present each chromatic end.

459. The term nucleolus was coined by:

(a) R. Brown (b) R. Hooke
(c) Bowman (d) Hanstein

AFMC-2001

@apna_pdf

Ans. (c) : The term nucleolus was coined by Bowman but first described by Fontana in 1781. Nucleolus is produced by nucleolar organizing Region (NOR) of chromosome. Nucleolus is place of formation of ribosome.

460. In nucleoplasm, a spherical body attached to particular chromosome on a definite position is called

(a) nucleolus (b) karyolymph
(c) plasmid (d) reticulum

BHU PMT (Mains)-2010

Ans. (a) : Nucleoplasm is a spherical body attached to particular chromosome on definite position is called nucleolus. It is largest nuclear organelle .It is primary site of ribosome subunit biogenesis in eukaryotic cells.

461. Plant and animal cells, both have in common:

(a) cell membrane and nucleolus
(b) cells membrane and cell wall
(c) nucleolus and chloroplast
(d) nucleus and cell wall

BVP-2005

Ans. (a) : Cell membrane and nucleolus are common organelles present in both plant & animal cell. Cell membrane also known as plasma membrane or plasmalema & found in all cells. It consists of lipid bilayer & regulates transport of materials.

462. Two sister chromatids are attached with :

(a) spindle fibre (b) centromere
(c) chromocentre (d) chromatid

BVP-2000

Ans. (b) : Two sister chomatids are held together at a constricted region of chromosome called centromere. Centromere is the region where microtubules are organized & form spindle fibres.

463. Genetically active area of chromosome is called

(a) euchromatin (b) heterochromatin
(c) heptan (d) cistron

BVP-2000

Ans. (a) : In 1928, E. Heitz coined the term euchromatin and Heterochomatin to describe the parts of chromatin that are less coiled & those remain highly coiled condensed euchromation is transcriptionally active & protein coding genes. Euchomatic regions have accessible structures characterized by histone acetylation, methylation at H3K4 and H3K9.

464. Chromosomes with equal arms are called:

(a) metacentric (b) telocentric
(c) acentric (d) polycentric

AIIMS-2000

Ans. (a) : Chromosome with equal arms called metacentric chromosome. Metacentric means centromere present at middle of chromosome.

- Sub metacentric refers to centromere slightly away from middle of chromosome.
- Acrocentric means centromere present near the end of chromosomes.
- Telocentric means centromere present at the tip.

465. Which is distributed more widely in a cell?

(a) DNA (b) RNA
(c) Chloroplasts (d) Sphaerosomes

AIPMT-1992

Ans. (b) : DNA and RNA are two types of nucleic acids. DNA gets converted into RNA by the process of transcription. m-RNA, t-RNA and r-RNA are the three types of RNA. It widely distributed in the cell cytoplasm.

466. In salivary gland chromosomes/polytene chromosomes, pairing is:

(a) Absent
(b) Occasional
(c) Formed between non-homologous chromosomes
(d) Formed between homologous chromosomes.

AIPMT-1993

Ans. (d) : In salivery gland chromosomes/polytene chromosomes, pairing is formed between homologous chromosomes. A characteristics feature of these chromosomes is that somatic pairing occurs in them and hence their number appears half of normal somatic cells. Polytene chromosomes develop from the hromosomes of diploid nucleic by successive duplication of each chromosomal element without their segregation.

467. Lowest number of chromosomes are found in :

(a) Haplopappus (b) Cyprus
(c) Salix (d) None of these

Punjab MET-2006

Ans. (a) : Haplopappus gracilis have lowest number of chromosomes, i.e. [2n = 4]. Its common name is slender golden weed. Highest number of chromosomes are found in ophioglossum reticulatum [n = 630](Pteridophyte).

468. A conspicuous rounded body present in nucleoplasm and attached to a particular chromosome at a definite place is

(a) plasmid (b) karyolymph
(c) nucleolus (d) nuclear reticulum

Punjab MET-2007

Ans. (c) : Nucleoplasm is a spherical body attached with nucleolar organizing chromosome on definite position is called nucleolus. It is largest nuclear organelle & primary site of ribosome subunit biogenesis in eukaryotic cells.

469. In the given diagram I and II indicate

s

(a) Chromomere and chromonemata
(b) Centromere and secondary constriction
(c) Secondary constriction and satellite
(d) Telomere and satellite

MHT CET-2015

Ans. (d) : In the given diagram I represent terminal end of chromosome i.e. telomere while II represents secondary constriction or satellite

@apna_pdf

470. The chromosome with centromere near the end is called____

(a) Acrocentric (b) Metacentric
(c) Sub-metacentric (d) Telocentric

MHT CET-2014

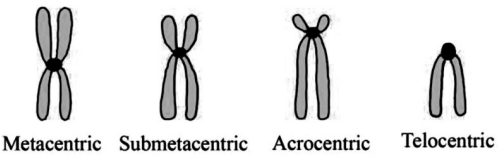
Ans. (a) : Acrocentric - The centromere is present near the end of chromosomes one extremely short and one very long arms.

Metacentric - Chromosome have a Centromere in the middle of chromosome and divided the chrosome into two equal arms the shape of the metacentric chromosome is V shape.

Submetacentric Chromosome - Centromere slightly away from the middle forming one shorter arm and one longer arm. it is an L - shaped chromosome most chromosomes in humans are submetacentric, and X chromosome also found.

Telocentric Chromosome-It is not observed in human. They have centromere present at the end of the chromosome. The shorter arm is rarely visible, shape of the chromosome at anaphase is like the letter rod like or I shape.

Types of Chromosomes



471

(a) centriole (b) kinetochore
(c) chromocentre (d) chromomere

BCECE-2001
WB JEE-2007

Ans. (b) : Knetochore is disc shaped protein structure associated with duplicated chromatids in eukaryotic cells where spindle fibres attach during cell division to pull sister chromatids. It is a large protein that connects chromosomes to microtubules of mitotic & meiotic spindles to distribute replicated genome from mother cell to its daughter cells.

472. Lampbrush chromosomes are seen in:

(a) interphase (b) zygotene
(c) diplotene (d) metaphase

JCECE-2014
Rajasthan PMT-1999
DUMET-2006

Ans. (c) : Lampbrush chromosomes was first observed by flemming in 1882 in amphibian oocytes. It develops during diplotene stage of meiotic prophase during oogenesis in oocytes of all vertebrates as well as invertebrates. These are meiotic bivalent, consisting of 2 pairs of sister chromatids held together by chiasmata. Due to pair of loops these chromosomes appears like lampbrush and hence called lampbrush chromosomes.

473. One key function of nuclear pores is to

(a) aid in the production of new nuclei
(b) allow cells to communicate with each other
(c) form connections between different organelles
(d) allow molecules like protein to move in and out of the nucleus

MGIMS Wardha-2015

Ans. (d) : Bidirectional transport of molecules occurs through nuclear pore between cytosol and nucleus. RNA molecules and ribosomal subunits are exported to cytosol while all proteins that functions in nucleus are synthesized in cytosol and then imported. Proteins imported to or exported to nucleus through nuclear pores contains specific amino acid sequence that acts as "Nuclear locolization signals"

474. The function of glyoxysome is :

(a) protein metabolism
(b) carbohydrate metabolism
(c) fat metabolism
(d) protein synthesis

DUMET-2002

Ans. (c) : In plants, glyoxisomes (type of microbodies) plays an essential role in converting fatty acids stored in germinating seeds. It contains enzymes for glyoxylate cycle through which fats are converted into carbohydrates (gluconeogenesis).

475. The function of peroxisomes is :

(a) H_2O_2 destruction
(b) conversion of fat to carbohydrates
(c) detoxification of heavy metals
(d) oxidative phosphorylation

WB JEE-2015
DUMET-2002

Ans. (a) : Peroxisomes provide protection against photo-oxidative damage. In photorespiration, glycolate transported from chloroplast into peroxisome then glycine glycolte is converted first into glyoxylate and acts to H_2O_2 to destruct. peroxisomes take part in oxidative process like reduction of reactive oxygen species eg. H_2O_2. Luciferase enzyme generating light in fire flies is also present in peroxisomes.

476. Who discovered the glyoxysome?

(a) Jenssen and Jenssen (b) Tolbert
(c) Beevers (d) Purkinje

Rajasthan PMT-1997

Ans. (c) : Harry Beever discovered glyoxysomes in 1961. Glyoxysomes are specialized peroxisomes found in plants and fungi, seeds that contain fats oils. Glyoxysomes are microbodies which occur in β oxidation of fatty acid, perform glycolate cycle, protect plant from photo-oxidation by catalase enzyme.

477. A animal cell lacks nucleus. Which one will also be absent in it?

(a) Ribosome (b) Chromosome
(c) Lysosome (d) Centriole

BVP-2014

Ans. (b) : Nucleus is primary carrier of hereditgry. In 1953 (Hammerling) conducted experiments on Acetabularia and proved that nucleus plays an important role in heredity. It can be divided into 4 parts-nuclear membrane, nucleoplasm, chromatin/ chromosomes & nucleolus.
In absence of nucleus, chromosomes also absent.

@apna_pdf

478. Which of the following does not contain DNA?
(a) Mitochondria (b) Chloroplast
(c) Peroxysome (d) Nucleus
BVP-2009
Rajasthan PMT-1997 / VMMC-2009

Ans. (c) : Peroxysomes are small, membrane enclosed orgamelle that contain enzymes involved in variety of metabolic reactions. Peroxisomes do not contain their own genomes, but mitochondria, chloroplast and nucleus are have DNA material.

479. Nucleus was discovered by:
(a) Robert Brown (b) Robert Hooke
(c) Leeuwenhoek (d) None of the above
J&K CET-2001

Ans. (a) : Nucleus is also known as karyon its study is known as karyology. It was discovered by an English Botanist Robert Brown in 1831. It is the primary carrier of hereditary material. Hammerling proved by its experiments that nucleus is the key of heredity by using Acetabutaria. Robert Hook discovered the cell wall.

480. A student wants to study metaphasic behavior of chromosomes in a living cell. The technique most suitable is :
(a) phase contrast microscope
(b) x-ray microscope
(c) cell fractionation
(d) scanning electron microscope
MGIMS Wardha-2006

Ans. (a) : It is an option microscopy technique that converts phase shift in light passing through transparent specimen to brightness change in image phage contrast microscopy makes highly transparent object. The cells can be observed in natural state by this microscopy.

481. Which cell organelle would not originated by endosymbiosis?
(a) Mitochondria (b) Flagella
(c) Nucleus (d) Chloroplasts
JCECE-2014

Ans. (c) : Endosymbiotic theory states that some eukaryotic cell organelles like mitochondria, chloroplast, flagella, plastid evolved from free- living prokaryotes. This hypothesis states that they have nucleic acid & originated independent- free living organism. Nucleus is not originated by endosymbiosis.

482. A chromosome having sub-terminal centromere is called
(a) telocentric (b) acrocentric
(c) metacentric (d) sub-metacentric
CG PMT-2004

Ans. (b) : A chromosome having sub-terminal centromere is called acrocentric. Acrocentric means centromere present near the end of chromosomes.
- Metacentric means centromere present at middle of chromosome.
- Sub metacentric refers to centromere present slightly away from middle of chromosome.
- Telocentric means centromere present at the tip.

483. Who coined the term 'chromosome'?
(a) Balbiani (b) Waldeyer
(c) Sutton (d) Purkinje
CG PMT-2004

Ans. (b) : The term "Chromosome" was given by "W. Waldeyer" in 1888. Chromosome is a DNA molecule that contains genetic material for an organism chromosomal structure is composed of DNA and special proteins to form dense, coiled structure.

484. Structure present over the chromosomes is
(a) nucleolus (b) centromere
(c) centrosome (d) Golgi complex
CG PMT-2004

Ans. (b) : Centromere is also called kinetochore. It is the primary constriction at which spindle attaches during cell division. It is the last part to get duplicated in dividing chromosomes. Centromere contains highly repeated satellite DNA. Position of centromere describes shape of chromosomes.

485. Which of the following is stained using carmine?
(a) Bacteria (b) Diatoms
(c) Chromosomes (d) Viruses
BVP-2009

Ans. (c) : Carmine is the basic dye used to stain nucleic acid and chromosomes given pink colour. Acetocarmine is saturated solution of carmine in 45% acetic acid used for sapid staining of fresh unfixed chromosomes. It is used to study stages of cell division. Carmine is prepared by coccus cacti(insect)

486. Membrane is absent in
(a) nucleus (b) nucleolus
(c) vaculoe (d) lysosome
JIPMER-2011 / AIPMT-1992

Ans. (b) : Nucleolus described by F. Fontana. It is a non-membrane bound structure which disappears in late prophase & reappears in Telophase stage of cell division. Each nucleolus is produced by a Nucleolar organizing Region [NOR] of a chromosome.

487. Within the nucleus, DNA is organized along with proteins into material called :
(a) nuclear lamina (b) chromatin
(c) chromosome (d) chromatid
Punjab MET-2005

Ans. (b) : Chromatin is the suspended material of nucleoplasm. It is the interphase chromosomal material, complex between eukaryotic DNA and protein. Protein of chromatin containing high proportion of basic amino acids and facilitate binding with DNA.

488. Which of the following features is/are correct for heterochromatin of eukaryotic nucleus?
(a) It is highly expanded in interphase
(b) It stains densely with basic dyes
(c) It is highly condensed in interphase
(d) Both B and C
WB JEE-2015

Ans. (d) : In 1928, E. Heitz coined the term euchromatin and Heterochomatin to describe the parts of chromatin that are less coiled and those remain highly coiled condensed. In a typical nucleus. Some regtion of chromatin are loosely packed (and stains light) are referred to as euchromatin. The chromatin that is more densely packed and stains dark are called as Heterochromatin. Euchromatin is said to be transcriptionally active chromatin, whereas heterochromatin is inactive.

@apna_pdf

09 BIOMOLECULES

A. Analysing and Composition

1. Simplest amino acid is :

(a) glycine (b) proline
(c) tryptophan (d) leucine

NEET-2020 phase- I
AP EAMCET-2011
JIPMER-2010, 2007
WBJEE-2007
AIPMT-2005
HARYANA PMT-2001
AFMC-2000

Ans. (a) : Glycine is a simplest amino acid.

• Proline is non essential amino acid, which means that it is manufactured from other amino acid in the liver, it does not have to be obtained directly through the diet.

Tryptophan is an amino acid needed for normal growth in infant and for the production and maintenance of the body's proteins, muscles, enzymes and neurotransmeter.

• Leucins is one of the 3-essential branched chain amino acids.

2. Match List-I and List-II with respect to proteins and their functions and select the correct option.

List-I	List-II
Collagen	p. Fight infectious agents
Trypsin	q. Hormone
Insulin	r. Enzyme
Antibody	s. Intercellular ground substance

(a) 1-s, 2-p, 3-r, 4-p (b) 1-q, 2-r, 3-q, r-s
(c) 1-s, 2-q, 3-r, 4-p (d) 1-s, 2-r, 3-q, 4-p

Karnataka CET-20.05.2023

Ans. (d) : The correct match is (d) – 1-s, 2-r, 3-q, 4-p

• Collagen – Intercellular ground substance. (It provides strength and elasticity to tissues).

• Trypsin – Enzyme (digestive enzyme that breaks down protein into smaller molecules).

• Insulin – Hormone (regulates blood sugar levels).

• Antibody – Fight infections agent (fight against foreign invaders such as bacteria, virus).

3. The biomolecules which are acid insoluble fraction and molecular weight more than 10000 daltons are

(I) Polysaccharides
(II) Nucleic acids
(III) Lipids
(IV) Proteins

(a) I, III, IV (b) II, III, IV
(c) I, II, III (d) I, II, IV

TS EAMCET-10.05.2023, Shift-II

Ans. (d) : Polysaccharides, nucleic acids and proteins are all beiomolecules with molecular weight more than 10,000 daltons.

• Lipid have molecular weight less than 10,000 daltons but they are still found in the acid insoluble fraction because they form aggregates that are insoluble in water.

4. Match the following

List-I		List-II	
A.	Potassium	1.	Constituent of ferredoxin
B.	Sulphur	2.	Necessary in stomatal movement
C.	Molybdenum	3.	Needed for auxin synthesis
D.	Zinc	4.	Component of nitrogenase

(a) A – III, B – I, C – II, D – IV
(b) A – I, B – IV, C – II, D – III
(c) A – II, B – I, C – IV, D – III
(d) A – III, B – I, C – IV, D – II

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : The correct match is (c) : A – II, B – I, C – IV, D – III

A.	Potassium	II.	Necessary in stomatal movement
B.	Sulphur	I.	Constituent of ferredoxin
C.	Molybdenum	IV.	Component of nitrogenase
D.	Zinc	III.	Needed for auxin synthesis

5. Find the wrong statements

A. Polymers of polysaccharides, fats and proteins are synthesized from monomers by ionic bonding
B. Molecules with polarheads and hydrophobic tails are present in cell membrane
C. Left end of protein chain is N- terminal end
D. Right and left handed helices are observed in protein

(a) A & B (b) B & C
(c) C & D (d) A & D

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : • Molecules with polarheads and hydrophobic tails are present in cell membrane.

• Left end of protein chain is N-terminal end which contain amino group (NH_2). The C-terminal end of a protein is contain carboxyl group (COOH).

Explanation for wrong statement are–

A. Polymers of polysaccharides, fats and proteins are not synthesized from monomers by ionic bonding. They are formed through different chemical reactions like dehydration synthesis or hydrolysis.

D. Protein primarily exhibit right-handed helices (alpha helices). Left-handed helices in protein are rare.

@apna_pdf

6. Match the following

List-I	List-II
(A) Pollen germination	**(i) Sulphur**
(B) Synthesis of Ausins	**(ii) Calcium**
(C) Stabilization of protein structure	**(iii) Boron**
(D) Synthesis of cell wall	**(iv) Zinc**

(a) A – iii, B – ii, C – i, D – iv
(b) A – iii, B – iv, C – i, D – ii
(c) A – ii, B – iv, C – iii, D – i
(d) A – ii, B – iii, C – iv, D – i

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : The correct match is (b) : A – iii, B – iv, C – i, D – ii

A. Pollen germination	–	Boron.
B. Synthesis of Auxins	–	Zinc.
C. Stabilization of protein structure	–	Sulphur.
D. Synthesis of cell wall	–	Calcium.

7. Match the following

List - I	List - II	List - III
(I) Palmitic acid	(A) Arthopod	(i) Protein
(II) GLUT - 4	(B) Cotton fibre	(ii) Complex polysaccharide
(III) Chitin	(C) 16C	(iii) Amino sugar
(IV) Cellulose	(D) Glucose transport	(iv) High no. of $-CH_2$ Groups

(a) I C iv, II D i, III A ii, IV B iii
(b) I B iii, II A iv, III D ii, IV C i
(c) I D iii, II C i, III A ii, IV B iv
(d) I B iv, II D iii, III C i, IV A ii

AP EAPCET-23.05.2023, Shift-I

Ans. (a) :

- **Palmitic Acid–** It is saturated fatty acid with 16-carbon atom. It is a major component of animal fats and oils.
- **GLUT-4–** It is a glucose transporter protein that is found in muscle and fat cells. It is responsible for transporting glucose into these cells.
- **Chitin–** It is a polysaccharide that is found in the exoskeletons of arthropods and the cell walls of fungi. It is made up of repeating unit of N-acetylglucosamine.
- **Cellulose–** It is a polysaccharide that is found in plant cell walls. It is made up of repeating units of glucose.

8. Study the given statements and select the correct options ?

(i) Carbohydrates, proteins, nucleic acids and lipids are primary metabolites.
(ii) Alkaloids, flavonoids, rubber etc. are secondary metabolites.
(iii) Linoleic, linolenic and palmitic acids are the three essential fatty acids.

(a) Statements (i) & (ii) are correct
(b) Statements (i) & (iii) are incorrect
(c) Statements (i) & (iii) are correct
(d) Only statements (ii) is correct

AP EAMCET-03.09.2021 Shift-II

Ans. (a) : Carbohydrates, proteins, nucleic acids and lipids are primary metabolites as they have identifiable functions. Alkaloids, flavonoids, rubber are secondary metabolites present in plants. Essential fatty acids are those which have a good requirement by our body but it cannot produce them e.g. linoleic acid, Omega-6-fatty acid linolenic acid Omega-3-fatty acid whereas Palmitic acid is non-essential fatty acid.

9. Which one of the following amino acids is least likely to be in the core of a protein?

(a) Phenylalanine (b) Valine
(c) Isoleucine (d) Arginine

KVPY SB & SX-2019

Ans. (d) : Arginine is a charged amino acid, which is generally found at surface but phenyalanine, luccine and valine amino found at core of protein since they do not interact with water.

10. The amino acid _____ is directly used as the precursor in the formation of indole acetic acid.

(a) glutamic acid (b) alanine
(c) tyrosin (d) tryptophan

Tripura JEE-2019

Ans. (d) : In the formation of indole acetic acid is used by **tryptophan**.
Alanine is second simplest α- amino acid.
Tyrosin (Try, Y) is a precursor to neurotranemitters.
Glutamic acid is α- amino acid & is used in biosynthesis of protein in all living being.

11. Match the following structures with their correct names

List - I	List - II
(A) 	**i. Fatty acid**
(B) 	**ii. Serine**
(C)	**iii. Glycerol**
(D) 	**iv Glutamic acid**
	v. Alanine

The correct is match is :

	(A)	(B)	(C)	(D)
(a)	iv	ii	iii	i
(b)	iv	iii	i	ii
(c)	i	iv	iii	v
(d)	iii	i	iv	v

TS EAMCET-09.05.2019 Shift-I

Ans. (b) : List -I List-II

(A) $NH_2-CH-CH_2-CH_2-COOH$ (COOH below) — Glutamic acid

(B) CH_2-OH, $CH-OH$, CH_2-OH ——— Glycerol

(C) $CH_3-(CH_2)16$ —— COOH ——— Fatty acid

(D) $NH_2-CH-CH_2-OH$ (COOH below) —— Serine

@apna_pdf

12. Which one group of biological molecule are micro and macromolecule respectively?
(a) DNA and lipids
(b) Lipids, RNA and proteins
(c) Lipids and polysaccharides
(d) Amino acids and lipids

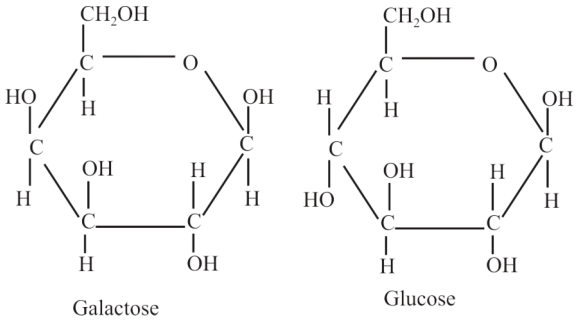
UP CPMT-2014

Ans. (b): Biomolecule, also called biological molecule, are any of numerous substances that are produced by cells and living organisms. The four major types of biomolecules are carbohydrates, lipids, nucleic acids and proteins. Carbohydrates are macromolecules. Lipids are not strictly macromolecules. Proteins and nucleic acid are macromolecules.

13. Lactose is composed of
(a) glucose + glucose
(b) glucose + galactose
(c) glucose + fructose
(d) fructose + galactose

JIPMER-2013

Ans. (b) :



It is a disaccharide composed of one molecule of glucose and one molecule of galactose. Lactose is properly known as milk sugar. Lactose is formed by beta 1,4 condensation of two hexose molecules.

14. 'Elicitors' are molecule which stimulate production of
(a) Primary metabolites
(b) Secondary metabolites
(c) Tertiary metabolites
(d) All metabolites

CG PMT-2010

Ans. (b) : Elicitors are molecule which stimulate production of secondary metabolites. Elicitors are molecules that are released by plants in response to infection or injury. They can also be produced by microorganism.

Elicitor triggers the hypersensitivity in plant. Elicitors are classified into two types i.e. pathogen derived elicitors (exogenous elicitor) and plant derived elicitors (endogenous elicitor).

15. Most abundant mineral of animal body is
(a) iron (Fe) (b) sodium (Na)
(c) potassium (K) (d) calcium (Ca)

WB JEE-2010

Ans. (d) : Most abundant mineral of animal body is calcium. It is an important constituent of bone and teeth where it provides hardness and structural strength.

16. Carbohydrates, the most abundant biomolecules on earth, are produced by –
(a) Some bacteria, algae and green plant cells
(b) All bacteria, fungi and algae
(c) Fungi, algae and green plants cells
(d) Viruses, fungi and bacteria

AIPMT-2005

Ans. (a) : Carbohydrate is the most abundant biomolecules on earth.

- Carbohydrate compound synthesized in the chlorophyll containing cells of some bacteria, algae and green plants during photosynthesis.
- Photosynthesis is a process of generating the food for green plants and other organisms. It involves the conversion of light energy, normally from the sun, into chemical energy in form of ATP.

17. The major role of minor elements inside living organisms is to act as: -
(a) co-factors of enzymes
(b) Building blocks of important amino acids
(c) Constituent of hormones
(d) Binder of cell structure

AIPMT-2003

Ans. (a): The major role of minor elements inside living organisms is to act as co-factors of enzymes. Minor nutrients are also known as **micro-elements or trance elements**. They are present in plants in very small quantities. However, they can be toxic to plants if it is present in a large amount. These nutrients are zinc, iron, boron etc.

18. Match the biological molecules listed under column I with their Biological functions listed under column II; choose the choice which gives correct combination of alphabets of the two columns:

Column –I (Biological molecules)	Column –II (Function)
A. Glycogen	**p. Hormone**
B. Globulin	**q. Biocatalyst**
C. Steroids	**r. Antibody**
D. Thrombin	**s. Storage product**

(a) A = r, B = q, C = s, D = p
(b) A = s, B = q, C = p, D = r
(c) A = q, B = s, C = r, D = p
(d) A = s, B = r, C = p, D = q

Karnataka CET-2001

Ans. (d) :

Column–I (Biological molecules)	Column –II (Function)
A. Glycogen	s. Storage product
B. Globulin	r. Antibody
C. Steroids	p. Hormone
D. Thrombin	q. Biocatalyst

19. The most abundant molecule in cell is
(a) water (b) carbohydrate
(c) lipid (d) protein

DUMET-2011

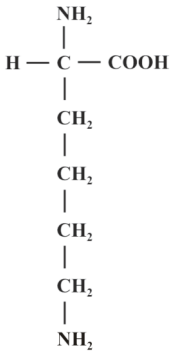
@apna_pdf

Ans. (a) : The most abundant molecule present in the cell is called water. It is around 70% of total cell mass. Water makes up 62% of the cell, followed by fat (16%), protein (16%), minerals (6%), and carbohydrate (less than 1%).

20. Which one out of (a) to (d) given below correctly represents the structural formula of the basic amino acid?

(a) 
(b) 
(c) 
(d) 
JIPMER-2013
AIPMT-2012

Ans. (d) :



Lysine (Lys, K)

- Amino Acid is made up of two functional group namely $-NH_2$ and COOH amino acid substituted by methanes.
- The – COOH stands for the carboxylic Acid group & $-NH_2$ stands for amino acid. It is an organic compound containing one or more amino groups together with one or more carboxylic acid groups in a molecules. The basic amino acid are arginine (Arg), Lysine (Lys) and histidine (His)

21. Cereal proteins are deficient in one of the following amino acid

(a) Methionine (b) Threonine
(c) Lysine (d) Glutamic acid

CG PMT-2010

Ans. (c) : Cereals protein are deficient in several amino acid such as tryptophon, threonin and lysine.

22. Which amino acids are present in histones?

(a) Lysine and histidine
(b) Valine and histidine
(c) Arginine and lysine
(d) Arginine and histidine

Rajasthan PMT-2011

Ans. (c) : Arginine and lysine are amino acids are present in histones. Histones are the alkaline protine which wrapped DNA into a condensed form.

23. Separation of amino acid and carboxylic groups is called

(a) deamination (b) excretion
(c) egestion (d) transamination

VMMC-2007
Rajasthan PMT -2005
UPCPMT-2002

Ans. (a) : Separation of amino Acid and carboxylic group is called deamination.
It involves the removal of the amino group from the amino acid, producing ammonia and a keto acid. The ammonia is converted to urea and excreted, while the keto acid can enter metabolic pathway.

24. Which of the following is polymerized to form proteins?

(a) Protein (b) Carbohydrates
(c) Amino acid (d) Muramic acid

HP CET-2012
VMMC-2004

Ans. (c) : Amino acid is polymerized to form proteins. It is formed by various folded linear polymers of amino acids. The polymer of amino acids is called as poly peptides.

25. Choose the correct non-protein amino acid

(a) hydroxyproline (b) hydroxylysine
(c) cystine (d) γ-amino butyric acid

WB JEE-2009
JCECE-2012

Ans. (d) : γ- amino butyric acid is a non-protein amino acid.

26. Sulphur containing amino acids are

(a) valine, lysine and cystine
(b) tryptophan, glutamic acid and aspartic acid
(c) citrulline, methionine and glumeric acid
(d) cysteine, cystine and methionine

BVP-2014, 2010

Ans. (d) : Sulphur containing amino acid are cysteine, cystine and methionine.
Cysteine is a non-essential amino acid important for making protein, and for other metabolic functions.
Cystine is amino acid that is found digestive enzyme, in the cell of the immune system.
Methionine is an aliphatic, sulphur containing essential amino acid.

27. Which one of the following can be used to detect amino acids?

(a) Iodine vapour (b) Ninhydrin
(c) Ethidium bromide (d) Bromophenol blue

KVPY SB & SX-2015

Ans. (b) : Ninhydrin is a chemical solution that is used to detect both primary or secondary amino acid.

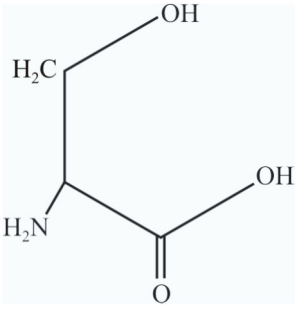
@apna_pdf

28. Which of the following amino acids has hydroxyl methyl group as its R group?

(a) Serine (b) Proline
(c) Alanine (d) Arginine

DUMET-2010

Ans. (a) : The amino acid serin has its R group with a hydroxyl group attached to a CH_2 (methyl) group.



SERINE [α-amino-β-hydroxy butyric Acid]

29. Before cellular respiration, amino acid undergo the process of :

(a) decarboxylation (b) hydrolysis
(c) deamination (d) phosphorylation

DU MET-2004
UPCPMT-2002
Rajasthan PMT-1998

Ans. (c) : Before cellular respiration, amino acid undergo the process of deamination.

It involves the removal of amino group from the amino acid, producing ammonia and a keto acid. The ammonia is converted to urea and excreted, while the keto acid can enter metabolic pathway.

30. Which one of the following amino acids is an essential part of human diet?

(a) Glycine (b) Phenylalanine
(c) Serine (d) Aspartic acid

AMU-2007

Ans. (b) : The 9 essential amino acid are histidine, isoleucine, leucine, lysine, methionine, phenylalanine, threonine, tryptophan and valine. Phenylalanine is an essential part of human diet It occur's naturally in many protein rich foods such as milk, eggs & meat.

It can cause intellectual disabilities, brain damage, seizures and other problem's in people with P.K.U (Phenylketonuria)

B. Structure of Amino acid and its Properties

31. Match the following

List - I	List-II
(A) Serine	**(I) AUG**
(B) Methionine	**(II) GGG**
(C) Lysine	**(III) UCU**
(D) Glycine	**(IV) AAA**

(a) A-II, B-I, C-IV, D-III
(b) A-II, B-IV, C-I, D-III
(c) A-III, B-I, C-IV, D-II
(d) A-III, B-IV, C-I, D-II

TS EAMCET-10.05.2023, Shift-II

Ans. (c) :
The correct match is (c) : A-III, B-I, C-IV, D-II

Amino acid		**Codon**
Serine	–	UCU
Methionine	–	AUG
Lysine	–	AAA
Glycine	–	GGG

32. Match the following

Table-I		Table-II	
A.	AUG	I.	Phenyl alanine
B.	UAA	II	Methionine
C.	UUU	III	Tryptophan
D.	UGG	IV	End codon

(a) A – III, B – II, C – I, D – IV
(b) A – II, B – III, C – IV, D – I
(c) A – II, B – IV, C – I, D – III
(d) A – II, B – IV, C – III, D – I

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : The correct match is (c) : A – II, B – IV, C – I, D – III

A.	AUG (start codon)	II.	Methionine
B.	UAA (signals the end of protein)	IV.	End codon
C.	UUU	I.	Phenyl alanine
D.	UGG	III.	Tryptophan

33. Match the following

List-I		List-II	
A.	Glutamic acid	1.	Aromatic amino acid
B.	Lysine	2.	Neutral amino acid
C.	Valine	3.	Basic amino acid
D.	Tyrosine	4.	Acidic amino acid

(a) A – II, B – I, C – IV, D – III
(b) A – IV, B – III, C – II, D – I
(c) A – IV, B – III, C – I, D – II
(d) A – I, B – IV, C – II, D – III

TS EAMCET 10.05.2023 Shift-I

Ans. (b) :
The correct match is (b) : A – IV, B – III, C – II, D–I

A.	Glutamic acid (–COOH on its side chain)	IV.	Acidic amino acid
B.	Lysine ($–NH_2$)	III.	Basic amino acid
C.	Valine	II.	Neutral amino acid
D.	Tyrosine	I.	Aromatic amino acid

34. Which of the following statements are false regarding the nature of amino acids?

A. The acidity and neutrality of amino acids is based on number of amino and carboxyl groups.
B. Both NH_2 and COOH groups of amino acids show ionizable nature.
C. In solutions of different pH, the structure of amino acids does not change.
D. The amino acids have amino group and aldehyde group as substituents on the same carbon.

@apna_pdf

(a) AB (b) CD
(c) BC (d) AD

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : Explanation for false statement–
C. The structure of amino acids can change in solution of different pH due to ionization of the amino and carboxyl groups. At low pH, the amino group (NH_2) is protonated (positively charged), while at high pH, the carboxyl group (COOH) is deprotonated (negatively charged). This affects the overall charge and structure of the amino acid.
D. Amino acids do not have an aldehyde group as a substituent; they have an amino group, a carboxyl group, a hydrogen atom, and an R-group attached to the same carbon.

35. Arrange the following in ascending order
I. Number of stop codons
II. Number of sense codons
III. Number of types of amino acids
IV. Number of types of Nucleosides
(a) III, IV, I, II (b) I, II, IV, III
(c) III, II, I, IV (d) I, IV, III, II

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : The correct order is (d) I, IV, III, II
I. Number of stop codons - 3 (the codan which does not codes for any amino acid)
IV. Number of types of nucleosides - 4
III. Number of types of amino acids - 20
IV. Number of sense codons - 61

36. Given below are two statements :
Statement I : A protein is imagined as a line, the left end represented by first amino acid (C-terminal) and the right end represented by last amino acid (N-terminal)
Statement II : Adult human haemoglobin, consists of 4 subunits (two subunits of α type and two subunits of β type.)
In the light of the above statement, choose the correct answer from the options given below:
(a) Statement I is false but Statement II is true.
(b) Both Statement I and Statement II are true.
(c) Both Statement I and Statement II are false.
(d) Statement I is true but Statement Ii is false.

NEET (UG) 07.05.2023

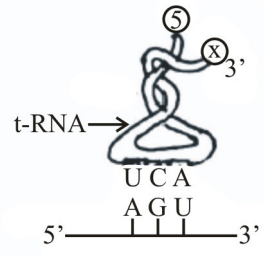
Ans. (a) : A protein is imagined as a line, the left end represented by the first amino acid and the right end represented by the last amino acid. The first amino acid is also called as N-terminal amino acid.
• Adult human haemoglobin are quaternary proteins composed of four protein subunits. However, adult haemoglobin is composed of two α (alpha) and two β (beta) subunits, while fetal hemoglobin is composed of two α (alpha) subunits and two γ (gamma) subunits.
Hence, statement I is false but statement II is true.

37. In the given figure below, what does the 'X' represents ?

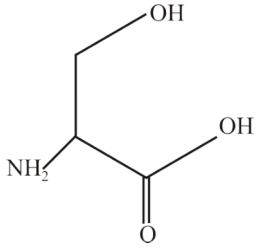
(a) Glycine (Gly) (b) Tyrosine (Tyr)
(c) Valine (Val) (d) Serine (Ser)

GUJCET-2023

Ans. (d) :



Serine is a amino acid. Amino acid are attached to the t-RNA 3'-end as a prerequisite for entering the ribosome for protein synthesis. Amino acid attachment also gives t-RNA access to non ribosomal cellular activities.



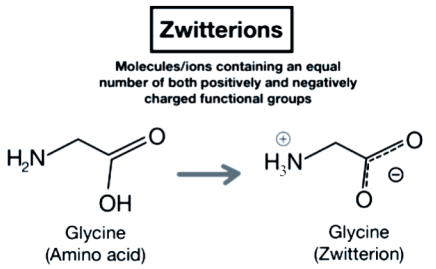
• It is critical for the production of body's proteins, enzymes muscle tissue, membrane & nerve sheet.
It helps also in the production of antibodies.

38. Given below are two statements:
Statement I : Amino acids have a property of ionizable nature of – NH_2 and – COOH groups, hence have different structures at different pH.
Statement II: Amino acids can exist as Zwitterionic form at acidic and basic pH
In the light of the above statements, choose the most appropriate answer from the options given below:
(a) Both Statement I and Statement II are correct
(b) Both Statement I and Statement II are incorrect
(c) Statement I is correct but Statement II is incorrect
(d) Statement I is incorrect but Statement II is correct

NEET (Re-Exam)-04.09.2022

Ans. (a) : Zwitterion is a compound which has no overall charge, but it contains separate parts which are positively and negatively charged.

@apna_pdf



39. _____**is the primary precursor of Indole-3-acetic acid**

(a) Tryptophan (b) Valine
(c) Tyrosine (d) Phenylalanine

AP EAPCET-11.07.2022 Shift-I

Ans. (a) : Tryptophan is the primary precursor for the production of the plant growth hormone indole- 3-acetic acid or auxin. It is an essential amino acid. The body uses tryptophan to make melatonin and serotonin. Indole-3 acetic acid (IAA, 3-IAA) is the most common, naturally occurring plants hormone.

40. Formula of Glycine

(a) $C_3H_7O_2N$ (b) $C_3H_7O_3N$
(c) $C_{16}H_{32}O_2$ (d) $C_2H_5O_2N$

AP EAPCET-12.07.2022 Shift-I

Ans. (d) : Glycine is an amino acid that has a single hydrogen atom as its side chain. It is used by body to create protein. While our body does naturally produce glycine, it is available through protein rich food.
Formula of Glycine is- $C_2H_5O_2N$.

41. Match the following lists.

List-I	List-II
A. Glycerol	I. Phospholipids
B. Aromatic amino acid	II. Lower melting point
C. Lecithin	III. Trihydroxypropane
D. Gingelly oil	IV. Tryptophan

The correct match is :

	A	B	C	D
(a)	III	IV	I	II
(b)	I	III	IV	II
(c)	II	IV	III	I
(d)	IV	I	II	III

TS EAMCET-09.08.2021 Shift-II

Ans. (a) :

List-I	List-II
A. Glycerol	(iii) Trihydroxypropane
B. Aromatic amino acid	(iv) Tryptophan
C. Lecithin	(i) Phospholipids
D. Gingelly oil	(ii) Lower melting point

42. Identify the statement which is incorrect.

(a) Tyrosine possesses aromatic ring in its structure
(b) Sulphur is an integral part of cysteine
(c) Glycine is an example of lipids
(d) Lecithin contains phosphorus atom in its structure

NEET-2020 Phase-II

Ans. (c) : Glycine (NH_2 - CH_2 – COOH) is an example of simplest amino acid. It is not a lipid. It is an amino acid. The R group in glycine consists of a hydrogen atom.

43. Citrulline structure

(a) (b) (c) (d) 
JIPMER-2019

Ans. (a) : The organic compound citrulline is an α-amino acid. Its name is derived from **Citrullus**, the Latin word for watermelon.
It has formula -$H_2NC(O)\,NH(CH_2)_3CH(NH_2)CO_2H$.

44. Identify the correct series of biomolecules which do not belong to the given category

- **Homopolymer**
- **Secondary metabolite**
- **Neutral Aminoacid**
- **Aromatic aminoacid**

Options:

(a) Insulin, Rubber, Valine, Tryptophan
(b) Protein, Scent, tyrosine, Tryptophan
(c) Cellulose. Protein, Glutamic acid, Tyrosine
(d) Rubisco, Sugar, Lysine, Valine

AP EAMCET-24.04.2019 Shift-II

Ans. (a) : Homopolymer:- Homopolymer is a type of polymer that is made up of only one type of monomer unit. Ex- Insulin, PVC (Poly Vinyl Chloride), Polythene.

- **Secondary metabolite:-** Secondary metabolites are substances manufactured by plants that make them competitive in their own environment. Ex- rubber, alkaloid etc.
- **Neutral Amino acid:-** Neutral amino acids contain equal number. of amino ($–NH_2$) and carboxyl (–COOH) groups. Ex- Leucine, valine, arginine & Histidine etc.
- **Aromatic amino acid:-** Aromatic amino acid includes an aromatic ring. Ex- phenylalanine, tryptophan and tyrosine.

@apna_pdf

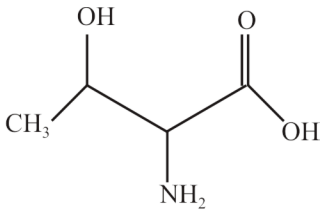
45. Indentify the amino acids containing hydroxy group in their structure

(i) Cysteine **(ii) Threonine**
(iii) Tyrosine **(iv) Glutamic acid**
The correct answer is:

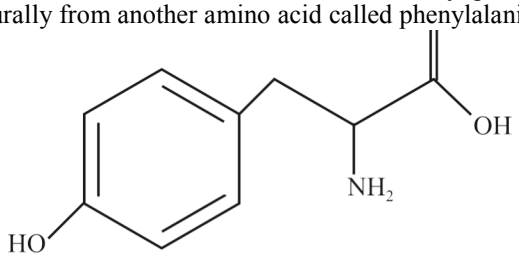
(a) (i) and (ii) (b) (ii) and (iii)
(c) (iii) and (iv) (d) (ii) and (iv)

TS EAMCET-02.05.2018 Shift-II

Ans. (b) : Threonine is an essential amino acid, is a hydrophilic molecule. It is an hydroxyl - containing amino acid.



Tyrosine is an amino acid which the body produce naturally from another amino acid called phenylalanine.



Tyrosine

46. Among the following, identify the Zwitterionic form

(a) $H_3^+N-\underset{\displaystyle R}{\underset{|}{C}}H-COOH$ (b) $H_3^+N-\underset{\displaystyle R}{\underset{|}{C}}H-COO^-$

(c) $H_3^+N-\underset{\displaystyle R}{\underset{|}{C}}H-CO^+$ (d) $H_2N-\underset{\displaystyle R}{\underset{|}{C}}H-COO^-$

TS EAMCET-02.05.2018 Shift-I

Ans. (b) : A zwitterions is an ion that contains two functional groups. It is an ion possessing both positive and negative electrical charge. The NH_2 group is the stronger base, and so it picks up H^+ from the –COOH group to form a zwitterion.

47. Which of the following is an amino acid derived hormone?

(a) Epinephrine (b) Ecdysone
(c) Estriol (d) Estradiol

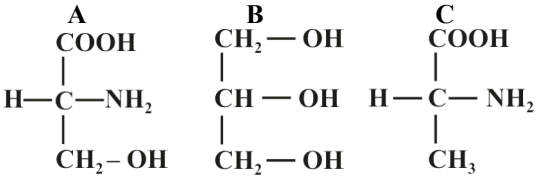
NEET-2018

Ans. (a) : Epinephrine is a tyrosine amino acid derivative hormone it is also known as **catecholamine** secreted by adrenal glands.

Epinephrine also known as **adrenaline**. It plays an in important role in the fight or flight by increasing blood flow to muscles.

- **Estradiol** and **Estriol** are steroid hormones involved in the regulation of estrous and menstrual cycle.
- **Ecdysone** is a steroid hormone that controls moulting in an insects.

48. Identify the names of the structures in the right order



The correct match is

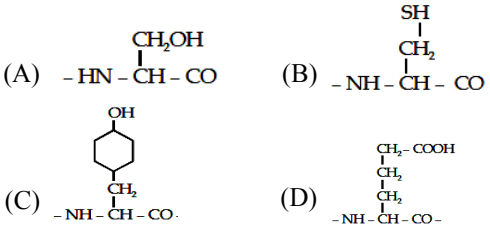
	A	B	C	D
(a)	Serine	Glycerol	Alanine	Fatty acid
(b)	Glycerol	Serine	Fatty acid	Alanine
(c)	Alanine	Fatty acid	Serine	Glycerol
(d)	Fatty acid	Alanine	Glycerol	Serine

TS EAMCET-12.05.2017

Ans. (a) : The specific structure of serine is indicative of its chemical formula, $C_3H_7NO_3$. The R group structure CH_3O, attaches to the central carbon of the amino acid back bone.

- Glycerol has 3 carbon atoms, 8 hydrogen atoms, and 3 oxygen atoms.
- An alanine molecule is composed at a total of three carbon atoms, seven hydrogen atoms, one nitrogen atom and two oxygen atoms.
- Fatty acid consists of a straight chain of an even number of carbon atoms, with hydrogen atoms along the length of the chain and at one end of the chain and a carboxyl group (–COOH) at the other end.

49. The figure shows a hypothetical tetrapeptide portion of a protein with parts labelled A-D. Which one of the following option is correct?

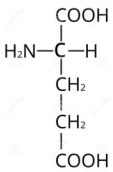


(a) A is the sulphur containing amino acid-methionine
(b) D is the acidic amino acid - glutamic acid
(c) C is an aromatic amino acid - tryptophan
(d) A is the C - terminal amino acid and D is N terminal amino acid

NEET (Karnataka)-2013

Ans. (b) : (D)- Glutamic acid - acidic amino acid.

Glutamic Acid



(A)- Serine (neutral, polar amino acid)
(B)- Cysteine (neutral, polar amino acid)
(C)-Tyrosine (aromatic R groups)

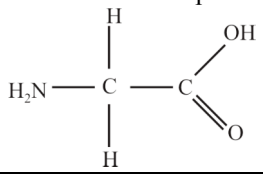
@apna_pdf

50. Which amino acid has no asymmetric carbon atom?

(a) Glycine (b) Alanine
(c) Proline (d) Threonine

Assam CEE-2014

Ans. (a) : Glycine is one of the 20 naturally – occurring amino acids. It's chemical formula is $NH_2 - CH_2 - COOH$. It is an amino acid that has a single hydrogen atom. It is not chiral (asymmetric carbon atom that has four different groups or atoms attached to it). It is a colorless solid having a sweet taste and is highly soluble in water. All amino acids except glycine have an asymmetric carbon which is the alpha- carbon.



51. Which of the following amino acid is metabolised by brain?

(a) Alanine (b) Glutamic acid
(c) Histidine (d) Glycine

BVP-2001

Ans. (b) : Glutamic acid is an amino acid that is used to make proteins. In the body it is converted to glutamate. This is a chemical that helps nerve cells. Send messases to and from other cells in the brain. It may be Inrolved in learning and memory. It is the most abundant excitatory hearotransmitter in vertebrate hervous system. Amiso acids such as teyptophan tyrosine, histidine and arginine are used by the brain for the synthesis of various nutraceuticals and neuromodulators.

52. Which is non-reducing sugar?

(a) Glucose (b) Galactose
(c) Mannose (d) Sucrose

JCECE-2010

Ans. (d) : Sucrose is a non-reducing sugar. A non-reducing sugar is a carbohydrate that does not have a free aldehyde or free ketone functional group in its molecular structure.

53. Initiation of polypeptide chain is through

(a) Methionine (b) Glycine
(c) Lysine (d) Leucine

CMC Vellore-2012

Ans. (a) : Initiation of polypeptide chain is through methionine. In translation, polymerization of amino acids takes place to form a polypeptide. For initiation of polypeptide chain ribosome binds to m-RNA at the start codon that is AUG. AUG is a triplet codon that codes for the amino acid methionine.

54. The reaction, Amino acid + ATP → Aminoacyl AMP + P-P depicts

(a) amino acid assimilation
(b) amino acid transformation
(c) amino acid activation
(d) amino acid translocation

DUMET-2011

Ans. (c) : Amino acid activation is also known as aminoacylation or tRNA charging. It refers to the attachment of an amino acid to its respective transfer RNA (t-RNA). The reaction occurs in the cell cytosol. The amino acid is first activated with ATP to synthesize the aa-AMP intermediate with the release of pyrophosphate.

55. Fish proteins are considered nutritionally superior to most vegetable proteins because they are rich in

(a) all the 20 amino acids
(b) essential amino acids
(c) peptide bonds
(d) polypeptides

AMU-2014

Ans. (b) : Fish proteins are considered nutritionally superior to most vegetable proteins because they are rich in essential amino acids. Animal food called complete protein food because they are the best source where all the essential amino acids are found. In plants, essential amino acids are not found in single vegetable or plants. So, fish protein is nutritionally superior to vegetable proteins. Fish protein is known for containing essential amino acids like tryptophan, cystine, lysine, methionine and threonine.

56. Identify the polypeptide subunits present in the adult human haemoglobin

(a) Two α type subunits and two β type subunits
(b) Four α type subunits
(c) Four β type subunits
(d) Three α type subunits and one β type subunits

AP EAMCET-2015

Ans. (a) : A haemoglobin molecule is made up of four polypeptide chains, two α-chains of 141 amino acid residues each and two β-chains of 146 amino acid residues each.

• There are four heme-iron complexes. Each chain holds a heme group containing one Fe^{++}atom. The heme-iron complexes are colored red because they give hemoglobin its red color.

57. Which of the following statements is wrong?

(a) Sucrose is a disaccharide
(b) Cellulose is a polysaccharide
(c) Glycine is a sulphur containing amino acid
(d) Uracil is a pyrimidine

J&K CET-2003

Ans. (c) : Glycine is a simplest amino acid which has a single hydrogen atom as its side chain. Its chemical formula is $NH_2 - CH_2 - COOH$. It helps in building proteins needed for tissue and hormone maintenance.

58. Which one of the following amino acid was not found to be synthesised in Millers experiment?

(a) Glycine (b) Aspartic acid
(c) Glutamic acid (d) Alanine

JCECE-2014

Ans. (c) : Glutamic acid was not found to be synthesised in Millers experiment. In Miller's experiment amino acids are formed, such as Alanine, Glycine and Aspartic acid.

@apna_pdf

59. Identify the sulphur containing amino acid

(a) Proline (b) Methionine
(c) Aspartic acid (d) Tryptophan

WB JEE-2008

Ans. (b) : Methionine and cysteine are the two sulphur containing amino acids in mammals. Methionine is an essential amino acid, obtained by dietary intake while cysteine is non-essential and a metabolite of methionine metabolism. Methionine helps in the initiation of the protein synthesis.

60. Select the aromatic amino acids.

(a) Tyrosine
(b) Valine
(c) Lysine
(d) Tryptophan
(e) Serine

(a) (a) and (d) only (b) (a), (d) and (e) only
(c) (c) and (d) only (d) (b) and (d) only
(e) (a) and (e) only

Kerala PMT-2013

Ans. (a) : Tyrosine, phenylalanine and Tryptophan are the three aromatic amino acid involved in protein synthesis. An amino acid that includes an aromatic ring is called aromatic amino acid to build proteins, all plants and microbes synthesize aromatic amino acids.

C. Lipid and its Function

61. Paraffin wax is

(a) ester (b) acid
(c) monohydric alcohol (d) cholesterol

UP CPMT-2008
BCECE-2010
VMMC-2012
BHU-PMT (Screening)-2006
CGPMT-2008

Ans. (a) : Paraffin wax is an ester. It is obtained from petroleum. It assist in extracting perfumes from flowers, forms a base for medical ointments and supplies a waterproof coating for wood.
It used in candle, wax paper, polishes, cosmetics and electrical insulator.

62. Which of the following is/are essential fatty acids for man ?

(a) Arachidonic acid (b) Linolenic acid
(c) Linoleic acid (d) All of these

Tripura JEE-2018
BHU-PMT (Screening)-2008
VMMC-2004
Punjab MET-2003

Ans. (d) : The two essential fatty acids in the human body are alpha-linolenic acid and linoleic acid. Omega-6 polyunsaturated fatty acid is arachidonic acid. It is found in phospholipids and contributes to membrane formation. The conversion of linoleic acid into arachidonic acid is not an essential amino acid.
Arachidonic acid is a polyunsaturated omega-6 fatty acid. It is present in the phospholipids and helps in the formation of membranes.

63. Assertion (A) : Enzymes are inactivated at low temperature
Reason (R) : Temperature changes the structure of the substrate
The correct option among the following is

(a) (A) and (R) are true, (R) is the correct explanation for (A)
(b) (A) and (R) are true, but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : (A) is true but (R) is false.

- Enzymes are inactivated at low temperature. At low temperatures, the number of successful collisions between the enzyme and substrate in reduced because their molecular movement decreases. The reaction is slow.
- Temperature does not change the structure of the substrate.

Hence, c one is the correct answer.

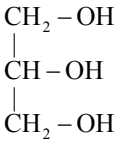
64. Which of the following statements are true regarding lipids?

a) Glycerol is a simple lipid trihydroxy propane.
b) In triglycerides fatty acid is esterified with glycerol.
c) The melting point of oils is higher than that of fats.
d) Saturated fatty acids do not have double bonds

(a) abd (b) abc
(c) acd (d) bcd

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : Among the following statements (a) is true. Glycerol is a simple lipid that is made up of three hydroxyl groups (–OH) bonded to a carbon skeleton. Because of the presence of three hydroxyl groups, it is called trihydroxy. Propane is a three-carbon alkane with the molecular formula C_3H_8. When three hydrogen atoms of propane are replaced by three hydroxyl groups, this gives rise to a molecule of glycerol.



- Statement (b) is also true. In triglycerides, three fatty acids are esterifies to glycerol.
- Statement (c) is false. The melting point of oils is lower than that of fats. Oils are liquid at room temperature, while fats are solid. This is because oils have more double bonds in their fatty acids, which makes them less saturated.
- Statement (d) is true. Saturated fatty acids do not have double bonds. The saturated fatty acids are stable and are short chain fatty acids. When the hydrogen reacts with the unsaturated fatty acid, all the double bonds are converted into the single bonds.

@apna_pdf

65. Following are the statements with reference to 'lipids'

(A) Lipids having only single bonds are called unsaturated fatty acids

(B) Lecithin is a phospholipid.

(C) Trihydroxy propane is glycerol.

(D) Palmitic acid has 20 carbon atoms including carboxyl carbon.

(E) Arachidonic acid has 16 carbon atoms.

Choose the correct answer from the options given below.

(a) (B) and (E) only (b) (A) and (B) only
(c) (C) and (D) only (d) (B) and (C) only

NEET-2021

Ans. (d) : Lecithin is phospholipid, lecithin is a generic term to designate any group of yellow-brownish fatty substances occuring in animal and plant tissues which are amphiphilic, they attract both water and fatty substances and are used for smoothing food textures, emulsifying.

- Glycerol is a simple trihydroxy propane lipid. Glycerol sometimes called **glycerin** is a chemical molecule that is commonly used to treat burns and wounds.

66. Which one of the following is INCORRECT about saturated fatty acids ?

(a) They do not have double bond between carbon atoms.
(b) They are not fully saturated with hydrogen atoms.
(c) Palmitic acid and stearic acid are saturated fatty acids.
(d) They contain maximum possible hydrogen atoms.

MHT CET-06.10.2020 Shift-I

Ans. (b) : When there are only single bonds between the neighboring carbons in the hydrocarbon chain, a fatty acid is said to be saturated. Fatty acid are saturated with the hydrogen. Hence, they are not fully saturated with hydrogen atoms. This statement is incorrect about saturated fatty acid.

67. Concanavalin A is

(a) an essential oil (b) a lectin
(c) a pigment (d) an alkaloid

NEET-2019

Ans. (b): Concanavalin A is lectin. Lectins are proteins with a high degree of stereospecificity to recognize various sugar structures and form reversible linkages upon interaction with glycol-conjugate complexes.

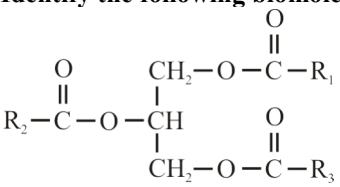
68. Lecithin is a

(a) carbohydrate (b) phospholipid
(c) Nucleoside (d) Protein

NEET (Odisha)-2019
KVPY (SA)-2018

Ans. (b) : Lecithin is a complex mixture of phospholipids found mainly in egg yolk, soya, and coleseeds. The body uses lecithin in the metabolic process and to move fats. It is composed of phosphoric acid, cholines, two fatty acids and esters of glycerol.

69. Identify the following biomolecule :



The above biomolecule is

(a) Triglyceride (b) Glycerol
(c) Phospholipid (d) Cholesterol

TS EAMCET-08.05.2019 Shift-I

Ans. (a) : The above biomolecule is triglycerides. They are esters in which three molecules of one or more different fatty acids are linked to the alcohol glycerol.

70. Which one among the following pairs of nitrogenous bases of nucleic acids, is wrongly matched with the category mentioned against it?

(a) Adenine, Thymine – Purines
(b) Guanine, Adenine – Purines
(c) Uracil, Cytosine – Pyrimidines
(d) Thymine, Uracil – Pyrimidines

JCECE-2018

Ans. (a) : There are 5 types of nitrogenous bases, categorized under purines and pyrimidines. The purine contains bases are Adenine and Guanine while pyrimidine contains Cytosine, Thymine and Uracil. Adenine, Guanine, Cytosine and Thymine are found in DNA while Thymine is replaced by Uracil in RNA.

71. Which of the following are not polymeric?

(a) Nucleic acids (b) Proteins
(c) Polysaccharides (d) Lipids

NEET-2017

Ans. (d) Lipid are not polymer. The basic unit of lipids is a triglyceride, which is synthesized from glycerol (propane-1,2,3- triol) and fatty acids.

72. Which one of the following biomolecules is synthesized in smooth endoplasmic reticulum

(a) Proteins (b) Lipids
(c) Carbohydrates (d) Nucleotides

KVPY (SA)-05.11.2017

Ans. (b) : Lipid molecules in the cell are synthesized by the smooth endoplasmic reticulum. The rough endoplasmic reticulum synthesizes proteins. Golgi apparatus synthesizes complex sugars and plastids are involved in the synthesis of carbohydrates through photosynthesis.

73. Chemically wax is:

(a) A protein (b) A lipid
(c) A carbohydrate (d) An amino acid

VMMC-2003
HP CET-2013
Haryana PMT-2005

Ans. (b) : Chemically wax is a lipid. Waxes are found in nature as coating on leaves and stems. They prevent the plant from losing excessive amount of water

74. Low calorie and low cholesterol is found in

(a) soyabean oil (b) peanut oil
(c) sesame oil (d) sunflower oil

Manipal-2010

@apna_pdf

Ans. (d) : Sun flower oil has low calories and low cholesterol compared to soyabean oil, pea-nut oil, and sesame oil.

75. Most abundant lipid in the cell membrane is:

(a) cholesterol (b) phospholipids
(c) glycolipids (d) cerebrosides

AFMC-2001

Ans. (b) : Most abundant lipid in the cell membrane is phospholipid. These have polar head group and two hydrophobic hydrocarbon tails and head is hydrophilic in nature.

76. What is the substrate for lipase enzyme?

(a) Protein (b) Carbohydrate
(c) Lipid (d) Nucleic acid

WB JEE-2012

Ans. (c) : The substrate for lipase enzyme is lipid. The substrate is the triglyceride which is the building unit of lipids, and the product is the sub-units of the triglyceride which are the glycerol and the fatty acid.

77. Phospholipids are formed by the esterification of

(a) three ethanol molecules with three fatty acid molecules.
(b) one glycerol and two fatty acid molecules.
(c) one glycerol and three fatty acid molecules.
(d) one ethylene glycol and two fatty acids molecules.

KVPY SB & SX-2015

Ans. (b) : Phospholipids are formed by the esterification of one glycerol and two fatty acid molecules. The structure is typically made of a glycerol back bone, 2 fatty acid and tails (hydrophobic) and a phosphate group (hydrophilic).

78. Spoilage of oil can be detected by which fatty acid?

(a) Oleic acid (b) Linolenic acid
(c) Linoleic acid (d) Erucic acid

BHU PMT (Screening)-2010

Ans. (d) : Spoilage of fat oil can be detected by erucic acid. It is a monosaturated omega -9 fatty acid. It is found in more concentrations in oil and easily degraded by micro organisms and produces a foul smell and taste.

79. Hydrolysis of lipid yields :

(a) fats
(b) fatty acids and glycerol
(c) mannose and glycerol
(d) maltose and fatty acid

J&K CET-2006
Rajasthan PMT-2002

Ans. (b) : Hydrolysis of lipid yields is fatty acid and glycerol. Hydrolysis can break down a fat or oil and release the tri-glycerol and fatty acids.

80. Given below is the chemical formula of

$$CH_3(CH_2)_{14}-\overset{\overset{O}{\|}}{C}-OH$$

(a) palmitic acid (b) glycerol
(c) galactose (d) stearic acid

JIPMER-2014

Ans. (a) : The given chemical formula is of palmitic acid. It is the most common saturated fatty acid found in animals, plant and microorganisms. Its chemical formula is $CH_3(CH_2)_{14}$ COOH and is represented as :

$$CH_3(CH_2)_{14}-\overset{\overset{O}{\|}}{C}-OH$$

81. Phospholipids are

(a) amphipathic (b) amphibolic
(c) hydrophobic (d) none of these

JIPMER-2004

Ans. (a) : Phospholipids are amphipathic carrying both hydrophilic polar and Hydrophobic non polar groups.

- The hydrocarbon chains of the two fatty acids function as form hydrophobic non polar tails of the phospholipids molecules. The phosphate and additional group (nitrogenous or non nitrogenous) behave as hydrophilic polar group of the molecule.

82. Lipids are insoluble in water because lipid molecules are : -

(a) Hydrophilic (b) Hydrophobic
(c) Neutral (d) Zwitter ions

AIPMT-2002

Ans. (b) : Lipids are organic compounds which are non polar molecules. They are soluble only in non polar solvents and insoluble in polar solvents like water.
Lipid lack charged groups, the water molecules have nothing to stick and don't mix with them.

83. A phosphoglyceride is always made up of :

(a) a saturated or unsaturated fatty acid is esterified to a phosphate group which is also attached to a glycerol molecule
(b) only saturated fatty acid is esterified to a glycerol molecule to which a phosphate group is also attached
(c) only a unsaturated fatty acid is esterified to a glycerol molecule to which a phosphate group is also attached
(d) a saturated or unsaturated fatty acid is esterified to a glycerol molecule to which a phosphate group is also attached

NEET-2013

Ans. (d) : Phosphoglyceride is made of a saturated or unsaturated fatty acid esterified to a glycerol molecule. They are also called as glycerophospholipids.
Biological membranes usually involve two layers of phospholipids with their tails pointing inward, this arrangement is called a phospholipid bilayer.

84. One of the following substances is at its lowest level in fish food:

(a) actin (b) myosin
(c) cholesterol (d) tissue fluid

AP EAMCET-1998

Ans. (c) : Cholesterol is present in very low level in the fish food. It is a sterol that is found in very small amounts in fish flesh.

85. Hydrolysis of lipid yields:

(a) fatty acids and maltose
(b) fatty acids and glycerol
(c) mannose and glycerol

@apna_pdf

(d) maltose and fatty acid

Rajasthan PMT-2002
JCECE-2003

Ans. (b) : Hydrolysis of lipid can break down a fat or oil and release the triglyceral and fatty acids. An enzyme called lipase catalyses the hydrolysis of the fats and oils. It also known as **lipolysis**.

$$\text{Fats} + H_2O \xrightarrow{\text{lipase}} \text{Glycerol} + \text{Fatty acids}$$

86. Chemically wax is :
(a) a protein (b) a lipid
(c) a carbohydrate (d) an amino acid

BCECE-2015
Haryana PMT-2001

Ans. (b) : Naturally waxes are present as coating on leaves and stems and prevents the plant from losing excessive amount of water. It is a simple lipid which is an ester of a long-chain alcohol and a fatty acid. Alcohol may contain from 12-32 carbon atoms.

87. Paraffin wax is :
(a) ester (b) acid
(c) monohydric alcohol (d) cholesterol

BCECE-2010
CG PMT-2008
BHU PMT (Screening)-2006

Ans. (a) : Paraffin wax is classified as a petroleum wax. It comes from petroleum, coal and oil shale. The esters of long-chain (about 14-C to 36-C atoms) saturated and unsaturated fatty acids with long-chain alcohols (16-C to 30-C atoms) are known as waxes. It means, chemically the waxes are esters

88. In DNA molecule, the number of hydrogen bonds between adenine and thymine are:
(a) two (b) three
(c) four (d) eight

AP EAMCET-1997

Ans. (a) : In DNA molecule, Adnenine (A) and Thymine (T) together form a double hydrogen bond $(A = T)$ while Cytosine and Guanine form a triple Hydrogen Bond $(C \equiv G)$. Hydrogen bonds are formed between complementary nitrogenous bases on the interior of DNA.

89. The enzyme which acts to hydrolyse or breakdown a polynucleotide chain into its component nucleotide is
(a) Gyrases (b) Polymerases
(c) Nucleases (d) Primases

CG PMT-2010

Ans. (c) : The enzyme which act to hydrolyse or breakdown a polynucleotide chain into its components nucleotides is nuclease. DNA nuclease catalyze the cleavage of phosphodiester bonds. These enzymes play crucial roles in various DNA repair processes which involve DNA replication, base excision repair nucleotide excision repair, mismatch repair and double strand break repair.

90. Which base is present in RNA but not in DNA?
(a) Uracil (b) Thymine
(c) Guanine (d) Cytosine

BCECE-2004

Ans. (a) : Uracil is present in RNA but not in DNA Uracil is one of the four nucleobases in the nucleic acid RNA. The others are adenine, cytosine and guanine. In RNA, uracil binds to adenine via two hydrogen bonds. In DNA, the uracil nucleobases is replaced by thymine. Uracil is a demethylated form of thymine.
Formula:- $C_4H_4N_2O_2$

91. What base is responsible for hot spots in spontaneous point mutation?
(a) Adenine (b) Guanine
(c) 5-bromouracil (d) 5-methylcytocine

AMU-2002

Ans. (c) : Spontaneous point mutations are mutations that occurs naturally in DNA without any external influence. They can be caused by errors in DNA replication, deamination or depurination.
5- bromouracil is a base that is structurally similar to thymine. It can be incorporated into DNA in place of thymine during DNA replication.

92. Purines possess nitrogen at
(a) 1, 2, 4 and 6 position
(b) 1, 3, 5 and 7 position
(c) 1, 3, 7 and 9 position
(d) 1, 2, 6 and 8 position

WB JEE-2010

Ans. (c) : Purines posses nitrogen at 1,3,7 and 9. Nitrogen bases present in DNA can be grouped into two categories Purines (Adenine [A] Guanine [G]) and Pyrimidine (Cytosine [C] and thymine [T].) These nitrogenous bases are attached to C1 of deoxyribose through a glycosidic bond.

93. A nucleoside is :
(a) base + sugar
(b) base + phosphate
(c) sugar + phosphate
(d) base + sugar + phosphate

Punjab MET-2003

Ans. (a) : A nucleoside consist of a base and sugar.
A Nitrogenous base is a nitrogen containing compound that may form a nucleoside when they are attached to five carbon sugar ribose or deoxyribose.

94. The number of hydrogen bonds present between guanine and cytosine are:
(a) 2 (b) 3
(c) 4 (d) 5

BVP-2014
Rajasthan PMT-1996

Ans. (b) : The number of hydrogen bonds present between guanine and cytosine are three that is $(G \equiv C)$.

95. A nucleoside differs from a nucleotide in not having
(a) sugar (b) glucose
(c) nitrogen base (d) phosphate group

DUMET-2010

Ans. (d) : A nucleoside differs from a nucleotide in not having phosphate group. The main difference is in between their molecular composition as nucleosides contain sugar and a base where as nucleotides contain sugar, base and a phosphate group as well.

@apna_pdf

96. RNA and DNA are similar in

(a) having similar sugars
(b) having similar pyrimidine bases
(c) being capable to replicate
(d) being polymers of nucleotides

AFMC-2007

Ans. (d) : RNA and DNA are similar in being polymers of nucleotides. The other similarities are that both DNA and RNA store genetic information consist of sugar, nitrogenous bases and phosphate.

D. Nitrogenous Base

97. Which purine base is found in RNA?

(a) Thymine (b) Uracil
(c) Cytosine (d) Guanine

CGPMT-2004
MANIPAL-2001
AIPMT-1996
Rajasthan PMT-1995

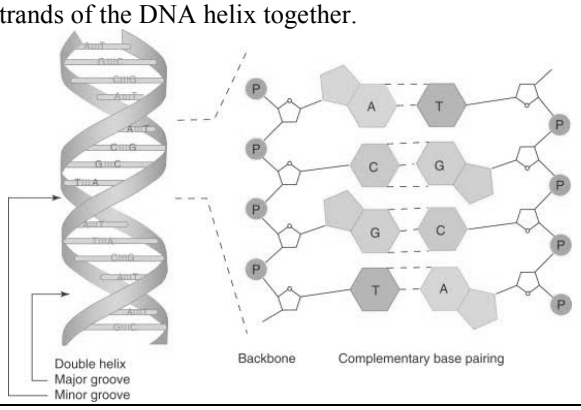
Ans. (d) : Purines are derived from their parent compound purine, which contains a 6-membered pyrimidine ring fused to the 5-membered imidazole ring and is related to uric acid. The 2 purine derivatives are- Adenine and Guanine. These are found in both DNA and RNA

98. The bonds found in a polynucleotide chain between the individual nucleotides and nitrogen bases

(a) Peptide bond, Hydrogen bond
(b) Hydrogen bond, Peptide bond
(c) Phosphodiester bond, Hydrogen bonds
(d) Glycosidic bond, Phosphodiester bond

AP EAPCET-22.05.2023, Shift-I

Ans. (c) : The bonds found in a polynucleotide chain between the individual nucleotides and nitrogen bases are phosphodiester bond and hydrogen bonds. Phosphodiester bonds are covalent bonds that are formed between the phosphate group of one nucleotide and the hydroxyl group of the sugar of the next nucleotide in a linear chain while hydrogen bonds forms between nitrogenous bases of the nucleotides. These bonds are weak bonds. Hydrogen bonds hold the two strands of the DNA helix together.



99. Match List - I with List - II:

List-I		List-II	
A.	Adenine	1.	Pigment
B.	Anthocyanin	2.	Polysaccharide
C.	Chitin	3.	Alkaloid
D.	Codeine	4.	Purine

Choose the correct answer from the options given below:

(a) (A) - (iv), (B) - (i), (C) - (ii), (D) - (iii)
(b) (A) - (iv), (B) - (iii), (C) - (ii), (D) - (i)
(c) (A) - (iii), (B) - (i), (C) - (iv), (D) - (ii)
(d) (A) - (i), (B) - (iv), (C) - (iii), (D) - (ii)

NEET (Re-Exam)-04.09.2022

Ans. (a) :

A.	Adenine	4.	Purine
B.	Anthocyanin	1.	Pigment
C.	Chitin	2.	Polysaccharide
D.	Codeine	3.	Alkaloid

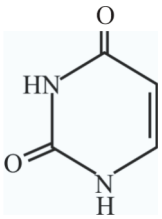
100. The bonds between Guanine and Cytosine

(a) Single H bond (b) 3-H bonds
(c) Double H bonds (d) Tetra H bonds

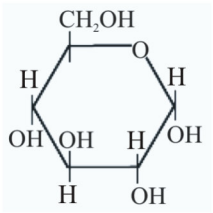
SRM JEEE-2018
AP EAMCET-11.07.2022 Shift-II

Ans. (b) : Guanine and cytosine are bonded with three H–bond (C ≡ G), while adenine and thymine make two H–bond (A = T) between them.

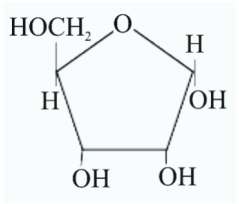
101. Select the option having correct matching of structure and sequence of the molecules given below –



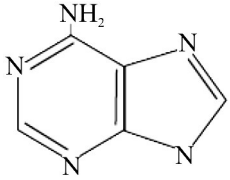
A



B



C



D

(a) A – Uracil, B – Glucose, C – Ribose, D - Adenine
(b) A – Adenine, B – Glucose, C – Uracil, D - Ribose
(c) A – Uracil , B –Ribose, C – Glucose, D – Adenine
(d) A – Adenine, B – Uracil, C – Ribose, D – Glucose

AIIMS-27.05.2018 Shift-I

@apna_pdf

Ans. (a) : Nucleic acids and DNA in particular are key macromolecules for the continuity of life. DNA bears the hereditary information that's passed on from parents to children.

Uracil is one of the four nucleobases in the nucleic acid RNA. The others are Adenine, Cytosine, and Guanine. In RNA, Uracil binds to adenine via two hydrogen bonds. In DNA, the Uracil is replaced by Thymine.

Glucose is the group of carbohydrates which is a simple sugar with a chemical formula $C_6H_{12}O_6$.

Ribose is a simple sugar and carbohydrates with molecular formula $C_5H_{10}O_5$.

102. Suppose, evolution on earth had occurred in such a way that there are 96 amino acids instead of 20. DNA has 12 different types of bases and DNA synthesis occurs in the same way as today. The minimum number of bases per DNA codon would be

(a) 12 (b) 8
(c) 2 (d) 3

AIIMS-2017

Ans. (c) : If one base codes for single amino acid, the total amino acids will be 12 as (12^1) is equal to 12. But we have 96 amino acid. Similarly, if two bases code for one amino acid, the total amino acids will have 144 as (12^2) is equal to 144. Thus, 2 bases can be used to code 96 amino acids or 20 amino acids Hence, the minimum number of bases per DNA codon should be 2.

103. Which of the following is not a pyrimidine?

(a) Thymine (b) Uracil
(c) Guanine (d) Cytosine

JIPMER-2008

Ans. (c) : Purines and pyrimidines make up the two groups of nitrogenous bases, including the two groups of nucleotide bases. So, Guanine is not a pyrimidine derivative. Two major purines present in nucleotides are adenine (A) and guanine (G), and three major pyrimidines are thymine (T), cytosine (c), and uracil (U).

104. DNA and RNA are different molecules as:

(a) DNA has cytosine and RNA has guanine
(b) DNA has uracil and RNA has thiamine
(c) DNA is a macromolecule and RNA is a macromolecule
(d) DNA has thymine and RNA has uracil

J&K CET-2002

Ans. (d) : DNA and RNA are different molecules as DNA has thymine and RNA has uracil. DNA differs from RNA in the nature of sugar & Pyrimidines. DNA has deoxyribose sugar, while RNA has ribose sugar. Among Pyrimidines, DNA has thymine and cytosine, while RNA has uracil and cytosine.DNA Replicates and stores genetic information & RNA carry out instructions encoded in DNA.

105. Which of the following is nucleoside?

(a) Adenosine (b) Adenine
(c) Deoxyribose (d) Adenylic acid

Assam CEE-2014

Ans. (a) : Nucleosides are made of a nitrogenous base, usually either a purine or pyrimide, and a five-carbon carbohydrate ribose or deoxyribose.
Nucleoside = Nitrogen base + Pentose sugar

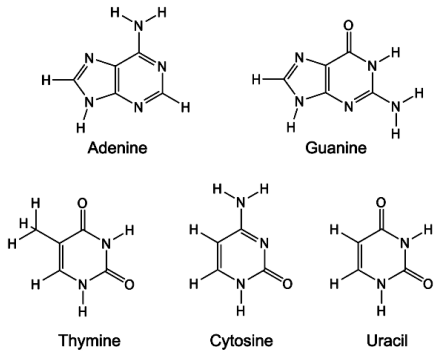
106. Which statement is true?

(a) Adenine has 4 nitrogen atoms
(b) Cytosine has 3 nitrogen atoms
(c) Guanosine has 3 nitrogen atoms
(d) Uracil has 5 nitrogen atoms

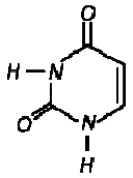
AIIMS-2007

Ans. (b) : Purines and Pyrimidines - Adenine (A) and Guanine (G) are purines.
Cytosine (C), Thymine (T) and Uracil (U) are pyrimidines.

- Cytosine is a pyrimidine nucleobase with a chemical formula of $C_4H_5N_3O$. Nitrogeneous base cytosine has three nitrogen atom.



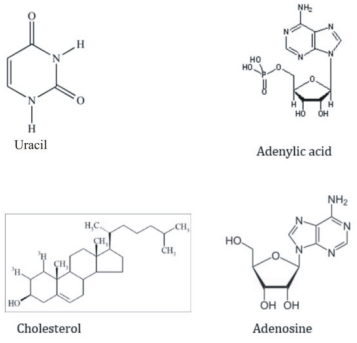
107. Identify the given structure.



(a) Adenylic acid (b) Uracil
(c) Cholesterol (d) Adenosine

AIIMS-2016

Ans. (b) The demethylated form of thymine is uracil. It is a primary nitrogenous base of RNA which pairs with the adenine by forming two H-bonds. It is replaced by thymine in DNA.
The image given below gives the structure of uracil, adenylic acid, cholesterol and adenosine.



108. Which of the following nucleotide sequences contains 4 pyrimidine bases?

(a) GATCAATGC (b) GCUAGACAA
(c) UAGCGGUAA (d) Both (b) and (c)

AIPMT-1994

@apna_pdf

Ans. (a) : Pyrimidine Bases are the nitrogenous bases, which have single heterocyclic ring. These are all derived from their parent heterocyclic compound pyrimidine As- Uracil, Thymine & Cytosine.
In, GATCAATGC = 4 pyrimide bases are present.

109. Which of the following is correct pair of pyrimidime bases ?
(a) Adenine and Thymine
(b) Adenine and Guanine
(c) Thymine and Cytosine
(d) Guanine and Cytosine

MHT CET-2015

Ans. (c) : Cytosine and thymine are examples of pyrimidine which is composed of a single ring 6 atom structure.

110. Which of the following is absent in DNA?
(a) U (b) A
(c) T (d) G

DUMET-2003

Ans. (a) : The nitrogenous bases present in DNA are- Adenine, Guanine, Cytosine and Thymine, while in RNA, Uracil is present in place of Thymine. In DNA molecule Uracil is absent.

111. Adenine is :
(a) pyrimidine base (b) purine base
(c) five carbon ring (d) structure with ring

Rajasthan PMT-1999
AIPMT-1992

Ans. (b) : Adenine is derived from purine, which contains of a 6- membered pyrimidine ring fused to the 5-membered imidazole ring & is related to uric acid. It is a white crystalline purine base, found in both DNA & RNA.

112. The nitrogen base found only in DNA is also called
(a) 5-methyl uracil (b) NH_4Cl
(c) Uracil (d) Guanine

Karnataka CET-2015

Ans. (a) : The nitrogen base found only in DNA is called Thymine or 5-methyl uracil or 5-methyl 2,4 dioxy pyrimidine.

113. During prolonged fasting, in what sequence are the following organic compounds used up by the body?
(a) First carbohydrates, next proteins and lastly lipids
(b) First proteins, next lipids and lastly carbohydrates
(c) First carbohydrates, next fats and lastly proteins
(d) First fats, next carbohydrates and lastly proteins

MGIMS Wardha-2010

Ans. (c) : During prolonged fasting first carbohydrates, next fats and lastly proteins moleculs are used up by the body. In addition prolonged fasting leads to an increase in the concentration of growth hormone glucagon and a decrease in the blood levels of thyrotropin and T_3/T_4

114. Houskeeping proteins are found in
(a) endoplasmic reticulum (b) cytoskeleton
(c) Golgi complex (d) All of the above

Manipal-2015

Ans. (d) : Houskeeping proteins are found in endoplasmic reticulum, cytoskeleton and Golgi complex. They are defined as proteins which are required for the basis function of a cell .
For example-enzymes involved in the synthesis and processing of DNA, RNA, proteins or the major metabolic pathways, These kinds of proteins are found in all cells and in various organelles of the cell. so the correct option is D.

115. Which statement is correct for biomolecules?
(a) DNA is a polymer of ribonucleotides
(b) All carbohydrates break into glucose
(c) Sequence of amino acids determine primary structure of protein
(d) RNA is single - stranded and contains different urine bases other than DNA

VMMC-2011

Ans. (c) : Sequence of amino acids determine primary structure of protein. Each amino acid is linked to next amino acid through peptide bonds created during the protein biosynthesis process.

116. Which one of the following peak absorption range of ultraviolet light by heterocyclic bases (nitrogen bases)
(a) 26 nm (b) 1500 nm
(c) 75 nm (d) 260 nm

Rajasthan PMT-2000

Ans. (d) : The heterocyclic bases of DNA or RNA absorb ultraviolet light a wavelength of 260 nanometer. This is because the alternating single and double bonds in the ring create a system of molecular orbitals that can absorb ultraviolet light at this wavelength.

117. Nitrogenous bases present in DNA
(a) adenine, guanine, cytosine, thymine
(b) adenine, guanine, cytosine, uracil
(c) adenine, thymine, uracil
(d) guanine, uracil

AFMC-2010

Ans. (a) : Nitrogenous base present in DNA are Adenine, Guanine, Cytosine and Thymine. Nitrogenous bases also called Nucleobases, are nitrogenous compounds that form an important part of the nucleotides, Nucleotides are building blocks of DNA and RNA that are composed of a sugar, nitrogenous base and a phosphate group.

E. Primary and Secondary Metabolites

118. The mineral elements required for carbohydrate translocation, photoysis of water and for chlorophyll synthesis are respectively
(a) Boron, Manganese, Zinc
(b) Boron, chlorine, Iron
(c) Molybdenum, copper, Magnesium
(d) Molybdenum, Copper, Iron

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : • Carbohydrate translocation– Boron (B) is the mineral element required for carbohydrate (sugar) translocation in plants.

@apna_pdf

- **Photolysis of Water–** Manganese (Mn) is essential for the process of photolysis of water during photosynthesis. Manganese and calcium are present in the core of the OEC, which is essential for photolysis of water.
- **Chlorophyll Synthesis–** Iron and magnesium (Mg) is necessary for the synthesis of chlorophyll, the green pigment used in photosynthesis.

119. Find out the correct match

Set-I		Set-II	
A.	Carbohydrates	i.	Nucleosides, Phosphates
B.	Proteins	ii.	Glucose, Fructose, Galactose
C.	Fats	iii.	Amino acids
D.	Nucleic acids	iv.	Fatty acids, glycerols

(a) A – i, B – iii, C – iv, D – ii
(b) A – ii, B – iii, C – i, D – iv
(c) A – ii, B – iii, C – iv, D – i
(d) A – ii, B – iv, C – iii, D – i

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : The correct match is (c) : A – ii, B – iii, C – iv, D – i

A.	Carbohydrates	ii.	Glucose, Fructose, Galactose
B.	Proteins	iii.	Amino acids
C.	Fats	iv.	Fatty acids, glycerols
D.	Nucleic acids	i.	Nucleosides, Phosphates

120. Which of the following are not secondary metabolites in plants?

(a) Rubber, gums
(b) Morphine, codeine
(c) Amino acids, glucose
(d) Vinblastin, curcumin

NEET-2021

Ans. (c) : Amino acids and glucose are included under the category of **primary metabolites**.

- They have identifiable functions and play known roles in normal physiological processes**.**
- Rubber, gum, morphine, codeine, vinblastin and curcumin are included under the category of secondary metabolites as their role or functions in host organisms is not known yet.

121. Match the following

A.	**Aquaporin**	**i**	**Amide**
B.	**Asparagine**	**ii**	**Polysaccharide**
C.	**Abscisic acid**	**iii**	**Polypeptide**
D.	**Chitin**	**iv**	**Carotenoids**

Select the correct option

(a) (A)-(iii), (B)-(i), (C)-(ii), (D)-(iv)
(b) (A)-(iii), (B)-(i), (C)-(iv), (D)-(ii)
(c) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)
(d) (A)-(ii), (B)-(i), (C)-(iv), (D)-(iii)

NEET-2020 Phase-II

Ans. (b) :

(A)	Aquaporin	(iii)	Polypeptide
(B)	Asparagine	(i)	Amide
(C)	Abscisic acid	(iv)	Carotenoids
(D)	Chitin	(ii)	Polysaccharide

122. Match the following

(A)	**Inhibitor of catalytic activity**	**(i)**	**Ricin**
(B)	**Possess peptide bonds**	**(ii)**	**Malonate**
(C)	**Cell wall material**	**(iii)**	**Chitin**
(D)	**Secondary metabolite**	**(iv)**	**Collagen**

Choose the correct option from the following

	(A)	**(B)**	**(C)**	**(D)**
(a)	(iii)	(i)	(iv)	(ii)
(b)	(iii)	(iv)	(i)	(ii)
(c)	(ii)	(iii)	(i)	(iv)
(d)	(ii)	(iv)	(iii)	(i)

NEET-2020 Phase-I

Ans. (d) :
(A) Inhibitor of Catalytic activity (ii) Malonate
(B) Possess peptide bonds (iv) Collagen
(C) Cell wall material in fungi (iii) Chitin
(D) Secondary metabolite (i) Ricin.

123. Glucose on reacting with Benedict solution may give the following precipitates except

(a) Violet precipitate
(b) Orange red precipitate
(c) Brick red precipitate
(d) Green/yellow precipitate

AIIMS-26.05.2019 Shift-I

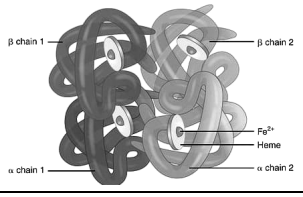
Ans. (a) : Glucose give different precipitation on reacting with Benedict solution like orange red precipitate, Brick red precipitate and Green/ yellow precipitate but does not give a violet precipitate. Benedict's solution is a reagent used to test for reducing sugar.
Benedict solution is a complex mixture of sodium carbonate, sodium citrate and copper (ii) sulfate pentahydrate.
Benedict's solution to test for simple carbohydrates like glucose. Benedict's solution is blue but, if simple carbohydrates are present, it will change color – green/yellow to brick red color.

124. How many polypeptide chains are there in 1 Hb molecule?

(a) 2 α & 2 β (b) 4 α
(c) 4 β (d) 1 α & 3 β

AIIMS-26.05.2018 Shift-I

Ans. (a) : In one molecule of haemoglobin chain there are total four polypeptide chains including two alpha (α) chains with 141 amino acid residues and two beta (β) chains with 146 amino acid residues.



@apna_pdf

125. Which ONE of the following molecules is a secondary metabolite?

(a) Ethanol (b) Lactate
(c) Penicillin (d) Citric Acid

KVPY (SA)-2018

Ans. (c) : Penicillin is secondary metabolites. Secondary metabolites are the natural organic products of low molecular mass produced by bacteria, fungi, animals or plants which are not directly involved in the normal growth, development or reproduction of the organism. Their production is influenced by environmental factors and production is regulated by complex – biochemical pathways.

126. Which one of the following is the correct matching of a vitamin, its nature and its deficiency disease?

(a) Vitamin-A-Fat soluble-Night blindness
(b) Vitamin K-Fat soluble -beri-beri
(c) Vitamin-A-Fat soluble-beri-beri
(d) Vitamin-K-Water soluble-Pellagra

AIIMS-2017

Ans. (a) : Fat-soluble vitamins are A, D, E, and K. The deficiency of vitamin A can cause **night blindness**.

- **Vitamin A** acts as regulator of cell and tissue growth and differentiation. vitamin-D provides a hormone like function, regulating mineral metabolism for bones and other organ.
- **Beri-Beri** disease is caused by due to deficiency of vitamin-B.
- **Pellagra** disease caused by vitamin-B_3.

127. Match the biological molecule listed under column-I with their biological function listed under column-II. Choose the answer which gives correct combination of alphabets or the two columns.

column-I (Biological Molecule)		column-II (Function)	
A.	Glycogen	1.	Hormone
B.	Globulin	2.	Biocatalyst
C.	Steroid	3.	Antibody
D.	Thrombin	4.	Storage product

	A	B	C	D
(a)	3	2	4	1
(b)	4	2	1	3
(c)	2	4	3	1
(d)	4	3	1	2

JIPMER-2015

Ans. (d) :

Biological Molecule		Function
Glycogen	-	Storage Product
Globulin	-	Antibody
Steroid	-	Hormone
Thrombin	-	Biocatalyst

128. Which of the following secondary metabolites belong to the group drugs?

(i) Morphine (ii) Curcumin
(iii) Codeine (iv) Vinblastine
(v) Abrin

(a) i and ii only (b) i and v only
(c) ii and iii only (d) ii and iv only
(e) iii and iv only

Kerala PMT-2015

Ans. (d) : Curcumin and vinblastine secondary metabolites belong to the group drugs.
Vinblastine is used as an anticancer drug. It is the salt of an alkaloid extracted from of flowering herb commonly known as periwinkle.
Curcumine is a component of turmeric and also used as a drug. It is produced by plalnts of *Curcuma longa* species. It can help in oxidative, inflammatory conditions, metabolic syndrome, arthritis etc.

129. Three crops that contribute maximum to global food grain production are –

(a) Wheat, rice and maize
(b) Rice, maize and sorghum
(c) Wheat maize and sorghum
(d) Wheat, rice and barley

AIPMT-2005

Ans. (a) : Wheat, rice and maize contribute maximum to global food grain production. They are a rich source of carbohydrate, present in endosperm, which is edible portion in cereals.

- Rice alone is the staple food of 60% of world population more than 50% Indians.
- Wheat is world's most widely cultivated crop. Maize is an important Kharif crop of India and also contributed to food production.

130. Vitamin B_6 is also called

(a) Thiamine (b) Pantothenic acid
(c) Pyridoxine (d) Retinol

AIIMS-2010

Ans. (c) : Vitamin B_6 is also called as **pyridoxine**. B_6 helps to produce calming neurotransmitters, including serotonin and GABA. It is involved in the process of making serotonin and non-epinephrine which are chemicals that transmit signals in the brain.

- Vitamin B_6 is also involved in the formation of myelin, a protein layer that forms around nerve cells.
- Vitamin B_6 might help reduce symptoms of depression.
- B_6 deficiency causes problem in nerves, skin, mucous membranes and circulatory system.

131. Which of the following sugars is not found in plants?

(a) Sucrose (b) Glucose
(c) Lactose (d) Fructose

AIIMS-2009

Ans. (c) : Except lactose, all fructose, sucrose and glucose are found in plants. Lactose is a disaccharide made up of glucose and galactose. It is also known as **milk sugar**. It is found the cow milk, buffalo milk and human (female) milk

132. From the following groups, select the one which has only secondary metabolites?

(a) Arbrin, cellulose, arginine, tyrosine
(b) Glycine, gums, serine, diterpenes
(c) Carotenoids, phenylalanine, curcumin, rubber
(d) Concanavalin–A,morphine,codeine,vinblastin

AIIMS-2013

@apna_pdf

Ans. (d) : Concanavalin- A, morphine, codeine, vinblastine are secondary metabolites. The secondary metabolites are the derivatives of the primary metabolites and they do not have any direct function in growth and development of plants.

133. Select the option having all correctly matched pairs.

A. Alkaloids	**(i) Carotenoid; Anthocyanin**
B. Pigments	**(ii)Vinblastin; curcumin**
C. Drugs	**(iii)Morphine; Codeine**

(a) A-i; B-ii; C-iii (b)A-ii;B-iii; C-i
(c) A-iii; B-i, C-ii (d)A-i; B-iii; C-ii

AIIMS-2012

Ans. (c) :

(A) Alkaloids	(iii) Morphine, Codeine
(B) Pigments	(i) Carotenoid, Anthocyanin
(C) Drugs	(ii) Vinblastin, Curcumin

134. Which of the following would not give Fehling's test?

(a) Glucose (b) Sucrose
(c) Fructose (d) Lactose.

AIIMS-2002

Ans. (b) : Fehling's test is given only by reducing sugars. When Fehling's solution is added to any reducing sugar then a red precipitate is formed which shows that reduction has taken place. Sucrose does not give this test. Presence of aldehyde but not ketones is detected by this test. The test will turn out to be positive only when a free aldehyde group is present . The Fehling's test does not detect presence of sugar, it can only detect sugar having aldehyde group.

135. Which of the following vitamins is essential for DNA synthesis and cell division?

(a) Vitamin - A (b) Vitamin - D
(c) Folic acid (d) Vitamin - K

CG PMT-2005

Ans. (c) : Folic acid is also known as **vitamin B9**. It is an essential nutrient necessary for protein and nucleic acid (DNA & RNA) synthesis. It is an important part of cell division and in making cells in some organs and bone marrow.

136. Antifeedant property occurs in

(a) nicotine (b) azadirachtin
(c) rotenone (d) cinerin

WB JEE-2007

Ans. (b) : It is a naturally occuring substance in certain plants which adversely affects insects or other animals which eat them. Azadirachtin has been shown to be and antifeedant and disrupt insect growth by blocking the release of the morphogenic peptide harmone. It is an extract of fruit from the neem tree *(Azadirachta indica),* which is largely grown in India.

137. Which of the following cannot be isolated from plants ?

(a) Riboflavin (b) Niacin
(c) Vitamin B_{12} (d) Vitamin C

DUMET-2002

Ans. (c) : Vitamin B_{12} commonly known as cyanocobalamin is exclusively generated commercially through fermentation in presence of *Pseudomonas denitrificans* and *Propionibacterium freudenreichii.* Vitamin B_{12} is the only vitamin that cannot be isolated by plant. It is a water soluble vitamin and they contain cobalt element and play role in the production of red blood cell and the function of the nervous system.

138. Which of the following metal is present in vitamin B_{12}?

(a) Cobalt (b) Copper
(c) Zinc (d) Magnesium

DUMET-2005

Ans. (a) : Cobalt metal is present in vitamin B_{12} so, it is called as **cobalamine.** This makes it the largest and most complex vitamin of all. Cobalt in ruminants, is an essential component for the microbial synthesis of vitamin B_{12}.

139. Maltose gives rise to two molecules of

(a) fructose (b) lactose
(c) glucose (d) sucrose

DUMET-2011

Ans. (c) : Maltose gives rise to two molecules of glucose. When maltose is hydrolysed, the glycosidic bond between the two glucose molecules breaks and maltose is converted in to 2 glucose molecules in the presence of maltase enzyme.

$C_{12}H_{22}O_{11} + H_2O \xrightarrow{\text{Maltase}}$ Glucose + Glucose ($2C_6H_{12}O_6$) (maltose)

140. Which of the following vitamins has some physiological effects similar to those of parathormone?

(a) Vitamin - A (b) Vitamin - D
(c) Vitamin - C (d) Vitamin - B

DUMET-2011

Ans. (b) : Vitamin D has same physiological effect similar to parathormone. Parathyroid hormone increases the activity of the enzyme that produces active vitamin D. This increase in the concentration of calcium together with vitamin-D feeds back to the parathyroid glands to stop further parathyroid hormone release.

141. Which one of the following is antioxidant vitamin?

(a) C, E, A (b) B_1, B_4
(c) A, D, E (d) B_3, B_5

DUMET-2003

Ans. (a) : Antioxidants are found in certain foods and may prevent some of the damage caused by free radicals by neutralising them. These include the nutrient antioxidants, vitamin A, C, E, and the minerals copper, zinc and selenium. They are found in colourful fruits and vegetables, especially those with purple, blue, red, orange and yellow hues.

142. Linoleic acid is an unsaturated fatty acid and its content is highest in

(a) coconut oil (b) sunflower oil
(c) groundnut oil (d) cotton oil

J&K CET-2013

@apna_pdf

Ans. (b) : Linoleic acid is an unsaturated fatty acid derived from hydrolyzed botanical oils, such as sunflower, and is a major component of biological cell membranes. Sun flower oil has 70% linoleic acid, 20% oleic acid and 10% saturated fats.

143. A typical disacchride, maltose is composed of
(a) β-glucose and β-galactose
(b) α-glucose and α-fructose
(c) α-sucrose and β-glucose
(d) two units of similar glucose

Manipal-2014

Ans. (d) : Maltose is composed of two molecules of glucose in an α- (1,4) glycosidic linkage. Maltose (or malt sugar) is an intermediate in the intestinal digestion of glycogen & starch, and is found in germinating grains.

144. Maltose consists of which one of the following?
(a) β - glucose and β - galactose
(b) α – glucose and α - fructose
(c) α – sucrose and β - glucose
(d) glucose and glucose

Manipal-2005

Ans. (d) : Maltose results from the enzymatic hydrolysis of amylose, a homopolysaccharide by the enzyme amylase.
• Maltose is composed of two molecules of glucose joined by an α- 1,4 – glycosidic linkage. It is a reducing sugar that is found in sprouting grain, wheat, corn meal, barley etc.

145. Which one of the following vitamins can be synthesized by bacteria inside the gut?
(a) B (b) C
(c) D (d) K

Haryana PMT-2001

Ans. (a) : Thiamine (B_1), folate (B_9) biotin (B_7), riboflavin (B_2) and panthothenic acid (B_5) are water soluble vitamins that are plentiful in the diet but that are also synthesized by gut Bacteria.
• Healthy adult gut micro biota sustains its own vitamin B_{12} requirement in an in vitro batch fermentation model.

146. The vitamin responsible for antisterile activity is:
(a) Vitamin B (b) Vitamin E
(c) vitamin K (d) Vitamin H

Haryana PMT-2001

Ans. (b) : Vitamin E also know as Tocopherol. It is also know as anti-sterility vitamin because of the fact that it's deficiency results in sterility. It is a fat soluble vitamin with several forms, but α-tocopherol is the only one used by the human body. It is important for reproduction, vision, brain & skin.

147. Which is not carbohydrate?
(a) Cellulose (b) Glucose
(c) Starch (d) Wax

Rajasthan PMT-1995

Ans. (d) : Wax is not a carbohydrate. They are a type of lipids. It is an ester of a long-chain alcohol and a fatty acid. The alcohol may contain 12-32 carbon atoms.

148. Vitamins are
(a) organic compounds (b) hormones
(c) minerals (d) salts

Rajasthan PMT-2001

Ans. (a) : Vitamins are organic molecules that are essential to an organism in small quantities for proper metabolic function. A vitamin is an organic compound, which means it contains carbon.

149. Which of the following vitamins are fat soluble?
(a) A, B, C, K (b) A, B, D, E
(c) A, D, E, K (d) A, D, C, K

WB JEE-2008

Ans. (c) : Vitamins are essential in the diet to promote growth, reproduction and health. The vitamins A, D, E and K are called **fat-soluble vitamins**, because they are soluble in organic solvents and are absorbed and transported in a manner similar to that of fats.

150. Which of the following carbohydrates is not a disaccharide?
(a) Maltose (b) Lactose
(c) Sucrose (d) Galactose

WB JEE-2008

Ans. (d) : Carbohydrates are divided into four types, Monosaccharides, Disaccharides, Oligosaccharides and polysaccharides.
Monosaccharides- Glucose, fructose galactose.
Disaccharides/oligosaccharides- Sucrose, lactase, maltose/Raffinose.
Polysaccharides- Starch, glycogen, cellulose.

151. Which of the following is not a source of vitamin A?
(a) Carrot (b) Mango
(c) Apple (d) Yeast

Rajasthan PMT-2005

Ans. (d) : Vitamin A is also known as **retinol**. They are found in most of the yellow, orange and red fruits and vegetables.
Yeast is a microorganism. It has a high content of vitamin B-complex and amino acid.

F. Protein and its Structure

152. Protein in silk thread is
(a) fibroin (b) keratin
(c) albumin (d) globulin

Punjab MET-2009
Rajasthan PMT-2009
UP CPMT-2003,2009
AMU-2006

Ans. (a) : Silk produced by silk worms (*Bombax mori*) consists of 2 important proteins which are fibrous proteins. They are sericin and fibroin. Sericin is water soluble silk protein whereas fibroin are large complex proteins and make up different types of silk. It is composed of amino acids like glycine, alanine and serine.

153. Select the correct statement regarding the cell membrane from the following
(a) Na^+ and k^+ ions move across cell membrane without carrier proteins

@apna_pdf

(b) Proteins make up 60 to 70% of the cell membrane
(c) Lipids are arranged in a bilayered cell membrane with polar heads towards the inner part
(d) fluid mosaic model of cell membrane was proposed by Singer and Nicolson

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : The correct statement is only (d). Fluid mosaic model of the cell membrane was proposed by singer and Nicolson in 1972. According to this model, cell membranes are quasi-fluid with a viscous lipid bilayer having proteins distributed at places both on the surface and inside.

- Sodium (Na^+) and potassium (K^+) ions move across the cell membrane through carrier proteins.
- Protein make up about 50% of the cell membrane.
- Lipid are arranged in a bilayered cell membrane with the polar heads facing outwards and the non-polar tails facing inwards.

154. Regulatory proteins of a myofibril are
(a) Actin and myosin
(b) Actin and troponin
(c) Myosin and tropomyosin
(d) Troponin and tropomyosin

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : Regulatory proteins of a myofibril are troponin and tropomyosin. Regulatory protiens includes M-protein, gamma-actin, C-protein, troponin and tropomyosin. Troponin and tropomyosin are the regulatory protein in the muscle contraction. These are the protein which regulates the interaction between actin and myosin. Troponin is bound within the filament of the contractile apparatus. Troponin controls muscle contraction by binding calcium ions and changing the position of tropomyosin, which uncovers the myosin-binding sites on actin filaments to relax the muscle.

155. The biological value and Protein Efficiency ration (PER) of egg are
(a) 13.3, 2.5 (b) 96 %, 4.5
(c) 20%, 11.5 (d) 173, 109

AP EAPCET-23.05.2023, Shift-I

Ans. (b) : Biological value measures protein quality by calculating the nitrogen used for tissue formation divided by the nitrogen absorbed from food. This product is multiplied by 100 and expressed as a percentage of nitrogen utilized. The biological value of egg are 96%, it shows a measure of how efficiently dietary protein is turned into body tissue.
Protein efficiency ratio (PER) is based on the weight gain of a test subject divided by its intake of a particular food protein during the test period. It measures the nutritive value of protein sources. Protein efficiency ratio of egg are 4.5.

156. The most abundant protein in the whole of the biosphere
(a) Collagen
(b) RuBisCO (Ribulose bisphosphate carboxylase – oxygenase)
(c) Trypsin
(d) Insulin

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : RuBisCO (Ribulose 1, 5 bisphosphate carboxylase – oxygenase) is the most abundant (10^{17}) protein in the whole of the biosphere. It is found in all photosynthetic organisms. It catalyzes the carboxylation of RuBP and the fixation of CO_2 during glucose synthesis in the calvin cycle.

157. Match List- I With List- II

	List-I		List-II
(A)	Protein	(i)	C=C double bonds
(B)	Unsaturated fatty acid	(ii)	Phosphodiester bond
(C)	Nucleic acid	(iii)	Glycosidic bonds
(D)	Polysaccharide	(iv)	Peptide bonds

Choose the correct answer from the options given below:
(a) (A)-(iv), (B) -(i), (C)-(ii), (D)-(iii)
(b) (A)-(i), (B) -(iv), (C)-(iii), (D)-(ii)
(c) (A)-(ii), (B) -(i), (C)-(iv), (D)-(iii)
(d) (A)-(iv), (B) -(iii), (C)-(i), (D)-(ii)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : Proteins are present in all living organisms and include many essential biological compound such as enzymes, hormones etc. Protein is consist of amino acid residues joined by peptide bonds.

- Unsaturated fatty acids contain one or more double bonds in their hydrocarbon chain.
- Nucleic acids are large biomolecules that play essential role in all cells and viruses, it involves the storage and expression of genomic information.
- Polysaccharide is a carbohydrate formed by long chain of repeating units linked together by glycosidic bonds.

158. Motor protein in the myofibril that is able to convert chemical energy into mechanical energy is
(a) Actin (b) Troponin
(c) Tropomyosin (d) Myosin

TS EAMCET-31.07.2022 Shift-II

Ans. (d) : Myosin is the motor protein in the myofibril that is able to convert chemical energy into mechanical energy. Myosin is a long, rod shaped proteins that forms cross bridges with actin filament.

159. Assertion (A): Active site of an enzyme is a crevice or pocket into which the substrate fits.
Reason (R): In tertiary structure of protein the Polypeptide chain when folds upon itself, the chain criss-crosses itself, and many crevices are formed.
The correct option among the following is:
Options:
(a) (A) is true, (R) is true and (R) is the correct explanation of (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-30.07.2022 Shift-II

@apna_pdf

Ans. (a) : An active site of an enzyme is a crevice or pocket into which the substrate fits and binds to an enzyme. With the binding of substrate the active site activates the enzyme . These sites are present on tertiary structure of protein.
Tertiary structure of protein at which polypeptide chain become function. A number of tertiary structure may fold into a quaternary structure .

160. A protein or polysaccharide molecule that simulates antibody formation is _____ .
(a) Antibiotics (b) Antigen
(c) Exotoxin (d) Toxin

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Antigens are the proteins, peptides or polysaccharides molecules that stimulate the antibody formation.
Antigens are toxin or other foreign substance which induces an immune response in the body especially the production of antibodies.

161. Which one of the following is the most abundant protein in the animals?
(a) Collagen (b) Lectin
(c) Insulin (d) Haemoglobin

NEET-2020 Phase-I
AIPMT-2002

Ans. (a) : The structural protein named as collagen found in tissues of animals is the most abundant protein in the animal. It provides structural support or strength to the skin, muscles, bones and connective tissues.

162. Plastocyanin is a/an containing metalloprotein.
(a) zinc (b) iron
(c) copper (d) cobalt

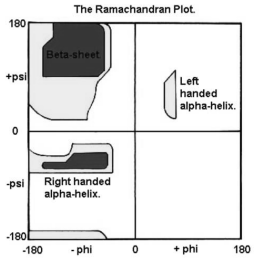
Tripura JEE-2019

Ans. (c) : Plastocyanin is a copper containing metallo-protein. It is found in variety of plants, cyanobacteria and some algae where it participates in photosynthesis. The protein is a prototype of the blue copper proteins, a family of intensely blue-coloured metalloproteins.

163. "Ramachandran plot" is used to confirm the structure of
(a) DNA (b) RNA
(c) Proteins (d) Triacylglycerides

NEET (Odisha)-2019

Ans. (c) :



"Ramachandran plot" is used to confirm the structure of proteins. The Ramachandran plot shows the statistical distribution of the combinations of the backbone dihedral angles ϕ and ψ.
In theory, the allowed regions of the Ramachandran plot show which values of the ϕ and φ angle are possible for an amino acid, X, in a $\alpha - X - \alpha$ tripeptide.

164. In primary structure of protein, the protein thread showed helix with four amino acids S-C-Y-E and a napthalene structure in aminoacid Y. In such condition what will be the direction of helix and what are the positions of amino acids
Options:
(a) From left to right Serine-Cystein-Tyrosine-Glutamic acid
(b) From right to left Serine-Tyrosine- Glutamic acid-Cystein
(c) From left to right Glutamic acid -Tyrosine - Cystein - Serine
(d) From right to left Cystein - Glutamic acid - Tyrosine - Serine

AP EAMCET-24.04.2019 Shift-I

Ans. (a) : The helix having a right-handed direction and the amino acids in the order Serine- Cysteine- Tyrosine-Glutamic acid.

165. Which of the following cannot be synthesized directly from the DNA ?
(a) mRNA (b) tRNA
(c) rRNA (d) Protein

Tripura JEE-2017

Ans. (d) : Protein synthesis is not done by DNA directly but it does take part indirectly. In the nucleus, DNA is transcribed to RNA. The mRNA carries the message out of the nucleus to the ribosome's in the cytoplasm where the tRNA helps translate the message to form a protein.

$$DNA \xrightarrow[\text{Transcription}]{} RNA \xrightarrow[\text{Translation}]{} Protein .$$

166. _____ are the most abundant proteins in the living world.
(a) Ribozyme of plants and collagen of animals
(b) RuBisCO of plants and collagen of animals
(c) PEPcase of plants and keratin of animals
(d) Alcohol dehydrogenase of plants and melanin of animals

Karnataka CET-2014

Ans. (b) : RuBisCO (Ribulose Biphosphate Carboxylase Oxygenase) is not only the most abundant protein in plants but also in the whole biosphere
It is present in the mesophyll cells of C_3 plants and bundle sheath cells of C_4 plants.

167. Globular protein composed of oval or spherical molecule does not act like
(a) Antibodies
(b) Enzyme
(c) Structural protein molecule
(d) Hormone

UP CPMT-2014

Ans. (c): Globular protein composed of oval or spherical molecule does not act like structural protein molecule. They are composed of oval or spherical or globular, which are water soluble and can form crystals. It act as antibodies, enzyme, hormone

168. Even after disruption of all the hydrogen bonds, which structural level of a protein molecules still remains intact :

@apna_pdf

(a) tertiary structure
(b) primary structure
(c) secondary structure
(d) Quaternary structure

AFMC -2011

Ans. (b) : The primary structure of protein contains peptide bond which are covalent in nature. Hence, after disruption of hydrogen bond its structure will remain intact.

169. When breast feeding is replaced by less nutritive food low in proteins and calories, the infants below the age of one year are likely to suffer from :

(a) Pellagra (b) Marasmus
(c) Rickets (d) Kwashiorkor

AIPMT-2009

Ans. (b) :
Marasmus - It occur due to deficiency of protein and calories.
Kwashiorkor - It develops in children whose diet are deficient of protein.
Pellagra - It is due to deficiency of vitamin B_3 (Niacin)
Rickets - It develops in children due to deficiency of vitamin D .

170. Secondary structure of protein, which is attached to lipid layer and lining the pores of cell membrane will be

(a) α-Helix (b) β-Strand
(c) β-Chain (d) Random

AIPMT-1999

Ans. (a) : The alpha helix is a common motif in the secondary structure of proteins and is a right hand-helix conformation in which every backbone N-H group hydrogen bonds to the backbone carbonyl group of the amino acid located four residues earlier along the protein sequence.

171. Nitrogen is the main constituent of

(a) fats (b) protein
(c) polyphosphates (d) carbohydrates

BHU PMT (Screening)-2011

Ans. (b) : Nitrogen is the main constituent of protein. The building blocks of proteins are amino acids, which are small organic molecules that consist of an alpha (central)carbon atom linked to an amino group, a carboxyl group, a hydrogen atom, and a variable component called a **side chain**.

172. Inadequate protein intake leads to kwashiorkor. The subsequent edema is most closely related to inadequate synthesis of which protein?

(a) Gamma globulin (b) Glucagon
(c) Insulin (d) Albumin

WBJEE-2012
DUMET-2009

Ans. (d) : Kwashiorkor is a form of protein malnutrition that is characterized by edema (swelling) weight loss, and skin changes. It is most common in children who are weaned from breast milk and do not get enough protein in their diet. Albumin is a protein that is synthesized by the liver. It help to maintain blood pressure and fluid balance.

173. What is common among amylase, rennin and trypsin?

(a) These all are proteins
(b) These all are proteolytic enzymes
(c) These are produced in stomach
(d) These all hormones

VMMC-2003

Ans. (a) : Amylase, rennin and trypsin are proteins. Amylase is a digestive enzyme predominantly secreted by the pancrease and salivary glands and found in other tissue at very small levels.
Rennin also called chymosin, protein digestive enzyme that curdles milk by transforming caseinogens into insoluble casein.
Trypsin is an enzyme that helps in digesting protein.

174. The water soluble protein associated with silk thread is

(a) fibroin (b) serecin
(c) chitin (d) mucin

AP EAMCET-2006
Manipal-2010

Ans. (b) : Silk thread is obtained from the cocoon of *Bombyx mori*. It mainly contains a water soluble protein called as **serecin** . Fibrin is a protein that makes up a major components of silk and insoluble in natures.

175. Richest source of protein is

(a) Rice (b) Gram
(c) Wheat (d) Glycine max

AMU-2003

Ans. (d) : Glycine max is richest source of protein. Its common name is soyabean, 36-56% of the dried weight in soybean is protein in nature. Glycine and conglycine are the main proteins, which makes up to 80% of total protein.

176. α- helical model of protein was proposed by

(a) Pauling and Corey (b) Stanley
(c) Webster (d) Robert Brown

AMU-2002
BVP-2000

Ans. (a) : Linus Pauling, Robert Corey, and Herman Branson proposed the α-helical and β-sheet (1951), now known to form the back-bones of tens of thousands of proteins. The alpha helix is rod- like structure whose inner section is formed by a tightly coiled main chain, with its side chains extending outward in helical array.

177. Which one of the following is an example of glycoprotein?

(a) Haemoglobin (b) Lecithin
(c) Mucin (d) Casein

AMU-2001

Ans. (c) : Example of glycoprotein is mucin, which are secreted in the mucus of the respiratory and digestive tracts. The sugars when attached to mucins give considerable water- holding capacity and also make them resistant to proteolysis by digestive enzymes.

178. Molecular weight of protein is :

(a) > 12000 (b) < 6000
(c) < 12000 (d) 600-3000

BCECE-2005

@apna_pdf

Ans. (a) : Molecular weight of protein is more than 12000. Protein are larger biomolecules and macromolecules that comprise one or more long chain of amino acid residues .

179. Which one is not protein?

(a) Actin (b) Myosin
(c) Albumin (d) Haematin

Manipal-2011
Rajasthan PMT-1995

Ans. (d) : Haematin is not protein. It is a complex red organic pigment containing iron and other atoms to which oxygen bind whereas, actin, myosin and albumin are proteins.

180. During protein denaturation which of the following is disrupted?

(a) 2D structure (b) 3D structure
(c) Peptide bond (d) AA sequence

BVP-2004

Ans. (b) : Denaturation is the process of modifying the molecular structure of a protein. It involves the breaking of many of the weak linkages or bonds (eg- hydrogen bond) within a protein molecule that are responsible for the highly ordered structure of the protein in its natural state. Protein may be denaturated by chemical action, heat or agitation causing a protein to unfold.

181. The term nucleosome was given by Outdet, Olins and Olins called these particle as nu particles, which histone is absent in nucleosome ?

(a) H_1 (b) H_2
(c) H_3a (d) H_4

Uttarakhand PMT-2006

Ans. (a) : The term nucleosome was given by Outdet, Olins and Olins called these particle as nu particles is H_1. Each nucleosome is composed of a little less than two turns of DNA wrapped around a set of eight proteins called histones, which are known as a histone octamer. Each histone octamer is composed of 2 copies each of the histone protein H2A, H2B, H3 and H4.H_1 is located outside the nucleosome core. It seals the DNA in the nucleosome by binding at site where DNA enters and leaves the nucleosome. H_1 is linker protein not histone protein .

182. The casein is a :

(a) milk protein (b) blood protein
(c) wheat protein (d) fish protein

BVP-2000

Ans. (a) : Casein protein is a protein found in milk that gives milk its white colour. Cows milk consists of around 80% casein protein.

183. Which of the following is the least likely to be involved in stabilising the three-dimensional folding of most proteins?

(a) Hydrogen bonds
(b) Electrostatic Interaction
(c) Hydrophobic interaction
(d) Ester bonds

NEET-2016 Phase-II

Ans. (d) : Ester bond is formed between the sugar and phosphate in a nucleotide and hence is responsible or least involved for the stability also of a polypeptide chain.

184. Maximum application of animal cell culture technology today is in the production of: -

(a) Insulin (b) Interfereons
(c) Vaccines (d) Edible proteins

AIPMT-2003

Ans. (c): Maximum application of animal cell culture technology are used in the production of vaccines. It is a biological preparation that provides active acquire immunity to a particular infections disease vaccine contains weakened or killed forms of the microbe or toxin or one of surface protein.

185. Not all proteins have a :

(a) Primary structure (b) Secondary structure
(c) Tertiary structure (d) Quaternary structure

BCECE-2015

Ans. (d) : The different structures of the proteins are primary, secondary, tertiary and quaternary structures. The quaternary structure of proteins is not commonly found in all types of proteins. They are formed when several protein molecules are joined and function as a single protein molecule.

186. Proteins which help other proteins to fold properly are called:

(a) Chaprones (b) Actins
(c) Porins (d) Synthases

BCECE-2015

Ans. (a) : Chaperones are proteins that assist the conformational folding or unfolding of large proteins or macromolecular protein complexes. It is also involved in the translocation of proteins for proteolysis.

187. Which structural level enables the proteins to function as enzymes?

(a) Primary (b) Secondary
(c) Tertiary (d) Quaternary

AMU-2014

Ans. (c) : Tertiary structural level enables the proteins to function as enzymes. The tertiary structure of protein gives it a very specific shape.

188. A nutrient which is used to build protoplasm is:

(a) fat (b) protein
(c) carbohydrate (d) calcium

Rajasthan PMT-2001

Ans. (b) : A nutrient which is used to build protoplasm is protein. Protoplasm is primarily composed of biomolecules like nucleic acids, proteins, lipids and carbohydrates. It holds in organic salts & molecules of water. It is surrounded by the membrane of the cells.

189. Match the protein with its function and choose the right option.

Protein		Function	
A.	**Collagen**	**i.**	**Glucose transport**
B.	**Trypsin**	**ii.**	**Hormone**
C.	**Insulin**	**iii.**	**Intercellular ground substance**
D.	**GLUT-4**	**iv.**	**Enzyme**

(a) a – 3, b – 4, c – 2, d – 1
(b) a – 4, b – 1, c – 2, d – 3
(c) a – 2, b – 4, c – 1, d – 3

@apna_pdf

(d) a – 3, b – 4, c – 1, d – 2
(e) a – 2, b – 1, c – 4, d – 3

Kerala PMT-2013

Ans. (a)

Protein		Function	
A.	Collagen	iii.	Intercellular ground substance
B.	Trypsin	iv.	Enzyme
C.	Insulin	ii.	Hormone
D.	GLUT-4	i.	Glucose transport

G. Nucleic Acid

190. Match the following

List-I	List-II	List-II
(A) Guanine	(I) Cytidylic	(i) Carboxylic amino bond
(B) Cytosine	(II) Purine	(ii) Cytidine
(C) Peptide bond	(III) Heteropolymer	(iii) Angiosperms
(D) Chitin	(IV) Dehydration	(iv) 2C-N rings

(a) A-II-iii, B-III-iv, C-I-ii, D-IV-i
(b) A-II-iii, B-I-iv, C-III-ii, D-IV-i
(c) A-II-iv, B-I-ii, C-IV-i, D-III-iii
(d) A-I-iv, B-II-iii, C-III-ii, D-IV-i

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : The correct match is (c) : A-II-iv, B-I-ii, C-IV-i, D-III-iii

(A) Guanine	(II) Purine	(iv) 2C-N rings
(B) Cytosine	(I) Cytidylic	(ii) Cytidine
(C) Peptide bond	(IV) Dehydration	(i) Carboxylic amino bond
(D) Chitin	(III) Heteropolymer	(iii) Angiosperms

191. Assertion (A) : Loss or gain of a segment of DNA results in alteration in chromosomes.
Reason (B) : Alterations in chromosomes do not result in abnormalities
(a) Both A and R are correct and R is the correct explanation of A
(b) Both A and R are correct and R is not the correct explanation of A
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct

AP EAPCET-22.05.2023, Shift-I

Ans. (c) : • **Assertion (A) is correct.** Loss or gain of a segment of DNA results in alternation in chromosomes. This is due to chromosomes are made up of DNA. When a segment of DNA is lost or gained, the chromosome is altered.

• **Reason (B) is incorrect.** Alternations in chromosomes can result in abnormalities. This is due to the altered chromosomes may not be able to function properly. Chromosomal alternation means chromosomal abnormalities.

192. The structures that appear as "Beads - on string" in the chromatin and the number of base pairs are
(a) nucleotides, 100 (b) Genes, 200
(c) Kinetochore, 100 (d) Nucleosome, 200

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : The nucleosome that appear as " Beads - on string" in the chromatin and the number of base pairs are 200. The nucleosomes actually represent the beads of beads-on-string structure visible under electron microscope.

193. In the chromatin the charge of a DNA and associated proteins, number of types of histones and copies are
A. Positive, Negative
B. Negative, Positive
C. 4, 2
D. 16, 4
(a) B, D (b) B, C
(c) A, C (d) A, D

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : The charge of the DNA and associated histone proteins in chromatin are negative and positive, respectively. There are 4 type of histone proteins, H_1, H_2A, H_2B and H_3 and each histone protein has 2 copies.

194. The following sequence read the same on two strands in $5^1 \rightarrow 3^1$ direction and $3^1 \rightarrow 5^1$ is called as
5^1 —— GAATTC —— 3^1
3^1 —— CTTAAG —— 5^1
(a) Mismatch sequence
(b) Palindromic nucleotide sequence
(c) Zig-zag Sequence
(d) Recognition sequence

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : Restriction endonuclease commonly recognizes DNA sequences that are palindromes i.e it may be read same forward or backward from central axis, In two strands 5' → 3' direction and 3' → direction is read same.
ex. 5-TATA-3 and same from 5' → 3' & 3'→ 5'
Similarly 5' – GAATTC-3'
3' – CTTAAG – 5'

195. Identify the chemical components of nucleic acid
(A) Cysteine
(B) Heterocyclic compound
(C) Tyrosine
(D) Phosphoric acid
(E) Ribulose
(F) Monosaccharide
Options:
(a) A, B, E, F (b) A, B, D
(c) B, D, F (d) A, C, D, F

TS EAMCET-09.08.2021 Shift-I

Ans. (c) : All nucleotides are made of three subunits: one or more phosphate groups, a pentose sugar (five–carbon sugar, either deoxyribose or ribose) and a nitrogen containing base (either adenine, cytosine, guanine, thymine, or uracil).

196. Two consecutive nucleotides of a nucleic acid are linked with_____bond.
(a) glycosidic (b) phosphodiester
(c) peptide (d) hydrogen

MHT CET-01.10.2020 Shift-I

@apna_pdf

Ans. (b) : Two consecutive nucleotides of a nucleic acid are linked with phosphodiester bond. A phosphadiester bond is a type of covalent bond that is formed between the phosphate group of one nucleotide and the hydroxyl group of the 3' carbon atom of the next nucleotide This bond called the backbone of nucleic acids, such as DNA and RNA

197. Which two are nucleotides :

(A) 
(B) 
(C) 
(D) 
(a) A and B (b) C and D
(c) A and D (d) B and C

AIIMS-26.05.2019 Shift-I

Ans. (a) : The nucleotide is a compound consisting of a nucleoside linked to a phosphate group. Nucleotides form the basic structural unit of nucleic acids such as DNA. Here, A and B two are nucleotides.
Nucleotides contain nitrogenous bases, sugar and phosphoric acids in ester linkage. The nitrogenous base presenting nucleotides are purine (Adenine and Guanine) pyrimidines (Cytosine, Thymine and Uracil). The uracil can only be found in ribonuceotides while thymine base can only be found in deoxyribonucleotides.

198. Nucleic acid occurs in

(a) Cytoplasm
(b) Mitochondria and chloroplast
(c) Golgibody
(d) Lysosomes

Karnataka CET-2007

Ans. (b) : Nucleic acid occurs in organelles like mitochondria and chloroplast.

199. In three dimensional view the molecule of t-RNA is:

(a) L-shaped (b) S-shaped
(c) Y-shaped (d) E-shaped

AIPMT-2000

Ans. (a) : In three dimensional view, the molecule of t-RNA is an L-shaped molecule. The L-shape is formed by the folding of the secondary structure of the t-RNA, which is a clover leaf-shaped structure. The anticodon loop is located at the bottom of the L, and the amino acid attachment site is located at the top of the L.

200. Anticodon occurs in:

(a) t-RNA (b) m-RNA
(c) r-RNA (d) DNA

AIPMT-2000

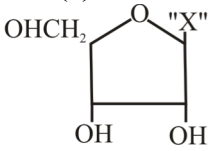
Ans. (a) : Anticodon occurs in t-RNA. A codon or triplet of bases specifies a given amino acid. They are specified by more than one codon. The conversion of codon information into proteins is conducted by transfer RNA. Each transfer RNA (t-RNA) has an anticodon which can base pair with a codon.

201. Given below is the diagrammatic representation of one of the categories of small molecular weight organic compounds in the living tissues. Identify the category shown and the one blank component 'X' in it:

	Category	Component
(a)	Nucleotide	Adenine
(b)	Nucleoside	Uracil
(c)	Cholesterol	Guanin
(d)	Amino Acid	NH_2

AIPMT (Screening)-2012
JIPMER-2004

Ans. (b) :



= Here "X" is uracil

The given structure represent a ribose sugar. Since, no phosphate groups is attached, hence it is not a nucleotide.
Cholesterol and amino acid does not consist of a sugar hence, it is **nucleoside.**
Structure of DNA/ RNA – nitrogenous base + sugar → nucleoside + phosphate group → nucleotide.

202. Which one of the following is wrong statement?

(a) Phosphorus is a constituent of cell membranes certain nucleic acids and all proteins
(b) Nitrosomonas and Nitrobacter are chemoautotrophs
(c) Anabaena and Nostoc are capable of fixing nitrogen in free-living state also
(d) Root nodule forming nitrogen fixers live as aerobes under free-living conditions

AIPMT (Screening)-2012

Ans. (a) : Phosphorus is a component of cell membrane DNA and RNA but not protein.
Phosphorus is present in cell membrane in the form of phospholipid bilayer.

203. Uridine present only in RNA is a

(a) Pyrimidine (b) Nucleoside
(c) Nucleotide (d) Purine

NEET (Karnataka)-2013

@apna_pdf

Ans. (b) : Uridine present only in RNA is a nucleoside. It is formed by the combination of uracil as a nitrogenous base and ribose sugar.

204. Which one is the sweetest sugar?
(a) Sucrose (b) Glucose
(c) Fructose (d) Maltose
UP CPMT-2013

Ans. (c) : Fructose is the sweetest sugar. It is a monosaccharide or simple sugar, that is found in naturally in fruits, honey and other foods. The chemical formula of fructose is $C_6H_{12}O_6$ which is twice as sweet as sucrose.

205. A nucleoside differs from nucleotide in not having the:
(a) sugar nitrogen base (b) nitrogen base
(c) glucose (d) phosphate group
J&K CET-2002

Ans. (d) : Sugars and nitrogenous bases join to form nucleoside. The bond between sugar and nitrogenous base is known as 'N-glycoside bond", whereas when the phosphate group joins with sugars and nitrogenous base forms nucleotide. The phosphate group join with hydroxyl group of sugar by the phosphoester bond.

206. Nucleic acid can be fragmented by the enzyme:
(a) polymerases (b) nucleases
(c) proteases (d) ligases
J&K CET-2002

Ans. (b) : Nucleic acid can be fragmented by nucleases. It is capable of cleaving phosphodiester bonds between nucleotides of nucleic acid.

207. When a phosphate group is added to a nucleoside, an acid-soluble biomolecule is formed, called
(a) nitrogen base (b) adenine
(c) sugar phosphate (d) nucleotide
Assam CEE-2014
BVP-2001
AIPMT-1991

Ans. (d) : When a phosphate group is added to a nucleoside, an acid-soluble biomolecule is formed, called nucleotide.

208. Which one of the following will be untenable nucleotide combination?
(a) Phosphate – deoxyribose - uracil
(b) phosphate – ribose - uracil
(c) phosphate – ribose - adenine
(d) phosphate – deoxyribose – cytosine.
JIPMER-2012
AMU-1995

Ans. (a) : Nucleotide comprises of nitrogen bases, pentose sugar, phosphate group. The nitrogenous base present in DNA are adenine, guanine, cytosine and thymine
Deoxyribose sugar in DNA comprises thymine base whereas RNA comprises of uracil base.

209. Basis of life are-
(a) nucleic acids (b) proteins
(c) nucleoproteins (d) amino cids
AIIMS-2011
Rajasthan PMT-1995

Ans. (a) : Nucleic acid also known as the basis of life as they store genetic information and are responsible for heredity.
• Nucleic acids are made up of nucleotides. These's are two types
(1) Deoxyribonucleic acid (DNA)
(2) Ribonucleic acid (RNA)

210. Which is wrong about nucleic acids?
(a) DNA is single stranded in some viruses.
(b) RNA is double stranded occasionally.
(c) Length of one helix is 45 Å in B-DNA.
(d) One turn of Z-DNA has 12 bases.
AIPMT-1993

Ans. (c) : The double helical structure of DNA was given by Watson and Crick in 1953. The length of on helix in B-DNA is 34 Å i.e 0.34nm and the helical width is 2nm.
B-DNA is the most common form of DNA. It is a right-handed double helix, with 10 base pairs per turn. B-DNA stabilized by the H-bond between the nitrogenous bases of the two strands.

211. Flow cytometry allows detection of differences in length of nucleic acids as small as about:
(a) 1.5 Mbp (b) 15 Mbp
(c) 25 Mbp (d) 100 Mbp
BCECE-2015

Ans. (a) : Flow cytometry allows detection of differences in length of nucleic acids as small as about 1.5 Mbp. Flow cytometry is a technology that rapidly analyzes single cells while suspended in diffused salt based solution.

212. Single stranded nucleic acid is found in:
(a) E.coli (b) $\phi \times 174$
(c) λ (d) T_4
DUMET-2003

Ans. (b) : Bacteriophage $\phi \times 174$ is small is icosahedral virus that contains a single stranded, closed circular genome. $\phi \times 174$ bacteriophage mostly infects Escherichia coli (E.coli). It has naked capsid (no envelope outside). The $\phi \times 174$ genome is about 5386 nucleotide long.

213. A stretch of DNA consisting of 10-20 bases is most appropriately be called as
(a) polynucleotide (b) nucleotides
(c) nucleosides (d) oligonucleotide
AMU-2014

Ans. (d) : A stretch of DNA consisting of 10-20 bases is most appropriately be called as oligonucleotide. DNA has double helix structure in which two strands are coiled over each other.A oligonucleotide is a short sequence of nucleotides, typically 10-20 bases long. Nucleotides are the building blocks of DNA and RNA, and they consist of a sugar, a phosphate group, and a nitrogenous base.

214. Which biomolecules other than proteins can be catabolised by humans or apes for the production of uric acid?
(a) Carbohydrates (b) Lipids
(c) Nucleic acids (d) Vitamins
AMU-2014

@apna_pdf

Ans. (c) : Uric acid is a product of purine metabolism generated during breakdown of nucleic acid (DNA & RNA) and ATP. Both adenine and guanine nucleotides convert at xanthine. Purines plays an important role in regulation of uric acid metabolism.

215. Nucleic acid is absent in :
(a) nucleus (b) mitochondria
(c) chloroplast (d) golgi body

Rajasthan PMT-1999

Ans. (d) : Golgi apparatus is the cell organelle that do not contain nucleic acid DNA is found in every organelle mitochondria and chloroplasts are semi autonomous organelle i.e they have their own genetic material.

216. Which of the following radioisotope is not suitable for DNA labelling based studies?
(a) H^3 (b) P^{32}
(c) N^{15} (d) S^{35}

J&K CET-2011

Ans. (d) : In the given options, all are used as radioisotopes except S^{35}. S^{35} is suitable for protein labeling based studies because proteins contains sulphur whereas H^3 is present in backbone of sugar as well as nitrogen base and is used for DNA labeling. P^{32} is also present in entire backbone of DNA strands and nitrogenous bases in DNA are composed of N, hence N^{15} is used as DNA labeling.

217. Width of the DNA molecule is
(a) 15 Å (b) 20 Å
(c) 25 Å (d) 34 Å

BVP-2009

Ans. (b) : The width of DNA molecule is 20 Å or 2nm.

218. Condensation product of adenine, ribose and phosphoric acid is named as :
(a) adenosine (b) adenylic acid
(c) adenine phosphate (d) none of these

Punjab MET-2005

Ans. (b) : Condensation product of adenine, ribose & phosphosric acid is adenylic acid and molecular formula of adenine is $C_5H_5N_5$ the nitrogenous bases attaches at first C-sugar.

219. Match the following and choose the correct combination from the options given.

	Column I : Chemical compounds		Column II : Example
(A)	Nitrogen base	(1)	RNA
(B)	Nucleoside	(2)	Thymidylic acid
(C)	Nucleotide	(3)	Cytidine
(D)	Nucleic acid	(4)	Uracil

(a) A - 1 B - 2 C - 3 D - 4
(b) A - 1 B - 3 C - 2 D - 4
(c) A - 4 B - 3 C - 2 D - 1
(d) A - 4 B - 1 C - 2 D - 3
(e) A - 4 B - 2 C - 3 D - 1

Kerala PMT-2014

Ans. (c)

	Column I : Chemical compounds		Column II : Example
(A)	Nitrogen base	(4)	Uracil
(B)	Nucleoside	(3)	Cytidine
(C)	Nucleotide	(2)	Thymidylic acid
(D)	Nucleic acid	(1)	RNA

H. Polysaccharides

220. Co factor that forms coordination bonds with side chains at active site of enzyme
(a) Prosthetic group (b) Co-enzyme
(c) Metal ions (d) Apoenzyme

AP EAPCET-23.05.2023, Shift-I

Ans. (c) : Metal ions are inorganic Co-factors that can form co-ordination bonds with side chains at the active site of an enzyme. These bonds helps to stabilize the enzyme's structure and to bind the substrate.

221. Select the correct sequential steps regarding absorption of fatty acids and glycerol, in intestine.
(A) Micelles are reformed into small protein coated fat globules called chylomicrons.
(B) Micelles move into intestinal mucosa.
(C) Fatty acids and glycerol are incorporated into small droplets called micelles.
(D) Lacteals release the absorbed substances into blood stream.
(E) Chylomicrons are transported into lacteals.
Choose the correct answer from the options given below :
(a) (C), (B), (A), (E), (D)
(b) (B), (C), (E), (A), (D)
(c) (A), (E), (B), (D), (C)
(d) (D), (E), (B), (C), (A)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : It represents the correct sequential steps regarding absorption of fatty acid and glycerol in intestine that is –
- Fatty acid and glycerol are incorporated into small droplets called micelles.
- Micelles move into mucosa.
- Micelles are reformed into small protein coated fat globules called chylomicrons.
- Chylomicrons are transported into lacteals.
- Lacteals release the absorbed substances into blood stream.

⇒ So, these are the correct sequence of absorption of fatty acid and glycerol.

222. Inulin is a polymer of :
(a) Amino acids (b) Glucose
(c) Fructose (d) Galactose

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (c) : Inulins are group of naturally occurring polysaccharides produced by many types of plants.
• Inulin is a polymer of fructose. It is not metabolized in human body and is readily filtered through kidney.

@apna_pdf

223. Cellulose does not form blue colour with Iodine because

(a) It breaks down when iodine reacts with it.
(b) It is a disaccharide.
(c) It is a helical molecule.
(d) It does not contain complex helices and hence cannot hold iodine molecules.

NEET (UG) 07.05.2023

Ans. (d) : Cellulose is a polymer of glucose unit bonded together cellulose insoluble in water

- Cellulose is made up of a series of sugar molecules linked together in a long chain. It found in all plant foods.
- Cellulose does not have a helical structure. It does not bind to iodine to form a colored product.

224. True statement for cellulose molecule :

(a) β–1–4 linkage, unbranched
(b) β–1–4 linkage, branched
(c) α–1–4 linkage, branched
(d) β–1–6 linkage, unbranched

APEAMCET-2022
AIPMT-1998

Ans. (a) : Cellulose molecule has β-1-4 linkage unbranched, polymer of glucose. Cellulose is a structural polysaccharide. It is an unbranched polymer of glucose unlike starch which is also a polymer of glucose but shows branching.
It is highly biodegrable and insoluble in water.

225. Most abundant organic compound on earth is

(a) Protein (b) Cellulose
(c) Lipids (d) Steroids

J & K CET-2022
MHCET-2020 / AIPMT-2001

Ans. (b) : Cellulose is the most abundant organic compound, biopolymer and polysaccharide found on earth. It is found in the cell walls of plants, and it is also the main component of wood.

226. A dehydration reaction links two glucose molecules to product maltose. If the formula for glucose is $C_6H_{12}O_6$ then what is the formula for maltose?

(a) $C_{12}H_{24}O_{11}$ (b) $C_{12}H_{20}O_{10}$
(c) $C_{12}H_{24}O_{12}$ (d) $C_{12}H_{22}O_{11}$

NEET-2022

Ans. (d) : Maltose is a disaccharide formed by dehydration process i.e. synthesis by elimination on one water molecules to from a glycosidic bond in between two glucose molecules.

227. Monomer of Insulin

(a) Glucose (b) Fructose
(c) Arabinose (d) Galactose

AP EAPCET-11.07.2022 Shift-I

Ans. (b) : Insulin is a monomer of fructose. It is a polypeptide hormone made by pancreatic β-cell. The structure of insulin is made up of a dimers of two peptide chains linked with two disulfide bonds. It regulates metabolism of carbohydrates and protein by promoting absorption of glucose from blood into liver, fat and skeletal muscle cells glucose is converted into glycogen via glycogensis or fat via lipogenesis.

228. Match List-I with List-II

	List-I (Biological Molecules)		List-II (Biological functions
(A)	**Glycogen**	**(i)**	**Hormone**
(B)	**Globulin**	**(ii)**	**Biocatalyst**
(C)	**Steroids**	**(iii)**	**Antibody**
(D)	**Thrombin**	**(iv)**	**Storage product**

Choose the correct answer from the options given below:

(a) (A) - (iv), (B) - (iii), (C) - (i), (D) - (ii)
(b) (A) - (iii), (B) - (ii), (C) - (iv), (D) - (i)
(c) (A) - (iv), (B) - (ii), (C) - (i), (D) - (iii)
(d) (A) - (ii), (B) - (iv), (C) - (iii), (D) - (i)

NEET-2022

Ans. (a) :

	List-I (Biological Molecules)		List-II (Biological functions
(A)	Glycogen	(iv)	Storage product
(B)	Globulin	(iii)	Antibody
(C)	Steroids	(i)	Hormone
(D)	Thrombin	(ii)	Biocatalyst

229. Match the following lists.

List-I	List-II	List-III
A. Deoxyribose	**i. Gums**	**I. Fatty acids**
B. Lipids	**ii. $C_5H_{10}O_4$**	**II. True macro molecules**
C. Polymeric substances	**iii. Trypsin**	**III. Cellulose**
D. Polypeptides	**iv. Glycerol**	**IV. Carbohydrate**

The correct match is :

	A	B	C	D
(a)	ii, IV	iii, I	i, III	iv, II
(b)	iii, II	ii, I	i, III	iv, IV
(c)	iv, I	i, III	iii, IV	ii, II
(d)	ii, IV	iv, I	i, III	iii, II

TS EAMCET-09.08.2021 Shift-II

Ans. (d) :

List-I	List II	List-III
A. Deoxy ribose	(ii) $C_5H_{10}O_4$	(iv) Carbohydrate
B. Lipids	(iv) Glycerol	(i) Fatty acids
C. Polymeric substance	(i) Gum	(iii) Cellulose
D. Polypeptides	(iii) Trypsin	(ii) True macro-molecule

230. Which of the followings are the metabolic products of glucose and glutamine?

(a) CO_2 and NH_3 (b) CO_2 and lactate
(c) Lactate and ammonium (d) Lactate only

SRM JEEE-2019

Ans. (c) : Lactate and ammonium are the metabolic products of glucose and glutamine.
Ammonium lactate is a compound with formula NH_4 $(C_2H_4(OH)COO)$. It is the ammonium salt of lactic acid. It has mild anti-bacterial properties. Ammonium lactate is the chemical combination of lactic acid and ammonium hydroxide.

@apna_pdf

231. Which one of the following sugar does not have same empirical formula as that of carbohydrate?

(a) Maltose (b) Galactose
(c) Digitoxose (d) Glycogen

MHT CET-2019

Ans. (c) : Digitoxose, component of cardiac glycosides found in *Digitalis purpurea*. It is a glycoside made up of one molecule of digioxigenin and three molecules of sugar digitosose. Chemical formula is $C_6H_{12}O_4$ obtained by hydrolysis of glycoside of *Digitalis*. They are used as conventional drugs for over 200 years.

232. Polysaccharides can be tested by

(a) Iodine (b) HCl
(c) KCl (d) KNO_3

AIIMS-26.05.2019 Shift-II

Ans. (a) : Polysaccharides can be tested by iodine. The basis for this test is that starch is a coiled polymer of glucose, iodine interacts with these coiled molecules and becomes bluish-black. The iodine test is used for distinguishing between starch, glycogen, and carbohydrates.

233. Which one of the following carbohydrates is a heteropolysaccharide?

(a) Cellulose (b) Starch
(c) Glycogen (d) Hyaluronic acid

MHT CET-2018

Ans. (d) : Carbohydrate are homopolysaccharides or heteropolysaccharides. Heteropolysaccharides contains two or more units of monosaccharides or polysaccharides, do not have a fixed molecular weight. Hyaluronic acid made up of N-acetyl-glucosamine -6-phosphate and glucoronic acid. It is found in connective tissue and skin. It functions in signaling and also acts as lubrication of synovial joints and helps in joint movement.

234. Choose the correct statements

(I) Inulin is a polymer of glucose
(II) Cellulose does not contain complex helices
(III) Starch is a polymer with helical secondary structure
(IV) Store house of energy in animal tissue is glycogen

Options:

(a) I, IV, III (b) I, III, II
(c) II, IV, I (d) II, III, IV

AP EAMCET-25.04.2018 Shift-II

Ans. (d) : (i) Inulin is a polymer of fructose.
(ii) Cellulose does not contain complex helices and hence cannot hold iodine and remain colourless.
(iii) Starch can hold iodine molecules in its helical secondary structure and hence it gives colour with iodine.
(iv) Glycogen is a homopolysaccharide found in the liver and muscles of animals, where it is used to store energy.

235. Marcomolecule of Chitin are -

(a) Simple polysaccharide
(b) Nitrogen containing polysaccharide
(c) Phosphorus containing polysaccharide
(d) Sulphur containing polysaccharide

NEET-2013

Ans. (b) : Chitin is a nitrogen containing modified polysaccharide made up of units of N-acetyl-d-glucosamine. Macromolecule chitin is an example complex structural heteropolysaccharide.
It has nitrogen containing glucose derivatives such as N-acetyl glycosamine. It ispresent as the structural components of fungal cell and exoskeleton of arthopods etc.

236. Ribose sugar is present in

(a) RNA only
(b) RNA polymerase and ATP
(c) RNA and ATP
(d) RNA polymerase, RNA and ATP

Karnataka CET-2009

Ans. (c) : Ribose sugar is present in RNA and ATP. RNA is a nucleic acid that is made up of ribonucleotides. Ribonucleotides consists of ribose sugar, nitrogenous base and phosphoric acid. ATP (Adenosine triphosphate) is a ribonucleotide that is used to store transfer energy to cell.

237. Benedicts reagent test is conducted to confirm the presence of

(a) Reducing sugars
(b) Proteins
(c) Polysaccharides like starch
(d) Lipids

Karnataka CET-2008

Ans. (a) : Benedicts reagent test is conducted to confirm the presence of reducing sugars. This reagent is a complex mixture of sodium citrate, sodium carbonate and the pentahydrate of copper (II) sulphate. Benedict's reagent changes colour of reducing sugars from clear blue to bright red.

238. In a polysaccharide, number of monosaccharides are linked by

(a) peptide bond (b) phosphoester bond
(c) glycosidic bond (d) hydrogen bond

Karnataka CET-2016

Ans. (c) : Two monosaccharide units can be joined together by a glycosidic bond The glycosidic bond is formed between the anomeric carbon of one monosaccharide and a hydroxyl group of another. Starch is the best example of glycosidic bond.

239. Amylopsin acts upon

(a) Polypeptides
(b) Polysaccharide in any medium
(c) Polysaccharide in acidic medium
(d) Polysaccharide in alkaline medium

BHU-2007
Manipal-2011
BCECE-2011

Ans. (d) : Amylopsin is an enzyme that breaks down starch into sugar. It is produced by the pancreas and is present in pancreatic juice. It is most active in an alkaline medium, such as small intestine. It is a pancreatic enzyme having pH of 2 to 3 and digests starch. It is also known as pancreatic amylase

@apna_pdf

240. Which one is not a carbohydrate?
(a) Starch (b) Chitin
(c) Glycogen (d) Methionine
Uttarakhand PMT-2011

Ans. (d) : Starch, Chitin, Glycogen are carbohydrates whereas methionine, is an amino acid. It is a rare amino acid and only amino acid used as precursor in both animal and plant kingdom.

241. Mannitol is
(a) amino acid (b) amino alcohol
(c) sugar alcohol (d) sugar acid
WB JEE-2011

Ans. (c) : Mannitol is sugar alcohol used as sweetener and medication. As a medication, used to decrease pressure in eyes and to lower increased intracranial pressure. It helps to produce more urine and used to treat people with kidney failure, to remove excess water & toxins from body.

242. Which one is hexose sugar?
(a) Mannose (b) Galactose
(c) Both [a] and [b] (d) Cellulose
BCECE-2001

Ans. (c) : Hexose sugar is a monosaccharide with 6 carbon atoms. The chemical formula of hexose is $C_6H_{12}O_6$, common examples of hexose sugars are glucose, galactose, mannose and all these are aldoses whereas fructose is ketose. Glucose, galactose and mannose are epimers i.e they differ from one another at units of symmetry.

243. Which one of the following enzymes has no role in protein synthesis?
(a) RNA polymerase
(b) Restriction endonuclease
(c) Amuno acyl synthetase
(d) Peptidyl transferase
JCECE-2010

Ans. (b) : Restriction endonuclease are also know as **biological scissors**. They are not involve in protein synthesis instead they acts as a scissor i.e they cut DNA fragments at a specific site. They are of 3 types – Type I, Type II and Type III, Only Type II restriction endonucleases are used in DNA technology and gene cloning.

244. The organic compound having polyhydroxy aldehydes or ketones is
(a) carbohydrate (b) lipid
(c) protein (d) vitamin.
AMU-1995

Ans. (a) : The organic compound having polyhydroxy aldehydes or ketones is carbohydrate. Polyhydroxy aldehydes or polyhydroxy ketone are those carbon compounds in which number of carbon unit is high where more than one C atom has alcohol or hydroxyl group and terminal C has either aldehyde or ketone group.

245. Which one of the following is a non-reducing carbohydrate?
(a) Maltose (b) Sucrose
(c) Lactose (d) Ribose 5- phosphate
AIPMT-2014

Ans. (b) : Sucrose is a non-reducing sugar which is a carbohydrate that is not oxidized by a weak oxidizing agent such as the Tollen's reagent in basic aqueous solution. The characteristic property of non-reducing sugars is that, they do not generate any compounds containing an aldehyde group in aqueous medium.

246. Table sugar is consist of
(a) lactose (b) sucrose
(c) maltose (d) glucose
UP CPMT-2009

Ans. (b) : Table sugar consists of sucrose. It is made of disaccharide. Sucrose (table sugar) is an equal combination of glucose and fructose. It comes from sugarcane and beets which contain sucrose. It is a type of carbohydrate disaccharide made of equal parts of two monosaccharides.

247. Starch and cellulose are the compounds of many units of
(a) amino acids (b) glycerol
(c) simple sugars (d) fatty acids
AIIMS-1996

Ans. (c) : Starch and cellulose are the compounds of many units of simple sugars. Starch is glucose polymer of amylase and amylopectin. Natural starch consists of 10-30% amylase and 70 – 90 % anylopectin. Amylose is a linear polysaccharide composed entirely of D-glucose units joined by α-1,4 glycosidic linkages. Cellulose is fibrous carbohydrates found in all plants and is structural component of plant cell walls. Cellulose is linear polymer of glucose joined by β, 1-4 glycosidic bond. Starch and cellulose both belongs to polysaccharides.

248. Identify the trisaccharide
(a) Mannose (b) Maltose
(c) Raffinose (d) Galactose
Uttarakhand PMT-2010

Ans. (c) : Raffinose is a trisaccharide in which glucose acts as monosaccharide bridge between galactose and fructose. It has both α and β glycosidic bonds and hydrolyzed to d-galactose and, sucrose via engyme α-glycosidic activity. It is found in beans, cabbage, brussel sprouts, broccoli.

249. When a man starves, he first of all consumes to the stored:
(a) protein (b) carbohydrate
(c) glycogen (d) fat
JIPMER-1996

Ans. (c) : Glycogen is a stored form of glucose made up of many glucose molecules. Glucose is the main sources of energy and comes from carbohydrate. Glycogen is stored in liver and muscles. Muscles needs a lot of energy to move, healing etc and uses stored glycogen for metabolism during starvation/fasting.

250. Polysaccharides, polypeptides and polynucleotides have in common that they all
(a) contain amino acid
(b) are formed in condensation reactions
(c) contain nitrogen
(d) come out in acid soluble pool
MGIMS Wardha-2015

@apna_pdf

Ans. (b) : Condensation reaction is a type of chemical reaction in which two molecules are combined to form a single molecule with loss of small molecules such as water. Polysaccharides are formed with condensation of many glucose units.
Polypeptide chain is generated by condensation of amino acids and release of water.

251. Glucose is:
(a) Pyranose pentose sugar
(b) Furanose pentose sugar
(c) Ketose hexose sugar
(d) Aldose hexose sugar

MP PMT-2013

Ans. (d) : Glucose is aldose hexosoe sugar. It can exists in an open chain as well as ring form. Chemical formula of glucose is $C_6H_{12}O_6$. Galactose & fructose are structural isomers of glucose

252. Which of the following statements is wrong for sucrose?
(a) It is a disaccharide
(b) It is a non - reducing sugar
(c) It accumulates in the cytoplasm
(d) It is comprised of maltose and fructose

WB JEE-2014

Ans. (d) : Sucrose is a disaccharide and composed of glucose and fructose subunits. It is produced naturally in plants and main constituent of white sugar.
Sucrose contains no anomeric hydroxyl groups, hence grouped as non-reducing sugar.

253. A complex polysaccharide produced from sucrose by the bacterium Leuconostoc mesenteroides is
(a) Chitin (b) Starch
(c) Cellulose (d) Dextran

BVP-2007

Ans. (d) : A complex polysaccharide produced from sucrose by the bacterium Leuconostoc mesenteroides is dextran. It is a low molecular weight polymer of glucose.

I. Nature of Bond

254. Match List-I with List-II.

	List-I		List-II
(A)	**Protein**	**(i)**	**C = C double bonds**
(B)	**Unsaturated fatty acid**	**(ii)**	**Phosphodiester bonds**
(C)	**Nucleic acid**	**(iii)**	**Glycosidic bonds**
(D)	**Polsyaccharide**	**(iv)**	**Peptide bonds**

Choose the correct answer from the options given below

	(A)	(B)	(C)	(D)
(a)	(iv)	(iii)	(i)	(ii)
(b)	(iv)	(i)	(ii)	(iii)
(c)	(i)	(iv)	(iii)	(ii)
(d)	(ii)	(i)	(iv)	(iii)

NEET-2021

Ans. (b) :

	List-I	List-II
(A)	Protein	Peptide bonds
(B)	Unsaturated fatty acid	C = C double bonds
(C)	Nucleic acid	Phosphodiester bonds
(D)	Polysaccharide	Glycosidic bonds

255. DNA polymerase links nucleotide by forming which type of bond:
(a) Phosphodiester bond (b) Hydrogen bond
(c) Glycosidic bond (d) Ester bond

AIIMS-25.05.2019 Shift-I
CG PMT-2005

Ans. (a) : DNA polymerase links nucleotide by forming which type of bond Phosphodiester bond. These bonds in DNA polymers connect the 5' carbon of one nucleotide to the 3' carbon of another.

256. Match the given bonding groups and their respective bond.

List-I [Bonding groups]	**List-II [Bonds]**
(A) 2C-atoms of adjacent monosaccharides	**(I) Ionic bond**
(B) Carboxyl and amino group of two aminoacids	**(II) Hydrogen bond**
(C) Two nucleotides	**(III) Peptide bond**
(D) Phosphate and hydroxyl group of sugar in DNA	**(IV) Ester bond**
	(V) Glycosidic bond

The correct answer is
Options :

	A	B	C	D
(a)	I	II	III	IV
(b)	I	III	II	IV
(c)	I	IV	II	III
(d)	I	II	IV	III

AP EAMCET-28.04.2017 Shift-I

Ans. (b) :

(A)	2C-atoms of adjacent monosaccharides	(I) Ionic bond
(B)	Carboxyl and amino group of two amino acids	(III) Peptide bond
(C)	Two nucleotides	(II) Hydrogen bond
(D)	Phosphate and hydroxyl group of sugar in DNA	(IV) Ester bond

257. Two polynucleotide chains are held together by which of the following bonds?
(a) Phosphate (b) Hydrogen
(c) Disulphide (d) None of the above

Assam CEE-2014

Ans. (b) :DNA molecule made of two strands of nucleotides which is linked by hydrogen bonds between complementary base pairs.

258. Lipase breaks the
(a) ester bonds (b) peptide bonds
(c) hydrogen bonds (d) glycosidic bonds

Uttarakhand PMT-2011

@apna_pdf

Ans. (a) : Lipase catalyzes the hydrolysis reaction and breaks down ester bonds of lipids and fats and converts into fatty acids, glycerol, and other alcohols. Lipase perform essential roles in digestion, transport processing of dietary lipids.

259. How many phosphodiester bonds are there in ATP?

(a) 3 (b) 2
(c) 1 (d) 0

BCECE-2015

Ans. (d) : In ATP no phosphodiester bond are present. ATP has only two high energy bonds i.e. phosphoanhydride bond. ATP is a nucleoside triphosphate consisting of nitrogen base (Adenine), ribose sugar and three serially bonded phosphate group It is known as ‘‘Energy currency of cell”

260. In DNA helix, cytosine is paired with guanine by:

(a) three hydrogen bonds
(b) phosphate bond
(c) two hydrogen bonds
(d) covalent bond

AP EAMCET-1998

Ans. (a) : In the DNA double helix structure, adenine pairs with the thymine by two hydrogen bonds and guanine paired with cytosine by three hydrogen bonds.

261. Study the following lists

List-I		List-II	
(A)	**Hydrogen bond**	**(I)**	**Adenine-Deoxyribose**
(B)	**N-glycosidic linkage**	**(II)**	**Glucose-Fructose**
(C)	**Phosphodiester bond**	**(III)**	**Leucine-Glycine**
(D)	**Peptide bond**	**(IV)**	**Nucleotide-Nucleotide in polynucleotide chain**
		(V)	**Guanine-cytosine on opposite strands of DNA**

The correct match is

	A	B	C	D
(a)	(V)	(I)	(IV)	(III)
(b)	(II)	(I)	(V)	(III)
(c)	(V)	(III)	(IV)	(II)
(d)	(I)	(IV)	(V)	(II)

TS EAMCET-15.05.2016

Ans. (a) :	
Hydrogen bond	Guanine-cytosine on opposite strands of DNA
N-glycosidic linkage	Adenine-Deoxyribose
Phosphodiester bond	Nucleotide-Nucleotide in polynucleotide chain
Peptide bond	Leucine-Glycine

262. Which one of the following is catalysed by the presence of enzyme peptidyl transferase ?

(a) Peptide bond formation
(b) Transfer of a ammo acid
(c) Transfer of ribosomes units
(d) Transfer of peptide bonds

BVP-2006

Ans. (a) : Peptide bond formation is catalysed by the presence of enzyme peptidyl transferase. It is catalyzes peptide bond formation between amino acid of the t-RNA during translation process of protein synthesis.

J. Concept of Metabolism and Living State

263. Match the following

List-I (Element)		List-II (Activator of)	
A.	**Iron**	**I.**	**RUBISCO**
B.	**Manganese**	**II.**	**Cytochrome ‘C’ oxidase**
C.	**Magnesium**	**III.**	**Nitrogenase**
D.	**Molybdenum**	**IV.**	**Catalase**
		V.	**IAA oxidase**

(a) A – III, B – IV, C – I, D - II
(b) A – V, B – II, C – I, D - III
(c) A – IV, B – V, C – I, D - III
(d) A – II, B – III, C – I, D - V

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : The correct match is (c) : A – IV, B – V, C – I, D - III

A.	Iron	IV.	Catalase
B.	Manganese	V.	IAA oxidase
C.	Magnesium	I.	RUBISCO
D.	Molybdenum	III.	Nitrogenase

264. Enzymes, vitamins and hormones can be classified into a single category of biological chemicals because of all of these

(a) enhance oxidative metabolism
(b) are conjugated proteins
(c) are exclusively synthesised in the body of a living organism as at present
(d) help in regulating metabolism

NEET AIPMT-2005
AIIMS-2008

Ans. (d) : Enzymes, vitamins and hormones can be classified into a single category of biological chemicals because of all of these help in regulating metabolism. They have a role in regulating in the metabolism of a living organism Hence, they are classified in a single category of biological chemicals. Vitamins, hormones, enzymes, ATP, carbohydrate lipids, nucleic acids and proteins are only a few examples.

265. Following technique uses radioactive precursors for observing metabolic activities of macromolecules, is

(a) chromatography
(b) density gradient centrifugation or cell fractionation

@apna_pdf

(c) autoradiography
(d) electron microscope

DUMET-2004

Ans. (c) : Autoradiography is a photographic method to detect radioactive materials. Autoradiograph is an image on X-ray film, produced by emissions of β-particles or gamma rays from a distribution of radioactive substance it is used to study metabolism of plants and animals.

266. Breaking down of organic compounds in the body and liberation of energy is :
(a) a catabolic process (b) an anabolic process
(c) a digestive process (d) none of the above

Rajasthan PMT-2001

Ans. (a) : Breakdown of organic compounds in the body and liberation of energy is a catabolic process.

K. Enzymes and Enzyme Action

267. Disaccharide Lactose on hydrolysis forms galactose and glucose. The enzyme related is
(a) Lactase (b) permease
(c) Transacetylase (d) β-galactosidase

TS EAMCET 10.05.2023 Shift-I

Ans. (d) : β-galactosidase catalyzes the hydrolysis of the glycosidic bond in lactose, resulting in the release of galactose and glucose.
Lactose → Glucose + Galactose
Lactose is a disaccharide which, hydrolyzes into glucose and galactose by breaking of glycosidic bonds.

268. Below reaction is catalyzed by the enzyme
$CO_2 + H_2O \rightarrow H_2CO_3$
(a) Enolase (b) Aconitase
(c) Fumarase (d) Carbonic anhydrase

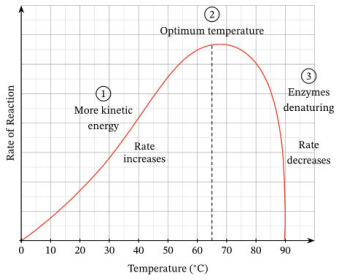
AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Carbonic anhydrase catalyzes the conversion of CO_2 + H_2O to H_2CO_3 and maintain the balance of CO_2 and bicarbonate ions in the body.

269. Enzymes are denaturated by
(a) Low Ph
(b) High substrate concentration
(c) Low temperature
(d) heat

AP EAPCET-22.05.2023, Shift-II

Ans. (d) : Enzyme are denatured at high temperature of heat because heat disrupts their molecular structures and affects their active sites. Enzymes are protein molecules that get denatured at high temperatures. High heat breaks hydrogen and ionic bonds leading to disruption in enzyme shape.



270. Given below are two statements :
Statement I : Low temperature preserves the enzyme in a temporarily inactive state whereas high temperature destroys enzymatic activity because proteins are denatured by heat.
Statement II : When the inhibitor closely resembles the substrate in its molecular structure and inhibits the activity of the enzyme, it is known as competitive inhibitor.
In the light of the above statements, choose the correct answer from the options given below :
(a) Statement I is false but Statement II is true.
(b) Both Statement I and Statement II are true.
(c) Both Statement I and Statement II are flase.
(d) Statement I is true but statement II is false.

NEET (UG) 07.05.2023

Ans. (b) : At very high temperature, enzymes because they are made of protein, can be denatured or destroyed. The material on which the enzyme will act is called the substrate.
• An inhibitor may bind to an enzyme and block binding of the substrate, for example, by attaching to the achieve site this is called competitive inhibition, because the inhibitor "completes" with the substrate for the enzyme.

271. Assertion (A) : Active site of an enzyme is a crevice or pocket into which the substrate fits.
Reason (R) : In tertiary structure of protein chain when folds upon itself, the chain criss-crosses itself, and many cervices are formed.
The correct option among the following is:
(a) (A) is true, (R) is true and (R) is the correct explanation of (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-30.07.2022 Shift-II

Ans. (b) : Active site of an enzyme is a crevice or pocket into which the substrate fits. In tertiary structure of protein chain when folds upon itself, the chain criss – crosses itself and many crevices are formed. Tertiary structure of protein gives a very specific shape to proteins.

272. Enzymes are functional at ——— temperature in human body
(a) 17° C (b) 27° C
(c) 37° C (d) 47° C

AP EAMCET-12.07.2022 Shift-II

Ans. (c) : Enzymes are functional at 37°C temperature in human body. They are temperature sensitive and are not functional at low temperatures. At very high temperature, enzymes undergo denaturation.

273. In the enzyme which catalyses the breakdown of:
$H_2O_2 \rightarrow H_2O + O_2$
the prosthetic group is:
(a) Nicotinamide adenine dinucleotide
(b) Haem

@apna_pdf

(c) Zinc
(d) Niacin

NEET (Re-Exam)-04.09.2022

Ans. (b) : Haem is the prosthetic group associated with enzymes that catalyze reactions, where oxygen molecules are involved in the breakdown.

274. The term Enzyme was proposed by _____
(a) W F Khune (b) E Fisher
(c) D Koshland (d) E Buchner

AP EAPCET-12.07.2022 Shift-I

Ans. (a) : The discovery of enzyme is credited to Eduand Buchner.
The name of enzyme was coined in 1878 by W F Khune. Enzyme are proteins that function as biological catalyst.

275. _____enzyme converts sucrose into glucose and fructose
(a) Zymase (b) Invertase
(c) Isomerase (d) Maltase

AP EAPCET-11.07.2022 Shift-I

Ans. (b) : The Enzyme Invertase is used to convert sucrose (cane sugar) into glucose and fructose. Invertase is also know as sucrose and saccharase.

276. Match the following lists:

List-I	List-II	List-III
A) Coenzymes are organic compound	i) No structure similarities	I) Ribose-5 phosphate isomerase
B) Isomerases	ii) Differ from inorganic catalysis	II) During catalysis
C) Non-competitive enzyme inhibition	iii) Catalyzing inter conversion of optical positional isomers	III) Operates at high Temperatu re also
D) Enzyme catalysts	iv) With the apoenzyme only as a transient	IV) Metal ion of copper

The correct match is

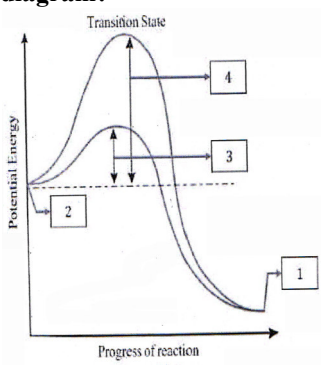
	A	B	C	D
(a)	iv, II	iii, I	i, IV	ii, III
(b)	iii, III	ii, I	iv, III	i, IV
(c)	vi, II	iii, I	i, III	ii, IV
(d)	iii, III	ii, IV	iv, I	I, II

TS EAMCET-10.08.2021 Shift-I

Ans. (a) :

List-I	List-II	List-III
A) Coenzymes are organic compound	iv) With the apoenzyme only as a transient	II) During catalysis
B) Isomerases	iii) Catalyzing inter conversion of optical positional isomers	I) Ribose-5 phosphate isomerase
C) Non-competitive enzyme inhibition	i) No structure similarities	IV) Metal ion of copper
D) Enzyme catalysts	ii) Differ from inorganic catalysis	III) Operates at high Temperature also

277. Identify the labelled parts 1, 2, 3, 4 in the Concept of Activation energy shown in the below diagram?



(a) 1-Activation energy with enzyme, 2-Product, 3-Substrate, 4-Activation energy without enzyme
(b) 1-Product, 2-Substrate, 3-Activation energy with enzyme, 4-Activation energy without enzyme
(c) 1-Substrate, 2-Activation energy with enzyme, 3-Product, 4-Activation energy without enzyme
(d) 1-Activation energy without enzyme, 2-Activation energy with enzyme, 3-Substrate, 4-Product

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : The structure of substrate gets transformed into the structures of products. Activation energy without enzyme is very high, whereas enzyme provides the path of lower activation energy.

278. Match the following-

Enzymes		Functions	
A.	Lyases	i.	Oxido reduction
B.	Isomerases	ii.	Link compounds
C.	Dehydrogenases	iii.	Transfer of group
D.	Ligases	iv.	Interconversion
		v.	Removal of groups

Options:

	A	B	C	D
(a)	v	iv	i	ii
(b)	iv	v	ii	iii
(c)	iii	ii	iv	i
(d)	i	iii	v	iv

AP EAMCET-03.09.2021 Shift-II

@apna_pdf

Ans. (a) :

Enzymes		Functions	
A.	Lyases	v.	Removal of groups
B.	Isomerases	iv.	Interconversion
C.	Dehydrogenases	i.	Oxido reduction
D.	Ligases	ii.	Link compounds

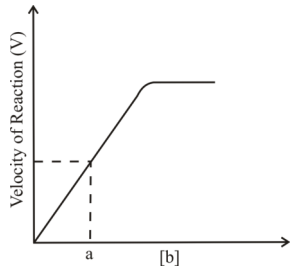
279. Enzymes can react with acidic or basic substances due to their____nature.

(a) Amorphous (b) Competitive
(c) Colloidal (d) Amphoteric

MHT CET-2019

Ans. (d) : Enzyme can react with both acidic or basic substance due to their amphoteric nature. This flexibility helps them function effectively over a range of pH conditions, as they contain amino acid residues that can donate or accept protons.

280.



In the above figure representing an enzyme catalysed reaction 'a' and 'b' respectively are

(a) Michaelis Menten constant and substrate concentration
(b) $\frac{1}{2}V_{max}$ and K_m
(c) $\frac{1}{2}V_{max}$ and substrate concentration
(d) K_m and [E]

TS EAMCET-03.05.2018 Shift-I

Ans. (a) : Michaelis Menten constant (K_m) is a constant indicating the substrate concentration at which an enzyme catalyzed reaction attains half of its maximum velocity. Lower the value of K_m greater the speed of reaction.

281. Study the following

(I)	**K_m value**	**Affinity of the enzyme**	**Inverse measure enzyme affinity**
(II)	**Hydrolases**	**P-O bonds**	**Linking 2 compounds**
(III)	**Transferases**	**Transfer of a group**	**Inhibitor of reaction**
(IV)	**Emil Fischer**	**Lock and key hypothesis**	**Formation of ES complex**

The correct combinations are

(a) I, IV (b) II, III
(c) I, III (d) II, IV

AP EAMCET-25.04.2018 Shift-I

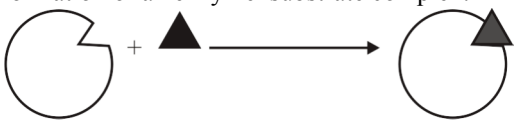
Ans. (a) : The kinetics of enzyme catalyzed reaction was explained by Michaelis and Menten in 1913. Michaelis-Menten theory of enzyme kinetics is the simplest one that accounts for kinetic properties of many enzymes.

Michaelis-Menten derived following equation-

$$V_0 = \frac{V_{max}[S]}{K_m + [S]}$$

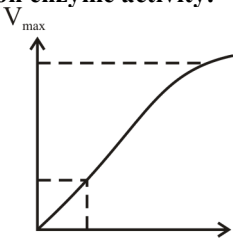
Fischer's lock and key model:- According to this model, complementary structural features are present between enzyme and substrate and the active site is pre-shaped to fit the substrate.

The substrate can fit into its complementary site on the enzyme as a key fits into a lock. This results in the formation of an enzyme substrate complex.



Enzyme Substrate Enzyme substrate complex

282. The following graph shows concentration of substrate on enzyme activity:



What does the Y-axis represent?

(a) Temperature
(b) Velocity of reaction
(c) pH
(d) Pressure

Karnataka CET-2018

Ans. (b) : In the following graph y-axis represent the velocity of reaction and the substrate-enzyme activity is represented on x- axis. Enzyme activity represented by Michaelis Menten equation.

283. Which one of the following statement is correct with reference to enzymes?

(a) Apoenzyme = Holoenzyme + Coenzyme
(b) Holoenzyme = Apoenzyme + Coenzyme
(c) Coenzyme = Apoenzyme + Holoenzyme
(d) Holoenzyme = Coenzyme + Cofactor

NEET-2017

Ans. (b) : Holoenzyme or conjugate enzymes consist of a protein as well as non protein part essential for the activity.

- The protein part of the holoenzyme is known as apoenzyme which is inactive.
- The non-protein part is called a coenzyme and is necessary for the catalytic function of the enzymes. So, holoenzyme is an active enzyme-cofactor complex i.e. an apoenzyme attached to a coenzyme.
- Co-enzymes are tightly bound to the enzyme they are referred to as a prosthetic group.

@apna_pdf

284. Which of the following is not correctly matched for the organism and its cell wall degrading enzyme?

(a) Fungi – Chitinase (b) Bacteria–Lysozyme
(c) Plant cells–Cellulase (d) Algae–Methylase

NEET-2013

Ans. (d) : Enzymes are proteins that help speed up metabolism, or the chemical reactions in our bodies. They build some substances and break other down. All living things have enzymes. Our bodies naturally produce enzymes.

285. Jacob and Monod named some enzymes as allosteric whose activity is regulated by

(a) end product (b) substrate
(c) by product (d) coenzyme

JIPMER-2014

Ans. (a) : Jacob and Monod named some enzymes as allosteric whose activity is regulated by end product. Allosteric enzyme have one or more allosteric sites**.** The term allosteric has been introduced by Jacob and Monod to denote an enzyme site different from the active site. These enzyme have one or more allosteric site that are binding site different from enzyme active site.

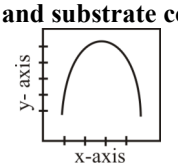
286. Three of the following statements about enzymes are correct and one is wrong which one is wrong

(a) Most enzymes are proteins but some are lipids
(b) Enzymes require optimum pH for maximal activity
(c) Enzymes are denatured at high temperatures but in certain exceptional organisms they are effective even at tempreatures 80°- 90°C
(d) Enzymes are highly specific

AIPMT (Mains)-2010
Neet Karnataka - 2013

Ans. (a) : Enzymes are biocatalysts and they catalyze the biochemical reaction both in vivo as well in vitro. They are highly specific to its substrate and high great catalytic power i.e. they enhance the rate of reaction tremendously without being change. All enzyme are proteins with some exception of some small group of catalytic RNA molecules called ribozymes.

287. The curve given below shows enzymatic activity with relation to three conditions (pH, temperature and substrate concentration)



What do the two axises (x and y) represent ?

	x-axis	y-axis
(a)	enzymatic activity	temperature
(b)	enzymatic activity	pH
(c)	temperature	enzyme activity
(d)	substrate concentration	enzymatic activity

AIPMT (Screening)-2011

Ans. (c) : Enzymes are generally proteins that act as biological catalysts by accelerating chemical reactions. They generally function in a narrow range of temperature and pH. Each enzyme shows its highest activity at a particular temperature and pH called the optimum temperature and optimum pH. Activity declines both below and above the optimum values. X axis always represents temperature or pH. Y axis represents enzyme activity.

288. Assertion: Enzyme have active sites and substrate reactive site on their surfaces respectively.
Reason: Active and reactive sites push the enzyme and substrate molecules away from each other.
(A) If both (A) and (R) are true and the (R) is correct explanation of the (A).
(B) If both (A) and (R) are true but the (R) is not correct explanation of the (A).
(C) If the (A) is true but the (R) is false.
(D) If both the (A) and (R) are false.
(E) If (A) is false, but (R) is true.

(a) A (b) B
(c) C (d) D
(e) E

AIIMS-1999

Ans. (c) : The region of the enzyme surface which combines with the substrate to form the enzyme substrate complex and at which the transformation of the substrate products occurs is called the active site of the enzyme.

289. Who coined the term zymase?

(a) Pasteur (b) Buchner
(c) Kuhne (d) Summer

AIIMS-1999

Ans. (b) : Zymase was first isolated from the yeast cell in 1897 by a German chemist named Eduard Buchner. He got Noble prize in 1907 in chemistry. He proved that yeast extract formed sugary material. He concluded that was something present in yeast cell which is responsible for fermentation that was zymase.

290. Which of the following is associated with synthesis of enzymes?

(a) Translation (b) Replication
(c) Transduction (d) Transformation

BVP-2005

Ans. (a) : Translation is associated with the synthesis of enzymes. It is the process where the information encoded in an mRNA molecule is used to assemble a specific amino acid sequence resulting in the formation of a functional protein.

291. Which one of the following statements is true for the enzymes?

(a) All enzymes are protein
(b) All proteins are enzymes
(c) All enzymes are not protein
(d) All enzymes are vitamins

BVP-2002

Ans. (a) : All enzymes are protein in nature and their synthesis involves the linking together of amino acids acting as catalyst in specific biochemical reaction. They are naturally produced in the body.

@apna_pdf

292. Biological catalyst is:
(a) an enzyme (b) an amino acid
(c) an amino sugar (d) an antacid

BVP-2001

Ans. (a) : Enzymes are biocatalysts and they catalyze the biochemical reaction both in vivo as well in vitro. They are highly specific to its substrate and high great catalytic power i.e. they enhance the rate of reaction tremendously without being change. All enzyme are proteins with some exception of some small group of catalytic RNA molecules called ribozymes.

293. Enzymes with two sites are called
(a) allosteric enzyme (b) apoenzyme
(c) conjugate enzyme (d) holoenzyme

AIIMS-1995

Ans. (a) : Allosteric enzyme are those enzymes possess additional sites, known as allosteric sites besides the active site. They are unique places on the enzyme molecules, allosteric enzymes have one or more allosteric site.

294. Transition state structure of the substrate formed during an enzymatic reaction is :
(a) permanent and stable
(b) transient but stable
(c) permanent but unstable
(d) transient and unstable

NEET-2013

Ans. (d) : Transition state structure of the substrate formed during an enzymatic reaction is transient and unstable. Transition state is unstable and transient the transition state have a activation energy which is high when energy is absent but activation enzyme become low when enzyme present so enzyme move fast reaction.
The transitions state is the intermediary state of the reaction, when the molecule is neither a substrate or product.

295. In which one of the following sets of three items each belong to the category mentioned against them?
(a) Lysine, glycine, thymine – amino acids
(b) Myosin, oxytocin and gastrin – hormones
(c) Rennin, helicase and hyaluronidase – enzyme
(d) Optic nerve, oculomotor, vagus – sensory nerves

AIIMS-2006

Ans. (c) : Rennin, helicase, hyaluronidase are all enzymes.
- **Rennin (Chymosin),** secreted by the stomach is responsible for clotting of milk. It acts on a soluble milk protein (caseinogens) to converts it into the insoluble form casein.
- **Helicase** unwinds double stranded helical DNA during replication.
- **Hyaluronidase** is able to digest hyaluronic acid (major glycosaminoglycan) and is therefore important in modulating the removal of cell matrix in order to facilitate all movement or tissue organization.

296. Curdling of milk in small intestine occurs due to the action of
(a) Rennin (b) Erypsine
(c) Trypsin (d) Chymotrypsin.

AIIMS-2002

Ans. (d) : Curdling of milk in small intestine is due to the presence of chymotrypsin. In babies, curdling of milk occurs in stomach due to the presence of enzyme rennin but **in adults curdling occurs in small intestine by Chymotrypsin enzyme** which coagulate milk protein casein into curd.

297. An organic substance bound to an enzyme and essential for its activity is called
(a) coenzyme (b) holoenzyme
(c) apoenzyme (d) isoenzyme

AFMC-2008

Ans. (a) : An organic Substance bound to an enzyme and essential for it activity is called a coenzyme.
It is a non-protein factor of the enzyme and can be easily separated from the enzymes.
Ex:- NAD^+, $NADP^+$

298. The enzyme which converts maltose into glucose is
(a) diastase (b) hydrogenase
(c) invertase (d) maltase

Punjab MET-2007

Ans. (d) : Maltase is the enzyme that breakdown maltose into glucose by breaking the bond between the two glucose molecules in maltose. This allows the glucose to be absorbed into the body for energy.

$$\text{Maltose} \xrightarrow{\text{Maltase}} \text{Glucose}$$

299. The enzyme which converts corn starch into fructose rich corn syrup is
(a) amylases (b) glucoamylases
(c) glucoisomerases (d) all of the above

Punjab MET-2007

Ans. (d) : The enzyme which converts corn starch into fructose rich corn syrup is amylases, glucoamylases and glucoisomerases. It application in flavour soft drink, and sweets biscuits and cakes.

300. In plants, enzymes are present :
(a) Only in leaves
(b) Only in flowers
(c) Only in storage organs
(d) In all the living cells of plant body

JIPMER-2002

Ans. (d) : Enzymes are present in all the living cells of plant body because no life process can be carried out successfully in the lack of enzyme.

301. Enzyme 'renin' is secreted by
(a) Cells of stomach
(b) Cells of intestine
(c) The cortical cells of kidney
(d) The cells of juxtaglomerular apparatus of kidney

CG PMT-2005

Ans. (d) : Enzyme renin is secreted by the cells of the juxtaglomerular apparatus of kidney. When systolic blood pressure falls or kidneys sense that volume depletes kidney, release renin into blood stream. Renin is also known as angio-tensinogenase.

@apna_pdf

302. Mo is a part of this enzyme:
(a) Reverse transcriptase
(b) Restriction endonuclease
(c) Hexokinase
(d) Nitrogenase

BCECE-2015

Ans. (d) : Nitrogenase enzymes are found in N_2 fixing microbes that is capable of reducing nitrogen, the enzyme require to fix the nitrogen is Mo-Fe protein. It converts atmospheric nitrogen into ammonia.

303. Substrate of an enzyme is
(a) The reactant of the reaction catalysed by the enzyme
(b) Competitive inhibitor of the enzyme
(c) Uncompetitive inhibitor of the enzyme
(d) Prosthetic group of the enzyme

AMU-2014

Ans. (a) : Substrate of an enzyme is the reactant of the reaction catalysed by the enzyme. A substrate is a molecule that an enzyme reacts with. It is basically starting material for enzymatic chemical reaction.

304. The inorganic catalyst attached to enzymes is called:
(a) Activator (b) Lysozyme
(c) Apoenzyme (d) Inhibitor

Rajasthan PMT-2001

Ans. (a) : An activator attached to enzymes which is an inorganic catalyst. These activators are bind to the enzyme and increase its activity.

305. Metabolic processes in living organisms are catalyzed by :
(a) hormones (b) enzymes
(c) lipids (d) amino acids

Rajasthan PMT-2001

Ans. (b) : Metabolic processes in living organism are catalyzed by enzymes.
Enzymes are biological catalyst and they catalyze the biochemical reactions. All enzymes are proteins with exception of some small group of catalytic RNA molecules called ribozymes.

306. K_m is
(a) Product (b) Enzyme
(c) Constant (d) Unit

WB JEE-2014

Ans. (c) : Michaelis- Menten kinetics is one of the best known and simplest models of enzyme kinetics. K_m act as a Michaelis-Menten constant in the equation-

$$V_0 = \frac{V_{max}[S]}{K_m[S]}$$

where, K_m is called Michaelis constant, V_0 is initial velocity, V_{max} is maximum velocity of reaction, and [S] is substrate concentration.

307. The enzyme, which combines with non-protein part to from a functional enzyme known as
(a) Co-enzyme (b) Holoenzyme
(c) Apoenzyme (d) Prosthetic group

BVP-2007

Ans. (b) : Holoenzyme consist of a protein part and non-protein part, protein part is called apoenzyme and non-protein part is called co-factor. The complete biologically active conjugated enzyme is called Holoenzyme.

308. Bromelain is an enzyme extracted from
(a) Yeast (b) Ficus
(c) Pineapple (d) Papaya

CMC Vellore-2011

Ans. (c) : Bromelain is a protein digestive enzymes obtained commercially from fruit or stem of pineapple which is belongs to the family Bromlaceae.

309. The enzyme peptidyl transferase of prokaryotes resides in
(a) 50 S ribosome (b) 30 S ribosome
(c) 40 S ribosome (d) 60 S ribosome

WB JEE-2015

Ans. (a) : The enzyme peptidyl transferase of prokaryotes resides in large ribosomal subunit 50 S.
It has a fundamental role in protein synthesis. It forms peptide bond between adjacent amino acid during protein synthesis with the help of tRNA.

310. Which one of the following enzymes is responsible for the conversion of norepinephrine to epinephrine?
(a) Catecholamine-O-methyltransferase
(b) Phenylalanine-N-methyltransferase
(c) DOPA decarboxylase
(d) Monoamine oxidase

WB JEE-2015

Ans. (b) : The enzyme **phenylalanine-N-methyl transferase** found in adrenal medulla of kidney that converts nor-epinephrine to epi-nephrine and these hormones are responsible for the stress responses.

311. Hydrolytic enzymes which act at low pH are called as
(a) proteases (b) α-amylases
(c) hydrolases (d) peroxidase

AIPMT-2002
Rajasthan PMT-2007

Ans. (a) : Protease is an enzyme that contains hydrolytic property. It acts in low pH for digesting protein in stomach.

312. Some of the enzymes, which are associated in converting fats into carbohydrates are present in
(a) microsomes (b) liposomes
(c) Golgi bodies (d) glyoxysomes

Punjab MET-2010

Ans. (d) : Glyoxysomes are specialized peroxisomes found in fungi and other higher plant (specially in fat storage tissues in germinating seeds). When oil filled seeds germinate, then the number and activity of glyoxysomes also increase. Glyoxysomes contain all the enzymes necessary for the fatty acid- oxidation, glyoxylate cycle and glyconeogenesis.

@apna_pdf

313. Which of the following statements regarding enzyme inhibition is correct –

(a) Competitive inhibition is seen when a substrate competes with an enzyme for binding to an inhibitor protein

(b) Non-competitive inhibitors often bind to the enzyme irreversibly

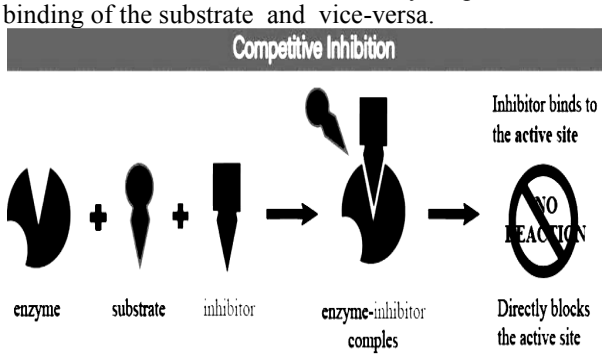
(c) Competitive inhibition is seen when the substrate and the inhibitor compete for the active site on the enzyme

(d) Non-competitive inhibition of an enzyme can be overcome by adding large amount of substrate

AIPMT-2005

Ans. (c) : Competitive inhibition is seen when the substrate and the inhibitor compete for the active site on the enzyme. When the binding of the chemical shuts off enzyme activity, the process is called inhibition, and the chemical is called an inhibitor. When the inhibitor closely resembles the substrate in its molecular structure and inhibits the activity of the enzyme it is known as competitive inhibitor.

Competitive inhibition occurs when the binding of the inhibitor to the active site on the enzyme prevents the binding of the substrate and vice-versa.



L. Factor Affecting Enzyme Activity

314. The chylomicrons are broken down to fatty acids and glycerol by the action of the enzyme

(a) Steapsin (b) Lipoprotein lipase

(c) Intestinal lipase (d) Gastric lipase

AP EAPCET-22.05.2023, Shift-I

Ans. (b) : The chylomicrons are broken down to fatty acids and glycerol by the action of the enzyme Lipoprotein lipase. This enzyme is present on the surface of blood vessels in various issue and facilitates the release of fats from chylomicrons.

315. Identify A and B in the following equation Casein $\xrightarrow[Ca^{++}]{A}$ Calcium paracaseinate $\xrightarrow{B}$ Peptones

(a) A. Renin B. Chymotrypsin

(b) A. Rennin B. Trypsin

(c) Ptyalin B. Pepsin

(d) A. Rennin B. Pepsin

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : Casein $\xrightarrow[Ca^{2+}]{Rennin}$ Calcium paracaseinate $\xrightarrow{Pepsin}$ peptones.

The reaction represents the breakdown of casein, a milk protein, into calcium paracaseinate and peptones due to the action of the enzymes rennin and pepsin, respectively.

316. The essential component of many co-enzymes are

(a) Vitamins (b) Metal ions

(c) Hormones (d) Lipids

TS EAMCET-11.05.2023, Shift-II

Ans. (a) : Coenzymes are cofactors that enhance enzyme activity by helping in chemical transformation. Many of these coenzymes are derived from essential organic compounds called vitamins.

317. 'Transketolase'' catalyses the following reaction

(a) G-3-P+DHAP and Fructose 6P + G-3 P Reactions

(b) Fructose-6 P + G-3-P and Sedoheptulose –7-P Reactions

(c) G-3-P + DHAP and Erythrose -4-P + DHAP Reactions

(d) Erythrose-4-P + DHAP and Sedoheptulose – 7-P + G-3 Reactions

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : The enzyme "Transketolase" catalyzes the reaction Fructose-6P + G–3–P and sedoheptulase–7–P.

This reaction involves the transfer of a two-carbon fragment from one sugar phosphate molecule to another, contributing to the inter-conversion of sugar phosphates in the pentose-phosphate pathway.

318. Enzyme catalyzed reactions can be inhibited by

(a) Zn^{2+} (b) Mg^{2+}

(c) Hg^{2+} (d) Cu^{2+}

Uttarakhand PMT-2011

Ans. (c) : Mercury inhibits glucose-6- phosphatase, enzyme is involved in production of glucose in cells. It also inhibits many enzymes involved in digestion of food molecule.

319. An example of non-competitive inhibition is

(a) The inhibition of succinic dehydrogenase by malonate

(b) Cyanide action on cytochrome oxidase

(c) Sulpha drug on folic acid synthesizing bacteria

(d) The inhibition of hexokinase by glucose 6-phosphate

(e) Reaction of succinic dehydrogenase

Kerala PMT-2009

Ans. (b) : Non-competitive inhibition is a type of inhibition where, inhibitor has no structural similarity with substrate and bind with the enzyme at different site other than the active site.

Example of non competitive inhibition is cyanide action on cytochrome oxidase..

320. Which is a typical example of 'feedback inhibition?

(a) Cyanide and cytochrome reaction

@apna_pdf

(b) Sulpha drugs and folic acid synthesizer bacteria
(c) Allosteric inhibition of hexokinase by glucose 6-phosphate
(d) Reaction between succinic dehydrogenase and succinic acid

AIPMT-1996

Ans. (c) : Allosteric inhibition of hexokinase by glucose 6-phosphate. It is a typical example of feedback inhibition. In glycolysis, the glucose, changes to glucose-6-phosphate in presence of hexokinase. When amount of glucose-6-phosphate exceeds it deactivate hexokinase.

321. Choose the wrong statement among the following
(a) Trypsinogen is activated by enterokinase
(b) The optimum pH for salivary amylase activity is 8.9
(c) Rennin helps in the digestion of milk proteins
(d) Goblet cells secrete mucous
(e) Submucosal glands of the intestine are also known as Brunner's glands

Kerala PMT-2014

Ans. (b) : The optimum pH for salivary amylase range is between 6.7 to 7
Trypsinogen is activated by enterokinase and forms an active enzyme 'Trypsin'.
Goblet cells are mucus secreting unicellular glands.
Rennin is a proteolytic enzyme found in gastric juice of infants which help in the digestion of milk protein.

M. Nomenclature of Enzyme and its Classification

322. Which of the following enzymes belong to class 6 Ligases ?
(a) Glutamine synthetase
(b) Hexokinase
(c) Malate dehydrogenase
(d) Arginosuccinase

TS EAMCET 10.05.2023 Shift-I

Ans. (a) : Glutamine synthetase belongs to class 6 ligases which catalyzes the formation of glutamine by joining glutamate and ammonia, using ATP as an energy source.

323. Haem group associated with the enzyme catalase is an example of
(a) Apoenzyme (b) Prosthetic group
(c) Co-enzyme (d) Co-factor

AP EAPCET-23.05.2023, Shift-II

Ans. (b) : The haem group is a prosthetic group that is found in the enzyme catalase. It is essential for the activity of catalase, which is an enzyme that breaks down hydrogen peroxide.

324. Enzymes are mainly classified into _____ groups
(a) 5 (b) 6
(c) 7 (d) 8

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : Enzymes are mainly classified into 6 class-

Class	Nature of reaction
1. Oxidoreductases	Oxidation Reduction
2. Transferases	Functional group transfer
3. Hydrolases	Cleavage of chemical bond
4. Isomerases	Isomerization of substrate into structural isomers
5. Ligases	Joining of two molecule by forming new covalent bond.
6. Lyases	Non Hydrolytic cleavage of chemical bond.

325. Choose the correct pair from the following
(a) Polymerases – Break the DNA into fragments
(b) Nucleases – Separate the two strands of DNA
(c) Exonucleases – Make cuts at specific positions within DNA
(d) Ligases – Join the two DNA molecules

NEET-2020 Phase-I

Ans. (d) : DNA Ligase is an essential biological enzyme because it fixes phosphodiester links that have broken as a result of DNA replication or recombination.
In genetic engineering, it is used to close gaps in the sugar- phosphate chains that develop as a result of connecting DNA molecules.

326. Assertion (A) : Glucose + ATP $\xrightarrow{\text{Hexokinase}}$ Glucose – 6 – Phosphate + ADP
Reason (R) : Enzyme which catalyzes this reaction belongs to enzyme class "Transferase".
The correct answer is:
(a) Both (A) and (R) are true, (R) is the correct explanation of (A)
(b) Both (A) and (R) are true but (R) is not the correct explanation of (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-08.05.2019 Shift-I

Ans. (a) : Hexoknase is the initial enzyme of glycolysis, catalyzing the phosphorylation of glucose by ATP to glucose-6-phosphate and ADP. Basically hexokinase is protein and it is classified under enzyme transferases.

327. Which one of the following enzymes acts as the molecular glue in the cell?
(a) Lipase (b) Ligase
(c) Polymerase (d) Exopeptidase

Tripura JEE-2017

Ans. (b) : Ligase are known as molecular glues because DNA ligase is used to joint two fragments of DNA to seal the gaps between them. In the process of ligation only matching DNA fragments with complementary ends can be joined.

@apna_pdf

328. Arginosuccinase is an example to

(a) Hydrolase (b) Ligase
(c) Lyase (d) Oxido-reductase

AP EAMCET-2013

Ans. (c) : Argininonsuccinate lyase is the full name of the enzyme called as argininosuccinase or ASL. The reversible breakdown of argininosuccinate (ASA) into arginine amino acid and fumaric acid is catalysed by this enzyme. It is the fourth urea cycle enzyme and is essential for the generation of urea in ureotelic species.

329. Which of the following acts as an isomerase enzyme?

(a) Phosphoglucomutase
(b) Fumerases
(c) Transphosphorylases
(d) Nitrate reductase

BCECE-2015

Ans. (a) : The enzyme phosphoglucomutase (phosphotransferases) belongs to the group of isomerases, which transfer phosphate groups within a molecule.

330. In the nomenclature of enzyme restriction endonuclease the Roman numeral indicates

(a) Number of times it is used
(b) The order of discovery from source
(c) Number of cuts on DNA
(d) Number of recombinants formed

MHT CET-2015

Ans. (b) : The roman number typically denotes the sequence of discovery of restriction enzymes in a specific strain.

331. Choose the type of enzyme involved in the following reaction :

$$S\text{-}G + S' \rightarrow S + S'\text{-}G$$

(a) Dehydrogenase (b) Transferase
(c) Hydrolase (d) Lyase
(e) Isomerase

Kerala PMT-2011

Ans. (b) : Transferase is the enzymes involves in transferring of specific functional group like glycosyl or methyl group from one molecule to another molecule.

N. Co-Factor

332. Match the following lists:

	List-I		List-II		List-III
A	NADP	I	Prosthetic group	i	Enzyme's globular structure changes
B	Peroxidase	II	Coenzyme	ii	Bonds with enzyme and substrate
C	Cu	III	Cofactor	iii	Transient association with coenzyme
D	Zn	IV	Non competitive inhibitor	iv	Tightly bound to apoenzyme

The correct match is:

	A	B	C	D
(a)	II, iii	I, iv	IV, i	III, ii
(b)	III, iii	II, ii	IV, iv	I, i
(c)	II, iii	I, iv	III, ii	IV, i
(d)	III, ii	I, iv	IV, i	II, iii

TS EAMCET-31.07.2022 Shift-I2

Ans. (a) :

	List-I		List-II		List-III
A	NADP	II	Coenzyme	iii	Transient association with coenzyme
B	Peroxidase	I	Prosthetic group	iv	Tightly bound to apoenzyme
C	Cu	IV	Non competitive inhibitor	i	Enzyme's globular structure changes
D	Zn	III	Cofactor	ii	Bonds with enzyme and substrate

333. Consider the following statement :

(A) Coenzyme or metal ion that is tightly bound to enzyme protein is called prosthetic group.

(B) A complete catalytic active enzyme with its bound prosthetic group is called apoenzyme.

Select the correct option.

(a) (A) is true but (B) is false.
(b) Both (A) and (B) are false
(c) (A) is false but (B) is true.
(d) Both (A) and (B) are true.

NEET-2019

Ans. (a) :

(i) A-coenzyme – A non-protein organic substance which is dialyzable, thermostable and loosely attached to the protein part.

(ii) Prosthetic group – An organic substance which is dialyzable and thermostable which is firmly attached to the protein apoenzyme portion.

334. Match the column I and Column II:

Column-I	Column-II
(i) MoO_2^{+2}	**(A) Alcoholic dehydrogenase**
(ii) Mg^{+2}	**(B) Nitrogenase**
(iii) Zn^{+2}	**(C) Catalase**
(iv) Fe^{+3}	**(D) PEP carboxylase**

(a) (i)–B, (ii) –D, (iii) –C, (iv) –A
(b) (i) –B, (ii) –A, (iii) –D, (iv) –C
(c) (i) –D, (ii) –B, (iii) –A, (iv) –C
(d) (i) –B, (ii) –D, (iii) –A, (iv) –C

AIIMS-26.05.2018 Shift-I

Ans. (d):

(i) MoO_2^{+2} (B) Nitrogenase
(ii) Mg^{+2} (D) PEP carboxylase
(iii) Zn^{+2} (A) Alcoholic dehydrogenase.
(iv) Fe^{+3} (C) Catalase

@apna_pdf

335. Enzymes used for isolation of DNA from Bacterial cell

(I) Lysozyme **(II) Cellulose**
(III) Chitinase **(IV) Protease**
(V) Ribonuclease **(VI) Endonuclease**

Options:

(a) I,IV,V (b) II, V, VI
(c) I, II, IV, VI (d) I, III, IV, V

AP EAMCET-28.04.2017 Shift-II

Ans. (a) : In the first step isolation of DNA from bacterial cell we have to break the cell open to release DNA, protein etc. This is achieved by the enzyme Lysozyme.
→ Protein can be removed by the treatment of protease.
→ RNA can be removed with the treatment of Ribonuclease.

336. Study the following lists.

	List I		List II
(A)	Oxidative decarboxylation	(i)	Carbonic anhydrase
(B)	Competitive inhibition	(ii)	Malic enzyme
(C)	Metal ion as Cofactor	(iii)	Pepsin
(D)	Organic molecule as cofactor	(iv)	Peroxidase
		(iv)	Succinic dehydrogenase

The correct match is :

	A	B	C	D
(a)	2	1	5	4
(b)	5	2	3	1
(c)	2	5	1	4
(d)	5	1	2	4

AP EAMCET-2010

Ans. (c) : List I	**List II**
Oxidative decarboxylation	Malic enzyme – It catalyses the reversible oxidative decarboxylation of malate to pyruvate, CO_2 and NADPH in the presence of divalent metal ion.
Competitive inhibitor	Succinic dehydrogenase – It catalyses the oxidation of succinate into fumarate.
Metal ion as cofactor	Carbonic anhydrase – It catalyses the inter conversion of carbon dioxide and carbonic acid.
Organic molecule as cofactor	Peroxidase – It catalyse the oxidation of substrate by hydrogen peroxide (H_2O_2) or an organic peroxide.

337. FAD coenzyme is made from :

(a) pantothenic acid
(b) thymine
(c) riboflavin
(d) folic acid

Haryana PMT-2001

Ans. (c) : FAD (Flavin adenine dinucleotide) Riboflavin is a primarily found as an integral component of co-enzyme FAD derived from riboflavin or vitamin E.
• Riboflavin is water soluble vitamin or vitamin B_2 .

338. Which statement regarding coenzyme is incorrect ?

(a) Every coenzyme is a cofactor and every cofactor is a coenzyme
(b) Every coenzyme is a cofactor but every cofactor is not a coenzyme
(c) Most of the coenzymes are nucleotides and are composed of vitamins
(d) Coenzymes are the active constituents of enzymes

Punjab MET-2005

Ans. (a) : Cofactor can be organic molecules or metal.
Co-factor are non protein constituents of enzyme, which are bound to the enzyme to make the enzyme catalytically active.
- There may be 3 kinds of cofactor- prosthetic group, coenzymes and metal ions.
- Prosthetic groups are organic compounds that are tightly bound to the apoenzyme.
- Coenzymes are also organic compounds but their association with the apoenzyme is only transient.
- The most of components of coenzyme are nucleotides and vitamins.

Thus every co-enzymes are co-factors but every co-factor can not be co-enzyme.

339. Enzyme ATPase is required for muscle contraction. The location of that enzyme is

(a) Actin
(b) Troponin
(c) Actinin Phlebotomus
(d) Myosin

Manipal-2014

Ans. (d) : Enzyme ATPase is required for muscle contraction. The location of that enzyme is myosin. It cross bridges the heads during muscle contraction. It consist an action binding protein as well as an ATPase, which is activated by Ca^{2+} and Mg^{2+} ons.

340. Which one of the following enzymes initiates protein digestion?

(a) Amino peptidase
(b) Carboxy peptidase
(c) Trypsin
(d) Pepsin

CG PMT-2004

Ans. (d) : Pepsin initiates protein digestion in stomach. Pepsin breaks the polypeptide bond of protein into small fragments.

@apna_pdf

10 CELL CYCLE AND CELL DIVISION

A. Cell Cycle

1. Polyploidy can be induced by the application of

(a) auxin (b) kinetin
(c) colchicine (d) ethylene

JIPMER- 2012, 2005 / BVP-2009
CMC Vellore-2008 / BHU PMT (Mains)-2006
AMU-2006 / BVP-2006, 2001
JCECE-2005 / Haryana PMT-2007, 2005
Punjab MET-2004 / BHU PMT-2003
JIPMER-2001 / AIIMS-2000 / Manipal-2000

Ans. (c) : Colchicine is a chemical that arrests the spindle fibre formation during cell division. As a result of it chromosome do not separate and ploidy level of the cell increases.

Auxin:- Auxin is a plant hormone that promotes cell division delays senescence, prevent abscission and induces parthenocarpy.

Ethylene:- It is a gaseous plant phytohormone. Ethylene is mainly concerned with maturation and ripening of fruits.

Kinetin:- It is a cytokinin plant hormone that promotes cell division, delays senescence, promotes lateral growth.

2. Attachment of spindle fibers to kinetochores of chromosomes becomes evident in

(a) Metaphase (b) Anaphase
(c) Telophase (d) Prophase

NEET-2020 Phase-II /NEET-2016 Phase-I
NEET (Karnataka)-2013 / JIPMER-2012
AIPMT (Mains)-2011

Ans. (a) : In cell cycle, during metaphase stage spindle fibres originating from the chromosomes attaches to the kinetochore of the chromosomes.

• Kinetochore is a disc shaped structure at the surface of centromere through which the sister chromatids are held together, During metaphase the chromosome arrange themselves at equator on metaphasic plate due to this arrangement, the attachment of spindle fibers to kinetochore is clearly visible.

3. A bacterium divides after every 35 min if a culture containing 10^5 cells per mL is grown, then cell concentration per mL after 175 min will be

(a) 175×10^5 (b) 125×10^5
(c) 48×10^5 (d) 32×10^5

UP CPMT-2012 / BHU PMT (Screening)-2008
CG PMT-2008 / BVP-2007
BHU PMT-2004

Ans. (d) : A bacterium divides every 35 minutes.
At zero minutes the culture contains 10^5 cell/m after 35 minutes the culture will contain 2×10^5 cell/m that is –
After 175 minutes, 5 generation of the number of cell will be $2^5 \times 10^5$ cell/m.
That is equal to 32×10^5 cell/m

4. Cell that do not divide further due to the following changes in cell cycle

(a) Exit G_1 and enter S phase of cell cycle
(b) Exit G_0 and enter G_1 phase of cell cycle
(c) Exit G_1 and enter G_0 phase of cell cycle
(d) Exit interphase and enter M phase

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : G_0 is a non-dividing phase of the cell cycle. Cells in G_0 are not dividing, but they are still alive and metabolically active. Cells can enter G_0 from any phase of the cell cycle, and they can exit G_0 and return to the cell cycle. So, the cell that does not divide further will exit G_1 and enter G_0 phase of the cell cycle.

5. Given below are two statements:

Statement I : During G_0 phase of cell cycle, the cell is metabolically inactive.

Statement II : The centrosome undergoes duplication during S phase of interphase.

In the light of the above statements, choose the most appropriate answer from the options given below:

(a) Statement I is incorrect but Statement II is correct.
(b) Both Statement I and Statement II are correct.
(c) Both Statement I and Statement II are incorrect.
(d) Statement I is correct but Statement II is incorrect.

NEET (UG) 07.05.2023

Ans. (a) : Cells in this stage remain metabolically active but not longer proliferate unless called on to do so depending on the requirement of the organism.

• The cell cycle is the process by which a cell duplicates its genome, synthesizes other cell parts and eventually splits into two daughter cells.

6. Choose the incorrect statements among the following.

(A) Cells of the lining of the gut are replaced by mitotic division constantly
(B) Formation of liquid endosperm takes place, if karyokinesis is not followed by cytokinesis
(C) In telophase, the chromosomes reach the poles and start condense to form the chromatic network
(D) In quiescent stage, the cell is metabolically inactive

Options:

(a) A, B (b) B, C
(c) C, D (d) A, D

TS EAMCET-09.08.2021 Shift-I

@apna_pdf

Ans. (c) :
Formation of liquid endosperm in coconut takes place because karyokinesis is not followed by cytokinesis. During the early development of liquid endosperm in coconuts.

7. Meiocytes are ____
(a) Gametes (b) Gamete mother cells
(c) Haploid gametes (d) Diploid gametes

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : Meiocyte differentiate into gamete through the process of meiosis. The diploid meiocyte divides into four genetically different haploid gametes. Hence, they are called as "gamete mother cell".

8. Amitosis is the usual process of cell division
(a) Meristematic cells
(b) Prokaryotic cells
(c) Eukaryotic cells
(d) Spore mother cells

HP CET-2018
BCECE-2011

Ans. (b) : Amitosis is a type of direct cell division in which the nucleus divides into two daughter nuclei without chromosomal differentiation or the formation a spindle apparatus.

9. Cytokinin helps in
(a) Cell division (b) Cell elongation
(c) Apical dominance (d) All of these

UP CPMT-2010

Ans. (d) : The cytokinin helps in cell division. Cytokinins affect many aspects of plant growth and development including cell division, shoot Initiation and growth, leaf senescence, apical dominance and embryonic development.
• Cytokinin discovered by Folke Skoog and colleagues (1950).
• Apical dominance is the phenomenon in plants where a main shoot dominates and inhibits the outer growth of other shoots

10. Anticlinal or radial division mean division in :
(a) Transverse plane
(b) At right angle to outer wall
(c) Plane parallel to outer wall
(d) At any plane

AFMC -2011

Ans. (b) : Anticlinal or radial division means division in at right angle to outer wall.
"The process by which new cells files are added to the cambial layer is called Anticlinal division".
• Anticlinal cell division found in protoderm.

11. Chromosome number is
(a) Fixed for a species
(b) Fixed for an ecosystem
(c) Fixed for a community
(d) Fixed for a biosphere

CG PMT-2007

Ans. (a) : "Van Beneden" 1887 discovered that each species has a fixed number of chromosomes in their body. In plants, highest number of chromosome found in *Ophioglossum reticulatum* (2n = 1262).

12. Congression is a phenomenon of
(a) movement of sister chromatids towards the poles
(b) pairing of homologous chromosomes
(c) separation of paired chromosomes
(d) bringing the chromosomes on equator of spindle apparatus

AMU-2007

Ans. (d) : Congression is a phenomenon of bringing the chromosome on equator of spindle apparatus.
• Congression means the act or action of coming together.
• This process takes 15-20 min and result in the formation of the metaphase plate.

13. Choose the chemical used in artificial polyploidy:
(a) polyethylene glycol
(b) sodium alginate
(c) acenaphthene
(d) sodium hypochloride

AP EAMCET-2003

Ans. (c) : Acenaphthene chemical used in artificial polyploidy. Chemical formula is $C_{12}H_{10}$
• Polyethylene glycol is used management and treatment of constipation.
• Sodium alginate is used in thickening agent emulsifier, texture improver.
• Sodium hydrochloride used in bleach & disinfecting agent.

14. Best material for demonstrating streaming movements of protoplasm within living cells is
(a) onion peelings
(b) staminal hair of tradescantia
(c) sensitive plant
(d) pith cells

Haryana PMT-2007

Ans. (b) : Best material for demonstrating streaming movements of protoplasm with in living cell is staminal hairs of Tradescantia.
-Tradescantia commonly known as spiderwort in family commelinaceae.
• Pith parenchyma cell store water in various plants organs
• Pith is a small zone at the center of the stem.

15. Meiosis in Dryopteris takes place during
(a) gamete formation (b) spore germination
(c) zygote formation (d) spore formation

AMU-2006

Ans. (d) : In Dryopteris the gametophytes give rise to sporophyte by gametic union and sporophyte give rise to gametophytes by forming haploid spores after meiosis.

$$\text{Gametophyte(n)} \xrightarrow{\text{Gamitic union}} \text{Sporophyte(2n)}$$

$$\text{Sporophyte(2n)} \xrightarrow{\text{meiosis}} \text{Gametophyte(n)}$$

• Dryopteris is a pteridophyte plant commonly called wood ferns, male ferns or bucker ferns is a fern genus in the family Dryopteridaceae.

@apna_pdf

16. Yeast cell can progress through the cell cycle in about

(a) 30 min (b) 60 min
(c) 90 min (d) 120 min

AMU-2012

Ans. (c) : Yeast cell can progress through the cell cycle in about 90 minute. The duration of the cell cycle depends on the type of cell and external factors such as temperature, oxygen supplies,

17. Which of the following maintain the constant number of chromosomes generation after generation ?

(a) Meiosis (b) Endomitosis
(c) Mitosis (d) Amitosis

MGIMS Wardha-2003

Ans. (a) : Meiosis maintain the constant number of chromosome generation after generation.
-Amitosis is cell division by simple cleavage of the nucleus and division of the cytoplasm without spindle formation or appearance of chromosome
-Endomitosis is one of the processes leading to endopolyploidy in which the stages of mitosis (prophase, metaphase, Anaphase) takes place inside the nuclear membrane and without spindle formation. In mammals endomitosis has been observed in the trophoblast of the placenta of the mouse, rat, rabbit.

18. The anaphase promoting complex is activated by

(a) M cdk cyclin (b) G cdk cyclin
(c) S cdk cyclin (d) Transcription factor

Manipal-2010

Ans. (a) : The anaphase promoting complex is activated by M cdk cyclin. (Mitotic cyclin – dependent kinases)
-M- cdk control entry into mitosis but their role during mitotic progression is less well understood.

- S cdk cyclin that provides domicile essential for enzymatic activity.
- Transcription factors are proteins involved in the process of converting or transcribing DNA into RNA. It is mostly located in the cytoplasm

19. Which is not true for anaphase ?

(a) Golgi body and ER are reformed
(b) Chromosomes move to opposite poles
(c) Spindle poles more farther apart
(d) Centromeres split and chromatids separate
(e) None of the above

CMC Vellore-2010

Ans. (a) : Golgibody and Endoplasmic reticulum are not reformed during Anaphase. They reappear later on after cytokinesis.
In Anaphase the sister chromatids separate from each other and pulled towards opposite ends of the cell.

20. If a bacterial cell divides repeatedly in every minute (one division) and one hour is taken to fill a cup then how much time it will take to fill half cup?

(a) 45 minute (b) 30 minute
(c) 15 minute (d) 59 minute

UP CPMT-2014
AMU -1998

Ans. (d): When a bacterial cell divides every minute and make double its mass and it is taking one hour to fill a cup. Then half of the cup will be filled in 59 minutes, just immediate after that division one cup will be filled.

21. Assertion : Phase of cell division is also known as formative phase.
Reason : In formative phase, new cells are produced from pre-existing cells through meiosis division.

(a) Both Assertion and Reason are true and reason is the correct explanation of the Assertion
(b) Both Assertion and Reason are true but the Reason is not the correct explanation of Assertion
(c) Assertion is true, but Reason is false
(d) Both Assertion and Reason are false

AP EAMCET-2011

Ans. (c) : Phase of cell division is also known as formative phase. In this phase new cells are formed from pre-existing cells through mitotic division. Cell division phase occurs in actively growing regions such as shoot apex and root apex.

22. Beads-on-string like structures of A are seen in B, which further condense to form chromosomes in C stage of cell division.

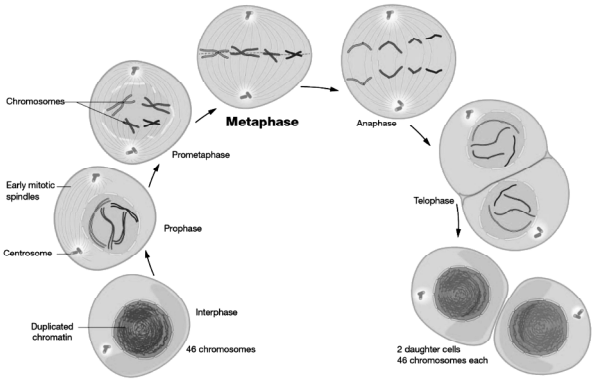
	A	B	C
a.	Chromonema	Chromatin	Metaphase
b.	Chromatin	Chromatid	Metaphase
c.	Chromonema	Chromosome	Anaphase
d.	Chromonema	Chromatid	Anaphase

AIIMS-2012

Ans. (a) :

Chromonema $\xrightarrow{\text{condence}}$ **Chromatin** $\xrightarrow{\text{Condence}}$ **chromosome**
(early prophase) **(metaphase)**

- Chromonema are the coiled mass of threads visible within a nucleus at the beginning of cell division. During metaphase these threads condense into chromatin to arrange at the equator.
- The "beads-on- a- string" structure is seen in electron micro scope of isolated metaphase chromosomes.
- Metaphase is a stage of mitosis in which chromosomes are at their second most condensed and coiled stage.



@apna_pdf

23. If a cell has twice as much DNA as in normal functional cell, it means that the cell …….

(a) has completed division
(b) is preparing to divide
(c) has caesed to function
(d) has reached the end of its lifespan

Karnataka CET-2005

Ans. (b) : If a cell has twice as much DNA as in a normal functional cell, it means that the cell is preparing to divide. Three phases occurs in cell division i.e. G_1, S and G_2 phase.
In the 'S' phase of the cell cycle, the amount of DNA doubles in each cell.

24. Guardian angel of genome is

(a) P^{RB} (b) P^{53} Protein
(c) T_4 Cell (d) Interleukin – I

AP EAMCET-2015

Ans. (b) : p^{53} protein has been called the guardian angel of the genome. The name p^{53} is in reference to its apparent molecular mass.
The gene activated by the DNA damage. The p^{53} protein function as activators are several other gene the molecular weight of p^{53} protein has 53.000 dalton. It is tumour suppresin gene and directly involve in DNA repair.

25. Chromosome was discovered by

(a) Hofmeister (b) Muller
(c) Fleming (d) Hammering

MGIMS Wardha-2012

Ans. (c) : Chromosome was discovered by Walther Flemming in 1882.
Chromosome is thread like structure present in the nucleus.
DNA molecules are highly organized and packaged in eukaryotic cell to fit inside the nucleus.

26. Match the item in column I with those in column II and the choose the correct answer.

Column I		Column II	
A.	**Mitosis**	**1.**	**Occurs in diploid cells only**
B.	**Meiosis**	**2.**	**Occurs in both haploid and diploid cells**
		3.	**Daughter and parent cells have same chromosome numbers**
		4.	**Synapsis of homologous chromosomes**

(a) A-1 B-2 (b) A-2 B-3
(c) A-3 B-4 (d) A-4 B-1

WB JEE-2015

Ans. (c) : Mitosis : - Mitosis occurs during the formation of body cells which is called somatic cell division. Since the daughter cell is genetically identical to its mother cell, it is also called all daughter cell by equational division and the parent cells have the same chromosome number.
Mitosis:- Equational division → daughter cell have same number of chromosome as parents.
Meiosis – It is a special type of cell division which reduces the chromosome number resulting in the production of haploid daughter cell synapses of homologous chromosomes.
Meiosis- Reductional division → daughter cells have haploid number of chromosome than parent cell.

B. Phases of Cell Cycle

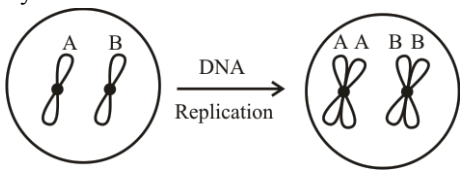
27. DNA replication takes place during

(a) G_1 - phase (b) S - phase
(c) G_2 - phase (d) M - phase

AP EAMCET-25.09.2020 Shift-I
JIPMER-2016, 2012, 2007, 2003
J&K CET-2015 / BVP-2005, 2012
VMMC-2011 / Karnataka CET-2010
WB JEE-2010 Uttarakhand PMT-2009
Rajasthan PMT-2008, 1998 / BCECE-2007
MGIMS Wardha-2005 / Haryana PMT-2004
Manipal-2003 / UP CPMT-2010, 2005, 2001
Punjab MET-1999

Ans. (b) : DNA replication takes place during S-phase.

- S phase is the period of whole DNA synthesis during which the cell replicates its genetic content
- DNA is replicated during s-phase of Interphase
- Cell continues to grow
- The chromosome are duplicated
- The DNA is copied
- Usually lasts about 8 -10 hours.



28. Spindle fibers are made up of

(a) actin with proteins and RNA
(b) cellulose and RNA
(c) tubulin protein and RNA
(d) Both (a) and (b)

VMMC-2012 / WB JEE-2011
Rajasthan PMT-2008, 2007, 2003
JIPMER-2009, 2002 / JCECE-2006
BHU PMT (Screening)-2006
AIPMT-2002 / Manipal-2002
AMU-2011 / BCECE-2010
UP CPMT-2008

Ans. (c) : Spindle fibers are made up of tubulin protein and RNA.
A spindle fiber is composed of a microtubule extending from centrosome. Spindle fibers are cellular structures that serve a function during cell division processes. They are responsible for organizing packages of DNA on opposite end of a cell to ensure that duplicated nuclei can divide into subsequent cell.
-Spindle fibers is a polymer of α and β-tubulin dimer.

@apna_pdf

29. Which one of the following precedes re-formation of the nuclear envelope during M-phase of the cell cycle?

(a) Decondensation from chromosomes and reassembly of the nuclear lamina
(b) Transcription from chromosomes and reassembly of the nuclear lamina
(c) Formation of the contractile ring and formation of the phragmoplast
(d) Formation of the contractile ring and transcription from chromosomes

CMC Vellore-2012
Rajasthan PMT-2010
CMC Ludhiana-2009
JCECE-2009 / AFMC-2008

Ans. (a) : Decondensation from chromosomes and reassemble of the nuclear lamina precede reformation of the nuclear envelope during M-phase of the cell cycle. The nuclear membrane which disappear during prophase reappears in telophase. But before its reappearance the nucleus gets reorganised and the decondensation from chromosome and reassamble of the nuclear lamina.

30. In which of the following stage chromosomes are arranged at equatorial plate?

(a) Anaphase (b) Metaphase
(c) Prophase (d) Telophase

BVP-2014 / KVPY SB & SX-2012
VMMC-2012 / BCECE-2010
BHU PMT (Screening)-2009
Uttarakhand PMT-2009
WB JEE-2009 / MGIMS Wardha-2008
DUMET-2005 / UP CPMT-2008, 2003

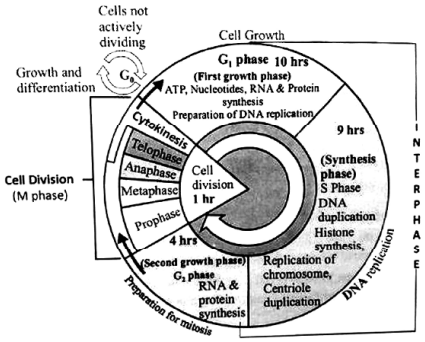
Ans. (b) : Chromosomes are arranged at equatorial plate during metaphase.
Chromosome can be seen best during metaphase stage. Metaphase start after prophase the spindle tube form and chromosome and aligned in the middle of the equatorial plate. The chromosomes are attached to the spindle tube at the centromere.
-Prophase begins immediately after the interphase. In this phase chromosomes resemble thin, coiled threads from starting and more visible in middle phase-Anaphase in which the chromatids in the centromere separate and move towards opposite sides of poles.
• Cell cycle was discovered by Prevost and Dumas (1824) while studying the cleavage of zygote of frog.

31. In 'S' phase of the cell cycle

(a) Amount of DNA doubles in each cell
(b) Amount of DNA remains same in each cell
(c) Chromosome number is increased
(d) Amount of DNA is reduced to half in each cell

AP EAMCET-24.09.2020 Shift-II
AIPMT-2014 / AIIMS-2013
CG PMT-2004

Ans. (a) : The interphase is characterized by G_1, S and G_2 phase. S phase marks the period during which the amount of DNA per cell doubles. DNA replication occurs in S phase.



32. The stage of cell cycle when cell has undergone differentiation is

(a) G_0 (b) G_1
(c) G_3 (d) G_4

BVP-2014, 2012 / DUMET-2007
MGIMS Wardha-2006 / AMU-2003

Ans. (a) : The cells which enter G0 phase start differentiation into specific types of cell. It is also known quiescent phase. Cell differentiation is the stage where cell loses its ability to divide and in this stage cell specialized in a particular type of function. Cell grows in the G1 phase and after that cell decides to undergo differentiation in G0 phase where cell decides to either grow special function by differentiation or enter into the S-phase.

33. During cell cycle, RNA and non-histone proteins are synthesized in

(a) S-phase (b) G_0 – phase
(c) G_2 – phase (d) M – phase

CMC Vellore-2010 / Punjab MET-2009, 2008
Rajasthan PMT-2009 / UP CPMT-2009 / AMU-2009

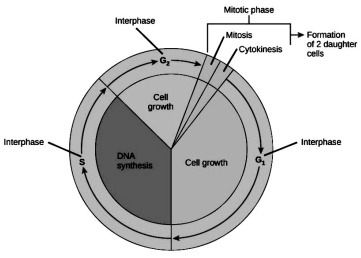
Ans. (c) : During cell cycle, RNA and non-histone protein are synthesized in G_2 phase.
G_2 phase is a period of rapid cell growth and protein synthesis during which the cell prepares itself for mitosis.
Pre-mitotic phase (Gap-2)
-Preparing cell for division
- Energy storage for chromosome movement.
-Mitotic specific protein
- RNA and microtubule subunits synthesize.

34. The correct sequence of different phases of cell cycle is

(a) S – G_1 – G_2 – M (b) G_1 – S – G_2 – M
(c) G_2 – S – G_1 – M (d) G_1 – G_2 – S – M

NEET-2020 Phase-II / NEET-2019
AMU-2014 / WB JEE-2012
AP EAMCET-2010 / WB JEE-2008
Rajasthan PMT-2003 / UPCPMT-2002 / AIIMS-1999

Ans. (b) :



@apna_pdf

Cell cycle is the series of events in which cells replicate and make two new cells. Cell cycle consists of stages in the sequence- G_1, S, G_2 and M (Karyokinesis).

- G_1 is the stage where the cell is preparing to divide. S (synthesis phase) phase where the cell replicates all the DNA.
- G_2 stages, where it organized and condenses the genetic material, and prepares to divide.
- M stands for mitosis. It is further divided into four stages namely prophase, metaphase, anaphase and telophase. This is where the cell actually divides the two copies of the genetic material into the two daughter cells.

35. Assertion: (A): If the chromosome number is 2n during G_1, after S phase the chromosome number is the same

Reason (R): After S phase there is no increase in DNA per cell

The correct option among the following is

(a) A and R are true. R is the correct explanation for A

(b) A and R are true, but R is not the correct explanation for A

(c) A is true, but R is false

(d) A is false but R is true

TS EAMCET-11.05.2023, Shift-II

Ans. (c) : If the chromosome number is 2n during G_1, after S phase the chromosome number is the same. During the S-phase, DNA replication takes place but number of chromosomes will be same (2n).

After the S. phase the number of chromosome will be same but amount of DNA is doubles. Hence, after S. phase increase in amount of DNA per cell.

36. Identify the meiotic stage in which the homologous chromosomes separate while the sister chromatids remain associated at their centromeres

(a) metaphase - I (b) Metaphase - II

(c) Anaphase - I (d) Anaphase - II

TS EAMCET-11.05.2023, Shift-I

Ans. (c) : During anaphase-I the meiotic stage in which the homologous chromosomes separate while the sister chromatids remain associated at their centromeres.

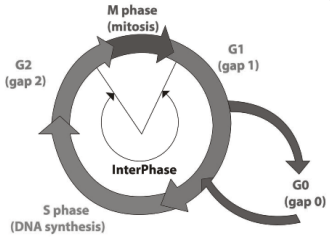
37. Which one of the following is the quiescent stage of cell cycle ?

(a) G_1 (b) G_0

(c) M (d) G_2

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : G_0 is called the quiescent stage of cell cycle, cells in G_0 phase are metabolically active but do not proliferate. G_0 phase is the phase of the cell outside the replicative stage. It is thought to be resting phase.



38. Select correct sequence of substages of Prophase-I of meiotic division:

(A) Zygotene (B) Pachytene

(C) Diakinesis (D) Leptotene

(E) Diplotene

Choose the correct answer from the options given below:

(a) (D), (A), (B), (E), (C)

(b) (A), (D), (B), (C), (E)

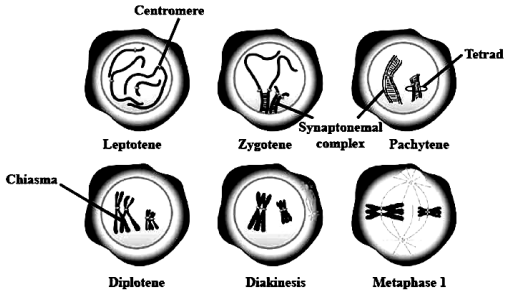
(c) (D), (B), (A), (E), (C)

(d) (A), (B), (D), (E), (C)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : According to meiosis-I, meiosis-I is initiated after the replication of the parental chromosomes in order to create identical sister chromatids in phases. The correct sequential manner of sub stages of prophase-I of meiotic division:

Leptotene, zygotene , Pachytene, Diplotene and Diakinesis.



39. During which stages of mitosis and meiosis, respectively does the centromere of each chromosome split?

(a) Telophase, Anaphase I

(b) Anaphase, Anaphase II

(c) Metaphase, Metaphase II

(d) Prophase, Telophase I

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Anaphase is the stage of mitosis after the process of metaphase in which chromosomes are split and newly- copied chromosomes are moved to opposite pole of the cell.

- Anaphase II is the stage when chromatids of every chromosome separate and begin to more toward the opposite ends of the cell.

40. The dissolution of synaptonemal complex occurs during

(a) Diakinesis (b) Leptotene

(c) Pachytene (d) Dilplotene

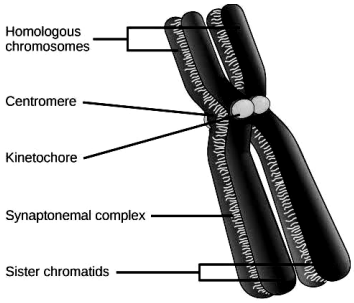
RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) : The synaptonemal complex is a protein structure that forms between homologous chromosomes during meiosis.

- Diplotene is fourth stage of the prophase of meiosis-I
- Chiasmata formation and dissolution of the synaptonemal complex occurs in diplotene stage.

  The beginning of diplotene is recognized by the dissolution of the synaptonemal and the tendency of the recombined homologous chromosomes of the bivalents to separate from each other except at the site of cross over.

@apna_pdf



41. Select the correct statement.

A. Tetrad formation is seen during Leptotene.
B. During Anaphase, the centromeres split and chromatids separate.
C. Terminalizartion takes place during Pachytene.
D. Nucleolus, Golgi complex and ER are reformed during Telophase.
E. Crossing over takes place between sister chromatids of homologous chromosome.

Choose the correct answer from the options given below:

(a) B and E only (b) A and C only
(c) B and D only (d) A, C and E only

NEET (UG) 07.05.2023

Ans. (c) : Crossing over takes place during meiotic prophase i.e during pachytene each pair of chromosome has four chromatids at that time. Crossing over occurs between non-sister chromatids.

- The point of exchange of segments between non sister chromatids of homologous chromosomes during meiotic prophase is called **chiasma**.
- When the chiasma is located at the end of the pairing chromatids. It is known as terminal chiasma and when it is located in the middle part of non-sister chromated called interstitial chiasma later on interstitial chiasma is changed to terminal position by the process of chiasma terminalization.

42. Match List I with List II

	List I		List II
A.	**M Phase**	**I.**	**Proteins are synthesized**
B.	**G_2 Phase**	**II.**	**Inactive phase**
C.	**Quiescent stage**	**III.**	**Interval between mitosis and initiation of DNA replication**
D.	**G_1 Phase**	**IV.**	**Equational division**

Choose the correct answer from the options given below

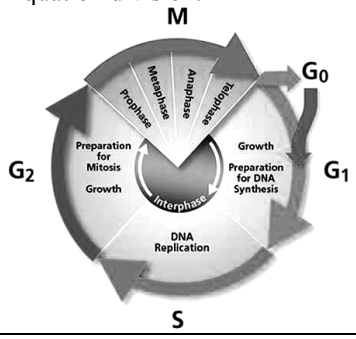
(a) A-II, B-IV, C-I, D-III
(b) A-III, B-II, C-IV, D-I
(c) A-IV, B-II, C-I, D-III
(d) A-IV, B-I, C-II, D-III

NEET (UG) 07.05.2023
AP EAMCET-2014

Ans. (d) : A cell cycle is a series of events that takes place in a cell as it grows and divides

- A cell spends most of its time in interphase and during this time, it grows and replicates its chromosome and prepare for cell division, the cell then leaves interphase undergoes mitosis, and completes its division.
- The time from end of one mitosis to the start of the next mitosis is called interphase.

G_1 Phase- G_1 is the interval between mitosis and initiation of DNA replication,
G_2 Phase- Protein are synthesized.
G_0 Phase- Quiescent stage / Inactive phase.
M - Phase- Equation division.



43. Match the following lists:

	List-I		List –II
A)	**Separation of homologous chromosomes**	**I)**	**Telophase**
B)	**Initiation of chromosomal pairing**	**II)**	**Kinetochore**
C)	**Chromosomal clustering at opposite spindle poles**	**III)**	**Anaphase-I**
D)	**Disc shaped part of centromere**	**IV)**	**Synapsis**

The correct match is:

	A	B	C	D
(a)	I	III	II	IV
(b)	III	IV	I	II
(c)	III	I	IV	II
(d)	II	I	IV	III

TS EAMCET-31.07.2022 Shift-I

Ans. (b) :

List-I	List -II
Separation of homologous chromosomes	Anaphase-I
Initiation of chromosomal pairing	Synapsis
Chromosomal clustering at opposite spindle poles	Telophase
Disc shaped part of centromere	Kinetochore

44. The appearance of recombination nodules on homologous chromosomes during meiosis characterizes :

@apna_pdf

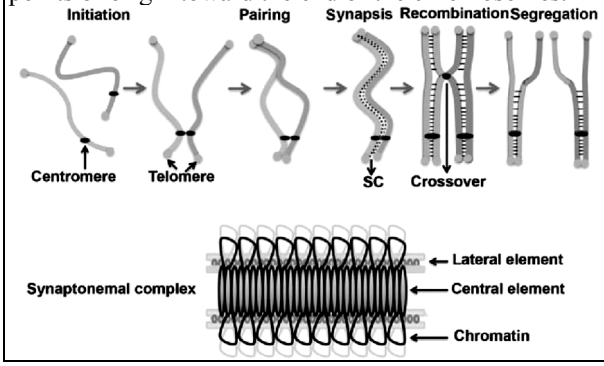
(a) Terminalization
(b) Synaptonemal complex
(c) Bivalent
(d) Sites at which crossing over occurs

NEET-2022

Ans. (d) : Pachytene stage of meiosis is characterized by the appearance of recombination nodules, the sites of which crossing over occurs between non-sister chromatids of homologous chromosomes.

Synaptonemal complex- The Synaptonemal complex is a highly ordered proteinaceous structure that assemble at the interface between aligned homologous chromosomes during meiotic prophase.

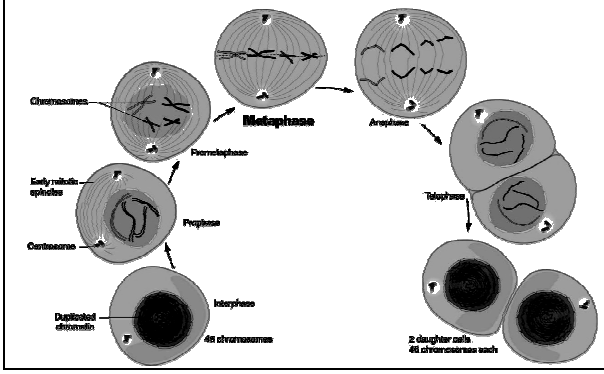
Terminalization - The movement of transverse bonds between paired chromosomes in meiosis from their points of origin toward the end of the chromosomes.



45. With respect to metaphase, which of the following statements is incorrect?
(a) Complete disintegration of nuclear envelope takes place
(b) Chromosomes are highly condensed
(c) Metaphase chromosomes are made up of four sister chromatids held together by centromere
(d) Chromosomes lie at the equator of the cell

NEET (Re-Exam)-04.09.2022

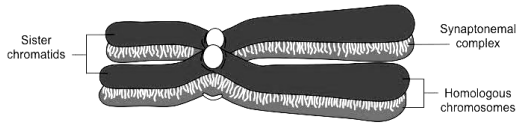
Ans. (c) : In metaphase, each chromosome is made up of two sister chromatids. Sister chromatids are identical copies of each other, and they are held together by a centromere. So, the statement that metaphase chromosomes are made up of four sister chromatids is incorrect.



46. Bivalent or Tetrad formation is a characteristic feature observed during:
(a) Synaptonemal complex in zygotene stage
(b) Chiasmata in Diplotene stage
(c) Synaptonemal complex in Pachytene stage
(d) Chiasmata in zygotene stage

NEET (Re-Exam)-04.09.2022

Ans. (a) : Synaptonemal complex is completely formed in zygotene phase of prophase-I of meiosis-I in which two homologous chromosomes paired and called bivalent or a tetrad. However these are more clearly visible at pachytene stage.

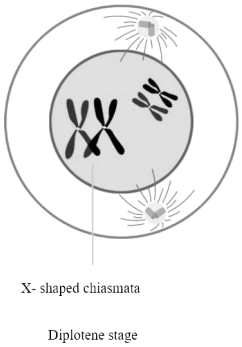


47. Which stage of meiosis can last for months or years in the oocytes of some vertebrates?
(a) Leptotene (b) Pachytene
(c) Diplotene (d) Diakinesis

NEET (Re-Exam)-04.09.2022

Ans. (c) : Diplotene is of longest duration in meiosis. In some vertebrates, cell gets arrested in diplotene for long duration.

- Cells like oocytes of some vertebrates (For example:- oocyte of mammalian females) are generally found arrested in the diplotene stage for years until the female reaches puberty.



48. Which stage of meiotic prophase shows terminalisation of chiasmata as its distinctive feature?
(a) Pachytene (b) Leptotene
(c) Zygotene (d) Diakinesis

NEET-2021

Ans. (d) : In meiosis 1st, chiasmata (x-shaped structure) is formed in diplotene stage and chromosome are fully condensed. .

- But it terminalise in diakinesis stage.
- Bivalents are formed in Zygotene stage.
- Crossing over takes place in pachytene stage.
- Compaction of chromosomal material occurs in leptotene stage.

49. Match List-I with List-II.

	List-I		List-II
(A)	S phase	(i)	Proteins are synthesized
(B)	G_2 phase	(ii)	Inactive phase
(C)	Quiescent stage	(iii)	Interval between mitosis and initiation of DNA replication
(D)	G_1 phase	(iv)	DNA replication

@apna_pdf

Choose the correct answer from the options given below

	(A)	(B)	(C)	(D)
(a)	(ii)	(iv)	(iii)	(i)
(b)	(iii)	(ii)	(i)	(iv)
(c)	(iv)	(ii)	(iii)	(i)
(d)	(iv)	(i)	(ii)	(iii)

NEET-2021

Ans. (d) :

(a)	S Phase	(iv)	DNA replication
(b)	G_2 Phase	(i)	Proteins are synthesized
(c)	Quiescent stage	(ii)	Inactive phase
(d)	G_1 Phase	(iii)	Interval between mitosis and initiation of DNA replication

50. 'G_0' stage of the cell cycle is characterized by _____

(a) Division inactive (b) Metabolically
(c) Metabolically active (d) Proliferation

AP EAMCET-03.09.2021 Shift-I

Ans. (c) : G_0 stage of the cell cycle is also known as the quiescent stage. In this phase, the cell remains metabolically active but does not proliferate that means cell is performing its function without actively preparing to divide.

51. Fill in the blanks

During metaphase, spindle fibers attach to..... . Centromeres split and chromatids..... during..... .

(a) Telomere, Condense, Nucleolus
(b) Centromere, Unite together, Prophase
(c) Kinetochores, Separate, Anaphase
(d) Golgi complex, Move, Telophase

TS EAMCET-10.08.2021 Shift-I

Ans. (c) : During metaphase spindle fibers attached to kinetochores.

- Centromeres splits and chromatids separate during Anaphase.

Kinetochores are large protein complexes that assemble at the centromere of a chromosome, and function to connect the chromosomes to mitochondrial tubules in the mitotic spindle.

52. If onion root tip cell has 14 chromosomes and DNA content is 2C, what are the number of chromosomes and DNA content during G_1, S and G_2 phases respectively?

(a) 14, 2C; 14, 4C; 14, 4C
(b) 14, 4C; 14, 2C; 14, 4C
(c) 7, 2C; 7, 4C; 7, 2C
(d) 7, 2C; 14, 4C; 14, 2C

TS EAMCET-10.08.2021 Shift-I

Ans. (a) :

Phase	No. of chromosome	Chromosome Content
G_1	14	2C
S	14	4C
G_2	14	4C

If onion root tip cell has 14 chromosomes and DNA content is 2C then it will remain same in G_1 phase but in S-phase after the replication of DNA, DNA amount will be double i.e. 4C but chromosome number still remain same and in G_2 phase the chromosome number and the DNA amount will remain same as S- phase i.e. 14 and 2C respectively.

53. On imbibitions, pea seeds swell more compared to that of wheat seeds because they contain____

(a) Protein (b) Carbohydrate
(c) Lipids (d) Starch

AP EAMCET-24.09.2020 Shift-II

Ans. (a) : The pea seeds swell more compared to that of wheat seeds because pea seeds have more imbibing capacity than wheat. The pea seeds are mostly composed of proteins. The wheat seeds are cereals which are enrich source of carbohydrate.

Imbibing capacity of protein is very high than carbohydrate i.e. on imbibitions pea seeds swell more compared to wheat seeds.

Imbibition is that process in which solid substance absorb water through their solid surface when seeds put in soil they become swell by absorbing water. This is called imbibition.

54. Colchicine checks_____

(a) Formation of spindle
(b) Replication of proteins
(c) Replication of DNA
(d) Replication of centrioles

AP EAMCET-24.09.2020 Shift-II

Ans. (a) : Colchicine is an alkaloid drug isolated from *Colchicum autumnale* It prevents mitosis in the metaphase by inhibiting the development of spindle fibre slowing the division of the centromere and preventing the division of the centriole. Cells begin mitosis but chromosome cannot be separated.

55. Identify the correct statement with regard to G_1 phase (Gap 1) of interphase.

(a) Reorganisation of all cell components takes place.
(b) Cell is metabolically active, grows but does not replicate its DNA.
(c) Nuclear Division takes place.
(d) DNA synthesis or replication takes place.

NEET-2020 Phase-I

Ans. (b) : In G_1 Phase the cell is metabolically active and continuously grows but does not replicate it's DNA.

- DNA replication take place S-phase stage but no change in chromosome number. Protein and enzyme synthesis take place at G_2 phase.

56. Dissolution of the synaptonemal complex occurs during

(a) Zygotene (b) Diplotene
(c) Leptotene (d) Pachytene

NEET-2020 Phase-I

Ans. (b) : The prophase stage of meiosis I^{st} (Prophase I^{st}) is divided into five stages which include Leptotene, Zygotene, Pachytene, Diplotene and Diakinesis.

- Diplotene is characterised by the dissolution of the synaptonemal complex. The recombined homologous chromosomes start separating except at

@apna_pdf

the crossing over sites giving rise to x-shaped structures called chiasmata.

- Leptotene is characterised by gradual condensates of chromosomes.
- Zygotene is characterised by the pairing of homologous chromosomes, called synapsis, accompanied with formation of the synaptonemal complex.
- Pachytene stage in which exchange of segments of non-sister chromatids of homologous chromosomes occurs.
- Diakinesis is marked by the terminalisation of chiasmata. Nuclear membrane and nucleolus completely disappear by the end of this phase.

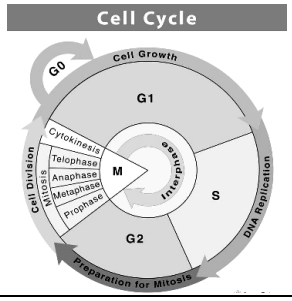
57. Some dividing cells exit the cell cycle and enter vegetative inactive stage. This is called quiescent stage (G_0). This process occurs at the end of

(a) G_1 phase (b) S phase
(c) G_2 phase (d) M phase

NEET-2020 Phase-I

Ans. (d) : Cell cycles are events that occur within a cell sequence and result in the division into two daughter cells.

- Four different stages of the cell cycle: G_1 phase, S phase (synthesis), the G_2 phase (collectively referred to as the interphase) and the M phase (mitosis and cytokinesis).



58. Match the following with respect to meiosis

(A) Zygotene (i) Terminalization
(B) Pachytene (ii) Chiasmata
(C) Diplotene (iii) Crossing over
(D) Diakinesis (iv) Synapsis

Select the correct option from the following

	(A)	(B)	(C)	(D)
(a)	(iv)	(iii)	(ii)	(i)
(b)	(i)	(ii)	(iv)	(iii)
(c)	(ii)	(iv)	(iii)	(i)
(d)	(iii)	(iv)	(i)	(ii)

NEET-2020 Phase-I
NEET-2016 Phase-II

Ans. (a) :

(A) Zygotene	–	(iv)	Synapsis
(B) Pachytene	–	(iii)	Crossing over
(C) Diplotene	–	(ii)	Chiasmata
(D) Diakinesis	–	(i)	Terminalization

59. Match the following events that occur in their respective phases of cell cycle and select the correct option :

A.	**G_1 phase**	**i**	**Cell grows and organelle duplication**
B.	**S phase**	**ii**	**DNA replication and chromosome duplication DNA**
C.	**G_2 phase**	**iii**	**Cytoplasmic growth**
D.	**Metaphase in M-phase**	**iv**	**Alignment of chromosomes**

(a) (A)-(i), (B)-(ii), (C)-(iii), (D)-(iv)
(b) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)
(c) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)
(d) (A)-(iv), (B)-(i), (C)-(ii), (D)-(iii)

NEET-2020 Phase-II

Ans. (a) :

(A)	G_1 phase	(i)	Cell grows and organelle duplication.
(B)	S phase	(ii)	DNA replication and chromosome duplication
(C)	G_2 phase	(iii)	Cytoplasmic growth
(D)	Metaphase in M-phase	(iv)	Alignment of chromosomes

60. In human beings, during oogenesis, Meiosis-I into _____.

(a) A haploid large-sized secondary oocyte and a haploid smaller polar body.
(b) A haploid large-sized primary oocyte and a haploid smaller polar body.
(c) A diploid large-sized primary oocyte and a haploid small-sized polar body
(d) A haploid large-sized secondary oocyte and a diploid smaller polar body

MHT CET-06.10.2020 Shift-I

Ans. (a) : In oogenesis, meiosis I in human beings result in the formation of haploid large-sized secondary ococytes. Oogenesis occurs in the ovary of female animals. When the sperm cell touch the ovum cell then meiosis II start. which results in the formation of a haploid ovum and second polar body. The polar bodies are non-functional cells that degenerate. The ovum, on the other hand is the female gamete that can be fertilized by sperm to form a zygote.

61. Arrange the following events of mitotic cell cycle in series

(A) Reformation of nucleolus, golgi complex and ER
(B) Amount of DNA per cell doubles
(C) Disappearance of golgi complex and ER
(D) Condensation of chromatin into chromosome
(E) Distribution of mitochondria and plastids to daughter cells
(F) Separation of chromatids at centromere

@apna_pdf

Options:
(a) B, C, D, F, A ,E (b) B, D, C, E, A, F
(c) B, D, C, F, A, E (d) B, D, C, F, E, A

AP EAMCET-24.04.2019 Shift-I

Ans. (c) : In mitotic cell division also called as duplication division. Amount of DNA per cell double. If initial amount 2c then it increases 4c.

- The chromatin condensed and spindle fibers form.
- In this stage disappearance of golgi complex & endoplasmic reticulum. Nuclear membrane disappears.
- Separation of chromatids and centromere both.
- Reformation of nucleolus, Golgi body and E.R. nuclear membrane begins to form chromatin (Stands of DNA)

62. Cells in G_0-phase of cell cycle
(a) Exit cell cycle (b) Enter cell cycle
(c) Suspend cell cycle (d) Terminate cell cycle

NEET-2019
WB JEE-2009

Ans. (a) : Cell in G_0-phase of cell cycle exit the cycle. It is resting phase or gap phase.

- Cell enters the G_0 phase from a cell cycle check point in G_1 phase. Cell resides in this phase until they receive appropriate signals.

63. Match the following

Set -I		Set-II	
(A)	**Condensation phase actually is the interval between Mitosis and initiation of DNA replication**	**(I)**	**M- Phase**
(B)	**Decondensation phase in which synthesis proteins takes place in preparation for mitosis**	**(II)**	**S- Phase**
(C)	**Replication in which the amount of DNA per cell doubles**	**(III)**	**G_1-Phase**
(D)	**Quiescent stage or inactive stage**	**(IV)**	**G_2- Phase**
		(V)	**G_0- Phase**

The correct answer is

	(A)	(B)	(C)	(D)
(a)	(iii)	(iv)	(ii)	(v)
(b)	(i)	(iii)	(ii)	(v)
(c)	(iii)	(i)	(ii)	(iv)
(d)	(i)	(ii)	(iii)	(iv)

TS EAMCET-03.05.2018 Shift-I

Ans. (a) : G_1-phase :- It is an intermediate phase that exists between M phase and S phase of cell cycle. It is also known as gap 1 phase or growth one phase. In this phase cell accomplish their most of the growth and prepaid itself for DNA replication.

G_2-phase :- It is a stage of further growth of the cell and it is preparation for division. During this stage synthesis of RNA and proteins occur.

S-phase :- It is called synthesis phase marks the period during which DNA synthesis takes place amount of DNA per cell double.

G_0-phase :- They do not divide further exit G_1-phase to enter an inactive stage called G_0 stage of cell cycle

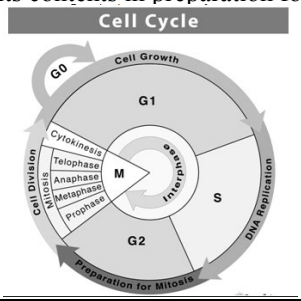
64. Interphase divides into:
(a) G_1, S, G_2
(b) Mitosis
(c) Prophase, metaphase, Anaphase, Telophase
(d) Cytokinesis

AIIMS-26.05.2018 Shift-I
Karnataka CET-2000

Ans. (a): Interphase is the longest part of the cell cycle. This is when the cell grows and copies its DNA before moving into mitosis. During mitosis, Chromosome will align, separate, and move into new daughter cells.

Interphase - Interphase consists of three steps -

- **G_1 phase :** first gap phase; the cell grow larger and organelles are copied.
- **S phase :** Synthesis phase; the cell synthesis a complete copy of the DNA in its nucleus.
- **G_2 phase :** Second gap phase; the cell grow more, makes proteins and organelles, and begins to reorganize its contents in preparation for mitosis.



65. The size of the chromosome is measured during
(a) Interphase (b) Prophase
(c) Metaphase (d) Anaphase

SRM JEEE -2017

Ans. (c) : During metaphase the nucleus dissolves and the cells chromosomes condense and move together, alighting in the center of the dividing cell. At this stage, the chromosomes are distinguishable when viewed through a microscope.

66. Which is synthesised in G_1-phase?
(a) DNA polymerase (b) Histones
(c) Nucleolar DNA (d) Tubulin protein

UP CPMT-2004
MGIMS Wardha-2004

Ans. (a) : DNA polymerase is synthesized in G_1 phase

- Cell growth (Gap -1) or (G_1-Phase)

Extensive metabolic Activity
-Grow in size and specific enzymes are produced
- DNA base units are accumulated

- DNA polymerases are widely used for DNA manipulation including DNA cloning, sequencing, labeling etc.
- Histone proteins are discovered by Albrecht Kossel. Histones bind to DNA give chromosomes and their shape and control the activity of genes.
- Tubulin proteins are found primarily found in centrosomes and spindle pole bodies.

67. Which phase comes in between the G_1 and G_2 phases of cell cycle?
(a) M - phase (b) G_0 - phase
(c) S - phase (d) Interphase

WB JEE-2010

@apna_pdf

Ans. (c) : • S-phase comes in between the G_1 and G_2 phases of cell cycle
• DNA is replicated during S-phase of inter-phase
• Diploid cells (2n) have 2 sets of chromosomes. One set comes from mom, the other from Dad.

1 chromosome 1 chromosome
1 chromatid 2 chromatids

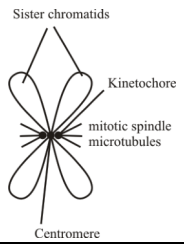
• A cell spends most of its time in inter phase and during this phase it grows, replicates its chromosomes and prepares for cell division.
The DNA is replicates in the preceding S-phase, the two copies of each replicated chromosome (called sister chromatids) remain glued together by cohesive complexes.

68. Diagrammatic representation of all chromosomes at metaphase is called
(a) Ideogram (b) Cardiogram
(c) Karyotype (d) Leotype
BVP-2010

Ans. (a) Diagrammatic representation of all chromosomes at metaphase is called Ideogram.
-Ideogram is a picture of symbol used in a system of writing to represent a thing or an idea but not a particular word or phrase for it.
- Cardiogram is synonyms of ECG. It is a graphical recording of the cardiac cycle produced by an electrocardiograph
- A normal human karyotype consists of 22 pair of autosome and two sex chromosomes. Total 23 pair chromosome

69. Small disc–shaped structures at the surface of the centromeres that appear during metaphase are
(a) Kinetochores (b) Metaphase plate
(c) Spindlefibres (d) Chromatid
AFMC -2009

Ans. (a) : Small disc-shaped structures at the surface of the centromeres that appears during metaphase are kinetochores. Kinetochores are a proteinaceous structure. It forms at the centromere of every chromosome.
- Spindle fibre forms a proteinaceous structure that divides the genetic material in a cell.
- Term chromatid was proposed by MC Clung (1900) chromatid are formed during chromosome duplication.



70. The point at which crossing over occurs is called as :
(a) Chiasmata (b) Centromere
(c) Chromosome (d) Gene loci
BHU PMT-2001

Ans. (a) : The point at which crossing over occurs is called as chiasmata.
A chiasma is the point of contact between 2 chromatids belonging to homologus chromosome
Chiasmata are visible only in the diplotene stage of prophase-I of meiosis X-shaped structures.
Centromere link a pair of sister chromatid together during cell division.
Gene loci are the physical site or location of a specific gene on a chromosome.

71. Chromosomes are visible with chromatids at this phase of mitosis
(a) Interphase (b) Prophase
(c) Metaphase (d) Anaphase
J&K CET-2008

Ans. (b) : Chromosome are visible with chromatids at prophase of mitosis. The main occurence in prophase are the condensation of chromatin reticulum and the disappearance of the nucleolus.

72. The phase of cell cycle during which DNA + polymerase is functionally active is:
(a) S (b) G_2
(c) G_1 (d) M
Karnataka CET-2002

Ans. (a) : The phase of cell cycle during which DNA Polymerase is functionally active is S-phase DNA replication takes place in S-phase of inter phase.
DNA polymerase is responsible for DNA replication. Thus its activity will be seen maximum during S-phase.
G_2 phase – RNA and protein synthesis complete. Tubuline protein is a protein which formed the spindle fibres synthesis occurs in G_2 phase.

73. Which of the following event occurs during G_1-phase?
(a) DNA replication
(b) Growth and normal function of cell
(c) Mutation
(d) Fertilization
DUMET-2008

Ans. (b) : Growth and normal function of cell is occurs during G_1- phase. In this phase cell remains metabolically active and continuous to grow and function normally.

74. The stage during which, cell decides to get specialized
(a) S- phase (b) M-phase
(c) G_1-phase (d) G_2- phase
DUMET-2008
AMU-1995

Ans. (c) : During G_1 phase, cell decides to get specialized. G_1 is a resting phase. During S-phase DNA synthesis takes place and G_2 phase is again a resting phase following DNA synthesis. These 3 phases via G_1, S, G_2 constitute interphase, while the main mitotic division takes place during M-phase.

75. Significance of meiosis lies in:
(a) Reduction of chromosome number to one half
(b) Maintaining consistency of chromosome number during sexual reproduction

@apna_pdf

(c) Production of genetic variability
(d) All of the above

HP CET-2011
VMMC-2005 / AMU-2004

Ans. (d) : Significance of meiosis lies in reduction of chromosome number to one half, maintaining consistency of chromosome number during sexual reproduction and production of genetic variability. Mitosis is necessary for growth and reproduction if only asexual method is present.
However in sexual methods of reproduction, fusion of gametes (male and female) is required.

76. Meiosis can be observed in:
(a) Tapetal cells (b) Megaspores
(c) Microspores (d) Spore mother cells

HP CET-2011

Ans. (d) : Meiosis can be observed in spore mother cell. It is obvious the study of mitosis that daughter cell resting from a mitotic division have same chromosome number as the parental cell had.
The vascular plant produce cell called spore mother cell these are diploid (2n) and represent last stage of the sporophyte generation and produce gametes by meiosis or reductional division.
- The tapetal cell is a specialised layer of nutritive cell, found within the anther of flowering plants.
- Microspores are generated within the pollen sac of the anther in flowering plants. When the microspore germinates it is known as a pollen grain.
- Megaspores also called macrospores are a type of spore that is present in heterosporous plants, germinates into female gametophyte which produces egg cell.

77. In man the meiotic cell division takes place in :
(a) Gonads (b) Nerve cells
(c) Muscular tissue (d) None of these

JIPMER-1999

Ans. (a) : Meiosis is a type of cell division that occurs in the gonads, which are the reproductive organs. it is a reductional division i.e. number of chromosomes in the daughter cells is half the number of chromosomes in the parent cell. This is necessary because the germ cells, which are the cell that give rise to gametes (eggs and sperms) only need half the amount of genetic material.

78. Which of the following characters is related with telophase?
(a) Formation of nuclear membrane
(b) Formation of nucleolus
(c) Elongation of chromosome
(d) Formation of two daughter nuclei

BCECE-2014
BHU PMT (Screening)-2009 / VMMC-2009

Ans. (d) : Formation of two daughter nuclei is related with telophase.
Telophase is the final phase of cell division between anaphase and inter phase in which the chromatids or chromosome move to opposite ends of the cell and two nuclei are formed.
During telophase chromosome arrive at opposite poles and uncoil into thin strand of DNA the spindle fibers disappear, and the nuclear membrane reappears.

79. Find out the correct statement
(a) During mitosis endoplasmic reticulum and nucleolus disappear completely at early prophase
(b) Chromosomes are arranged along the equator during prophase of mitosis
(c) Chromosome is made up of two sister chromatids at anaphase of mitosis
(d) A cell plate is laid down during interphase
(e) Small disc shaped structures at the surface of the centromeres that appear during metaphase are kinetochores

Kerala PMT-2015

Ans. (e) : A small disc shaped structure at the surface of the centromeres that appear during metaphase are kinetochores. Kinetochores are made up of proteins. It forms at the centromere of every chromosome.
Kinetochores are large protein assemblies that connect chromosomes to microtubules of mitotic and meiotic spindle in order to distribute the replicated genome from a mother cell to its daughters.

80. Which of the following products are obtained by anaerobic respiration from yeast?
(a) Alcohols (b) CO_2
(c) Beer and wine (d) All of these

JIPMER-2003

Ans. (d) : Alcohol, CO_2, Beer and wine are obtained by anaerobic respiration from yeast.
The yeast is eukaryotic, single-celled microorganism. Yeasts have two main uses in food production of baking and making alcoholic beverages.
Anaerobic respiration is the type of respiration in which cell can break down sugar to generate energy in the absence of oxygen.

$$C_6H_{12}O_6 \rightarrow 2C_2H_5OH + 2ATP + 2CO_2$$
(Glucose) (Ethanol) (Energy)

81. Chiasmata are most appropriately observed in meiosis during:
(a) diakinesis (b) diplotene
(c) metaphase II (d) pachytene

MGIMS Wardha-2004

Ans. (b) : Chiasmata are most appropriately observed in meiosis during diplotene. Chiasmata formation takes place at a point where the crossing over occurs. Crossing over occurs between the non-sister chromatids of the homologous chromosomes. There is a exchange of genetic material take place between non-sister chromatids of the homologous chromosomes.

82. The two chromatids of a metaphase chromosome represent:
(a) Replicated chromosomes to be separated at anaphase
(b) Homologous chromosomes of a diploid set
(c) Non-homologous chromosomes joined at the centromere
(d) Maternal and paternal chromosomes joined at the centromere

Karnataka CET-2003

@apna_pdf

Ans. (a) : The two chromatids of a metaphase chromosome represent replicates chromosomes to be separated at anaphase.

During prophase the nucleus disappears, spindle fibers form and DNA condenses into chromosomes (sister chromatids). During metaphase sister chromatids align along the equator of the cell by attaching their centromere to spindle fibre

During anaphase, sister chromatids are seprated at the centromere and are pulled towards opposite poles of the cell by the mitosis spindle.

83. Match the column I and column II and choose the correct option initiation.

Column I	Column II
(A) Initiation of spindle fibres	(1) Anaphase?
(B) Synthesis of RNA and protein	(2) Zygotene
(C) Action of endonuclease	(3) G_1 – phase
(D) Movement of chromatids towards the opposite poles	(4) Pachytene
	(5) Anaphase-II

Option

(a) A-2 B-3 C-4 D-5
(b) A-3 B-2 C-1 D-5
(c) A-1 B-3 C-5 D-4
(d) A-5 B-3 C-1 D-2

Manipal-2015

Ans. (a) : Initiation of spindle fibres formation begins in the zygotene phase of the prophase-I of meiosis.

- RNA and protein synthesis takes place during the G_1 and G_2 phase.
- Endonucleases help in the seperation of the chromosomes in the pachytene stage in which crossing over takes place.
- In anaphase II, the sister chromatids seperate and are pulled towards opposite poles of the cell.

84. When yeast ferments glucose the products are :

(a) ethanol and carbon dioxide
(b) methanol and CO_2
(c) water and carbon dioxide
(d) ethanol and water

JCECE-2003
Rajasthan PMT-2002
JIPMER-2000

Ans. (a) : When yeast (*saccharomyces*) ferments glucose and formed ethanol and carbon dioxide (CO_2).

$$C_6H_{12}O_6 \xrightarrow{\text{yeast}} 2C_2H_5OH + 2CO_2$$

(Glucose) (Ethanol) (Carbondioxide)

"Yeast is a fungus that grows as a single cell, rather than as a mushroom", yeast is typically considered a vegan food."

Methanol is produced from petroleum product (synthesis gas) via Hydrogenation of CO and CO_2 and remove water.

85. If you are provided with root-tips of onion in your class and are asked to count the chromosomes, which of the following stages can you most conveniently look into?

(a) Metaphase (b) Telophase
(c) Anaphase (d) Prophase

Manipal-2007
AIPMT-2004

Ans. (a) : Chromosomes arrange themselves in the centre or on the equator of spindle. chromosomes become shorter and thicker. In metaphase, the chromosomes are at their most condensed and are arranged in a single line across the center of the cell. This make them easy to observe and count.

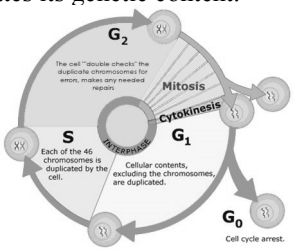
86. In the somatic cell cycle

(a) In G_1 phase DNA content is double the amount of DNA present in the original cell
(b) DNA replication takes place in S-phase
(c) A short interphase is followed by a long mitotic phase
(d) G_2 phase follows mitotic phase

Manipal-2014, 2007
AIPMT-2004

Ans. (b) : The Somatic cell cycle occurs in non-reproductive cells. Such cycle consists only 2 phases i.e. interphase and M phase. Interphase consists of G_1, S and G_2 phase.

S-phase is the period of DNA synthesis during which the cell replicates its genetic content.



87. In which one of the following stages of cell division, the DNA content doubled?

(a) Interphase (b) Metaphase
(c) Prophase (d) Anaphase

Manipal-2014, 2006

Ans. (a) : In Interphase the DNA content doubled. Duplication of DNA occurs in the S-phase of

- During metaphase the nucleus, dissolves and the cell chromosomes condense and move together.
- During anaphase, each pair of chromosomes is separated into two identical, independent chromosomes.
- During prophase condensation of the chromatin takes place and the disappearance of the nucleolus occur.

88. An egg cell has 5 pico gram of DNA in its nucleus. How much amount of DNA will be in this animal at the end of G_2 phase mitosis?

(a) 2.5 pico gram (b) 5 pico gram
(c) 5 gm (d) 20 pico gram

Manipal-2014, 2006

@apna_pdf

Ans. (d) : Egg cell and sperm cell are produced by meiotic division and contain haploid no. of chromosome. Animal somatic cell are diploid contain 10 pico gram of genetic material, Duplication of generic material occurs in S phase, so amount of genetic material in G2 phase will be 20 pico-gram.

89. Replication of centriole occurs during:

(a) interphase (b) prophase
(c) late prophase (d) late delophase

BHU-PMT (Screening)-2008
BHU PMT-2004

Ans. (a) : During the S-phase of the interphase, the centrioles separate and undergo duplication which produces two pairs of centrioles. Thus replication of centrioles occurs during interphase.

90. Which of the following is unique to mitosis and not part of meiosis ?

(a) Homologous chromosomes behave independently
(b) Chromatids are separated during anaphase
(c) Homologous chromosomes pair and form bivalents
(d) Homologous chromosomes crossover

DUMET- 2009

Ans. (a) : In the Eukaryotic cell cycle, chromosome duplication occurs during S-phase of inter phase and chromosome segregation occurs during M-phase (the mitosis phase). Homologous chromosomes behave independently during mitosis, which is not a part of meisois.

91. Synaptonemal complex is a ribonucleo protein structure reported by Moses 1956. It is visible from

(a) leptotene through diplotene
(b) pachytene through diplotene
(c) zygotene through pachytene
(d) diplotene through metaphase

CMC Vellore-2007

Ans. (c) : Synaptonemal complex is a ribonucleo protein structure reported by Moses 1956. It is visible from zygotene through pachytene. During leptotene stage the chromosome become gradually visible under the light microscope. The compaction of chromosome continues throughout leptotene. This is followed by the second stage of prophase-I called zygotene and zygotene is followed by pachytene. In pachytene stage crossing over occurs.

92. If we ignore the effect of crossing over, how many different haploid cells arise by meiosis in a diploid cell having 2n = 12 ?

(a) 8 (b) 16
(c) 32 (d) 64

AFMC-2006

Ans. (d) : Meiosis a type of cell division that reduces the number of chromosomes in a cell by half. So, a diploid cell with 2n = 12 will produce four haploid cells with n = 6 chromosomes each. The number of different haploid cells that can be produced by meiosis is 2^n, where n is the number of chromosomes in the haploid cells. In this case $2^6 = 64$ different haploid cells can be produced.

93. The stage at which cleavage or cytokinesis begins in animal cell is

(a) anaphase (b) telophase
(c) interphase (d) G_0 Phase

CMC Ludhiana-2007

Ans. (a) : Cytokinesis begins in anaphase and ends in telophase reaching completion as the next interphase begins. The first visible change of cytokinesis in an animal cell is the sudden appearance of a pucker or cleavage furrow on the cell surface.
Interphase is the phase of the cell cycle in which a typical cell spends most of its life.

94. The largest phase of meiosis-I is

(a) prophase–I (b) metaphase–I
(c) anaphase–I (d) telophase–I

BHU-PMT (Screening)-2008

Ans. (a) : Prophase-I is the longest phase of meiosis. It occurs in five stages they are Leptotene, Zygotene, pachytene diplotene and diakinesis
Sequence of meiosis-I is prophase, metaphase anaphase and telophase.
In prophase-I the strands of DNA and protein known as chromatin condenses to form chromosome.
In metaphase-I the homologous pair of chromosome align on either side of the equatorial plate.
The chromosome migrates in opposite direction during the third stage of meiosis-I known as Anaphase-I.
During telophase-I the chromosome are enclosed in nuclei.

95. In which of the following stage, the chromosome is single, thin and like long thread?

(a) Leptotene (b) Zygotene
(c) Pachytene (d) Diakinesis

CMC Ludhiana-2008

Ans. (a) : Leptotene also known as leptonema is the first stage of prophase-I of meiosis. In this stage chromosome appears thin and long and during which individual chromosome begin to condense into long strands within the nucleus which are loosely interwoven. However the two sister chromatid are still so tightly bound that they are indistinguishable from one another. They possess a string of swollen area called chromosome.

96. The prophase-I of the meiotic division has sub-stages.

(a) two (b) three
(c) five (d) six

Haryana PMT-2011

Ans. (c) : In meiotic division, the prophase is the most elaborated stage and has five sub stages- Leptotene, zygotene, pachytene, diplotene and diakinesis
Meiosis comprises of one interphase by two nuclear division meiosis-I and meiosis-II.
Meiosis - I $\rightarrow$ It is reductional division.
Meiosis - II$\rightarrow$ It is equational division.

97. While working in a lab, a student forgot to add colchicine while karyotyping through blood culture technique. Then what will happen:

(a) mitosis will be arrested at metaphase

@apna_pdf

(b) chromosomal division will continue and each chromosome will have four arms.
(c) chromosomal division will continue
(d) mitosis will be arrested at telophase

GUJCET-2014

Ans. (c) : Colchicine is a drug that inhibits the formation of microtubules, which are essential for cell division. If colchine is not added, to chromosomes will continue to divide and the cell will not be arrested at metaphase. This will result in a cell with doubled chromosome member. This is because the chromosomes will be able to replicate twice without being separated. This can lead to variety of chromosomal abnormalities, including Down syndrome.

98. The proteins involved in the movement of chromosomes towards the poles during cell division are
(a) actin (b) myosin
(c) tubulin (d) elastin

AP EAMCET-2008

Ans. (c) : The spindle apparatus formed during cell division is composed of microtubules radiating in all directions. The microtubules are chemically composed of tubulin protein (α- tubulin, β-tubulin).
These are helpful during cell division to separate the chromosome at anaphase and helps in the movement of chromosome toward the poles.

99. In cell cycle, during which phase, chromosomes are arranged in equatorial plates?
(a) Metaphase (b) Anaphase
(c) Telophase (d) Prophase

JIPMER-2009

Ans. (a) : During cell cycle chromosome are arranged in a equatorial plate which is known as Metaphasic stage. Metaphase is a stage of mitosis in the eukaryotic cell cycle in which chromosome is at their second-most condensed and coiled stage.

100. Most cytogenic activity occur during
(a) interphase (b) telophase
(c) prophase (d) anaphase

UP CPMT-2005

Ans. (a): Cytogenic activity is those that involve the nucleus of the cell. These activities include DNA replication, transcription and translation. Most of these activities occur during interphase, The interphase is divided into G1, S, G2, M, which is the longest phase of the cell cycle. During interphase the cell grows and duplicates its DNA in preparation for cell division.

- **Prophase** → Condensation of chromosomes.
- **Telophase** → During telophase, the chromosome is arrive at the cell poles.
- During **Anaphase**, each pair of chromosome is separated into two identical independent chromosomes.

101. Match the following list.

List I	List II
(A) G_2 phase	(i) Fusion of microtubules to from spindle apparatus
(B) Prometaphase	(ii) Production of energy required for spindle formation
(C) Anaphase	(iii) Recombination of genetic material
(D) Pachytene	(iv) Contraction of tubulin proteins
	(v) Reappearance of Plasmosome

The correct match is

	A	B	C	D
(a)	(v)	(iv)	(ii)	(iii)
(b)	(ii)	(iv)	(i)	(v)
(c)	(v)	(i)	(iv)	(ii)
(d)	(ii)	(i)	(iv)	(iii)

AP EAMCET-2013

Ans. (d) : G_2 Phase-Production of energy required for spindle fibers.
Prometaphase - Fusion of microtubles to form spindle apparatus.
Anaphase - Contraction of tubuline proteins.
Pachytene - Recombination of genetic material.

102. Interval between two successive cell division, better known as resting phase, but is actually a period of great biosynthetic activity is called as
(a) Interphase
(b) Synthetic phase (S-phase)
(c) M-phase
(d) G_2-phase

UP CPMT-2014

Ans. (a): Interphase– Interphase of cell cycle is better known as resting phase, but infact it is a period of great biosynthetic activity 90% of cell cycle formed by interphase.
When a cell completes the mitotic phase of the first cell cycle, two cells are formed. The interphase is the resting phase between two mitotic phases. It is the phase in which the cell spends most of its life.
S-phase– S-phase is characterized by replication of DNA molecule.
M-phase– M-phase is mitosis phase also called as somatic cell division.
G_2 phase– G_2 phase is a period of rapid cell growth and protein synthesis during which the cell prepares itself for mitosis.

103. The phragmoplast is organised at the
(a) Beginning of anaphase
(b) End of anaphase
(c) Beginning of telophase
(d) End of telophase

UP CPMT-2011

Ans. (b): Phragmoplast is a complex arrangement of microtubules, microfilaments. Golgi derived vesicles and endoplasmic reticulum that gives rise to the cell plate during the cytokinesis. It mainly take place at the end of anaphase. The formation of cell plate completely separates the two daughter cells at the telophase.

104. A cell at telophase stage is observed by a student in a plant brought from the field. He tells his teacher that this cell is not like other cells at telophase stage. There is no formation of cell plate and thus the cell is containing more number of chromosomes as compared to other dividing cells. This would result in

@apna_pdf

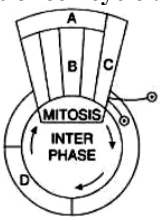
(a) Polytene (b) Aneuploidy
(c) Polyploidy (d) Somaclonal variation

NEET-2016 Phase-I

Ans. (c) :
A cell at the telophase stage shows no formation of a cell plate and contains more chromosomes as compared to other dividing cells. This would result in **polyploidy.**

- **Polytene** refers to a condition in which DNA constantly replicates without separation. This results in the formation of a giant chromosome called the **polytene chromosome.**
- **Aneuploidy** is a condition characterized by the gain or loss of one or more chromosomes. It occurs when chromatics fail to segregate during cell division.
- **Somaclonal Variation** is a phenomenon observed in plant tissue culture. The variation occurs due to chromosomal rearrangements.

105. Given below is a schematic break-up of the phases / stages of cell cycle :

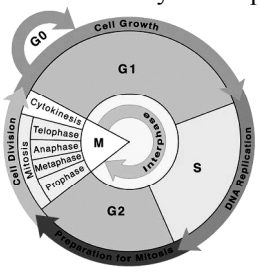


Which one of the following is the correct indication of the stage / phase in the cell cycle ?

(a) A-Cytokinesis (b) B-Metaphase
(c) C-Karyokinesis (d) D-Synthesis phase

AIPMT-2009

Ans. (d) : Mitosis is a sexual cell division that involves production of two offspring's at the end of the cell cycle. It consists of interphase (G-1 phase S-phase and G-2 phase) and M-phase (mitosis phase). The mitosis phase is divided into two stages – karyokinesis and cytokinesis. Karyokinesis is divided into four stages – prophase, metaphase, anaphase and telophase.
In the given figure–
A – Karyokinesis B – Anaphase
C – Cytokinesis D– synthesis phase



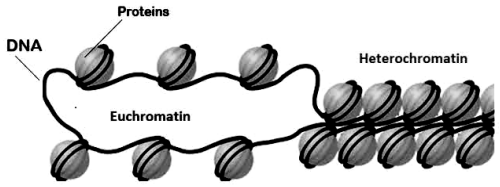
106. In S–phase, DNA is replicated in a medium containing radioactive thymidine, radioactivity will be observed in

(a) Euchromatin (b) Heterochromatin
(c) Both a and b (d) Nucleolus

AIPMT-1998

Ans. (c) : S phase includes replication of both euchromatin and heterochromatin DNA, the radioactive thymidine will be incorporated in both types of DNA.

- Euchromatin is closely loosely packed DNA with higher gene concentration as compared to heterochromatin which is tightly packed less DNA content.



107. Colchicine is an inhibitory chemical , which:

(a) prevents the spindle formation in mitosis
(b) prevents the formation of equatorial plane
(c) stops the functioning of centriole
(d) prevents attaching of centromeres with rays:

VMMC-2002

Ans. (a) : Colchicine is indeed an inhibitory chemical. It is a naturally occurring alkaloid compound found in the *Colchicum autumnale* plant, commonly known as autumn crocus or meadow saffron. Thus, colchicine is an inhibitory chemical which prevents the spindle formation in mitosis.

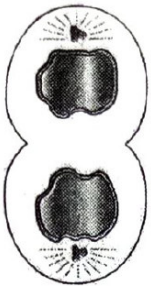
108. During which phase (s) of cell cycle, The amount of DNA in a cell remains at 4C level if the initial amount is denoted as 2C?

(a) G_0 and G_1 (b) G_1 and S
(c) Only G_2 (d) G_2 and M

AIPMT-2014

Ans. (c) : In the G_2 and M phase of the cell cycle, the amount of DNA in a cell remains at 4C level. When the initial amount is denoted as 2C in M-phase, both 4C and 2C of DNA are present in different stages. S-phase marks the period during which the amount of DNA in the cell doubles. Thus, at G_2 phase the amount of DNA is 4C. These doubled cellular contents prepare the cell to sustain in the further mitotic division.

109. A stage in cell division is shown in the figure. Select the answer which gives correct identification of the stage with its characteristics.



(a)	Prophase	Endoplasmic reticlulum and nucleolus not reformed yet
(b)	Telophase	Nuclear envelop reforms, golgi complex reforms
(c)	Late anaphase	Chromosomes move a away from equatorial plate, golgi complex not present

@apna_pdf

(d)	Cytokinesis	Cell plate formed, mitochondria distributed between two daughter cells

NEET-2013

Ans. (b) : In a Telophase mitotic spindles break down, decondensation of chromosome present at opposite poles occur nuclear envelop begins to form around each chromosomal set Golgi complex reform cytokinesis involves the cytoplasmic components to separate physically to form two daughter cells. These cell each enter an interphase of their own and begin a new cell cycle round.

110. During the cell cycle, 2 molecules of DNA are present in a chromosome in the :-

(a) G_1 phase (b) End of S phase
(c) End of M phase (d) G_2 phase

AIIMS-2001

Ans. (b) : The cell cycle is generally divided into two phase**.(i) Interphase (ii) mitosis**.

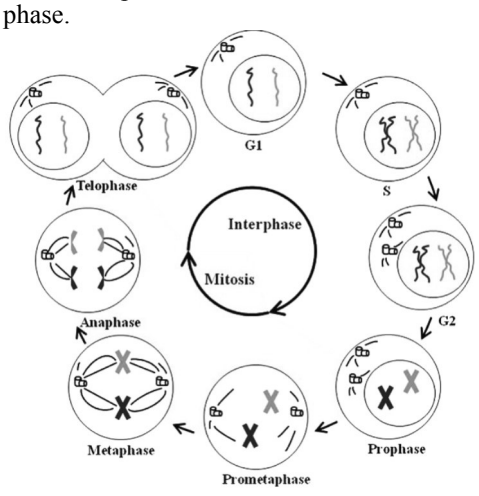
During **interphase**, the cell spends most of time performing the functions that make it unique. **Mitosis** is the phase of the cell cycle during which the cell divides into two daughter cells.

• **Interphase -** The interphase stage of the cell cycle include three distinctive parts i.e **G_1-phase**, **S-phase** and **G_2-phase.**

• The **G_1-phase** follows mitosis and is the period in which the cell is synthesizing, its structural proteins and enzymes to perform its functions.

• **S-phase -** During the S-phase or **synthetic phase** of interphase, replication of DNA and synthesis of histone proteins occur. New histones are required in massive amounts immediately at the begining of the S period of DNA synthesis to provide the new DNA with nucleosomes. Thus, at the end of S phase, each chromosome has two DNA molecules and a duplicate set of genes. S phase occupies roughly 35 to 45 percent of cell cycle.

• **G_2 phase -** This is a second gap or growth phase or resting phase of interphase. During G_2 phase, synthesis of RNA and proteins continues which is required for cell growth. It may occupy 10 to 20 percent time of cell cycle. As the G_2 phase draws to a close, the cell enters the M phase.



111. Barr Body is found in the cytoplasm during :-

(a) Interphase in cell of female mammal
(b) Interphase in cell of male mammal
(c) Prophase in cell of female mammal
(d) Prophase in cell of male mammal.

AIIMS-2001

Ans. (a) : Barr body is found in the cytoplasm of interphase cells of female mammals. It is condensed, inactive X chromosomes. Females have two X chromosomes, while males have one X chromosome and one Y chromosome, In female cells, one of the X chromosomes is inactivated to prevent too much gene expression from X-linked genes. The inactivated X chromosome is called a Barr body.

• Barr body is a small body which stains intensely with nuclear dyes.

• Barr body found at the rim of nucleus in female somatic cells between division.

Barr body = No. of x-chromosome – 1.

112. During cell division a cell plate is produced during:

(a) metaphase (b) telophase
(c) cytokinesis (d) anaphase

UP CPMT-2007
J&K CET-2000

Ans. (c) : During cell division, formation of cell plate occur during cytokinesis. Cytokinesis begins at Anaphase and ends during telophase. In the process of cell plate formation the cytoplasm of plant cells portioned from inside out and form a new cell wall called cell plate.

113. Centromere is required for–

(a) transcription
(b) crossing over
(c) cytoplasmic cleavage
(d) movement of chromosomes towards poles

Uttarakhand PMT-2010

Ans. (d) : The centromere is a specialized region of a chromosome that is responsible for the attachment of the mitotic spindle fibers. These spindle fibres are responsible for cell division.

114. Interphase nucleus is enclosed by

(a) non-porous nuclear membrane
(b) porous double nuclear membrane
(c) non-porous double discontinuous nuclear membrane
(d) a single porous unit membrane

Punjab MET-2007

Ans. (b) : A nuclear membrane keep the chromosomes apart from the rest of the cell. The nuclear membrane includes a series of small pores that allow the passage to certain object. Such as nucleic acids and proteins between the nucleus and cytoplasm.

115. Which is not character of mitosis?

(a) Leptotene (b) Zygotene
(c) Pachytene (d) All of these

CG PMT-2005

@apna_pdf

Ans. (d) : Leptotene, zygotene, and pachytene are three of the substages of prophase I in meiosis, which is a different type of cell division than mitosis. Mitosis is a type of cell division that occurs in somatic cells, (such as skin cells, muscle cells etc) while meiosis occurs in gametes such as sperm and eggs.

116. A diploid living organism develops from zygote by which type of repeated cell division?

(a) Meiosis (b) Amitosis
(c) Mitosis (d) Segmentation

J&K CET-2005

Ans. (c) : Mitosis is a type of cell division that produces two daughter cells that are genetically identical to the parent cell. This type of cell division is used to grow and repair tissue in the body. It is also used to create gametes (sex cells) in sexually reproducing organisms.

• Meiosis is special kind of cell that reduces the chromosome number by half (1/2).

117. The drug colchicine has inhibitory effect on cell cycle in which stage ?

(a) Prophase (b) Anaphase
(c) Metaphase (d) Telophase

Punjab MET-2011

Ans. (c) : Colchicine has a inhibitory effect on cell cycle progression during the mitotic phase, specifically at the metaphase stage. Metaphase is the stage of mitosis where chromosomes align at the cell's equatorial plate, and the spindle fibers attach to the centromeres of the sister chromatids. Colchicine disrupts the formation of microtubules, which are essential for the proper alignment and separation of chromosomes during this stage. As a result, cell division is inhibited, and the cell cycle cannot proceed beyond metaphase.

118. L-shaped chromosomes are also called

(a) acrocentric (b) telocentric
(c) sub-metacentric (d) None of the above

Rajasthan PMT-2008

Ans. (c) : The location of centromere determines the classification of chromosomes.

Sub-metacentric chromosomes are those in which the centromere is present but not exactly in the middle of the chromosome. They form L' shaped structure.

119. Just after G_1 – phase

(a) G_2 – phase (b) M-phase
(c) S-phase (d) None of these

JCECE-2014

Ans. (c) : Correct equation of cell cycle is:-

$$G_1 \rightarrow S \rightarrow G_2 \rightarrow M$$

Just after G_1-phase occurs followed by S-phase or synthesis-phase. It is period during which DNA synthesis or replication takes place during and this time the amount of DNA per cell double.

120. Replication of centriole occurs during

(a) Interphase (b) Prophase
(c) Late prophase (d) Late telophase

BVP-2007

Ans. (a) : The replication of centrioles actually occurs during a specific stage of the cell cycle called the " S phase", which is part of the interphase. The cell cycle consists of several phase, including interphase and mitotic phase. Interphase is the period in the cell cycle when the cell is preparing for cell division. It is divided into three sub phases: G1, S and G2. During G1 and G2 phases, the cell grows, synthesizes proteins, and prepares for the next steps. The S phase is the critical phase where DNA replication takes place, including the replication of centrioles.

121. Which of the following does not occur in the interphase of eukaryotic cell division?

(a) Increase of ATP synthesis
(b) Increase of DNA synthesis
(c) Increase of RNA synthesis
(d) Reduction in cell size

WB JEE-2015

Ans. (d) : Reduction in cell size does not occure in the interphase of eukaryotic cell division. Interphase is known as the resting phase of cell cycle. Interphase is the time during which the cell prepares for division by undergoing both cell growth and DNA replication.

C. Cytokinesis

122. The process of cytokinesis shows the division of

(a) chromatids (b) cytoplasm
(c) nucleus (d) chromosomes

HP CET-2012 / VMMC-2004
Punjab MET-1999

Ans. (b) : The process of cytokinesis show the division of cytoplasm. Cell division ends as the cytoplasm divides into two by the process of cytokinesis. It can occurs along with or soon after nuclear division either by mitosis or meiosis.

• The chromatid is one of the two identical halves of chromosome that has been replicated in preparation for cell division.

• Nucleus controls and conducts all activities of a cell.

123. During mitosis nuclear membrane disappears at

(a) Early prophase (b) Late prophase
(c) Metaphase (d) Anaphase

Tripura JEE-2017
MGIMS Wardha-2011
AIPMT (Screening)-2010

Ans. (b) : In late prophase, the chromosome condensed and the nuclear membrane breaks down. This allows the chromosomes to interact with the spindle fibers and move to the metaphase plate. The nuclear membrane reforms in telophase, after the chromosomes have separated.

124. At which stage does cytokinesis begin?

(a) Anaphase (b) prophase
(c) Metaphase (d) Interphase

CG PMT-2010

Ans. (a) : Cytokinesis begins at the stage of anaphase. It separates a parental cell's cytoplasm into two daughter cells. Cytokinesis ends at the stage of telophase.

125. Highest number of antibiotics are produced by

(a) Bacillus (b) Penicillium
(c) Streptomyces (d) Cephalosporoum

BVP-2014

@apna_pdf

Ans. (c) : Streptomyces is the genus of bacteria that produces the highest number of antibiosis. They are responsible for producing over two-thirds of the clinically useful antibiotics of natural origin.
Some of the most common antibiotics produced by streptomycin include penicillin, strepotomycin and neomycin.

126. Purified antibiotic penicillin of Pencillium notatum was discovered by
(a) Alexander Fleming (b) Howard Floxy
(c) Robert Hooke (d) Carolus Linnaeus
Punjab MET-2008
J&K CET-2001

Ans. (a) : Alexander Fleming was a Scottish bacteriologist who discovered penicillin in 1928. Penicillin is a natural antibiotic that is produced by the mold *Penicillium notatum*. It is a very effective antibiotic against a wide range of bacteria, including *Staphylococcus aureus* and *E.coli.*

D. Significance of Mitosis

127. During mitosis number of chromosomes gets
(a) change
(b) no change
(c) may be change if cell is mature
(d) may be change if cell is immature
BVP-2008
Uttarakhand PMT-2007
DUMET-2005
UP CPMT-2003

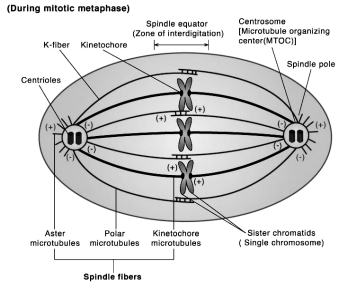
Ans. (b) : There is no change in chromosome number during mitosis but the DNA content per chromosome doubles during S-phase. Mitosis division is the process of cell division where chromosomes replicate and are equally distributed into two daughter cells. The chromosome number in each daughter cell is equal (no change) to that to the parent cell. e.g : diploid

128. Find the correct sub phase based on arrangement of chromosomes during M – phase
(a) Anaphase – Chromatin material in two poles
(b) Anaphase – Condensation of chromosomes
(c) Metaphase –Chromosomes lie at the equator
(d) Metaphase – Chromatids attached at the kinetochore
AP EAPCET-22.05.2023, Shift-II

Ans. (c) : Chromosomes lies at the equator of the cell during metaphase which is second stage of mitosis.
• Prophase – Condensed and the nuclear envelope breaks down.
• Anaphase – Sister chromatids separate and move to opposite poles of the cell.
• Telophase – Decondense and the nuclear envelope reform.

129. Select the incorrect statement with reference to mitosis:
(a) Splitting of centromere occurs at anaphase
(b) All the chromosomes lie at the equator at metaphase
(c) Spindle fibres attach to centromere of chromosomes
(d) Chromosomes decondense at telophase
NEET-2022

Ans. (c) : Spindle fibres attach to the kinetochores of chromosomes.
• Kinetochores are the disc shaped structures present on sides of primary constriction or centromere of chromosome.



130. Which one of the following never occurs during mitotic cell division?
(a) Coiling and condensation of the chromatids
(b) Spindle fibres attach to kinetochores of chromosomes
(c) Movement of centrioles towards opposite poles
(d) Pairing of homologous chromosomes
NEET-2022

Ans. (d) : Mitotic cell is a type of cell division that have a nucleus.
• Mitosis cells use it to make more cells. During mitotic division coiling and condensation of the chromatids and spindle fibers attach to kinetochores of chromosomes and also movement of centriole towards opposite poles.
So pairing of homologous chromosome never occur mitotic cell division.

131. Significance of Mitosis includes the following, except _____
(a) Growth (b) Cell repair
(c) Diploid daughter cells (d) Genetic variation
AP EAMCET-05.10.2021 Shift-I

Ans. (d) : Mitosis assist in preserving the same number of chromosomes in daughter cells after division.
It is a fundamental process in the growth and repair of all living things and it plays a crucial role in the development, reproduction and maintenance of organisms.

132. The fruit fly has 8 chromosomes (2n) in each cell. During interphase of Mitosis if the number of chromosomes at G_1 phase is 8, what would be the number of chromosomes after S phase?
(a) 32 (b) 8
(c) 16 (d) 4
NEET-2021

Ans. (b) : In the S phase of cell cycle DNA replication occur. After replication the content of DNA gets doubled in S phase but there is no change in chromosome count. The number of chromosomes does not increases as DNA quantity does. Therefore, if the fruit fly G_1 phase chromosome count is 8, the S-phase chromosomal count will also be 8.

@apna_pdf

133. Offsets are produced by

(a) Meiotic divisions (b) Mitotic divisions
(c) Parthenogenesis (d) Parthenocarpy

NEET-2018

Ans. (b) : Offsets is a part of plants or stem which is propagated by means of vegetative method.

- They are formed by mitosis in somatic cells.
- Each offset form when the meristem region of plant such as auxiliary buds or homologous structure.
- Offset are one internode long condensed rumors usually found in rosette plants.
- Offset daughter plants that are genetically identical to the parent.

134. Post mitotic gap phase is characterised by all, except

(a) Synthesis of RNA and nucleotides
(b) No change in DNA content
(c) Synthesis of histone proteins
(d) Growth phase of the cell

JIPMER-2017

Ans. (c) : In the cell cycle mitotic phase is that phase in which cell complete Prophase, Metaphase, Anaphase, Telephase. After mitotic phase cell enters in G_1 phase and S phase i.e these are called post mitotic phase. G_1 phase differentiate post mitotic & premitotic phase. It represents post mitotic gap. In post mitotic gap all process occurs except the synthesis of histone protein. The synthesis of histone protein occurs in S phase.

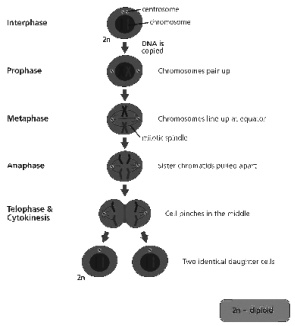
135. Which of the following options gives the correct sequence of events during mitosis?

(a) Condensation → nuclear membrane disassembly → crossing over → segregation → Telophase
(b) Condensation→nuclear membrane disassembly→arrangement at equator → centromere division→ segregation → Telophase
(c) Condensation → crossing over → nuclear membrane disassembly → segregation Telophase
(d) Condensation → arrangement at equator → centromere division → segregation → Telophase

NEET-2017

Ans. (b) : In mitosis, there are four phases prophase, metaphase, anaphase and telophase.

- In **Prophase** condensation of chromosomes occurs which is followed by nuclear membrane disintegration.
- **Metaphase** is characterised by arrangement of chromosomes on nuclear plate.
- In **Anaphase**, centromere division occurs, which aligned on opposite poles of the cell. The aligned chromosome are the segregated.
- In **Telophase**, chromosome moves to opposite poles and nuclear membrane reappear at each pole forming two daughter nuclei.



136. In mitotic cell division, the division of centromere and the division of chromatid occurs between:

(a) anaphase and telophase
(b) prophase and metaphase
(c) telophase and interphase
(d) anaphase and metaphase

WB JEE-2006

Ans. (d) : Anaphase is a mitotic cell division phase that comes after metaphase. Here the centromeres split and the chromatids separate and move to opposite poles.
Metaphase in this stage the microtubules start pulling the chromosome with equal force and the chromosome ends up in the middle of the cell.
Prophase is the first stage of mitosis. The completion of prophase is characterised by the initiation of the assembly of the mitotic spindle, the micro- tubules and the proteinaceous components of cytoplasm that help in the process
"Division of centromere followed by separation of sister chromatids is observed between anaphase and metaphase"

137. Mitosis occurs in:

(a) skin cells (b) heart cells
(c) kidney cells (d) all of these

Rajasthan PMT-2004

Ans. (d) : Mitosis is the process of cell division that produces two identical daughter cells. it occurs in all somatic cells, which are all the cells in the body that are not gametes (sex cells).

Difference b/w mitosis and meiosis

Feature	Mitosis	Meiosis
• Cell type	Somatic cells	Germ cells
• No. of daughter cells	2	4
• Chromosome number	Diploid (2n)	Haploid (n)
• Purpose	Growth repair and replacement of cells	Production of gametes

138. In mitosis, duplication of chromosomes occurs during:

(a) interphase (b) prophase
(c) metaphase (d) telophase

BHU PMT-2002

@apna_pdf

Ans. (a) : In mitosis, the duplication of chromosomes occurs during the "S phase" of the cell cycle, which is part of interphase. The cell cycle consists of different phases, and interphase is the stage where the cell prepares for division by growing, replication its DNA, and synthesizing new organelles .

139. Mitosis is : (1) Reduction in chromosome number (2) Karyokinesis (3) Formation of four daughter nuclei (4)Cytokinesis

(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2005, 2008

Ans. (c) : Karyokinesis is the process of partition of cell nucleus during the M-phase of cell cycle formed two daughter nuclei.

• Cytokinesis is the cytoplasmic division of the cell at the end of cell division, bringing about the separation in to two daughter cells.

140. In which stage of mitosis chromosome arrange on equatorial plate?

(a) Prophase (b) Metaphase
(c) Anaphase (d) Telophase

UP CPMT-2012
BVP-2009

Ans. (b) : At the metaphase stage chromosome arranged of on equatorial plate.

The second stage of mitosis is known as metaphase during this stage, the spindle fibers start to connect to the compressed chromosomes.

The preparation for their segregation, the microtubules rearranged the chromosomes so that they appear in a line known as the metaphase plate.

141. Anastral mitosis is the characteristic of:

(a) lower animals (b) higher animals
(c) higher plants (d) all living organisms

JIPMER-2000, 1997

Ans. (c) : In anastral mitosis, the spindle fibers form without the help of centrioles. This different type of microtubule organizing center called the spindle pole body, similar to centrioles but not having the same structure.

142. Which one of the following is the significance of mitosis?

(a) Restricted to haploid cell
(b) Cell repair
(c) Increases the genetic variability
(d) Recombination of chromosomes
(d) Leads to evolution of new genotypes

Kerala PMT-2015

Ans. (b) : Mitosis is the process of cell division that produces two identical daughter cells. This process is essential for the growth and repair of tissues in the body. When a cell is damaged, it can undergo mitosis to replace the damaged cells.

143. How many mitotic divisions are needed for a single cell to make 128 cells?

(a) 7 (b) 14
(c) 28 (d) 32

VMMC-2002
Karnataka CET-2007

Ans. (a) : Mitotic division is a type of cell division in which one cell (the mother) divides to produce two new cells (daughter) that are genetically identical to itself.

The number of mitotic division needed for a single cell to make 128 cell can be calculated by the formula 2^n, where n is the number of mitotic divisions.

$\therefore 2^n = 128$

$2^n = 2^7$

$n = 7$

Therefore the number of mitotic division needed for a single cell to make 128 cell is 7.

144. The post mitotic phase of the cell in which active synthesis of RNA and proteins takes place is :

(a) S-phase (b) amitotic phase
(c) G_2-phase (d) G_1-phase

Karnataka CET-2003

Ans. (d) : The G_1 phase is the first phase of the interphase of the cell cycle. It is a post mitotic phase, meaning that it occurs after the cell has divided. During the G_1 phase, the cell grows in size and synthesis RNA and proteins. The is an preparation for the S phase, when the cell will replicate its DNA.

145. Germ cells in gonads are produced by

(a) only mitosis
(b) only meiosis
(c) maturation without cell division
(d) Both [a] and [b]

CG PMT-2011

Ans. (b) : Germ cells in gonads, which are responsible for producing eggs in females and sperm in males, are produced through both mitosis and meiosis.

146. Which of the following is not a characteristic feature during mitosis in somatic cells

(a) Synapsis
(b) Spindle fibres
(c) Disappearance of nucleolus
(d) Chromosome movement

NEET-2016 Phase-I

Ans. (a) : Synapsis is the pairing of homologous chromosomes that occurs during prophase I of meiosis. It is important step for crossing over to occur, which is a process that allow genetic material to the exchanged between homologous chromosomes. In mitosis, there is no need for crossing over, so synapsis does not occur.

147. The mitotic cell cycle is divided typically into four phases: G_1, S, G_2 and M. Considering a mitotic cycle time of 18 hrs; the distribution of period of time (in hrs) for each of these phases will be

	G_1	S	G_2	M
(a)	1	3	5	9
(b)	9	1	3	5
(c)	9	5	3	1
(d)	3	5	9	1

JIPMER-2015

Ans. (c) : The mitotic cell cycle is divided into four phases: G_1 , S, G_2 and M. The G_1 phase is the first phase and it is a period of growth and preparation for DNA replication. The S phase is the second phase, and it is

@apna_pdf

when DNA replication occurs. The G_2 phase is the third phase, and it is a period of preparation for mitosis. The M phase is the fourth phase and it is when mitosis occurs.
The total time of the mitotic cell cycle is 18 H. The G_1 takes up 9H, S phase 5H, G_2 phase takes up 3H and the M phase takes up 1H..

148. Match the following pairs correctly:

Column–A		Column–B	
A.	**Statin**	**1.**	**Removal of oil stains**
B.	**Cyclosporin A**	**2.**	**Removal of clots from blood vessels**
C.	**Streptokinase**	**3.**	**Lowering of blood cholesterol**
D.	**Lipase**	**4.**	**Immuno-suppressive agent**

(a) A–2 B–3 C–1 D–4
(b) A–4 B–2 C–1 D–3
(c) A–4 B–1 C–2 D–3
(d) A–3 B–4 C–2 D–1

Assam CEE-2014

Ans. (d) : Statin – It is a group of medicine that can be lower blood cholesterol levels by blocking an enzyme in the liver that is necessary for making cholesterol.
Cyclosporin A – Cyclosporin is a calcine urin inhibitor, used as an immunosuppressant medication. It is taken orally or intrauenously for rheumatoid arthmitis.
Streptokinase–It is a thrombalytic medication activating plasminogen by non-enzymatic mechanism. As a medication it is used to break down the clots in some cases,
Lipase – It is an enzyme that breaks down triglyceriods into free fatty acids.

149. Where can we study mitosis?
(a) Brain (b) Legs
(c) Nail base (d) Kidney

CMC Vellore-2013

Ans. (c) : The cells in the nail base are called the cuticles. It is also named eponychium. The nail base is a good place to study mitosis because the cells in the nail base are living cells that are actively dividing. The cell in the nail base are also relatively large and the easy to see under a microscope.

150. Which one of the following preceeds reformation of the nuclear envelope during M phase of the cell cycle :-
(a) Transcription from chromosomes and reassembly of the nuclear lamina
(b) Formation of the contractile ring and formation of the phragmoplast
(c) Formation of the contractile ring and transcription from chromosomes
(d) Decondensation from chromosomes and reassembly of the nuclear lamina

AIPMT-2004

Ans. (d) : Telophase is the stage of the cell cycle. The nucleus is recognized by decondensation from the chromosomes and reassembly of the nuclear lamina before the nuclear membrane, which disappears during prophase and reappears in telophase is reconstituted.

151. Select the correct option :-

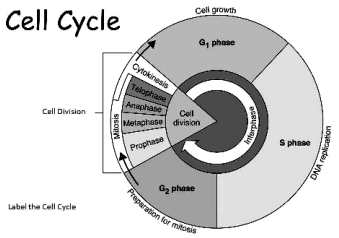
List-I		List-II	
(A)	**Synapsis aligns homologous chromosomes**	**(i)**	**Anaphase-II**
(B)	**Synthesis of RNA and protein**	**(ii)**	**Zygotene**
(C)	**Action of enzyme recombinase**	**(iii)**	**G_2-phase**
(D)	**Centromeres do not separate but chromatids move towards opposite poles**	**(iv)**	**Anaphase -I**
		(v)	**Pachytene**

	A	B	C	D
(a)	(ii)	(iii)	(v)	(iv)
(b)	(i)	(iii)	(v)	(iv)
(c)	(ii)	(iii)	(iv)	(v)
(d)	(ii)	(i)	(iii)	(iv)

AIPMT-2015

Ans. (a) : The zygotene stage of the prophase –I of meiosis-I. The pairing of two homologous chromosome occurs which is known as **synapsis**. After all synapsis formed a complex structure called **synaptonemal complex**. The homologous chromosome is called bivalent or a tetrad.

- **G2 phase-** of the cell cycle protein are synthesized for preparation of mitosis while cell growth continues.
- **Pachytene-** This stage is characterized by the appearance of recombination nodules. Crossing over is also an enzyme-mediated process and the enzyme involved is called **Recombinase**.
- **Anaphase-I-** Homologous chromosome separate chromatids move towards opposite poles. Centromeres do not separate and sister chromatids remain associated at their centromeres.
- **Anaphase-II-** This is the stage of meiosis-II which occur after metaphase-II when chromosome are in equatorial plate.



152. Centromere is a part of:
(a) ribosomes (b) mitochondria
(c) chromosome (d) endoplasmic reticulum

Haryana PMT-2001

Ans. (c) : The centromere which may be identified as a constrictive area of a chromosome, is important in helping the cell divided up its DNA during mitosis and meiosis. It is particular area where the spindle fibers of cell are attached.

@apna_pdf

153. Select the correct statement related to mitosis.

(a) Amount of DNA in the parent cell is first halved and then distributed into two daughter cells

(b) Amount of DNA in the parent cell is first doubled and then distributed into two daughter cells

(c) Amount of DNA in the parent cell is first halved and then distributed into four daughter cells

(d) Amount of DNA in the parent cell is first doubled and then distributed into four daughter cells

WB JEE-2014

Ans. (b) : In mitosis there are two daughter cells formed at the end of mitosis. The number of DNA in the parent cell is doubled in the S-phase of the interphase. During mitosis, it is equally distributed into two daughter cells, resuming the chromosome number of parent cell.

E. Meiosis

154. The longest phase of meiosis -I is:

(a) metaphase-I (b) prophase-I

(c) anaphase-I (d) telophase-I

BCECE-2014 / WB JEE-2011
JCECE-2005 / Punjab MET-2004
Haryana PMT-2002 / UP CPMT-2001
Manipal-2000 / AP EAMCET-1998

Ans. (b) : Prophase I is known as the longest phase of meiosis 1st. It is also called reductional division. It brings change in chromosome number from diploid to haploid.

Longest phase is prophase I- It is long and complete it divided into 5-stages.

1. **Leptotene-** Beaded long chromosomes
2. **Zygotene-** Chromosomes become shorter and thicker
3. **Pachytene-** Longest stage because it take time to cross over
4. **Diplotene-** Bivalent repel each other
5. **Diakinesis-** Terminalization occurs

155. The term Meiosis was given by :

(a) Johansen (b) Knoll and Ruska

(c) A. Fleming (d) Farmer and Moore

BVP-2005 / Haryana PMT-2004, 2000
JIPMER-2003 / Manipal-2003 / VMMC-2002

Ans. (d) : Term meiosis was given by Farmer and Moore (1905).

Johanson- Gave the term gene (1909).

Knoll and Ruska- Invented the first electron microscope (1931).

A. Fleming- He discovered the penicillin.

156. Pairing of homologous chromosomes takes place during

(a) leptotene (b) zygotene

(c) pachytene (d) diplotene

Haryana PMT-2005 / CG PMT-2004
BHU PMT-2003 / AP EAMCET-2000

Ans. (b) : Pairing of homologous chromosomes takes place during zygotene, where the homologous chromosomes comes into close contact and align themselves along their length. This process called synapsis. Once synapsis completed the homologous chromosomes are held together by protein called synaptonemal complex.

157. Meiosis can be observed in :

(a) tapetal cells (b) megaspores

(c) micropores (d) microspore mother cells

BCECE-2006 / VMMC-2005
AMU-2004 / BVP-2003

Ans. (d) : Meiosis is that type of cell division which reduces the number chromosome in gametes. The process of meiosis best seen in microspore mother cell which formed by the division of various stages in sporogenous tissue.

158. Match the following

	List-I		List-II
A.	Crossing over	I.	Diakinesis
B.	Synapsis	II.	Diplotene
C.	Weakening of synaptonemal complex	III.	Zygotene
D.	Terminalisation	IV.	Pachytene

(a) A – IV, B – III, C – II, D – I

(b) A – III, B – IV, C – II, D – I

(c) A – II, B – III, C – I, D – IV

(d) A – I, B – IV, C – II, D – III

TS EAMCET 10.05.2023 Shift-I

Ans. (a) :

A.	Crossing over	IV.	Pachytene
B.	Synapsis	III.	Zygotene
C.	Weakening of synaptonemal complex	II.	Diplotene
D.	Terminalisation	I.	Diakinesis

159. The reason for the genetic variation in the population of organisms

(a) Meiosis (b) Mitosis

(c) Cytokinesis (d) Karyokinesis

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : The main reason for the genetic variation in the population of organism is meiosis.

Meiosis is a reduction division, which means that the number of chromosome in the resulting cells is half the number of chromosomes in the original cell. The main reason of genetic variation is crossing over during meiosis.

160. Doubling of the number of chromosomes can be achieved by disrupting mitotic cell division soon after

(a) Prophase (b) Metaphase

(c) Anaphase (d) Telophase

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : All living organisms of the biological world start life as one cell i.e. unicellular zygote.

- During anaphase each pair of chromosomes is separated into identical, independent chromosomes and separated by mitotic spindle.
- Chromosome doubling may be carried out artificially with chemicals, such as colchicine oftain fertile plants from sterile hybrid.

@apna_pdf

161. The process of appearance of recombination nodules occurs at which sub stage of prophase I in meiosis?

(a) Diakinesis (b) Zygotene
(c) Pachytene (d) Diplotene

NEET (UG) 07.05.2023

Ans. (c) : Pachytene is the third stage of meiosis prophase-I

- Meiosis is the process in eukaryotic sexually reproducing animals that reduces the number of chromosomes in a cell before reproduction.
- Contraction of chromosomes is continuous. Pachytene stage begins just when the synapsis has completed. The paired chromosomes structures are called bivalents. If there are more than two homologous in paired condition they are called multivalents.

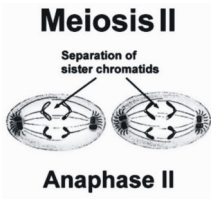
162. Which of the following stages of meiosis involves division of centrornere?

(a) Telophase (b) Metaphase I
(c) Metaphase II (d) Anaphase II

NEET (UG) 07.05.2023

Ans. (d) : In anaphase II two sister chromosome of each pair start to move towards the opposite poles of the spindle, they are being drawn towards the opposite pole by their centromeres

- Anaphase II is the third stage of meiosis II.
- It occurs after metaphase II when the chromosome are in the equatorial plane. The spindle fibers are connected to the kinetochores.



163. During Meiosis I, in which stage synapsis takes place?

(a) Leptotene (b) Pachytene
(c) Zygotene (d) Diplotene

NEET-2020 Phase-II
NEET (Karnataka)-2013

Ans. (c) : In zygotene, the pairing of homologous chromosome starts a process known as chromosomal synapsis, A pair of synapsis homologous chromosome forms a complex known as bivalent or tetrad called synaptonemal complex.

- At pachytene stage, crossing over of non-sister chromatids of homologous chromosomes occurs at the recombination nodules. The chromosome remains linked at the sites of crossing over.
- Diplotene marks the dissolution of the synaptonemal complex and separation of the homologous chromosome of the bivalents except at the sites of cross-over. The x-shaped structures formed during separation are known as chiasmata.

164. Match the following

List–I		List–II		List–III
(A) Interphase	(i)	Synapsed homologous Chromosomes	(I)	Two sequential cycles
(B) Meiosis	(ii)	Crossing over	(II)	Exchange of genetic material
(C) Bivalant	(iii)	Single cycle of DNA Replication	(III)	95% of cell cycle duration
(D) Recombi-nase	(iv)	Between two M-phases	(IV)	Zygotene

The correct answer is

	(A)	(B)	(C)	(D)
(a)	iv, III	iii, I	i, IV	ii, II
(b)	iv, III	i, I	ii, II	iii, IV
(c)	iii, III	i, II	ii, I	iv, IV
(d)	iv, III	i, II	ii, IV	iii, I

AP EAMCET-25.04.2018 Shift-II

Ans. (d) : (A) Interphase — Between to M–Phases — 95% of cell cycle duration.
(B) Meiosis — Single cycle of DNA replication— Two sequential cycles.
(C) Bivalant — Synapsed homologous chromosome — Zygotene.
(D) Recombinase – crossing over —— Exchange of genetic material.

165. The importance of meiosis lies in:

(a) bringing discontinuous variations
(b) addition in the number of chromosomes
(c) reduction in the number of chromosomes
(d) maintaining the number of chromosomes

WB JEE-2006

Ans. (d) : Meiosis discovered by Farmer and Moore. Meiosis is a special kind of cell division that reduces the chromosome number by half which results in the production of haploid daughter cells. The production of haploid phase in the life cycle of sexually reproducing organism where fertilization restores the diploid phase. It maintains chromosome number generation after generation.

166. Root cells of wheat has 2n = 42 chromosomes. Which one of the following is the basic chromosome number of wheat?

(a) 42 (b) 21
(c) 7 (d) 14

WB JEE-2010

Ans. (c) : According to question wheat species is hexaploid i.e. means

$6n = 42$

$n = 7$

Ploidy level of an organism shows the number of complete basic chromosomes set. It has 6-basic set of chromosome.

@apna_pdf

167. In meiosis division is:
(a) I[st] reductional and II[nd] equational
(b) I[st] equational and II[nd] reductional
(c) both reductional
(d) both equational

Haryana PMT-2005
JIPMER-2005
BHU PMT-2003

Ans. (a) : Meiosis division occur in two stages
Meiosis I- It is called the reductional division also called heterotypic division because it brings change from diploid to haploid stage (2n – n).
Meiosis II- It is called equational division also called homotypic division means for maintaining haploid number (n).

168. Synapsis occur between
(a) a male and female gamete
(b) mRNA and ribosomes
(c) spindle fibres and centromere
(d) two homologous chromosomes

Manipal-2012

Ans. (d) : Synapsis is the pairing of homologous chromosome by crossing over. It takes place during at the zygotene stage of meiosis. It is the exchange of chromosomal segment after synapsis which causes the genetic recombination i.e. pairing of chromosomes occurs and bivaleuts form synaptonemal complexes.

169. Identify the correctly matched pair (s).
(1) Chromonema - A localized condensed region of chromosome
(2) Non-disjunction - The failure of chromosomes to be separated during meiosis or mitosis
(3) Master and slave - Polytene chromosome hypothesis
(4) Chromocentre - Lampbrush chromosome
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2009

Ans. (b) :
- Chromonema – A localized condensed region of chromosome.
- Non disjunction – The failure of chromosomes to be separated during meiosis or mitosis.
- Master and slave – Lampbrush chromosome.
- Chromocentre – Polytene chromosome hypothesis.

170. At which phase of meiosis, the two cells, each with separated sister chromatids move towards opposite poles:
(a) metaphase I (b) metaphase II
(c) anaphase I (d) anaphase II

Punjab MET-2004
Manipal-2000

Ans. (d) : There are two division occur in the process of meiosis.
Meiosis I- Reductional division – The separation of homologous chromosome occur.
Meiosis II- Equational division – Daughter cell have same number of chromosome as the parent cell enter in meiosis II. In this division centromere of chromosome splits, sister chromatid move towards opposite pole during Anaphase II.

171. The four daughter cells derived from a single meiosis differ from each other due to
(a) difference in chromosome number
(b) crossing over only
(c) independent assortment of chromosomes
(d) crossing over as well as independent assortment of chromosomes

CG PMT-2007

Ans. (d) : A - haploid daughter cells which are formed as a result of it meiosis will differ from each other. It involves pairing of homologous chromosomes and recombination between them. It provides opportunities for new combination of genes to occur in the gametes by two-ways independent assortment of chromosomes and crossing over.

172. Tapetal cells are characterized by
(a) mitotic division
(b) meiotic division
(c) endomitosis
(d) endomitosis as well as endopolyploidy.

Haryana PMT-2007

Ans. (d) : The deepest layer of anther wall is called the tapetum it is the primary nourishing layer. Endomitosis and endopolyploidy cause its cells to become multinucleate and polyploid.

173. The second meiotic division leads to :
(a) separation of sex chromosomes
(b) fresh DNA synthesis
(c) separation of chromatids and centromere
(d) separation of homologous chromosomes

Haryana PMT-2004
Manipal-2003

Ans. (c) : The second meiotic or meiosis division lead to separation of chromatics and centromere at the anaphase-II.
In anaphase-II- centromere split and chromatids separate and chromatic move to opposite poles two group of chromosomes (total four group) are produce and end of telophase-II 4 haploid nuclei is form.

174. Among the following which one is longest phase in prophase of meiosis?
(a) Leptotene (b) Zygotene
(c) Pachytene (d) Diplotene

AMU-2005 / Haryana PMT-2004 / Manipal-2003

Ans. (d) : Prophase of first meiotic division is typically longer and more complex and prophase divided into five part leptotene, zygotene, pachytene, diplotene and diakinesis .
- Diplotene is longest phase in some oocytes of vertebrates diplotene can last for months or years.

175. Variations appear during meiosis due to
(1) independent assortment
(2) crossing over
(3) linkage
(4) glycolysis

@apna_pdf

Select the correct code-

(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 4 are correct. (d) 1 and 3 are correct.

BHU PMT (Mains)-2008, 2005

Ans. (b) : Independent assortment and crossing over are the two process that shuffle the genetic material during meiosis resulting in a wide variety of genetic combination in the offspring. This is essential for sexual reproduction as it is follows for the production of offspring with different traits than the parents.

176. Crossing over takes place at:

(a) one strand stage (b) two strand stage
(c) three strand stage (d) four strand stage

Punjab MET-2009 / Rajasthan PMT-2009
Haryana PMT-2003

Ans. (d) Crossing over takes place at the four strand stage of meiosis, also known as the pachytene stage. This is the stage where the homologous chromosomes are loosely paired and aligned, and the DNA is double stranded. Crossing over occurs when two non-sister chromatids exchange genetic material.

177. In oogenesis when a diploid cell in the ovary undergoes meiosis, how many ova results?

(a) 1 (b) 2
(c) 3 (d) 4

CG PMT-2010

Ans. (a) : Oogenesis is the process of egg production in females. It begins with a diploid cell in the ovary, called an Oogonium. The Oogonium undergoes two rounds of meiosis, resulting in four haploid cells. However, only one of these cells, called the secondary oocyte will mature into an ovum. The other three cells are called polar bodies and they degenerated.

178. Arrange the following events of meiosis in the correct sequence:

1. Terminalization
2. Crossing over
3. Synapsis
4. Disjunction sequences is:

(a) 4, 3, 2, 1 (b) 3, 2, 1, 4
(c) 2, 1, 4, 3 (d) 1, 4, 3, 2

AP EAMCET-2005

Ans. (b) : The pairing of homologous chromosomes take place during zygotene stage this is known as synapsis. In the next stage i.e. pachytene stage the exchange of some genes (part of chromatides) take place between two non-sister chromatid of a pair of homologous chromosome. In the last stage of prophage-I i.e. diakinesis is the process of terminalization i.e. movement of chiasmata (site of crossing over) towards the telomere of the chromosome take place. In the anaphase-I stage of meiosis-I. The process of disjunction of genome i.e. movement of sister chromatids of a pair of homologue towards opposite pole take place.

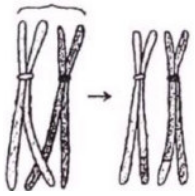
179. What is the function of the enzyme 'recombinase' during meiosis?

(a) Formation of synaptonemal complex
(b) Crossing over between non-sister chromatids
(c) Condensation of chromosomes
(d) Alignment of bivalent chromosomes on equatorial plane

Karnataka CET-2016

Ans. (b) : Recombinase is an enzyme that catalyzes crossing over between non-sister chromatids during meiosis. This process is essential for generating genetic diversity in the offspring.

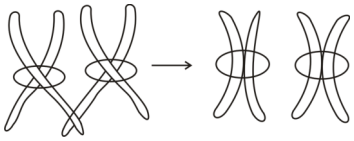
180. Given below is the representation of a certain event at a particular stage of a type of cell division. Which is this stage?



(a) Prophase of Mitosis
(b) Both prophase and metaphase of mitosis
(c) Prophase I during meiosis
(d) Prophase II during meiosis

AIPMT (Screening)-2012

Ans. (c) :



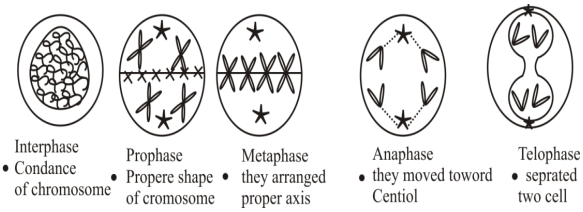
The figure represents crossing over between bivalent of non sister chromatids of homologous chromosomes occurred during pachytene stage prophase-I of meiotic cycle. Prophase-I marks the beginning of chromosome condensation where duplicated chromosome attached with sister chromatids are initially seen as long thin threads.

181. Select the correct option with respect to mitosis.

(a) Chromosomes move to the spindle equator and get aligned along equatorial plate in metaphase
(b) Chromatids separate but remain in the centre of the cell in anaphase
(c) Chromatids start moving towards opposite poles in telophase
(d) Golgi complex and endoplasmic reticulum are still visible at the end of prophase

AIPMT (Screening)-2011

Ans. (a) : During the mitosis – four phase – Prophase, Metaphase, Anaphase, Telophase.



Mitosis is the process by which a single cell is divided into two identical daughter cells by the process of cell division. Mitosis is also referred to as the repairment and regeneration of body structures like in starfish. In many organisms, mitosis is the method of asexual reproduction. The character of metaphase is spindle fibers attach to kinetochores of chromosomes.

@apna_pdf

182. The behaviour of the chromosomes was parallel to the behaviour of genes during meiosis was noted by
(a) Correns (b) Tschermark
(c) Sutton and Boveri (d) De Vries
(e) Henking

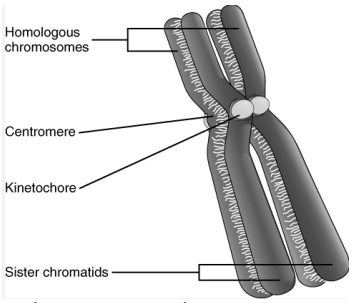
Kerala PMT-2012

Ans. (c) : Sutton & Boveri – Chromosomal theory of inheritance was proposed by-Sutton and Boveri in 1902. Similarties in the behavior of chromosomes & genes are occur in pairs.
Hugo De Vries (1901-03) – Dutch botanist and geneticist was given by mutation theory.
Henking – German cytologist who discovered the 'X' chromosome in 1890.

183. The enzyme recombinase is required at which stage of meiosis.
(a) Pachytene (b) Zygotene
(c) Diplotene (d) Diakinesis

AIPMT-2014

Ans.(a):



Crossing over is an enzymatic process occurring during the **pachytene state of prophase** I. It is an enzyme that catalyzes the cutting and rejoining of DNA. This process cuts one strand of DNA at a time and then joins them with another piece of DNA that has been cut from a different parent molecule. It is the point in meiosis when the homologous chromosomes have completely synapsed and are now called bivalents. The bivalents are held together by a series of proteins that form a structure called the synaptonemal complex.

184. The complex formed by a pair of synapsed homologous chromosomes is called :
(a) Axoneme (b) Equatorial plate
(c) Kinetochore (d) Bivalent

NEET-2013

Ans. (d) : The complex formed by a pair of synapsed homologous chromosomes is called a bivalent. A bivalent is made up of two homologous chromosomes that are held together by a synaptonemal complex.

185. Meiosis occurs in:
(a) somatic cells only (b) germ cells only
(c) both (a) and (b) (d) none of the above

J&K CET-2001

Ans. (b) : Meiosis occurs in germ cells only. Somatic cells are the cells that make up the body of an organism. germ cells that give rise to gametes. Meiosis is the process that produces gametes from germ cells.

186. Crossing over occurs during
(a) leptotene (b) diplotene
(c) pachytene (d) zygotene

BVP-2009

Ans. (c) : Pachytene - The pair of chromosomes becomes twisted cannot be distinguished separately. As a consequence of synapsis the number of observable chromosome is half of somatic chromosome number. Crossing over take place in this phase.
Zygotene – Chromosomes become shorter and thicker.
Diplotene – Bivalents repel each other. Chiasmata (sites of crossing over)

187. Chiasma shows the sites of
(a) spindle formation (b) synapsis
(c) crossing over (d) none of these

VMMC-2004

Ans. (c) : Chiasma shows the site of crossing over. The homologus chromosomes start moving away from each other. During the separation of homologus chromosomes of each bivalent. It is found that the chromosomes are attached with each other at one or more point. This attachment is known as chiasma.

188. Colchicine is an inhibitory chemical, which:
(a) prevents the spindle formation in mitosis
(b) prevents the formation of equatorial plane
(c) stops the functioning of centriole
(d) prevents attaching of centromeres with rays

Haryana PMT-2000

Ans. (a) : Colchicine is an inhibitory chemical that prevents the spindle formation in mitosis.
Colchicines is used to prevent gout attacks sudden severe pain in one or more joints caused by abnormally high level of a substance called uric acid.

189. Which one of the following is wrong for meiosis?
(a) It leads to formation of sister chromatids
(b) It occurs in diploid cell
(c) It occurs in haploid cell
(d) It occurs by splitting of centromeres and separation of sister chromatids

WB JEE-2015

Ans. (c) : Meiosis occurs in a diploid organisms, not haploid. Haploid organisms already have a single set of chromosomes, making meiosis unnecessary for their reproduction. Diploid cells reproduce by mitosis making daughter cells that are exact replicas.

190. The formation of multivalents at meiosis in diploid organism is due to
(a) monosomy
(b) inversion
(c) deletion
(d) reciprocal translocation

Punjab MET-2010

Ans. (d) : The formation of multivalents at meiosis in diploid organism caused by the reciprocal translocation.
Monosomy – Monosomy takes place when a missing number of a chromosome. Instead of 46-chromosome, the person has only 45-chromosomes. It occurs in a syndrome known as turner syndrome.
Deletion – It is a type of mutation that involves the loss of one or more nucleotide from a segment of DNA.

@apna_pdf

F. Phase of Meiosis and its Significance

191. When synapsis is complete all along the chromosome, the cell is said to have entered a stage called

(a) zygotene (b) pachytene
(c) diplotene (d) diakinesis

CMC Vellore-2012
CMC Ludhiana-2009
JCECE-2009 / AFMC-2008 / AIIMS-2005

Ans. (b) : When synapsis is completed , the cell entered a stage called pachytene. During this stage bivalent chromosomes now clearly appears as tetrads. In this stage recombination between homologous chromosomes is completed by the end of pachytene, leaving the chromosomes linked at the sites of crossing over.

192. In which of the following stage, the chromosome is single thin and like long thread?

(a) Leptotene (b) Zygotene
(c) Pachytene (d) Diakinesis

MP PMT-2011 / AMU-2012,2007
Manipal-2001 / DUMET-2001
AFMC-1997

Ans. (a) : Leptotene is stage in the prophase-I of meiosis . In this stage chromosome appears thin and long. The leptotene stage is also known as the bouquet stage due to the specific alignment of chromosomes in the nucleus .

193. Crossing over occurs during

(a) Leptotene (b) Diplotene
(c) Pachytene (d) Zygotene

VMMC-2009
BHU PMT (Screening)-2009
Uttarakhand PMT-2009
MGIMS Wardha-2008

Ans. (c) : Crossing over occurs during pachytene stage between non-sister chromatids of a pair of homologous chromosomes. During pachytene, stage one chromatid of each homologous overlaps. Non-sister chromatids in each bivalent exchange their segments during pachytene. Diplotene is characterised by appearance of chiasma marking the locations at which crossing over has already occurred in the pachytene stage.

194. Synaptonemal complex occurs in

(a) leptotene (b) zygotene
(c) pachytene (d) diakinesis

Tripura JEE-2018
BCECE-2012
UP CPMT-2010
Rajasthan PMT-1998

Ans. (b) : Synaptonemal complex occurs during second stage of prophase of first meiotic division called zygotene. During this stage chromosome start paring together any this process of association is called synapsis such paired chromosomes are called homologous chromosomes. The complex formed by a pair of synapsed homologous chromosomes is called a bivalent or a tetrad.

195. The complex formed by a pair of synapsed homologous chromosomes is called,

(a) Univalent
(b) Pentavalent
(c) Triad
(d) Bivalent

Karnataka CET-20.05.2023

Ans. (d) : A bivalent is a pair of synapsed homologous chromosomes. It is formed during prophase-I of meiosis. The homologous chromosome are held together by chiasma.

196. When pollen mother cell of Apple plant undergoes meiotic division, number of chromatids present in Anaphase I, Anaphase II and the number of bivalents respectively are

(a) 34, 34, 34 (b) 34, 17, 17
(c) 34, 17, 34 (d) 17, 17, 34

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : The pollen mother cell of an apple plant has 34 chromosomes. In Anaphase-I, the homologous chromosome are separated but the sister chromatids remain attached. So there are still 34 chromatids present, but they are arranged in 17 pairs of bivalents. In Anaphase-II, the sister chromatids of each chromosome separate and move to opposite poles of the cell, so there are 17 chromatids present in Anaphase-II.

197. Assertion (A) : Suitable stage to observe chromosome is metaphase
Reason (R) : In metaphase chromosomes are scattered in cytoplasm
The correct option among the following is

(a) (A) and (R) are true. (R) is the correct explanation for (A)
(b) (A) and (R) are true, (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET 10.05.2023 Shift-I

Ans. (c) : • The chromosomes are arranged in a single line along the equator of the cell in metaphase, where they observed easily.
• In metaphase, the chromosomes are not scattered in the cytoplasm, but they are attached to the spindle fibers at their centromeres.

198. Identify the correct sequence of events during prophase I of meiosis:

(i) Synapsis of homologous chromosomes
(ii) Chromosomes become gradually visible under microscope
(iii) Crossing over between non-sister chromatids of homologous chromosomes
(iv) Terminalisation of chiasmata
(v) Dissolution of synaptonemal complex
Choose the correct answer from the options given below:

(a) (i), (ii), (iii), (iv), (v)
(b) (ii), (iii), (iv), (v), (i)
(c) (ii), (i), (iii), (v), (iv)
(d) (i), (iii), (iv), (v), (ii)

NEET (Re-Exam)-04.09.2022

@apna_pdf

Ans. (c) : The correct sequence of event during prophase I of meiosis is-

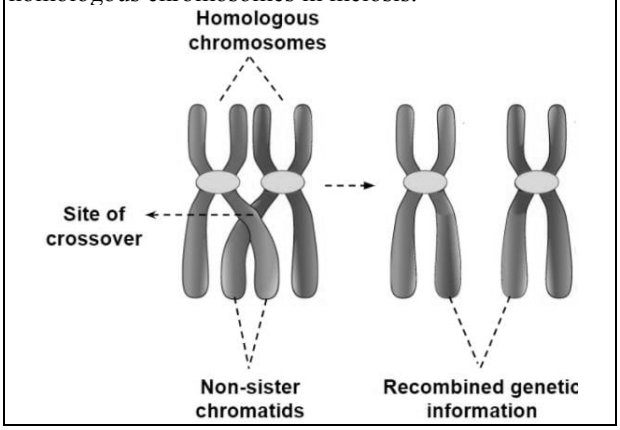
1. **Leptolene-** The chromosomes condense and become visible under microscope.
2. **Zygotene-** The homologous chromosomes pairs up and align next to each other.
3. **Pachytene-** The homologous chromosomes exchange genetic material through crossing over.
4. **Diplotene-** The synaptonemal complex dissolves and the chiasmata, the X-shaped structures that form at the point where the homologous chromosomes have exchanged genetic material.
5. **Diakinesis-** The chromosomes fully condensed and the spindle fibres begin to form.

199. In meiosis, crossing over and exchange of genetic material between homologous chromosomes are catalyzed by the enzyme:

(a) Phosphorylase (b) Recombinase
(c) Transferase (d) Polymerase

NEET (Re-Exam)-04.09.2022

Ans. (b) : Recombinase is the enzyme that catalyzes crossing over and exchange of genetic material between homologous chromosomes in meiosis.



200. Statement 1: Desynapsy ends at the diakinesis
Statement 2: Diakinesis is characterized by the terminilisation

(a) Statement 1 is false, statement 2 is true
(b) Statement 1 and statement 2 are true
(c) Statement 1 is true and statement 2 is false
(d) Both statements are false

AP EAMCET-11.07.2022 Shift-II

Ans. (b) : Diakinesis is the last stage of meiosis prophase-I. This stage is characterized by chiasmata terminalisation. After diakinesis, the dividing cell enters metaphase. At this stage, divalent distributes them evenly in the nucleus.

201. Match the following lists :

List-I	List-II
A) Anaphase I	**I) Diad of a cell is formed**
B) Telophase I	**II) Haploid daughter cells are formed**
C) Anaphase II	**III) Homologous chromosomes get separated**
D) Telophase II	**IV) Splitting of centromere in the chromosome**

The correct match is:

	A	B	C	D
(a)	III	I	II	IV
(b)	III	I	IV	II
(c)	III	IV	I	II
(d)	III	II	I	IV

TS EAMCET-30.07.2022 Shift-II

Ans. (b) :

Anaphase I	-	Homolagous chromosomes get separated
Telephase I	-	Diad of a cell is formed.
Anaphase II	-	Spliting of centromere in the chromosome.
Telophase II	-	Haploid daughter cells are formed.

202. The correct sequence of events in prophase I is

(a) Synapsis → Crossing over → Chiasmata → Terminalisation
(b) Crossing over → Synapsis → Chiasmata → Terminalisation
(c) Chiasmata → Synapsis → Crossing over → Terminalisation
(d) Chiasmata → Crossing over → Synapsis → Terminalisation

Karnataka CET-2021

Ans. (a) : Synapsis – In Zygotene stage the homologous chromosomes pairs, the process is called chromosomal synapsis.
Crossing over – In pachytene stage the crossing over of non-sister chromatids in homologous chromosomes takes place.
Chiasmata – In Diplotene stage the formation of X-shaped compositions takes place at the time of separation called chiasmata.
Terminalization – The displacement of chiasmata is termed as terminalization after crossing over in diakinesis.

203. Identify the correct sequence of the following sub-phase of prophase I.

(I) Zygotene (II) Diplotene
(III) Leptotene (IV) Pachytene
(V) Diakinesis

(a) I, II, III, IV, V (b) I, II, III, V, IV
(c) III, I, IV, II, V (d) III, I, IV, V, II

TS EAMCET-29.09.2020 Shift-II

Ans. (c) : Leptotene → Zygotene → pachytene → Diplotene → Diakinesis.
Leptotene:- Long chromosomes beadead, chromosomes shows bouquet arrangement.
Zygotene:- Chromosomes becomes shorter and thicker synapsis pairing of chromosomes occurs.
Bivalents forms synaptonemal complexes.
Pachytene:- longest stage because it takes time to crossing over.
Diplotene:- Bivalent each other repel.
Diakinesis:- Nuclear membrane disappears, centrioles migrate to poles and spindle fibres begin to form.

@apna_pdf

204. Identify the event in meiosis mediated by the enzyme recombinase

(a) Synaptic pairing (b) Terminalization
(c) Crossing Over (d) Interkinesis

Karnataka CET-2020

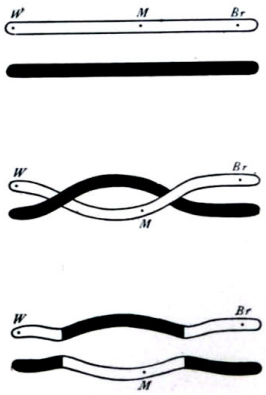
Ans. (c) : Crossing over is a process which occurs in pachytene stage of prophase-I of meiosis-I during cell division. Recombinase enzyme mediated in crossing over, between non-sister chromatics of chromosome.This process is facilitated by an enzyme called recombinase.

205. Crossing over takes place between which chromatids and in which stage of the cell cycle?

(a) Non-sister chromatids of non-homologous chromosomes at Pachytene stage of prophase I
(b) Non-sister chromatids of non-homologous chromosomes at Zygotene stage of prophase I
(c) Non-sister chromatids of homologous chromosomes at Pachytene stage of prophase I
(d) Non-sister chromatids of homologous chromosomes at Zygotene stage of prophase I

NEET (Odisha)-2019

Ans. (c) :



Scheme to illustrate double crossing over

• Crossing over takes place between non-sister chromatids of homologous chromosomes at the pachytene stage of prophase. I. During prophase I of meiosis, the homologous chromosomes pair up and form a structure called a bivalent.

206. After meiosis I, the resultant daughter cells have

(a) Four times the amount of DNA in comparison to haploid gamete.
(b) Same amount of DNA as in the parent cell in S phase.
(c) Twice the amount of DNA in comparison to haploid gamete.
(d) Same amount of DNA in comparison to haploid gamete.

NEET (Odisha)-2019

Ans. (c) : Meiosis-I is a reductional division, which means that the resultant cell will have half the number of chromosomes as diploid parent cells. Meiosis is a specialized form of cell division that produces reproductive cells such as plants, fungal spores, sperm and egg cells. The overall process of meiosis produces four daughter cells is haploid because it has half the number of chromosomes as the original parent cell.

• After meiosis-II, daughter cells will contain half the number of chromosomes and half of the amount of DNA is comparison to the parent cell.

207. The chromosomes align at the equator and the microtubules' from opposite poles of the spindle get attached to the kinetochores of sister chromatids are in

(a) Metaphase-I (b) Telophase-I
(c) Metaphase-II (d) Telophase-II

TS EAMCET-09.05.2019 Shift-I

Ans. (c) : Metaphase II– During Metaphase spindle fibers attach to the centromere of each pair of sister chromatids. The sister chromatids line up at the equator or center of the cell. This is also known as the metaphase plate. Metaphase is a stage during the process of cell division occur.

208. In meiosis two homologous chromosomes form bivalents by

(a) synaptonemal complex
(b) Golgi complex
(c) Complex medium
(d) Initiation complex

Tripura JEE-2019

Ans. (a) : Synaptonemal complex is that stage which indicates that chromosome synapsis, The synaptonemal complex form during the early stage of meiotic prophase-I. It is a ladder like complex that hold the two homologous chromosomes together. The pair of synapsed homologous chromosomes is called a bivalent or tetrad.

209. Non-disjunction in meiosis results in

(a) trisomy (b) normal diploid
(c) gene mutation (d) None of these

JIPMER-2018

Ans. (a) Non disjunction in meiosis is the failure of homologous chromosome or sister chromatids to separate properly during meiosis. This can result in the production of gametes with an abnormal number of chromosomes, such as trisomy(having three copy of chromosome instead of the usual two)

210. In biogas plant, the role of acidogenic bacteria is to

(a) Convert monomers to organic acids
(b) Convert monomers to complex polymers
(c) Transform acetic acid to biogas
(d) Digest fungi in the sludge

MHT CET-2018

Ans. (a) : Acidogenic bacteria breakdown complex organic matter into monomers, These organic acids are then used by bacteria in the biogas plant to produce methane, which is the main component of biogas.

211. Number of bivalents, chromatid tetrads, DNA strands, telomers present in pachytene phase of meiocyte of Maize

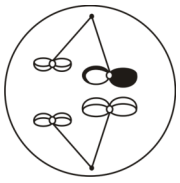
(a) 20, 20, 80, 80 (b) 20, 20, 40, 80
(c) 10, 10, 40, 80 (d) 10, 20, 40, 40

AP EAMCET-25.04.2018 Shift-I

@apna_pdf

Ans. (b) : The no. of bivalents, chromatid tetrads. DNA strands, and telomeres present in the pachytene phase of a meiocyte of maize is 20, 20, 40 and 80 respectively.

212.



Above diagram represents

(a) metaphase-I (b) anaphase-I
(c) metaphase-II (d) anaphase-II

JIPMER-2018

Ans. (a) : Metaphase - I is marked by the breakdown of the nuclear membrane and the attachment of kinetochore microtubules to the bivalent. Homologus pair moves together along the metaphase plate.

213.

Above diagram represents

(a) anaphase-I (b) metaphase-I
(c) telophase-I (d) prophase-I

JIPMER-2018

Ans. (a) : Anaphase - I homologus chromosomes are separated. In this phase, sister chromatids stay together. Homologus chromosomes separated and move to opposite poles.

214. The stage during which separation of the paired homologous chromosomes begins is

(a) Pachytene (b) Diplotene
(c) Zygotene (d) Diakinesis

NEET-2018

Ans. (b) : During diplotene the homologous chromosome develops a repulsive force and begins to separate from each other. Terminalization begins at diplotene stage i.e. chiasmata start to shift towards end. The separation of homologous chromosome and dissolution of synaptonemal complex occur at diplotene stage.In zygotene phase function of synapsis occur. During the pachytene crossing over between non-sister chromatid of homologous chromosome. Diakinesis marked by terminalization or chiasmata.

Phase of meosis : Leptotene → Zygotene → Pachytene → Diplotene → Diakinesis

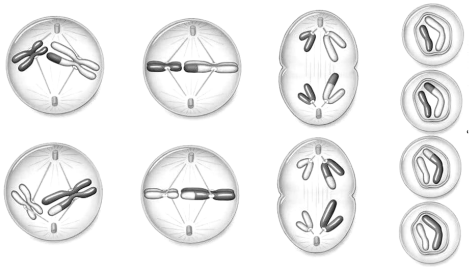
215. Indentify the correct matched pair.

(a) Segregation-Metaphase II
(b) Significance of meiosis-Production of genetically similar cells
(c) Exchange of genetic material-Diakinesis
(d) Anaphase II of meiosis-Centromeric division

AIIMS-2017

Ans. (d) : In anaphase II of meiotic division, the centromeres divide. This division results in the movement of two separated chromatids of chromosomes towards opposite poles.
Anaphase-II involves separation of the sister chromatids.

Meiosis II - Stages



216. Anaphase promoting complex (APC) is a protein degradation machinery necessary for proper mitosis of animal cells. If APC is defective in a human cell, which of the following is expected to occur?

(a) Chromosomes will not condense
(b) Chromosomes will be fragmented
(c) Chromosomes will not segregate
(d) Recombination of chromosome arms will occur

NEET-2017

Ans. (c) : The APC is a protein degradation machinery that is necessary for proper mitosis of animal cells. It degrades proteins that are involved in mitosis, such as cyclins and securing. It the APC is defective, then these proteins will not be able to proceed properly and the chromosomes will not segregate properly. This can lead to a number of problems, including-

- Cell death.
- Chromosomal abnormalities.
- Cancer.

217. Synapsis is characteristic feature of

(a) Leptotene (b) Zygotene
(c) pachytene (d) Diplotene

VMMC-2011

Ans. (b) : It is a characteristic features seen in the process of meiosis during formation of male and female gametes. The pairing of homologous chromosome during meiosis is referred to as synapsis. Synapsis is found in the zygotene stages of prophase-I in meiosis.

218. Formation of chiasmata is the characteristic feature of

(a) diplotene (b) pachytene
(c) zygotene (d) diakinesis

Himachal Pradesh PMT-2011
UP CPMT-2010,2004

Ans. (a) : Formation of chiasmata is occurs during the stage of deplotene of prophase-I. In this stage the crossing over is completed. Chiasmata is formed at the sites of crossover. These X-shaped structures are called chiasmata .

@apna_pdf

219. Meiosis-II performs
(a) Synthesis of DNA and centromere
(b) Separation of sex-chromosomes
(c) Separation of homologous chromosomes
(d) Separation of chromatids

VMMC-2013

Ans. (d) : Meiosis-II is initiated immediately after cytokinesis, usually before the chromosomes have fully elongated. In contrast to meiosis-I, meiosis-II resembles a normal mitosis. During meiosis-II in anaphase-II, the sister chromatids of the homologous pair separated and allowing them to move toward opposite poles of the cells.

220. Stages in proper sequence of prophase-I are
(a) zygotene, leptotene, pachytene, diakinesis
(b) leptotene, zygotene, pachytene, diplotene and diakinesis
(c) leptotene, pachyiene, zygotene, diakinesis and diplotene
(d) diplotene, diakinesis, pachytene, zygotene and leptotene

MGIMS Wardha-2007

Ans. (b) : Prophase of the first meiotic division is typically longer and more complex when compared to prophase of mitosis. It has been further sub divided into the following five phases base chromosomal behaviors. The proper sequences of prophase-I are Leptotene, zygotene, pachytene, diplotene and diakinesis.

221. Which of the following events takes place during diplotene stage of prophase-I of meiosis?
(a) Compaction of chromosome
(b) Formation of synaptonemal complexes
(c) Formation of recombinational nodules
(d) Dissolution of synaptonemal complexes

DUMET-2010

Ans. (d) : During diplotene stage of prophase-I of miosis-I. The dissolution of the synaptonemal complex and the tendency of recombined homologous chromosome of the bivalent to separate from each other except at the sites of cross over.

222. The exchange of segments of non-sister chromatids between chromosomes of a homologous pair is termed as
(a) transformation
(b) translocation
(c) crossing over
(d) chromosomal aberration

DUMET-2010

Ans. (c) : The exchange of segment of non-sister chromatids between chromosomes of homologous pair is termed as crossing over. In this process two homologous non-sister chromatids pair up with each other and exchange different segment of genetic material to form two recombinant chromosome sister chromatids.

223. The enzyme involved in the crossing over between two homologous chromosome is
(a) nuclease (b) RNA polymerase
(c) recombinase (d) DNA polymerase

J&K CET-2014

Ans. (c) : Crossing over is an enzyme-mediated process and the enzyme involved is called recombinase, Recombinase enzyme is involved during pachytene stage. Crossing over leads to recombination of genetic material on the two chromosomes.

224. The centromere or primary constriction of the chromosome contains rings of proteins that are intimately associated with a spindle fibre. These rings are called
(a) centrioles
(b) secondary constriction
(c) asters
(d) kinetochores

BHU PMT (Screening)-2010

Ans. (d) : Kinetochore is a proteinaceous structure assembles around the centromere of chromosome which helps in binding in spindle microtubule. The kinetochore is the region which is present in the center of the chromosome.

225. Which of the following characters is related with telophase?
(a) Formation of nuclear membrane
(b) Formation of nucleolus
(c) Elongation of chromosome
(d) Formation of two daughter nuclei cytokinasis

Uttarakhand PMT-2009
MP PMT-2009

Ans. (a) : The process of mitosis which divides the duplicated genetic material carried in the nucleus of a parent cell into two identical daughter cells is called telophase.

- To isolated the nuclear DNA from the cytoplasm a nuclear membrane develops around each set of chromosomes during telophase.
- Telophase is the final stage of both meiosis and mitosis.
- The consequences of prophase and prometaphase (disintegration of the nucleous and nuclar membrane) are reversed during telophase.
- As chromosomes reach the cells poles, a nuclear envelope form around, nucleoli resurface and chromosomes begin to decondense back into the extended chromatin of interphase.

226. During meiosis-I, the number of chromosomes is
(a) Halved (b) Tripled
(c) Doubled (d) Quadrupled

J&K CET-2015

Ans. (a) : A special kind of cell division that reduces the chromosome number by half result in the production of haploid daughter cell. This kind of division is called meiosis. Meiosis-I is initiated after the parental chromosomes have replicated to produce identical sister chromatids at the S shape.

227. Which is correct for meiotic metaphase -1?
(a) Bivalents are arranged at equator
(b) Univalents are arranged at equator
(c) Non-homologous chromosomes forms pair
(d) Spindle fibres are attached at chromomere

J&K CET-2006

@apna_pdf

Ans. (a) : During metaphase-I the bivalent chromosomes align on the equatorial plate. The microtubules from the opposite poles of the spindle attached to the kinetochore of homologous chromosomes.

228. The chromosome becomes gradually visible with compaction of chromosomes during the meiotic stage
(a) diplotene (b) leptotene
(c) zygotene (d) pachytene

AMU-2012

Ans. (b) : Chromosomes are visible as long and slender threads. They are much finer than those in mitotic prophase.
each chromosome has replicated and consist of two sister chromatics.

229. Arrange the following events of meiosis in the correct sequence.
I. Terminalisation
II. Crossing over
III. Synapsis
IV. Disjunction of genomes.
The correct sequence is
(a) IV, III, II, I (b) III, II, I, IV
(c) II, I, IV, III (d) I, IV, III, II

VMMC-2010
EAMCET-2005

Ans. (b) : The correct sequence of meiosis is-
Synapsis → Crossing over → Terminalization → Disjunction of genomes.

230. Chiasma shows the sites of
(a) Spindle formation (b) Synapsis
(c) Crossing over (d) None of these

HP CET-2012

Ans. (c) : During prophase-I homologous chromosomes make conducts with each other called chiasmata and crossing over occurs. This is where chromosomes exchange sections of DNA. This is important for generating genetic diversity but is also crucial mechanically hold homologous chromosomes together.

231. Visible expression of the genetic phenomenon of crossing over is called
(a) Recombination (b) Condensation
(c) Chiasmata (d) Spiralization

Karnataka CET-2012

Ans. (c) Chiasma is the visible expression of the genetic phenomenon of crossing over. It is a cross shaped structure that forms between two homologous chromosomes during the diplotene stage of prophase I of meiosis.

232. Identify the substage of prophase I of meiosis during which synapsis takes place
(a) Leptotene (b) Pachytene
(c) Diplotene (d) Zygotene

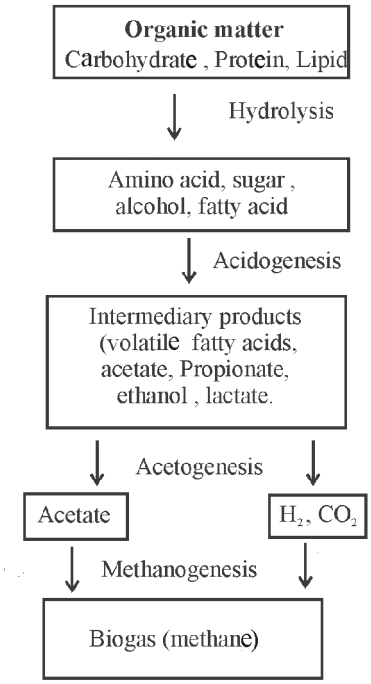
Karnataka CET-2008

Ans. (d) : Zygotene is the stage of prophase-I at which synapsis take place. The pairing of homologus chromosomes by the process of synapsis and formation of the synaptonemal complex.

233. Biogas production is carried out by
(a) thermoacidophils (b) methanogens
(c) halophiles (d) ruminants

AFMC-2010

Ans. (b) : Biogas production is carried out by methanogen. Biogas production involved mainly four stepes ; -



234. Statement (S) Non-disjunction is the failure of paired chromosomes to segregate during the metaphase of meiotic divisions of gametogenesis.
Reason (R) Non-disjunction results in production of abnormal gametes.
The correct answer is
(a) Both S and r are true, and R is not a correct explanation to S
(b) S is correct, but R is not correct
(c) S is not correct, but R is correct
(d) Both S and R are true, and R is a correct explanation to S

AP EAMCET-2013

Ans. (d) : Non disjunction is the failure of homologous chromosomes or sister chromatids to separate during cell division. Failure of a pair of homologous chromosomes to separate in meiosis – I . Non disjunction results in daughter cells with abnormal chromosomes numbers.

235. In meiosis crossing over is initiated at
(a) Diplotene (b) Pachytene
(c) Leptotene (d) Zygotene

NEET-2016 Phase-I

Ans. (b) : In pachytene recombination nodule is formed after which **crossing over**. Pachytene stage is characterized by formation of **synaptonemal complex** which allows the exchange of genetic material between the homologous chromosomes by a process known as

@apna_pdf

crossing over. This also helps in generation of recombinants.

- **Diplotene -** This stage characterized by **chiasmata formation.**
- **Lepotene -** In this stage chromosomes begin to condense.
- **Zygotene-** In this stage **synapsis** taken place.

236. Match the following column-I with column-II.

	column-I		column-II
A.	Carcinogen	1.	Cancerous tumour
B.	Anaphase-I	2.	Disjunction
C.	Mitosis	3.	Synapse
D.	Zygotene	4.	Plectonemic coiling

Codes:

	A	B	C	D
(a)	1	2	4	3
(b)	3	1	4	2
(c)	2	3	1	4
(d)	4	1	3	2

JIPMER-2015

Ans. (a) : Carcinogen – It is the agent that results in cancer or tumour formation. Some well-known carcinogens are asbestos, nickel, cadmium, radon, vinyl chloride and benzene.

Anaphase - In anaphase-I an individual separation of chromosomes occurs. This separation of the chromosomes is known as disjunction.

Mitosis - The types of coiling that occurs during the process of mitosis is plectonemic coiling.

Zygotene - In the Zygotene, homologous chromosomes being the align along their entire length by a process called a synapse.

237. The non-disjunction, in meiosis may result is extra copy of a chromosome in a sperm cell. During which phase the above phenomenon may occur?

(a) Prophase-I, prophase-II
(b) Metaphase-I, anaphase-II
(c) Anaphase-I, anaphase-II
(d) Anaphase-I, telophase-II

JIPMER-2015

Ans. (c) : In anaphase I, segregation of chromosomes occurs. And during anaphase II, chromosomes break from the centromere, when non-segregation occurs, there is failure in the segregation of chromosomes and this results in the formation of gametes with fewer or more chromosomes.

238. Independent assortment of gene occurs due to the orientation of chromosomes at

(a) metaphase-I of mitosis
(b) metaphase-I of meiosis
(c) metaphase-II of meiosis
(d) any phase of the cell division

JIPMER-2015

Ans. (b) : Independent assortment is defined as the inheritance of the character within the same individual. This is due to the orientation of the chromosome at the equatorial plane in the metaphase-I of meiosis.

It is random orientation homologous chromosome pairs during metaphase-I allow for the production of gametes with many different assortments of homologous chromosomes.

239. During gamete formation, the enzyme recombinase participates during:

(a) Prophase-I (b) Prophase-II
(c) Metaphase-I (d) Anaphase-II

AIPMT (Screening)-2012

Ans. (a) : During gamete formation , the enzyme recombinase participates during prophase –I of meiosis. Enzyme recombines observed during the pachytene stage where in enzyme recombinase helps in recombination of genes between homologous chromosome.

240. Activity of ligase enzyme is found in

(a) Leptotene (b) Zygotene
(c) Pachytene (d) Diplotene

AP EAMCET-2010

Ans. (c) Ligase enzyme is involved in the process of DNA recombination, which occurs during the pachytene stage of meiosis. Ligase is responsible for sealing the DNA breaks that are created during recombination

241. Study the following list

List I	List II
(A) Initiation of spindle fibres	1. Anaphase-I
(B) Synthesis of RNA and Protein	2. Zygotene
(C) Action of endonuclease	3. G_1 phase
(D) Movement of chromatids towards opposite poles	4. Pachytene
	5. Anaphase-II

The correct match is

	A	B	C	D
(a)	2	3	4	5
(b)	3	2	1	5
(c)	1	3	5	4
(d)	5	3	1	2

AP EAMCET-2009

Ans. (a) :

- Initiation of spindle fibre - Zygotene
- Synthesis of RNA and Protein - G_1 -Phase
- Action of endonuclease - Pachytene
- Movement of Chromatid towards opposite pole. - Anaphase II

Zygotene –During zygotene, homologous chromosomes begin to align along their entire length by a process called **synapsis** that is necessarily precise. Each pair of chromosome is held together by a ribbon-like protein and forms the synaptonemal complex.

Anaphase- II begins with the simultaneous splitting of the centromere of each chromosome into two. Consequently, the daughter chromosomes move towards the opposite poles of the cells.

@apna_pdf

G_1-Phase is an intermediate phase occupying the time between the end of cell division in mitosis and the beginning of DNA replication during S- phase.

Pachytene- The third stage of prophase of meiosis, begins with completion of synapsis during which the paired Chromosomes shorten and thicken. Each of the two chromatids separate and exchange of chromosome material occur between homologous chromosome through the process of crossing over.

242. When paternal and maternal chromosomes change their materials with each other in cell division this event is called :

(a) synapsis
(b) crossing over
(c) bivalent-forming
(d) dyad-forming

JIPMER-2003

Ans. (b) : Crossing over is reciprocal exchange of equal and corresponding segment between non-sister chromatids in a pair of homologous chromosome. It leads to recombination of genes present on two homologus chromosomes.

Synapsis – It is the pairing of two homologous chromosome that occurs during meiosis. It is also called as synapsis.

243. Study the following lists

	List-I		List-II
(A)	**Anaphase-I**	**(I)**	**Splitting of the centromere**
(B)	**Anaphase-II**	**(II)**	**Recombinase**
(C)	**Pachytene**	**(III)**	**Sister chromatides associated at their centromere**
(D)	**Diakinesis**	**(IV)**	**Chromosomes aligned on the equatorial plate**
		(V)	**Nucleolus disappears**

The correct match is

	A	B	C	D
(a)	(III)	(I)	(II)	(V)
(b)	(III)	(V)	(II)	(IV)
(c)	(II)	(III)	(V)	(IV)
(d)	(I)	(III)	(IV)	(II)

TS EAMCET-2015

Ans. (a) : Anaphase-I–The homologus pairs of chromosomes (non-sister chromatids) are pulled to opposite poles of the cell by breaking their connection with each and get separated. This process of separation of homologus chromosomes is called disjunction. Each daughter cell at this point has one chromosomes, each containing two sister chromatids.

Anaphase-II – It is the stage when sister chromatids of every chromosome separate and begin to move towards the opposite ends of the cell.

Pachytene – Crossing over (recombination occurs)

Diakinesis – Nuclear membrane disappears, centriodes migrate to poles and spindle fibers begins to form.

244. At which stage of the meiosis, the bivalents are formed?

(a) Leptotene (b) Pachytene
(c) Zygotene (d) Diplotene

J&K CET-2002

Ans. (c) : Zygotene – At zygotene stage of meiosis, the bivalent or a tetrad are formed.

The pairing of homologus chromosomes take place at this stage. This phenomenon known as synapsis. Each pair of homologus chromosomes forms as a result of synapsis is called a bivalent or a tetrad.

Leptotene – Beaded long chromosomes.

Diplotene – Bivalent repel each other except at site of crossovers.

245. Variation in character are brought about by;

(a) duplication of chromosomes during mitosis
(b) mutations
(c) crossing over during meiosis
(d) both (b) and (c)

J&K CET-2002

Ans. (d) : Genotypic variation are occurs due to the difference in number or structure of chromosomes or by difference in the genes carried out by the chromosomes. This is called mutation. Crossing over is also responsible for variation by the exchange of chromosomal material during meiosis.

Due to mitosis genetically identical daughter cells produces so it is not responsible for variation.

246. Recombination of genes occur at:

(a) prophase in mitosis
(b) prophase-I in meiosis
(c) prophase-II in meiosis
(d) metaphase-H in meiosis

J&K CET-2002

Ans. (b) : Recombination of genes occur at prophase I- in meiosis during pachytene stage. It is a longest phase because it take time to crossing over. This stage is characterized by the presence of recombination nodules. Pachytene involves mutual exchange of the corresponding segments of non-sister chromatids of homologous chromosomes.

247. The exchange of chromosomal segment between two non-homologous chromosomes called as

(a) crossing-over (b) translocation
(c) inversion (d) duplication

Assam CEE-2014

Ans. (b) : Translocation - When two non homologous chromosomes exchange their parts, the resulting chromosomal rearrangements are translocations. It may be reciprocal or non-reciprocal. Non reciprocal translocation involves the transfer of a segment in one direction from one chromosomes to another. In reciprocal translocation, the most common type is segment from one chromosome is exchanged with a segment form another non-homologous chromosome.

248. The pairing of homologous chromosomes in meiosis is known as.

(a) bivalent (b) synapsis
(c) disjunction (d) synergids.

AIIMS-1994

@apna_pdf

Ans. (b) : Synapsis is an event that occurs during meiosis in which homologous chromosomes pair. Synapsis is the pairing of two homologous chromosome that occurs during prophase-I of meiosis. It allows matching up of homologous pairs prior to their segregation. Synapsis are two specialized cell lying adjacent to the egg cell in the female gametophyte of angiosperms.

249. During meiosis, crossing over occurs between:

(a) Sister chromatids of homologous chromosome
(b) Non-sister chromatids of homologous chromosome
(c) Sister chromatids of non-homologous chromosome
(d) Non-homologous chromatids of homologous chromosome

BVP-2004

Ans. (b) : Crossing over is a reciprocal exchange of equal and corresponding segment between non-sister chromatids in a pair of homologus chromosomes. It leads to recombination of gene present on two homologus chromosomes and enzyme involve in crossing over is called recombinase.

250. The second meotic division leads to:

(a) separation of sex chromosomes
(b) fresh DNA synthesis
(c) separation of chromatids and centromere
(d) separation of homologus chromosomes

BVP-2005
DUMET-2003

Ans. (c) : After interkinesis, the second division of meiosis takes place. During this division the centromere of each chromosome divides during anaphase so that each of the new cells gets one of the two chromatids. The final result being the creation of four haploid cells.

251. Among the following which one is longest phase in prophase of meosis?

(a) Leptotene (b) Zygotene
(c) Pachytene (d) Diplotene

BVP-2005

Ans. (d) The longest phase in prophase of meiosis is diplotene. In the diplotene chromosome begins to start separate, terminalization of chiasmata occur in homologous chromosome. In oocytes of some vertebrates, diplotene can lost for month or years.

252. The non-sister chromatids twist around and exchange segments with each other during

(a) Diplotene (b) Diakinesis
(c) Leptotene (d) Pachytene
(e) Zygotene

Kerala PMT-2009

Ans. (d) : During pachytene, the homologous chromosomes pair up and undergo synapsis. This is when the non-sister chromatids twist around and exchange seqments with each other. This process is called crossing over.

253. Find the correctly matched pairs and choose the correct option

A. Leptotene-The chromosomes become invisible
B. Zygotene-Pairing of homologous chromosomes
C. Pachytene- Dissolution of the synaptonemal complex takes place
D. Diplotene-Bivalent chromosomes appear as tetrads
E. Diakinesis-Terminalization of chiasmata takes place

(a) A and B are correct
(b) B and D are correct
(c) B and E are correct
(d) B and C are correct
(e) C and D are correct

Kerala PMT-2012

Ans. (c) : Zygotene – Synapsis or paring of homologous chromosomes occur. Bivalents form synaptonemal complex to stabilize paired condition of chromosome. Chromosomes becomes short and thicker.
Diakinesis – The final stage of meotic prophase-I. This is marked by terminalization of chiasmata and spindles is assembled to prepare the homologous chromosomes.

254. During the meiotic division, the

(a) homologous chromosomes are separated
(b) linkage in disturbed
(c) homologous chromosomes do not segregate
(d) All of the above

JIPMER-2010
BHU PMT (Screening)-2005

Ans. (a) : In the meiosis mother cell divides two times after one round of DNA replication.
Meiosis I- Reductional division – The separation of homologous chromosome occur.
Meiosis II- Equational division – Daughter cell have same number of chromosome as the parents cell enter in meiosis-II know as homotypic division.

255. Genetic content of a cell reduces to half during

(a) meiotic prophase I (b) mitotic prophase
(c) meiotic prophase II (d) meiotic telophase

KVPY SB & SX-2013

Ans. (d) : Meiosis is a specialized from of cell division in which number of chromosomes is reduced to half, creating genetically distinct haploid cells.
Telophase I - The meiosis-I effectively ends when the chromosomes arrives at the poles. Each daughter cell now has half the number of chromosomes but each chromosomes consist of a pair of chromatids.

256. Meiosis I and Meiosis II are characterised by the separation of

(a) homologous chromosome; sister chromatids
(b) sister chromatids; homologous chromosomes
(c) centromere; telomere
(d) telomere; centromere

KVPY (SA)-2013

@apna_pdf

Ans. (a) : The process of meiosis is divided into two phases- Meiosis – I and Meiosis – II

Meiosis–I → Anaphase I → In the two cells separation and distribution of homologous chromosome occur.

Meiosis–II → Anaphase II → Separation of duplicated/sister chromatic occur in two cells.

257. During meiosis there is

(a) one round of DNA replication and one divisions

(b) two rounds of DNA replication and one divisions

(c) two rounds of DNA replication and two divisions

(d) one round of DNA replication and two divisions

KVPY (SA)-2011

Ans. (d) : Meiosis is a type of cell division that produces four haploid cells from a single diploid cell. It involves one round of DNA replication followed by two rounds of cell division. The first round of cell division is called meiosis I, and the second round is called meiosis II.

258. In human females, meiosis-II is not completed until?

(a) Birth

(b) Puberty

(c) Fertilization

(d) Uterine implantation

AIPMT (Re-Exam)-2015

Ans. (c) : In human females, meiosis-II is not completed until fertilization. Secondary oocyte is arrested in metaphase-II until sperm contacts plasma membrane of the oocyte and complete meiosis-II. In oogenesis, the primary oocytes undergoes meiosis up to the interphase or upto prophase I (diakinesis).

- The primary oocytes oocyte (2n) undergoes meiosis –I to produce two haploid cells (n), larger one is called Secondary oocyte oocyte and the smaller one in 1st polar body.
- Secondary oocyte undergoes the process of meiosis-II and proceeds upto metaphase II only. Completion of meiosis-II results in the formation of ovum and 2nd polar body.

259. Crossing over occurs

(a) single strand stage (b) two strand stage

(c) four strand stage (d) eight strand stage

UP CPMT-2009

Ans. (c) : In diplotene stage of prophase I of meiosis, each chromosome splits longitudinally into two chromatids and now bivalent is composed of four chromatids. This state is known as the four –strand stage or tetrad. Crossing over occurs in 4-strand stage It refers to the exchange of genetic material or chromosome segments between non- sister chromatids in meiosis. Crossing over is an enzyme mediated process, where the exchanges of genetic material between non-sister chromatids of homologous chromosomes takes place, its occur at the pachytene stage of prophase-I of meiosis.

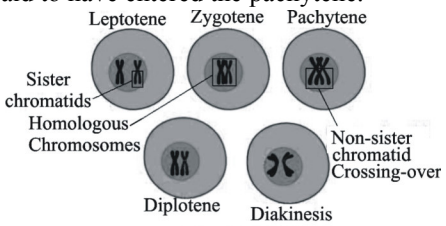
260. When synapsis is complete all along the chromosome, the cell is said to have entered a stage called?

(a) zygotene (b) pachytene

(c) diplotene (d) diakinesis.

CMC Vellore-2012
AFMC-2008
AIIMS-2005

Ans. (b) : Synapsis is the process of pairing of homologous chromosomes. It occurs during the pachytene stage of prophase I of meiosis. When synapsis is complete all along the chromosome.. The cell is said to have entered the pachytene.



Prophase I of Meiosis I

261. Synaptonemal complex is a structure of

(a) cytokinesis

(b) terminalisation

(c) chromosomal disfunction

(d) chromosomal pairing

BCECE-2015

Ans. (d) : The synaptonemal complex is a protein structure that forms between homologus two pairs of sister chromatids, during meiosis. It is a protein lattice that resembles railroad tracks and connects paired homologous chromosomes in most meiotic systems. It is thought to mediate synapsis and recombination during meiosis-I in eukaryotes. It is a complex protein structures.

262. Select the matched ones :

A. S phase DNA replication
B. Zygotene Synapsis
C. Diplotene Crossing over
D. Meiosis Both haploid and diploid cells
D. Gap 2 phase Quiescent stage

(a) A and B only (b) C and D only

(c) C and E only (d) A, C and E only

(e) A and D only

Kerala PMT-2011

Ans. (a) : S-phase:- It is also called as synthesis phase. Marks the period during which DNA synthesis or replication takes place. During this time the amount of DNA per cell doubles.

Zygotene :- Synapsis pairing of chromosomes occurs. Bibalent forms synaptonemal complexes to stabilize paired condition of chromosomes.

263. The meiosis is divided into two parts meiosis-I and II. The correct sequence of stages of cell division of meiotic-I, prophase is

(a) zygotene → leptotene → diplotene → diakinesis → pachytene

@apna_pdf

(b) leptotene → zygotene → pachytene → diplotene → diakinesis
(c) leptotene → diplotene → pachytene → dikinesis → zygotene
(d) diakinesis → diplotene → pachytene → zygotene → leptotenee
(e) leptotene → diakinesis → zygotene → pachytene

CMC Vellore-2015

Ans. (b) : The correct stages of cell division –
Leptotene → Zygotene → Pachytene → Diplotene → diakinesis.
Leptotene:- The initialization of chromosomes condensation takes place.
Zygotene:-The homologous chromosomes pair the process is called chromosomal synapsis.
Pachytene:- Crossing over of non-sister chromatids of homologous chromosomes takes place.
Diplotene:- It marks the synaptonemal complex dissolution and separation of homologous chromosome.
Diakinesis:- Disappearance of nucleolus takes place.

264. Which of the following is/are characteristic feature (s) of meiosis?

I. Number of choromosomes gets halved.
II. Crossing over takes place between non-homologous chromosomes, resulting in variation.
III. Helps in development of zygote into emboryo.
IV. It occurs in reproductive cells only.

(a) I and IV
(b) I, II and IV
(c) II, III and IV
(d) All of these
(e) None of the above

CMC Vellore-2015

Ans. (a) : Meiosis is a special type of cell division that reduces the number of chromosomes by half results in the production of haploid daughter cell. It ensures the production of haploid phase in the life cycle of sexually reproducing organisms why as fertilization restores the diploid phase.

265. A bivalent of meiosis I consists of

(a) Four chromatids and two centromeres
(b) Two chromatids and one centromere
(c) Two chromatids and two centromeres
(d) Four chromatids and four centromeres

Karnataka CET-2013

Ans. (a) A bivalent is a homologous chromosomes that have been paired up during prophase I of meiosis. Each chromosome consist of two sister chromatids that are held together by a centromere, So a bivalent consist of four chromatids and two centromeres.

266. Synapsis is found in:

(a) leptotene phase (b) zygotene phase
(c) pachytene phase (d) diplotene phase

Rajasthan PMT-1997

Ans. (b) : Synapsis occurs during prophase-I of meiosis in the zygotene stages. In this phase the chromosomes becomes shorter and thicker bivalent or tetrad are seen. Synapsis of chromosomes occurs and forms bivalent synaptonemal complexes to stabilize the paired position of chromosomes.

267. Exchange of paternal and maternal chromosomes material during cell division is called

(a) dyad formation (b) bivalent formation
(c) synapsis (d) crossing over

J&K CET-2013

Ans. (d) : Crossing over is the exchange of genetic material between two homologous non-sister chromatids. It occurs during prophase I of meiosis, when the homologous chromosomes are paired up. The exchange of genetic material can lead to new genetic combination in the offspring.

268. Identify the correct combination regarding Anaphase, Anaphase-I and Anaphase-II

(a) Anaphase - centromere splits,
Anaphase - I - Centromere splits,
Anaphase - II Centromere splits
(b) Anaphase - chromatids move to opposite poles;
Anaphase - I - Homologous chromosomes separate;
Anaphase – II- centromere splits.
(c) Anaphase - chromosomes cluster at opposite poles;
Anaphase – I- Homologous chromosomes separate;
Anaphase – II- Centromere splits
(d) Anaphase - chromosomes move to opposite poles;
Anaphase - I - Homologous chromosomes separate,
Anaphase - II - Centromere splits.

AP EAMCET-2015

Ans. (b) : Anaphase:- The spindle fibre splits the centromere and the chromatids move to opposite side of the cell.
Anaphase-I:- The third stage of the Ist meiotic division after prophase-I. The separation of paired homologous chromosomes towards opposite ends of the cell.
Anaphase –II:- It is same as the anaphase of mitosis, in which the centromere becomes half and chromosomes starts moving in opposite direction. After this, cytokinesis takes place.

269. Assertion (A) : Events in pachytene play a key role in evolutionary changes in organisms.
Reason (R) : Exchange of genetic material takes place between sister chromatids of homologous chromosomes.

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true and (R) is not the correct explanation of (A)

@apna_pdf

(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

AP EAMCET-2015

Ans. (c) : In pachytene stage of prophase I of meiosis I crossing over occur that creates new combination of genes which is the source of variation. So events in pachytene is associated with the evolutionary changes in organism. The exchange of genetic material is not occur in between sister chromatids of Homologous chromosome. It occurs in between non-sister chromatids of Homologous chromosome.

270. Exchange of genetic material two homologous chromosomes occurs in

(a) Zygotene (b) Pachytene
(c) Diakinesis (d) Anaphase I

TS EAMCET-15.05.2016

Ans. (b) : In the process of "crossing over". Which often occurs during the tetrad formation of meiosis, homologous exchange portions of their genetic code.

- The exchange of genetic material between two homologous chromosome is occur in the pachytene stage of prophase I of meiosis I.

271. Chiasmatas appear in which of the following phase?

(a) Zygotene (b) Diplotene
(c) Pachytene (d) Diakinesis

Rajasthan PMT-1995

Ans. (b) : Chiasmata represent the location where crossing over has occurred. It appears in diplotene stage of prophase I.

Zygotene:- Chromosomes becomes short and thick bivalents or tetrad pairs of chromosomes homologous are seen.

Pachytene:- It is charactedrized by the presence of recombination nodules.

Diakinesis:- Centrioles migrates to poles and spindle. fibre starts towards to form.

272. The frequency of crossing - over occurring between two genes located on the same chromosome depends on

(a) Length of the chromosome
(b) Position of the centromere
(c) Activities of two genes
(d) Distance between two genes

WB JEE-2014

Ans. (d) : The frequency of crossing-over occurring between two genes located on the same chromosome depends on the distance between the genes. The further apart the genes are on the chromosome, the higher the likelihood of crossing-over events between them during meiosis. This is because crossing-over is random process that increases with increasing physical distance between the genes on the chromosome.

273. A structure called Synaptonemal complex, which is considered to be physical structure which is associated with synapsis of homologous chromosomes was discovered by :

(a) King (b) Moses
(c) Griffith (d) Balbiani

BVP-2006

Ans. (b) : Synaptonemal complex was first time discovered by Montrose Moses in 1956. He was studying the chromosomes if the grasshopper under an electron microscope when he observed a distinctive structure that formed between homologous chromosomes during prophase I of meiosis. He named this structure the synaptonemal complex.

274. Gobar gas contains mainly :

(a) $CH_4 + CO_2$ (b) $CH_4 + CO_2$
(c) $CO_2 + H_2$ (d) $CO_2 + H_2O$

Haryana PMT-2000

Ans. (a) : The main component of Gobar gas is methane(CH_4),which makes up about 50-70% of the gas. Carbon dioxide(CO_2)is the next most abundant component making up about 30-40% of the gas.

275. Chromosomes replicate in which stage of meiosis?

(a) Prophase -I (b) Prophase -II
(c) Telophase -II (d) Interphase

WB JEE-2008

Ans. (d) : In replication of chromosomes in stage of interphase. It is the first stage of cell cycle and the period before cell division. During this phase the cell matures copies its DNA and prepare to divides. The replication of chromosome occur during the S phase.

276. Match the sub-stage of prophase I of meiosis in Column I and the events in Column II and choose the right option.

	Column I		Column II
(A)	Leptotene	(1)	Terminalization of chiasma
(B)	Zygotene	(2)	Crossing over and recombination
(C)	Pachytene	(3)	Synapsis
(D)	Diakinesis	(4)	Visibility of chromosomes

(a) A - 1 B - 2 C - 3 D - 4
(b) A - 1 B - 3 C - 2 D - 4
(c) A - 4 B - 3 C - 2 D - 1
(d) A - 4 B - 1 C - 2 D - 3
(e) A - 4 B - 2 C - 3 D - 1

Kerala PMT-2014

Ans. (c) :

Column I	Column II
Leptotene	Visibility of chromosomes
Zygotene	Synapsis
Pachytene	Crossing over and recombination
Diakinesis	Terminalization of chiasma

@apna_pdf

11 TRANSPORT IN PLANTS

A. Method of Transport

1. Active transport occurs

(a) against concentration gradient and requires ATP
(b) against concentration gradient and does not require ATP
(c) along concentration gradient but require ATP
(d) along concentration gradient but does not require ATP

TS EAMCET-02.05.2018 Shift-II
Tripura JEE-2017
BVP-2012 / AMU-2010
BHU-PMT (Screening)-2008
MGIMS Wardha-2006
BCECE-2014, 2003 / Manipal-2001

Ans. (a) : Active transport occurs against concentration gradient and requires ATP. Active transport is the movement of solute or solvent molecules against the concentration gradient. It requires the expenditure of energy in the from ATP.
Active transport requires specialized carrier proteins and expenditure of cellular energy.

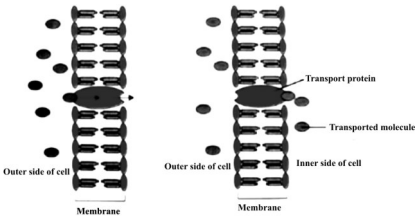
2. Choose incorrect statement related to diffusion

(a) Transport by diffusion in plants is limited to short distance
(b) Diffusion is limited to short distance
(c) Diffusion is not dependent on a living system
(d) Energy is spent for the diffusion of substances

AP EAPCET-22.05.2023, Shift-II

Ans. (d) : Transportation by diffusion in plant is limited to short distance and diffusion is not dependent on a living system and the energy is not spent for the diffusion.

3. Identity the following process and choose the correct option?



(a) Facilitated diffusion (b) Osmosis
(c) Deplasmolysis (d) Simple diffusion

AP EAMCET-05.10.2021 Shift-I

Ans. (a) : The process shown in the figure is facilitated diffusion. It is the process of moving molecules from high to low concentration across a membrane by using a protein channel in the membrane Facilitated diffusion does not use energy but relies on a protein to facilitate movement.

4. Choose the incorrect pair of movements

(a) Diffusion - Short
(b) Translation-Bulk
(c) Apoplast-living components
(d) Root pressure-small heights

AP EAMCET-25.09.2020 Shift-II

Ans. (c) : The apoplast (outer space) in non-living continuous system of plant which consists of plant which consists of cell wall, inter cellular spaces and xylem channels this is called free space.

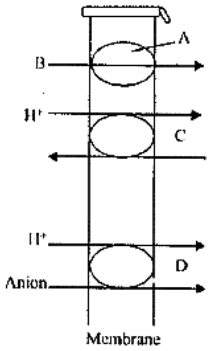
5. Identify the correct phenomenon with reference to transport in plants.

(a) Hormones are chemical stimulators always transport towards growing points.
(b) Transport of water and minerals through non living conducting tissue is multidirectional.
(c) Transport of solutes through living conducting tissue is unidirectional.
(d) Diffusion and cytoplasmic streaming supplemented by active transport is necessary for movement of substances to shorter distance.

AP EAMCET-24.04.2019 Shift-II

Ans. (d) : The substances that need to be transported in a flowering plant are water mineral nutrients, organic nutrients and plant growth regulators. Diffusion and cytoplasmic streaming supplemented by active transport is necessary for movement of substances to shorter distance. Transport over long distances proceeds through the vascular system (xylem and phloem) and is called translocation.

6. What do A, B, C and D represent in the following figure?



(a) A : carrier protein, B: symport, C : uniport, D : antiport
(b) A : carrier protein, B : uniport, C: antiport, D : symport
(c) A : carrier protein, B; antiport, C : symport, D: uniport
(d) A : carrier protein , B : uniport, C : symport, D : antiport

AIIMS-26.05.2019 Shift-I
AIIMS-2010

Ans. (b) : A : carrier protein, B : uniport, C: antiport, D : symport

@apna_pdf

7. The main difference between active and passive transport across cell membrane is :

(a) Active transport occurs more rapidly than passive transport.
(b) Passive transport is non-selective whereas active transport is selective.
(c) Passive transport requires a concentration gradient across a biological membrane whereas active transport requires energy to move solutes.
(d) Passive transport is confined to anionic carrier proteins whereas active transport is confined to cationic channel proteins.

NEET (Odisha)-2019

Ans. (c) : The main difference between active and passive transport across cell membrane is passive transport requires a concentration gradient across a biological membrane whereas active transport requires energy to move solutes.
This is because– Materials are transported across a membrane using a mobile carrier protein and ATP in Active Transport.

8. Which of the following elements is responsible for maintaining turgor in cells?

(a) Magnesium (b) Sodium
(c) Calcium (d) Potassium

NEET-2018

Ans. (d) : Potassium ion is responsible for maintaining the turgidity of cells.
Potassium ion regulates the proton pumps, present on guard cells during the opening and closing of stomata.
The stomata opening and closing depends on the generation of potassium ion gradient in guard cells.
Increasing in K^+ ion concentration in the guard cells makes them hypertonic so more water drawn inside the cells thus guard cell become turgid, widening the stomata opening.

9. Grahams law is correlated with

(a) diffusion (b) osmoregulation
(c) osmosis (d) absorption

WB JEE-2009

Ans. (a) : Graham's law states that at same pressure and temperature, rate of diffusion of gas is inversely proportional to its molecular mass. Graham's law was formulated by Scottish physical chemist themes Graham in 1848. The formula can be written as $\frac{\text{Rate}_1}{\text{Rate}_2} = \sqrt{\frac{M_1}{M_2}}$

10. Translocation of sugars in flowering plants occur in the form of :

(a) glucose (b) starch
(c) sucrose (d) maltose

AFMC -2011
VMMC-2002

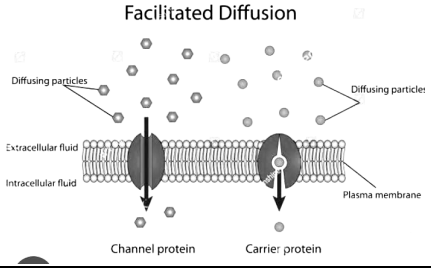
Ans. (c) : Translocation of sugars in the flowering plants occurs in the form of sucrose, because sucrose is more energy efficient in storage and transferring less reactive than glucose and water soluble.

11. Facilitated diffusion (1) occurs from higher concentration to lower concentration (2) takes place along the concentration gradient (3) form carrier-transport complex (4) is sterospecific

(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2011

Ans. (b) : Facilitated diffusion is the process of spontaneous transport of molecules or ions across a biological membrane via specific trans membrane integral proteins.
Facilitated diffusion take place along the concentration gradient from higher to lower concentration.



12. Which of the following does not require carrier molecules during transport through cell membranes?

(a) simple diffusion (b) facilitated diffusion
(c) $Na^+ - K^+$ transport (d) none of these

JIPMER-1998

Ans. (a) : Simple diffusion does not require carrier molecules during transport through cell membranes
Simple diffusion :- Movement of molecules from higher concentration to lower concentration does not require carrier molecule for transport through cell membrane.

13. The membrane which allows passage of certain substances more readily than others is termed as:

(a) permeable (b) selectively permeable
(c) semipermeable (d) impermeable

HP CET-2011

Ans. (b) : The membrane which allows passage of certain substances more readily than others is termed as selectively permeable. A permeable membrane is one which allows the movement of both the solvent and solute across it. For example cell wall.

14. In trees death of protoplasts is essential for a vital function such as:

(a) stomatal movements (b) water transport
(c) food transport (d) both (b) and (c)

JIPMER-1997

Ans. (b) : In trees death of protoplasts is essential for a vital function such as water transport. Tracheids serve on the wall. Tracheids serve for support and for upward conduction of water and dissolved minerals of water and dissolved minerals in all vascular plants and are the only such elements in conifers and ferns.

15. Which one of the following doesn't help in molecule transport?

(a) Diffusion (b) Osmosis
(c) Surface tension (d) Active transport

Haryana PMT-2005
BHU PMT-2003

Ans. (c) : Surface tension is not involved in the transport of molecules but is an important force, that ensures movement of water as a sheet or mass. We often see this occur with water but it occurs with all other liquids to some degree.

@apna_pdf

16. Which of the following criteria does not certain to facilitated transport?
(a) Uphill transport
(b) Requirement of special membrane proteins
(c) High selectivity
(d) Transport saturation

NEET-2013

Ans. (a) : The criteria does not certain to facilitated transport uphill transport. Facilitated transport is across the plasma membrane with the aid of carrier proteins.

17. What is correct about the movement of substance across the membrane in facilitated diffusion?
(a) It is an active transport
(b) It doesn't cause transport of molecules from low concentration to high concentration
(c) It is insensitive to inhibitors
(d) It is a very specific transport

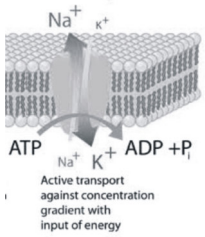
AIIMS-2010

Ans. (b) It doesn't cause transport of molecules from low concentration to high concentration. It is still passive transport because the solute is moving down the conc. gradient.

18. Na^+/K^+ pump is associated with:
(a) passive transport (b) active transport
(c) osmosis (d) imbibition

AIIMS-2012

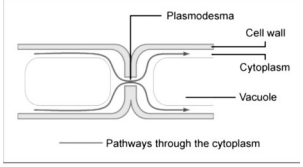
Ans. (b) : The Na^+/K^+ pump is an example of active-transport because energy is required to move the Na^+ and K^+ ions against the concentration gradient. During the sodium/potassium exchange $3Na^+$ out from the cytoplasm to extracellular fluid and $2K^+$ comes to the cytoplasm. In this process, ATP break down ADP+P_i. So, it is **active process**.



19. Plasmodesmata connections help in:
(a) Cytoplasmic streaming
(b) Synchronous mitotic divisions
(c) Locomotion of unicellular organism
(d) Movement of substances between cells.

Rajasthan PMT-2010
AIIMS-2003

Ans. (d) : Plasmodesmata connections help in movement of substances between cells.
Plasmodesmata, the structures that mediate symplasmic transport between plants cells, play an important role in phloem unloading and distribution of sugars and signalling molecules into developing organs.



20. The type of transport taking place across the bio-membranes without the help of proteins is
(a) facilitated diffusion
(b) active transport
(c) simple diffusion
(d) diffusion via symport

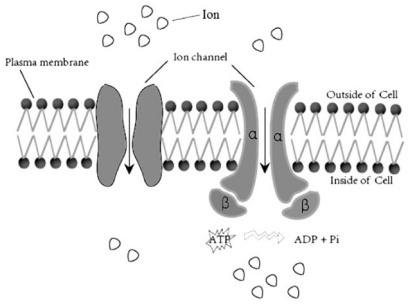
AMU-2014

Ans. (c) : The type of transport taking place across the biomembrane without the help of protein is simple diffusion. In this type of transport, solute particles moves along the concentration gradient through the semipermeable membrane. This type of transport does not require energy for the transport of molecules. Water, oxygen, carbon dioxide, ethanol and urea are transported by simple diffusion.

21. Which statement is incorrect for ion – Channels?
(a) They are proteins
(b) Movement through them is simple diffusion
(c) Movement through them is from high to low concentration
(d) All ions pass through the same type of channel

WB JEE-2008

Ans. (d) : All ions cannot pass through the same type of channel because the volume of each ion will be different.



B. Plant-Water link (Connection) and Imbibition

22. Which type of water is used by plants?
(a) Gravitational water (b) Capillary water
(c) Hygroscopic water (d) Bound water

AP EAPCET-11.07.2022 Shift-I / J&K CET-2011
DUMET-2009 / Punjab MET-2009
CMC Vellore-2009 / Rajasthan PMT-2009
Haryana PMT-2005 / BHU PMT-2003
VMMC-2003 / Haryana PMT-2000

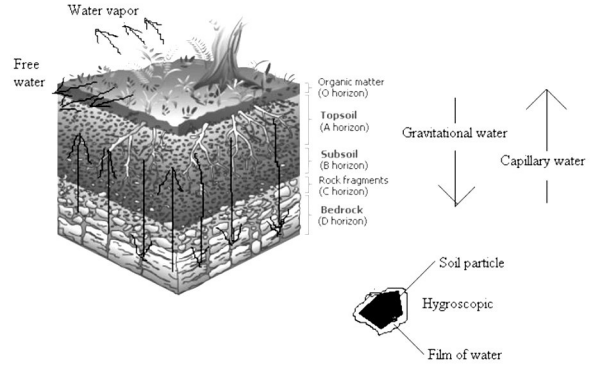
Ans. (b) : Capillary water is used in plants.
The capillary water is readily available to the plants and it s the main source of practically all the water absorbed by them.

23. A thin film of water is held by the soil particles under the influence of internal attractive force it is called :
(a) capillary water (b) combined water
(c) hygroscopic water (d) gravitational water

Karnataka CET-2013 / Manipal-2013
VMMC-2004 / DUMET-2001

@apna_pdf

Ans. (c) : A thin film of water is held by the soil particles under the influence of internal attractive force it is called hygroscopic water. The water is held tightly around the soil particles due to forces. This type of water in soil is not available to plants. Hygroscopic water cannot be easily removed by the plants.



24. Which one of the following forms of soil water can be readily absorbed by the roots?

(a) Capillary water (b) Hygroscopic water
(c) Runaway water (d) Gravitational water

VMMC-2010 / Manipal-2005
BVP-2001 / AIPMT-1991

Ans. (a) : In soil water that in readily absorbed by the roots is capillary water.

25. Following is not applicable in terms of plant - water relations, if a seed is soaked in water

(a) water movement along a concentration gradient.
(b) Increase in seeds volume
(c) Helps the seedlings to emerge out form soil
(d) No affinity between adsorbent and liquid

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : During plant-water relationship, if a seed soaked in water show an affinity between the adsorbent (the seed) and the liquid (the water).

26. Match the following lists:

	List-I		List-II
A	**Guttation**	**i**	**Abscisic acid**
B	**Imbibition**	**ii**	**Root endodermis**
C	**Dessication**	**iii**	**Diffusion**
D	**Suberin**	**iv**	**Shoot epidermis**
		v	**Root pressure**

The correct match is:

	(A)	(B)	(C)	(D)
(a)	ii	v	iv	i
(b)	v	iii	i	ii
(c)	iv	ii	v	i
(d)	ii	iii	v	iv

NEET (UG) 07.05.2023
TS EAMCET-09.05.2019 Shift-I

Ans.(b):

List - I	List-II
(A) Guttation	Root pressure
(B) Imbibition	Diffusion
(C) Dessication	Abscisic acid
(D) suberin	Root endodermis.

27. Match List-I with List-II.

	List-I		List-II
(A)	Cohesion	(i)	More attraction in liquid phase
(B)	Adhesion	(ii)	Mutual attraction among water molecules
(C)	Surface tension	(iii)	Water loss in liquid phase
(D)	Guttation	(iv)	Attraction towards polar surfaces

Choose the correct answer from the options given below.

	(A)	(B)	(C)	(D)
(a)	(ii)	(i)	(iv)	(iii)
(b)	(ii)	(iv)	(i)	(iii)
(c)	(iv)	(iii)	(ii)	(i)
(d)	(iii)	(i)	(iv)	(ii)

NEET-2021

Ans. (b) : Cohesion - Mutual attraction among water molecule.
- **Adhesion -** Attraction towards polar surfaces.
- **Surface tension -** More attraction in liquid phase.
- **Guttation -** Water loss in liquid phase.

28. Match the following?

	Column-I		**Column-II**
A.	**Cohesion**	**i.**	**Resist pulling force**
B.	**Adhesion**	**ii.**	**Water is pulled**
C.	**Tensile strength**	**iii.**	**Ability to rise in trachea**
D.	**Capillarity**	**iv.**	**Attraction between water molecules**
		v.	**Attraction of water molecules to surfaces**

Options:

(a) (A-iv), (B-v), (C-i), (D-iii)
(b) (A-i), (B-ii), (C-iii), (D-iv)
(c) (A-iii), (B-iv), (C-ii), (D-i)
(d) (A-ii), (B-iii), (C-i), (D-v)

AP EAMCET-05.10.2021 Shift-I

Ans. (a) : Correct match:-

Cohesion	Attraction between water molecules
Adhesion	Attraction of water molecules to surfaces
Tensile strength	Resist pulling force
Capillarity	Ability to rise in trachea

@apna_pdf

29. Rubber does not swell in water due to absence of _____

(a) Osmosis (b) Plasmolysis
(c) Imbibition (d) Diffusion

AP EAMCET-25.09.2020 Shift-I

Ans. (c) : Rubber does not swell in water due to absence of imbibition. Imbibition is the absorption of water by hydrophilic colloids. Imbibition requires an affinity between the imbibant and substance imbibed. Natural rubber is hydrophobic, thus not absorbing water.

30. Identify the INCORRECT statement about water in the soil.

(a) Water present in the form of hydrated oxides of silicon and aluminium is called combined water
(b) The hygroscopic and combined water is available to the plants for absorption.
(c) Water held between small, non-colloidal soil particles is called capillary water.
(d) Water which is held very tightly around soil particles by adhesive forces is called hygroscopic water.

MHT CET-06.10.2020 Shift-I

Ans. (b) : Water present in the form of hydrated oxides of silicon and aluminium is called combined water. It is not available to plants for absorption. The water which is held very tightly around soil particles by adhesive forces is called hygroscopic water. It is also not available to the plants for absorption by plant.
The water stored between small, non-colloidal soil particles is called capillary water. It is available for absorption by the plants.

31. During germination of seed, water absorption takes place by _____.

(a) endosmosis (b) osmotic pressure
(c) exosmosis (d) imbibition

MHT CET 5.10.2020 Shift-I

Ans. (d) : During germination of seed, water absorption takes place by imbibitions. Seed, germination begins with imbibitions, when the seed takes of water from the soil. The speeds up root development, allowing the seed to access more water while the shoots develop and move above ground toward the sun. All biochemical reactions. Take place in the presence of water and thus the seeds germinate.

32. Match the following

	Set-I		Set-II
A	Glucose	i	Facilitated diffusion
B	Long chain fatty acids	ii	Secondary active transport
C	Vitamin B_{12}	iii	Formation of Micelles
D	Fructose	iv	Castle's intrinsic factor

The correct match is

	(A)	(B)	(C)	(D)
(a)	i	iii	iv	ii
(b)	iv	iii	i	ii
(c)	ii	iii	i	iv
(d)	ii	iii	iv	i

TS EAMCET-09.05.2019 Shift-I

Ans. (d) :

Set -I	Set-II
(A) Glucose	Secondary active transport
(B) Long chain fatty acids	Formation of Micelles
(C) Vitamin B_{12}	Castle's intrinsic factor
(D) Fructose	Facilitated diffusion.

33. With the increase in temperature, the process of imbibitions

(a) decreases (b) increases
(c) remain the same (d) no effect

CG PMT-2011

Ans. (b) : The increase in temperature, the process of imbibitions increases. This can be explained largely on the basis of increase in kinetic activity of imbibing molecules.

34. Imbibition is always accompanied by swelling or increase in the volume of the imbibant. However, the increase in the volume of the imbibant is

(a) more than the volume of water imbibed
(b) some as the volume of the water imbibed
(c) less than the volume of the water imbibed
(d) it depends upon the type of imbibant

CG PMT-2011

Ans. (c) : Imbibition is always accompanied by swelling or increase in the volume of the imbibant. However, the increase in the volume of the imbibant is less than the volume of the water imbibed.
The imbibitions of water continues until a dynamic equilibrium is reached causing an increase in the volume of the imbibant, culminating in huge imbibitional pressure.

35. Process of imbibition involves

(a) adsorption of water
(b) diffusion of water
(c) movement of water into imbibant through capillary
(d) movement of water into imbibant through diffusion as well as capillary action

CMC Ludhiana-2007

Ans. (d) : An imbibant is made of a number of particles separated by fine interstices. During imbibitions water passes into the interstices as well as adsorbed over the particles. The process of imbibiton involes movement of water into imbibant through diffusion as well as capillary action.

36. If a dry wooden stakes driven into a small crack in a rock and then soaked, can develop enough pressure to split the rock. Such pressure is built up through the phenomenon of

(a) plasmolysis (b) imbibition
(c) deplasmolysis (d) none of these

Punjab MET-1999

Ans. (b) : Imbibitions is the absorption of water from the external environment through solids materials such as wood. For the example, water flows into wooden doors and rocks. Due to imbibitions only dry wooden stakes driven in cracks the rock and soaked will develop pressure that will split the rock.
Deplasmolysis- It is the swelling or entry of water to a plasmolysed cell.

@apna_pdf

37. Plants do not store carbohydrate as glucose but do so as starch because glucose
(a) is unstable
(b) attracts herbivores
(c) will change nucleic acids
(d) alters osmotic balance

CG PMT-2007

Ans. (d) : Plants do not store carbohydrate as glucose but do so as starch because glucose alters osmotic balance.

38. Swelling of house hold wooden item like door table and a log in open area during rainy season is due to
(a) endosmosis (b) exosmosis
(c) imbibition (d) diffusion

VMMC-2014 /BVP-2010 / AIIMS-2001

Ans. (c) : Swelling of house hold wooden item like door table and a log in open area during rainy season is due to imbibitions. The process of adsorption of water by solid particles of a substance without forming a solution is called imbibitions.

39. Which of the following plant material is an efficient water imbibant?
(a) Agar (b) Cellulose
(c) Lignin (d) Pectin

Karnataka CET-2008

Ans. (a) : Agar is an efficient water imbibant. Agar obtained from Gelidium and Gracileria. Imbibant is the solid substance which absorbs water and swells up.

40. The first process by which water enters into the seed coat when a seed is placed in suitable environment for germination is
(a) Absorption (b) Imbibition
(c) Osmosis (d) Active transport

Karnataka CET-2007

Ans. (b) : Imbibitions is a type of diffusion where the water is absorbed by the solid particles called colloids causing an enormous increase volume. Therefore, the first process by which water gets into the seed coat when a seed is placed in suitable situation for germination is Imbibition.

41. When pea seeds and wheat grains are soaked in water, pea seeds showed more swelling than the wheat. The reason is
(a) Imbibition capacity of proteins is more than that of starch
(b) Presence of less hydrophilic colloids in the wheat grains
(c) Cell membrane of pea seeds is more permeable
(d) Cell walls of wheat grains are less permeable

AP EAMCET-2007

Ans. (a) : When pea seeds and wheat grains are soaked in water, pea seeds showed more swelling than the wheat because Pea seeds have a high quantity of proteins in them and wheat seeds have high quantities of starch in them. So, the proteins imbibe more water as compared to the starch molecules.

42. Loading of phloem is related to : -
(a) Increase of sugar in phloem
(b) Elongation of phloem cell
(c) Separation of phloem parenchyma
(d) Strengthening of phloem fiber

AIPMT-2001

Ans. (a) : Loading of phloem is related to increase of sugar in phloem.

43. Which of the following has more imbibitions power?
(a) Cellulose (b) Hemicellulose
(c) Fat (d) Protein

CMC Vellore-2013

Ans. (d) : Protein show higher imbibitions capacity than cellulose and fats.
Protein >Cellulose >Hemicellulose > Fat.

44. A column of water within xylem vessels of tall trees does not break under its weight because of
(a) Positive root pressure
(b) Dissolved sugar in water
(c) Tensile strength of water
(d) Lignification of xylem vessels

AIPMT (Re-Exam)-2015

Ans. (c) : A column of water within the xylem vessels of tall trees does not break under its own weight because of tensile strength of water.
- Tensile strength is the ability to resist pulling forces.
- Cohesion, adhesion and surface tension are the forces responsible for movement of water up the tracheary element.
- An account of cohesion force, the water column can bear a tension or pull of upto 100 atm. Therefore, the cohesion force is also called tensile strength.
- Its theoretical value is 15000 atm but the measured value 45 atm to 207 atm.

45. Biolistics (gene-gun) is suitable for
(a) Constructing recombinant DNA by joining with vectors
(b) DNA finger printing
(c) Disarming pathogen vector
(d) Transformation of plant cell

AIPMT (Mains)-2012

Ans. (d) : A gene gun or a biolistic particle delivery system, originally designed for plant transformation , is a device for delivering exogenous DNA (transgenes) to cells.

46. A bottle filled with previously moistened Mustard seeds and water was screw capped tightly and kept in a corner. It blew up suddenly after about half an hour. The phenomenon involved is
(a) diffusion (b) imbibition
(c) osmosis (d) DPD

AIPMT-1990

Ans. (b) : When Mustard seeds are soaked in a bottle and kept in a corner the seeds absorb water due to imbibitions and suddenly fly up.
Adsorption of liquid by any solid material is called imbibitions. It is also a type of diffusion. It helps in the movement of water in to the ovules, which are ripening into seeds.

@apna_pdf

47. When Pea seeds and Wheat seeds are put in water, which of the two will imbibe more water?
(a) Wheat seeds
(b) Pea seeds
(c) Both will imbibe an equal amount of water
(d) Pea seeds imbibe water only at alkaline pH

Punjab MET-2007

Ans. (b) : When pea seeds and wheat seeds are put in water, then both of them will both imbibe an water however, pea seeds have a high quantity of protein in them whereas wheat seeds have high quantities of starch in them. Also, proteins imbibe more water as compared to the starch molecules. Thus pea seeds will imbibe more water.

48. Imbibition involves
(a) diffusion of water
(b) movement of water into imbibant through capillary
(c) movement of water into imbibant through diffusion as well as capillary action
(d) absorption of water

Punjab MET-2007

Ans. (c) : Imbibition involves movement of water into imbibant through diffusion as well as capillary action.

49. Which of the following is not a function of water in cell?
(a) It provides energy for chemical reaction
(b) It act as a solvent
(c) It provides a medium for chemical reaction
(d) It release hydrogen ions on ionization

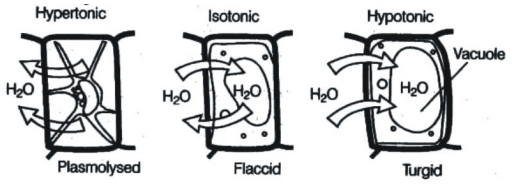
JCECE-2003

Ans. (a): It provider energy for chemical reaction is not a function of water in cell because energy for chemical reactions cell is provided by ATP.

50. Choose the wrong statement
(a) Cells swell in hypertonic solutions and shrink in hypotonic solution
(b) Water potential is the kinetic energy of water which helps in the movement of water
(c) The absorption of water by seeds and dry wood takes place by a special type of diffusion called imbibition
(d) Solute potential or Ψ_s is always negative
(e) Less than 1% of the water reaching the leaves is used in photosynthesis and plant growth

Kerala PMT-2014

Ans. (a) : Hypertonic solution is having lower water potential as compared to the cytoplasm of the cell. When a cell is placed in hypertonic solution, the water moves out of the cell, causes the cell to shrink.
Hypotonic solution is having higher water potential as compared to the cytoplasm of the cell. When a cell is placed in hypotonic solution, the water moves into the cell, causes the cell to swell.



51. Select the matched ones.

i.	**Guttation**	**Water loss in its liquid phase**
ii.	**Adhesion**	**Mutual attraction between water molecules**
iii.	**Imbibition**	**absorption of water by dry wood**
iv.	**Hypotonic solution**	**cells shrink**

(a) (i), (ii) and (iii) only
(b) (ii) and (iv) only
(c) (iii) and (iv) only
(d) (ii) (iii) and (iv) only
(e) (i) and (iii) only

Kerala PMT-2013

Ans. (e) : Correct match-

Guttation	Water loss in its liquid phase
Adhesion	Attraction of water molecules to surface
Imbibition	Absorption of water by dry wood
Hypotonic solution	Cell swell

C. Water Potential

52. Water potential of pure water at standard temperature is _____
(a) 0 (b) > 1
(c) < 1 (d) ∞

AP EAMCET-03.09.2021 Shift-II
MHT CET-08.10.2020 Shift-I
KVPY (SA)-2018 / NEET-2017
Assam CEE-2014 / Manipal - 2001 / AIPMT-1998

Ans. (a) : Water potential equation ,

$$\psi = \psi_s + \psi_p$$

Water potential (ψ) = Free energy water
By convention, at standard temperature, the water potential of pure water which is not any pressure is taken to be zero.
Solute potential (ψ_s) = Solute concentration (Osmotic potential)
Pressure potential (ψ_p) = Physical pressure on solution
Turgor pressure (Plants)
- Pure water ; $\psi_p = 0$ MP_a
- plant cells ; $\psi_p = 1$ MP_a

53. Water movement between cells is due to
(a) T.P. (b) W.P.
(c) D.P.D. (d) incipient plasmolysis

JCECE-2005 / Punjab MET-2004
Manipal-2000 / AIPMT-1992
Punjab MET-2003, 1999

Ans. (c) : Water movement between cell is due to DPD. In the DPD water molecules flow higher concentration to lesser concentration because the net force by which water enters into a cell is equal to the difference of osmotic pressure and turgor pressure.

DPD = OP – TP

@apna_pdf

54. Water potential is equal to solute potential in the following:

(a) A cell soaked in isotonic solution
(b) A cell soaked in hypertonic solution
(c) A cell soaked in hypotonic solution
(d) A cell with incipient plamolysis

AP EAPCET-23.05.2023, Shift-II

Ans. (b) : Water potential is equal to solute potential when if a cell soaked in hypertonic solution and it also equal at atmospheric pressure, there is no hydrostatic pressure (pressure potential) on the water in the solution.

55. Addition of more solutes in a given solution will:

(a) not affect the water potential at all
(b) raise its water potential
(c) lower its water potential
(d) make its water potential zero

NEET-2022

Ans. (c): The addition of solutes to water lowers its potential (makes it more negative), and the increase in pressure increases its potential (makes it more positive). All solution at atmospheric pressure have a negative values. This means that they have a lower water potential than water.

56. The magnitude of increment in water potential in a turgid cell is called _____

(a) Solute potential (b) Pressure potential
(c) Water potential (d) Osmotic potential

AP EAMCET-03.09.2021 Shift-II

Ans. (b) : The solute potential is negative and the pressure potential is positive. In a fully turgid cell, the solute potential is equal to pressure potential. If water enters into a cell, hydrostatic pressure develops and the cell becomes turgid. The magnitude of increase in water potential in a turgid cell is called pressure potential.

57. When the value of water potential decreases related to water potential pressure?

(a) When the value of Ψ_P is positive
(b) When the value Ψ_P is 0
(c) When the value of Ψ_P is negative
(d) When the value of Ψ_P is constant

GUJCET-2019

Ans. (c) : Water potential we–

$$\psi_w = \psi_p + \psi_s$$

ψ_w = Water potential

ψ_p = Pressure potential

ψ_s = Solute potential

If in equation, ψ_p (pressure potential) is –ve then water potential decrease (–ve).

58. Two potato pieces A and B weighing 5 grams each were soaked in 0.1M and 0.5M sucrose solutions respectively. After an hour 'A' weighed 5.5 grams and B 4.5 grams. Reasons for the change in weights of A and B.

(A) Chemical potential of water is high in A than B
(B) Osmotic potential is high in B than A
(C) Turgor pressure is high in A than B
(D) Pressure potential in 'A' is 'O'
Chose the correct answer :
Options :

(a) A, B, C, D (b) A, B, C
(c) B, C, D (d) B, D

AP EAMCET-28.04.2017 Shift-I

Ans. (b) : Solution A is a hypotonic solution and solution B is a hypertonic in respect to potato, so when 5 gm weighted piece of potato put into hypotonic solution their weight is increase due to water enters into potato cells while in hypertonic solution the cells are shrinked and their weight is decreased.
The others reason for the change in weights of A and B are:
(i) Chemical potential of water is high in A then B.
(ii) Osmotic potential is high in B than A
(iii) Turgor pressure is high in A than B.

59. The osmotic potential and pressure potential of three cells (A, B, C) located in different parts of an actively transpiring plant are given below.

Cell	Osmotic Potential (MPa)	Pressure (MPa)
A	– 0.87	0.44
B	– 0.92	0.34
C	– 0.68	0.27

identify these three cells as root hair, root cortical and leaf mesophyll cells respectively. The correct answer is

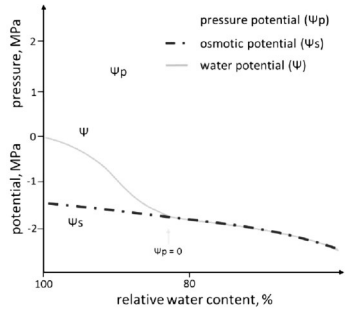
(a) A,B, C (b) A, C, B
(c) C, A, B (d) B, C, A

Manipal-2009
AP EAMCET-2011, 2009

Ans. (c) : The calculated values of water potential for three cells.
Formula –

$$\psi = \psi_P + \psi_S$$

ψ = Water potential
ψ_P = Pressure potential
ψ_S= Solute potential.
A = – 0.87+0.44= –43
B = – 0.92+0.34= –58
C = – 0.68+0.27= –41
Thus water will flow from c to A to B. This indicates that cell C must be root hair, A must be root cortex and B must be leaf mesophyll.



@apna_pdf

60. Which of the following has the highest water potential?

(a) 1 M salt solution (b) 1 M sugar solution
(c) Distilled water
(d) 1 M sugar solution with 2.3 bars pressure applied on it

CG PMT-2011
CMC Vellore-2007

Ans. (c) : The largest water potential any volume of water can have, if only standard atmospheric pressure is being applied to that particular volume of water. Distilled water has the greatest potential to move and displace any other object.

61. Endosmosis of water occurs when in comparison with the outer solution the water potential of cell sap is

(a) higher (b) lower
(c) equal (d) None of these

Haryana PMT-2011

Ans. (b) : Water in a plant always moves from an area of high water potential to an area of low water potential for endosmosis to occur, the water potential inside the cell must be less then the water potential around it. **Endosmosis;**-Endosmosis is the process by which water or solute will move inside the cell. This happens because the solute concentration of the surrounding solution is lower than that inside the cytoplasm.

62. Which one is a colligative property ? (1) Osmotic pressure (2) Vapour pressure (3) Cohesion force (4) Surface tension

(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2005

Ans. (b) : A property which is due to number of particles per volume as vapour pressure or osmotic pressure of a solution is known as colligative property.
The colligative property is the property which depends only on the number of solute particles present in the solution and not on the nature of the solute particles.

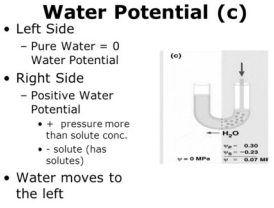
63. Which one is incorrect statement?

(a) Movement of water is expressed in terms of free energy
(b) Free energy determines the direction by which physical and chemical changes should occur
(c) Water potential is the sum of free energy of water molecules in pure water and in any other system
(d) Water potential of pure water is zero

J&K CET-2009

Ans. (c) : The water potential (ψ_w) in a plant cell or tissue is equal to the algebraic sum of the solute potential (ψ_s) due to dissolved solutes and the pressure potential (ψ_p).

$$\psi_w = \psi_s + \psi_p$$



64. Which one of the following denotes the water potential of the mesophyll cell in wilted condition?

(a) Equal to the value of osmotic potential
(b) Equal to the value of pressure potential
(c) Greater than the value of its osmotic potential
(d) Equal to zero

BCECE-2010
AP EAMCET-2007

Ans. (a) : The Osmotic potential becomes equal to the water potential of mesophyll cell valve which show in the wilted condition. The water potential of the soil is so low that plants cannot regain Turgor pressure even if all water loss through transpiration ceases. Hence the water potential of the soil is less than or equal to the osmotic potential of the plant.
Due to wilting the water potential becomes equal to osmotic potential.

65. Cell A and cell B are adjacent plant cells in cell A ψ_s = –20 bars and ψ_p = 8 bars. In cell B, ψ_s = –12 bars and ψ_p = 2 bars. Then.

(a) There is no movement of water between cell A and cell B
(b) Water moves from cell A to cell B.
(c) Equal amount of water is simultaneously exchanged between cell A and cell B.
(d) Water moves from cell B to cell A.

Karnataka CET-2010

Ans. (d) : Water potential can be calculated by adding solute potential and pressure potential.
Water always move from higher water potential to lower water potential.
Water potential = Osmotic potential + Pressure potential

$$\psi = \psi_s + \psi_p$$

For cell A, ψ_A = –20 + 8 = – 12 bars
For cell B, ψ_B = –12 + 2 = – 10 bars

$$\psi_B > \psi_A \text{ i.e., } -10 > -12$$

So, movement of water will occur from cell B to cell A.

66. The values of osmotic potential (π) and pressure potential (ρ) of cells A, B, C and D are given below:

	π	ρ
Cell A	**- 1.0**	**0.5**
Cell B	**- 0.6**	**0.3**
Cell C	**- 1.2**	**0.6**
Cell D	**- 0.8**	**0.4**

Identify the correct sequence that shows the path of movement of water from among the following:

(a) D→C→A→B
(b) B→D→A→C
(c) B→C→D→A
(d) C→B→A→D

AP EAMCET-2005

@apna_pdf

Ans. (b) : Water potential equation,

$$\psi = \psi_s + \psi_p$$

$\because \quad \psi = \pi + \rho$

For cell A,

$$\psi_A = -1 + 0.5 = -0.5$$

For cell B,

$$\psi_B = -0.6 + 0.3 = -0.3$$

For cell C,

$$\psi_C = -1.2 + 0.6 = -0.6$$

For cell D,

$$\psi_D = -0.8 + 0.4 = -0.4$$

Hence, path movement of water is correct sequence,

$$B \rightarrow D \rightarrow A \rightarrow C$$

67. Identify the correct relationship with reference to water potential of a plant cell.

(a) $\psi_w = \psi_m + \psi_s + \psi_p$

(b) $\psi_w = \psi_m + (\psi_s - \psi_p)$

(c) $\psi_w = \psi_m - (\psi_s + \psi_p)$

(d) $\psi_w = \psi_m - \psi_s - \psi_p$

Karnataka CET-2006

Ans. (a) : $\psi_w = \psi_m + \psi_s + \psi_p$

The difference between the free energy of a water molecule in pure water and the energy of water in any other system is termed as water potential.

The water potential is calculated by the sum of osmotic or solute potential and pressure potential.

The matrix potential is a minor factor in calculation of water potential and can be neglected.

68. 'A' and 'B' are the two adjacent living cells. The cell 'A' has solute potential (ψ_s) of –9 bars and pressure potential (ψ_p) of 4 bars, whereas cell 'B' has solute potential (ψ_s) of –8 bars and pressure potential (ψ_p) of 5 bars. What will be the direction of water movement between these cells?

(a) Cell A to Cell B

(b) Cell B to Cell A

(c) Do not move in any direction.

(d) Moves in both the directions.

Karnataka CET-2016

Ans. (b) : Water always move from higher water potential to lower water potential.

Water potential = Osmotic potential + Pressure potential

$$\psi = \psi_s + \psi_p$$

For cell A, $\psi_A = -9 + 4 = -5$ bars

For cell B, $\psi_B = -8 + 5 = -3$ bars

$$\psi_B > \psi_A \text{ i.e., } -3 > -5$$

So, movement of water will occur from cell B to cell A.

69. The real forces responsible for the movement of water from one cell to another cell is mainly

(a) Osmotic Pressure (OP)

(b) Turgor Pressure (TP)

(c) Diffusion Pressure Deficit (DPD)

(d) Imbibition

JIPMER-2004

Ans. (c) : The net force with which water is drawn into a cell is equal to difference off OP and TP, known as diffusion pressure deficit or suction pressure. DPD of pure water is maximum (= 1236 atm) solvent moves from cell of low DPD to high DPD. DPD, or SP = OP – TP. In a plant body water moves from one region to another region; it means from high DPD to low DPD.

70. What shall be the water potential of a root hair cell absorbing water from the soil

(a) Zero (b) Less than zero

(c) More than zero (d) Infinite

AIPMT-1999

Ans. (b) : Water potential of root hair cell absorbing water from soil is less than zero.

Water potential depends on the number of molecules of water in the system. More the number of water molecule more the water potential.

- Water potential of pure water is maximum and is zero.
- The root hairs present a large surface area. The more surface area, the greater is the absorption.
- Water potential of all solution is hence negative.
- Water always moves from a solution/region of higher water potential to a region/solution of lower water potential. Hence, water potential of roots cell cannot be more than zero i.e. negative value.

71. Study the following table and identify the correct sequence of cells which shows the path of water movement between them.

Cell	Osmotic Potential (MPa)	PressurePotential (MPa)
A	–0.95	0.40
B	–0.75	0.40
C	–0.85	0.25
D	–0.65	0.25

(a) $D \rightarrow B \rightarrow C \rightarrow A$ (b) $B \rightarrow C \rightarrow D \rightarrow A$

(c) $C \rightarrow B \rightarrow A \rightarrow D$ (d) $B \rightarrow D \rightarrow A \rightarrow C$

AP EAMCET-2013, 2010

Ans. (d) : The movement of water from one cell to another cell through the plasmodesmata is called the symplast pathway.

Water potential = Osmotic potential + Pressure.

Then,

$$\psi = \psi_O + \psi_p$$

$\therefore \quad \psi_A = -0.95 + 0.40 = -0.55$ MPa

$\psi_B = -0.75 + 0.40 = -0.35$ MPa

$\psi_C = -0.85 + 0.25 = -0.60$ MPa

$\psi_D = -0.65 + 0.25 = -0.40$ MPa

The correct Sequence of cell which show the path of water movement between them is

$$B \rightarrow D \rightarrow A \rightarrow C$$

72. Whose water potential is less than water potential of root hair during the water absorption by root hair?

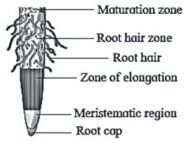
(a) Gravitational water (b) Soil solution

(c) Pure water (d) Vacuolar sap

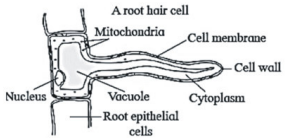
GUJCET-2011

@apna_pdf

Ans. (d): The water potential of vacuolar sap is less than water potential of root hair during the water absorption by root hair. Water always moves from area of high water potential to area of low water potential, i.e. from less negative to more negative. Water movement during water absorption by root hairs is possible if the water potential of the vacuole juice is less then the water potential of the root hair.



Root tip showing root hair zone



Structure of root hair

73. Which of the following does not affect water potential of Water?
(a) Concentration of dissolved substances.
(b) Atmospheric pressure.
(c) Gravitation.
(d) Capillarity.

GUJCET-2011

Ans. (d): Water potential is the difference between free energy of water molecules in pure from and energy of water in the solution. It depends on solute concentration, atmospheric pressure and gravitation. It is not affected by capillarity.

74. Study the following table showing the components of water potential of four cell of an actively transpiring plant.

Cell	Solute potential (MPa)	Pressure potential (MPa)
A	–0.68	0.42
B	–0.75	0.36
C	–0.83	0.47
D	–0.57	0.29

Identify the four cells as root hair, cortical cell, endodermal cell (lacking casparian strips) and pericycle cell respectively in the young root (assuming symplastic water flow through them)
(a) A, C, B, D (b) B, D, C, A
(c) D, A, C, B (d) A, D, C, B

AP EAMCET-2014

Ans. (d) : Formula for water Potential –
$\psi_w = \psi_s + \psi_p$
The movement of water in symplastic pathway occurs through, root hair → Epidermis → cortex, endodermis → pericycle → xylem.
Water potential of cell A = – 0.68 + 0.42 = –0.26
Water potential of cell B = – 0.75 + 0.36 = –0.39
Water potential of cell C = – 0.83 + 0.47 = –0.36
Water potential of cell D = – 0.57 + 0.29 = –0.28
Water always flows from higher water potential to lower water potential. So, A is root hair cell, D is cortical cell, C is endodermal cell, and B is pericycle cell.

75. Which of the following statement is correct?
(a) DPD = OP – WP (b) DPD = OP + WP
(c) DPD = WP – OP (d) DPD = TP + OP

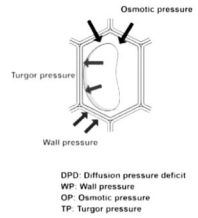
AIIMS-2014 / J&K CET-2004
Rajasthan PMT-1995

Ans. (a) : The value by which the diffusion pressure of a solution is lower than that of pure solvent is known as Diffusion Pressure Deficit. DPD or SP = OP – TP.
At the equilibrium, TP = WP.

So, $\boxed{DPD = OP - WP}$

Where, OP = Osmotic pressure
TP = Turgor pressure
WP = Wall pressure

• The term "Water potential" was given by **Slatyer and Taylor in 1960.**



(A) DPD = WP – OP
(B) DPD = OP – WP
(C) DPD = OP + WP
(D) DPD = TP + OP

76. With an increase in the turgidity of a cell, the wall pressure will
(a) fluctuate (b) remain unchanged
(c) increase (d) decrease

Manipal-2005 / Haryana PMT-2000
AIPMT-1997

Ans. (c) : With an increase in the turgidity of a cell, the wall pressure will increase. Turgidity is the state of the cell developed due to turgor pressure. Wall pressure is the pressure exerted by the cell wall on the plant cell.
→ If turgor pressure is higher than wall pressure, then the cell wall will be ruptured.

77. The potential energy of water is referred as:
(a) water potential (b) osmotic potential
(c) gravity potential (d) pressure potential

J&K CET-2005

Ans. (a) : The potential energy of water is referred as water potential. The water potential is the chemical potential of water in a system or part of a system expressed in units of pressure.

78. Consider the following statements and select the correct one:
Statement (A): Pure water has maximum water potential.
Statement (B): The osmotic potential is zero in pure water.
(a) Both statements are correct and (B) is not the reason for (A).
(b) Both statements are wrong.
(c) Both statements are correct and (B) is the reason for (A).
(d) Both statements are correct.

Karnataka CET-2013

Ans. (c) : The potential energy of water is referred as water potential. The water potential decreases with increase in solute concentration. Pure water has maximum water potential. The osmotic potential is zero in pure water because there is no solute and the pressure in the container is zero.

79. During absorption of H_2O by roots, the H_2O potential of cell sap is lower than that of:
(a) solution outside (b) pure H_2O
(c) one (d) none of above

DUMET-2004

@apna_pdf

Ans. (b) : Water potential is the potential energy of H_2O in a system compared to pure H_2O, when temperature and pressure both are kept the same. During absorption of water by roots, the water potential of cell sap is lower than that of pure H_2O and soil solution.

80. When the concentration of the solutes is low in plant cell, absorption of water is

(a) retarded (b) increased
(c) normal (d) absent

AMU-2014

Ans. (a) : When the concentration of the solutes is low in plant cell, then the cell sap is hypotonic as compared to soil solution. Water always flows from a hypotonic solution to a hypertonic solution. Hence, when the plant cell is hypotonic due to low concentration of solutes, the water flows out of the cell due to the process of exosmosis and absorption of water is retarded.

81. Movement of water through semipermeable membrane produces

(a) Wall pressure (b) Turgor pressure
(c) Suction pressure (d) Osmotic pressure

J&K CET-2013

Ans. (d) : Osmosis is a process of movement of molecules through a semipermeable membrane from a region of higher solvent concentration to lower solvent concentration. The movement of water through semipermeable membrane produces osmotic pressure. It is a colligative property and is dependent on the concentration of solute particles in the solution.

82. The correct ascending sequence of the cells with respect to their water potential is

	A	B	C	D
π	– 0.8 MPa	–1.0MPa	–0.9MPa	–0.3MPa
p	+0.4 MPa	+0.5MPa	+0.2MPa	+0.2MPa

(a) ABCD (b) CBAD
(c) CABD (d) CDBA

AP EAMCET-2015

Ans. (b) : Water potential equation,

$$\psi = \psi_p + \psi_s$$

Water potential of cell A,

$$\psi_A = -0.8 + 0.4 = -0.4\text{MPa}$$

Water potential of cell B,

$$\psi_B = -1.0 + 0.5 = -0.5\text{MPa}$$

Water potential of cell C,

$$\psi_C = -0.9 + 0.2 = -0.7\text{MPa}$$

Water potential of cell D,

$$\psi_D = -0.3 + 0.2 = -0.1\text{ MPa}$$

So, the correct ascending sequence of the cells with respect to their water potential is C, B, A, D.

83. Which of the following is the unit of measurement of water potential?

(a) Watts (b) Joule
(c) Pascal (d) Litre
(e) Cubic centimeter

CMC Vellore-2008

Ans. (c) : Pascal is the unit of measurement of water potential. Water potential is the measure of potential energy in water. Water potential is denoted by the Greek letter psi (Ψ).

84. When a solute is dissolved in pure solvent, the change in diffusion pressure called :

(a) diffusion (b) DPD
(c) osmosis (d) endosmosis

Rajasthan PMT-2001

Ans. (b) : The Diffusion Pressure Deficit (DPD) is the decrease or deficit in diffusion pressure. It is the change in diffusion pressure when a solute is dissolved in pure solvent. The diffusion pressure of a solvent in a solution is always lower than that in the pure solvent. Because of the presence of DPD, a solution will always tend to make up the deficit by absorbing water. Hence, DPD is the water absorbing capacity of a solution, and it is also called suction pressure.

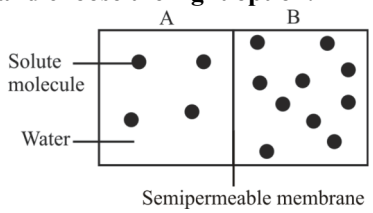
85. Two cells A and B are contigous. Cell A has osmotic pressure 10 atm, turgor pressre-7 atm and diffusion pressure deficit 3 atm. Cell B has osmotic pressure 8 atm, turgor pressure 3 atm and diffusion pressure deficit 5 atm. The result will be

(a) movement of water from cell B to A
(b) no movement of water
(c) equilibrium between the two
(d) movement of water from cell A to B

JIPMER-2011

Ans. (d) : Diffusion pressure deficit (DPD) is the force that drives water molecules to flow from a region of higher concentration to a region of lesser concentration. It is the driving force behind water absorption by cells and water moves from a region of low DPD to a region of high DPD. The DPD of cell A is 3 atm, and DPD of cell B is 5 atm. So, the result will be movement of water from cell A to B.

86. Chamber A and B are separated by a semi-permeable membrane. Study the given figure and choose the right option.



(a) Chamber A has higher water potential and water will move from A to B.
(b) Chamber B has lower solute potential and water will move from A to B.
(c) Chamber A has higher solute potential and water will move from B to A.
(d) Chamber B has lower water potential and water will move from B to A.
(e) Chamber B has higher solute potential and water will move from B to A.

Kerala PMT-2013

Ans. (a) : Water potential of pure water is zero and it decreases as the solute concentration increases. In chamber B, there are more solute particles than in chamber A. Hence, chamber A has higher water potential then chamber B, and water will move from lower concentration of solute (chamber A) to higher concentration of solute (chamber B).

@apna_pdf

D. Transport of water and its Pathway

87. Guttation is manifestation of :

(a) osmosis (b) transpiration
(c) root pressure (d) photosynthesis

HP CET-2011 / AIPMT (Mains)-2011
Karnataka CET-2007 / BHU PMT (Screening)-2006
BVP-2003, 2005 / VMMC-2005
Haryana PMT-2004 / AMU-2004
Manipal-2003 / BHU PMT-2001 / AIPMT-1992

Ans. (c) : The root pressure is maximum which forces the water upward through xylem elements and eventually exudes in the form of drops through hydathodes. At leaf margins.
Loss of water in a form of liquid from leaf surface is called guttation.

88. Who proposed the Cohesion Theory of ascent of sap?

(a) Strasburger (b) Godlewski
(c) Western (d) Dixon and Jolly

BVP-2014 /CMC Vellore-2012
HP CET-2011 / BVP-2010
Kerala PMT-2009 / BCECE-2006
VMMC-2005 / AMU-2004
BCECE-2001 / Rajasthan PMT-2000, 1995

Ans. (d) : Dixon and Jolly conceived the concept of a Cohesion tension system for the ascent of sap in 1894. The theory explains that the ascent of sap is due to the transpirations pull to tension, water cohesion and hydration of cell wall.
According to Godlewaski theory, the flow of water is due to pumping action of the wood parenchyma and medullary ray cells.

89. In plants, water supply is due to

(a) Osmosis (b) Imbibition
(c) Guttation (d) Adhesion force

VMMC-2012 / BCECE-2010
UP CPMT-2008 / MGIMS Wardha-2008
Rajasthan PMT-2008 / CG PMT-2008
BHU PMT (Screening)-2006

Ans. (a) : In plants, water supply is due to osmosis.
Root hairs function as tiny osmotic systems. Each root hair has a thin permeable cell wall, a semipermeable cytoplasm and an osmotically active cell sap present in the central vacuole.

90. Guttation is the process of elimination of water from plants through

(a) Stomata (b) Hydathodes
(c) Lenticels (d) Wounds

MHT CET-2019 / UP CPMT-2010
AFMC-2010 / J&K CET-2009
Punjab MET-2008 /BCECE-2007
UP CPMT-2005 / BVP-2002

Ans. (b) : Guttation is the process of elimination of water from plants. It occurs from the pores in leaves through which water comes out in the form of droplets or a specialized multicellular structure in leaves. Which excretes water droplets. The pores are called hydathodes.

91. Match column-I with column-II. Select the option with correct combination.

Column-I	Column-II
1. Hypertonic	p. Two molecules move in the same direction across membrane.
2. Capillarity	q. External solution is more concentrated than cell sap.
3. Symport	r. Water loss in the form of droplets.
4. Guttation	s. Ability of water to rise in thin tubes.

(a) 1-q, 2-s, 3-p, 4-r (b) 1-q, 2-s, 3-r, 4-p
(c) 1-q, 2-r, 3-p, 4-s (d) 1-q, 2-p, 3-s, 4-r

Karnataka CET-20.05.2023

Ans. (a) :

1.	Hypertonic	q.	External solution is more concentrated than cell sap
2.	Capillarity	s.	Ability of water to rise in thin tubes
3.	Symport	p.	Two molecules move in the same direction across membrane
4.	Guttation	r.	Water loss in the form of droplets

92. A : Sedges and grasses
B : Trees
C : Phytoplankton
D : Free floating plants
Arrange the above in a sequence in primary succession in water

(a) $B \rightarrow A \rightarrow D \rightarrow C$ (b) $C \rightarrow D \rightarrow A \rightarrow B$
(c) $A \rightarrow C \rightarrow D \rightarrow B$ (d) $D \rightarrow C \rightarrow A \rightarrow B$

AP EAPCET-22.05.2023, Shift-I

Ans. (b) : Phytoplankton → Free floating → Sedges and grass → Trees.
Primary succession is a type of ecological succession.

93. The physiological and morphological phenomena that happen, when bulliform cells absorb water and undergo water stress respectively.

(a) Flaccid: Leaf surface show no change.
Turgid: Leaf surface bend backward.
(b) Plasmolysed: Inward curling of leaf.
Turgid: No change.
(c) Plasmolysed: Inward curling of leaf.
Flaccid: Leaf surface exposed.
(d) Turgid: Leaf surface exposed.
Flaccid: Inward curling of leaf.

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : When bulliform cells absorb water, they become turgid and the leaf surface is exposed. When they are flaccid due to water stress, they make the leaves curl inwards to minimize water loss.
• Plasmolysis is the process of a cell losing water and its contends shrinking away from the cell wall. It is opposite of turgidity.

94. Consider the following tissues in the stelar region of a stem showing secondary growth.

(A) Primary xylem
(B) Secondary xylem
(C) Primary phloem
(D) Secondary phloem

@apna_pdf

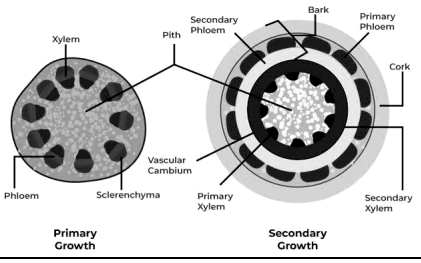
Arrange these in the correct sequence of the their position from pith towards cortex.

(a) (A), (B), (C), (D) (b) (B), (A), (D), (C)
(c) (A), (B), (D), (C) (d) (B), (A), (C), (D)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (c) : The xylem formed during the primary growth from pro cambium of root and shoot apex.

- Secondary xylem is consists of living and non-living components. It is called wood.
- Primary phloem produced by the primary meristem of a vascular plant.
- Secondary phloem forms from vascular cambium during secondary growth.
- The sequence of tissue in the stelar region of the stem showing secondary growth from pith toward cortex is Primary xylem → Secondary xylem → Secondary phloem → Primary phloem.



95. The movement of water through the cell wall is known as _____

(a) Tonoplast (b) Apoplast
(c) Plasmolysis (d) Symplast

AP EAPCET-12.07.2022 Shift-I

Ans. (b) : The movement of water through the cell wall is known as the apoplast. The apoplast is the network of cell walls and intercellular spaces that water and solutes can move through without crossing a plasma membrane.

96. When a carrier protein facilitates the movement of two molecules across the membrane in same direction, it is called:

(a) Uniport (b) Transport
(c) Antiport (d) Symport

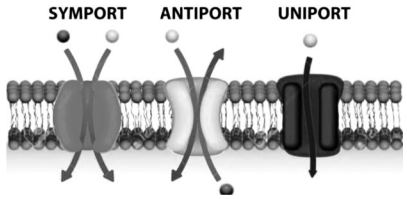
NEET (Re-Exam)-04.09.2022

Ans. (d) : Some carrier proteins allow transport only if two types of molecules move together called contransport. It is divided into symport and antiport method.

Antiport – Antiport occurs when two chemicals travels in opposite directions across a cell membrane.

Symport- Symport occurs when twop substances travel in the same direction across a cell membrane.

Uniport- Uniport occurs when a single substances travels in a single direction through a cell membrane.

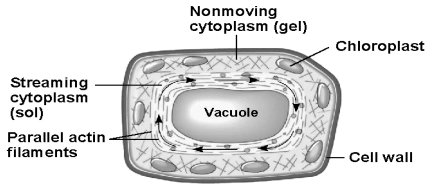


97. Which of the following is not observed during apoplastic pathway ?

(a) Apoplast is continuous and does not provide any barrier to water movement
(b) Movement of water occurs through intercellular spaces and wall of the cells
(c) The movement does not involve crossing of cell membrane
(d) The movement is aided by cytoplasmic streaming

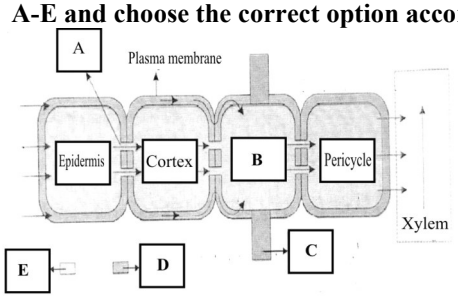
NEET-2022

Ans. (d) : Inside a plant the apoplast is the space outside the plasma membrane with in which material can diffuse freely. It is interrupted by the casparian strip in roots, by air spaces between plant cells and by the plant while. Apoplast is continuous and does not provide and barrier to water movement. The movement does not involve crossing of cell membrane.



(c) Cytoplasmic streaming in plant cells

98. In the given flow chart, the pathway of water movement is shown from soil to xylem. Identify A-E and choose the correct option accordingly?

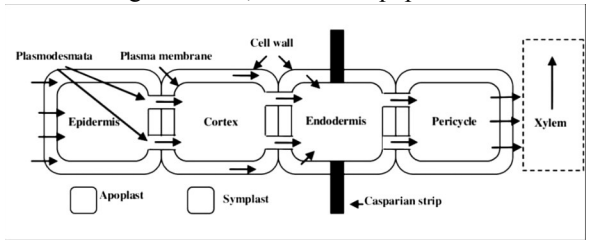


(a) A-Stomatal pore, B-Endodermis, C-Casparian strip, D-Symplast, E-Apoplast
(b) A- Plasmodesmata, B-Palisade, C-Medullary rays, D-Symplast, E-Apoplast
(c) A-Plasmodesmata, B-Endodermis, C-Casparian strip, D-Apoplast, E-Symplast
(d) A-Stomatal pore, B-Guard cell, C-Medullary, D-Apoplast, E-Symplast

AP EAMCET-05.10.2021 Shift-I

Ans. (c) : A- Plasmodesmata, B-Endodermis, C-Casparian strip, D- Apoplast, E- Symplast

During the transport of water from soil to xylem, water moves through mainly two channels, i.e, symplast and apoplast. Symplast when water moves between adjacent cell through cytoplasmic concention and when water moves through cell wall, it is called apoplastic movement.



@apna_pdf

99. Which one of the following processes maximally facilitates the ascent of sap?

(a) Guttation (b) Photosynthesis
(c) Photorespiration (d) Transpiration

KVPY (SA)-2021

Ans. (d) : The process of transpiration maximally facilitates the ascent of sap. Transpiration helps the ascent of sap by producing a suction force acting from the top of the plant.

100. Assertion (A) : In Apoplast pathway, water movement is ultimately symplastic in endodermis.
Reason (R) : Root endodermal cells are suberized.

(a) A is correct but R is wrong.
(b) A is wrong but R is correct.
(c) Both A and R are correct and R is not correct explanation for A.
(d) Both A and R are correct and R is the correct explanation for A.

AP EAMCET-03.09.2021 Shift-II

Ans. (d) : The apoplastic movement of water through the root layers is ultimately symplastic in the endodermis due to the presence of casparian strips. The root endodermal cell undergoes two states of differentiation, casparian strip formation and suberization.

101. What is NOT true about cohesion-tension theory of translocation of water in plants?

(a) Transpiration pull is transmitted downward from leaf, stem to root.
(b) Living cells of roots play an active role and ascent of sap occurs actively.
(c) There is a force of attraction between water and lignified walls of xylem cells.
(d) Water molecules have strong mutual attraction so they cannot be easily separated.

MHT CET-08.10.2020 Shift-I

Ans. (b) : The cohesion- tension theory explains the ascent of sap through the xylem tissues. This theory was put forward by Dixon and Jolly (1894). This theory is based on two principles, i.e., cohesion and adhesion, and transpiration pull. A strong force of attrition between water molecules is called cohesive force, while a strong force of attraction between water molecules and the lignified wall of xylem vessels is called adhesive force. The transpiration pull developed in the leaf vessel s transmitted down to the root and thus accounts for the ascent of sap. The ascent of sap is passive and occurs along the concentration gradient.

102. Attraction of water molecules to polar surface called

(a) Cohesion (b) Adhesion
(c) Surface tension (d) Capillary force

AP EAMCET-25.09.2020 Shift-II

Ans. (b) : Adhesion is the property of attraction of water molecules towards polar surfaces, such as the surface of tracheary elements. Cohesion is attraction between water molecules. These two forces combine together to pull up the water column in xylem. Capillarity is tendency of a liquid to rise in a capillary tube.

103. Arrange the following in the pathway of water movement in the root.

I. Cortex
II. Epidermis
III. Pericycle
IV. Endodermis

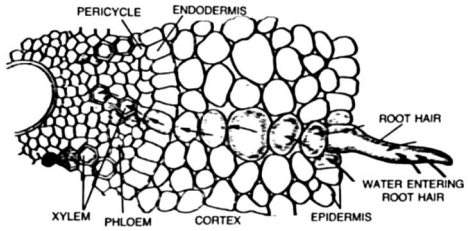
The correct answer is

(a) I, II, IV, III (b) II, I, IV, III
(c) II, III, I, IV (d) I, II, III, IV

TS EAMCET-08.05.2019 Shift-I

Ans. (b) : The correct sequence of water movement in the root is (Epidermis → Cortex → Endodermis → pericycle).

- Epidermis is the outermost layer of root that protects the inner layer of cells.
- Cortex is composed of parenchyma cells that allow the movement of water.
- Endodermis the innermost layer that regulates the flow of water.

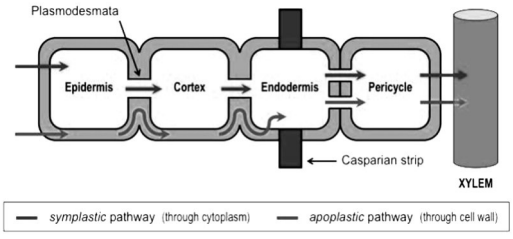


104. Which of the following is correct about symplast?

(a) Living continuum
(b) Cell wall and intercellular space
(c) Non-Living continuum
(d) None of these

AIIMS-25.05.2019 Shift-I

Ans. (a) : The symplastic system is the system of interconnected protoplasts neighboring cells are connected through cytoplasmic strands that extend through plasmodesmata symplast cell have more than one nucleus. During the symplastic movement, water travels through the plasmodesmata. As the symplastic system is the system of interconnected protoplast, it is considered as a living continuum.



105. Which of the following is not a feature of active transport of solutes in plants ?

(a) Requires ATP
(b) Occurs against concentration gradient
(c) Non-selective
(d) Occurs through membranes

NEET (Odisha)-2019

@apna_pdf

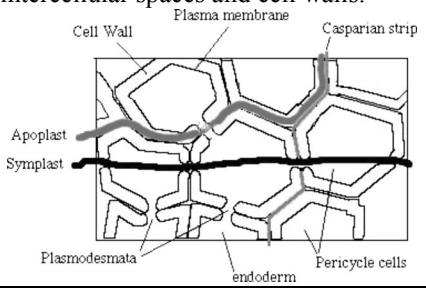
Ans. (c) : Non–selective is not a feature of active transport of solutes in plants Active membrane proteins, like enzymes, the carrier proteins are very specific (i.e., selective) in what they carry across the membranes.

- Active transport, i.e. the uphill transport of molecules uses energy (ATP) to pump molecules against a concentration gradient. It is highly selective.

106. Assertion (A) : Apoplastic path of water is considered to be non- living path.
Reason (R) : In apoplastic pathway. water does not move through intercellular spaces or through the space between cell wall and plasma membrane.
Which of the following is true?
(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and(R) are true. but (R) is not the correct explanation of (A)
(c) (A) is true, but (R) is false
(d) (A) is false, but (R) is true

TS EAMCET-03.05.2018 Shift-I

Ans. (c) : Apoplast is non- living and involves cell walls and intercellular spaces. Apoplast consists of adjacent cells that are continuous except at the casparian strips in the endodermis. The movement of water is through intercellular spaces and cell walls.



107. Continuous upward flow of water stream in tall trees is maintained due to____
(a) Guttation and transpiration
(b) Transpiration pull only
(c) Cohesive force between H_2O molecules only
(d) Cohesive force between H_2O molecules and transpiration pull

MHT CET-2018

Ans. (d) : Continuous upward flow of water stream in tall tree is maintained due to cohesive force between H_2O molecules and transpiration pull. Water moves up in plant due to phenomenon called transpiration.

108. Find correct statements from the following
(A) Protein transporters are responsible for maximum rates of transport under saturated state
(B) Translocation of substances in bulk flow requires hydrostatic pressure gradient
(C) Root pressure plays greatest contribution for upward movement of water in tall plants
(D) Transport proteins of endodermal cells are control points for active transport of ions in two directions
(a) A, C (b) A, B
(c) C, B (d) A, D

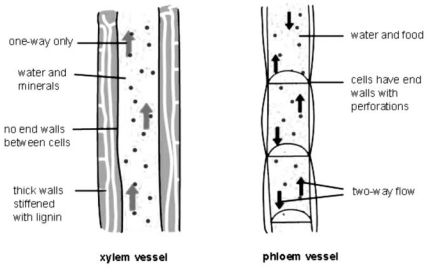
AP EAMCET-25.04.2018 Shift-I

Ans. (b) : Protein transporters are specialized membrane proteins that facilitate the movement of molecules across the cell membrane, and they can operate at very high rates, up to several million molecules per second. Bulk flow is the movement of fluids driven by pressure gradients, and it occurs in both animals and plants. Translocation of water and solutes in the xylem is driven by the hydrostatic pressure generated by the transpiration of water from leaves.

109. Water in plants is transported by:
(a) Cambium (b) phloem
(c) xylem (d) epidermis

SRM JEEE-2018 / JIPMER-2006 / AIPMT-1989

Ans. (c) : Water in plants is transported by xylem. Water from the soil enters the root hairs by moving along a water potential gradient and into the xylem through either the applets or symplast pathway. It is carried upward through the xylem by transpiration, and then passed into the leaves along another water potential gradient.



110. How much water is absorbed in 15 hours by a mustard plant having 2 kg wt.
(a) 2 kg (b) 6 kg
(c) 4 kg (d) 12 kg

GUJCET-2018

Ans. (b): A mustard plant absorbs water approximately equal to its own weight in about 5 hrs. This water is absorbed through root and evaporated through stomata. So according to this mustard plant of 2 kg will absorb 2kg of water in water in 5hrs, and total 6 kg in 15hrs.

111. Match the following lists

List-I	List-II
(A) Plasmolysis	**(I) Movement of water occurs exclusively through the intercellular spaces and the walls of the cells**
(B) Translocation	**(II) The bulk movement of substances through vascular tissues of plants**
(C) Symplastic	**(III) Water travels through the cells- their cytoplasm; intercellular movement is through plasmodesmeta**

@apna_pdf

(D) Apoplastic — (IV) Water moves out of the cell and the cell membrane of a plant cell shrinks away from its cell wall

(V) Symbiotic associations of a fungus with a root system. Fungus provides minerals and water to the roots

	A	B	C	D
(a)	III	II	V	I
(b)	IV	III	V	II
(c)	II	III	I	IV
(d)	IV	II	III	I

TS EAMCET-12.05.2017

Ans. (d) : Plasmolysis – Water moves out of the cell and the cell membrane of a plant cell shrinks away from its cell wall

- Translocation – The bulk movement of the substance through vascular tissues of plants
- Symplastic – Water travels through the cells their cytoplasm; intercellular movement is through
- Apoplastic – Movement of water occurs exclusively through the intercellular spaces and the walls of the cells

112. Which of the following helps in ascent of sap?

(a) Root pressure (b) Transpiration
(c) Capillarity (d) All of these

SRM JEEE -2017
AIIMS-2007

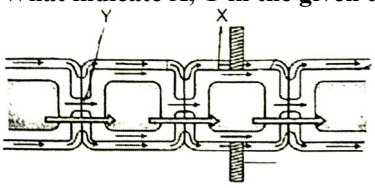
Ans. (d) : The process of translocation of water and minerals from the root tip to the stem top of the plant is called ascent of sap.

Root pressure- Water absorption behind transpiration water deficit occurs in plant which leads to decrease in rate of transpiration.

Capillary force theory – The water molecules are only held together by capillary tension but does not explain its upward translocation.

Transpiration pull theory – It is the force which upward the water from root to leaves. It is also known as suction force theory.

113. What indicate X, Y in the given diagram?

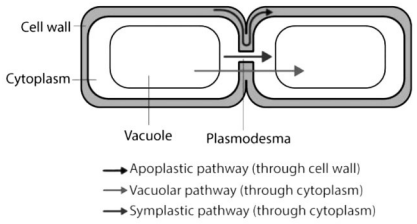


(a) X-Cell surface membrane Y-Plasmodesma
(b) X-Plasmodesma Y-Tonoplast
(c) X-Cell surface membrane Y-Cytoplasm
(d) X-Plasmodesma Y-Cell surface membrane

GUJCET-2017

Ans. (a) : The given diagram represents the symplastic pathway of water movement. During the symplastic movement water travels through the plasmodesmata.

The symplast consist of an entire network of cell cytoplasm which is interconnected by plasmodesmata. Hence, In the diagram, X is the cell surface membrane and Y is the plasmodesmata.

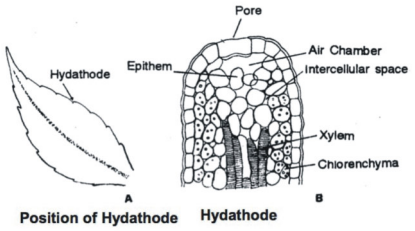


114. Loss of liquid water by guttation occurs through:

(a) hydathodes (b) stomata
(c) cuticle (d) bark

BHU PMT-2004

Ans. (a) : Guttation is loss of water in liquid from uninjured part of plants. Guttation is the phenomenon of loss of water from small pores which occurs on the margin of leaves known as hydathodes.



115. Water enters from soil into the root hairs due to

(a) turgor pressure of roots hair
(b) osmotic pressure of root hair
(c) suction pressure
(d) diffusion pressure

BHU PMT (Screening)-2011

Ans. (b) : Water enters from soil into the root hairs due to osmotic pressure of root hair.

For osmosis to occur there must be a higher concentration of solution, e.g. mineral ions inside the cell then in the soil water surrounding the roots. A high concentration of solutes means a there is a low concentration of water in the root hair cells compared to the soil water.

116. Cells are connected by plasmodesmata, the system is called

(a) symplast (b) protoplast
(c) chloroplast (d) imbibitions

WB JEE-2012
VMMC-2010

Ans. (a) : Plasmodesmata are intercellular pores connecting adjacent plant cells allowing membrane. Cells are connected by plasmodesmata the system is called symplast. Symplast present inside the cell membrane of the cell.

@apna_pdf

117. A plant with specialized epidermis for absorption of moisture from the atmospheres is:
(a) Avicinnia (b) Rhizophora
(c) Vanda (d) Jussiaea

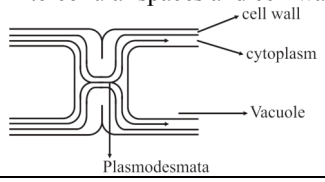
AP EAMCET-2002

Ans. (c) : Vanda is a type of orchid that is an epiphyte plant which has specialized epidermis absorb moisture from air.

118. The term apoplast signifies
(a) cell wall, intercellular space and water-filled channels
(b) protoplasts interconnected by plasmodesmata
(c) cell wall, cytoplasm and central vacuole
(d) None of the above

CG PMT-2011

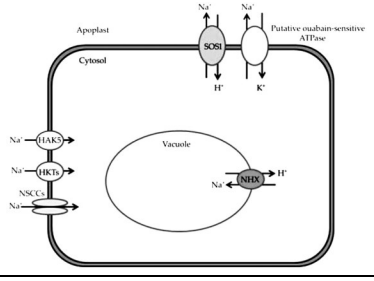
Ans. (a) : The term 'apoplast' refers to the continuous system of interconnected cell walls, extracellular spaces, and intercellular spaces within plant tissues. It is one of the transport pathways for water and solutes in plants.
Water and solutes pass through the extracellular gaps and non-living parts of the plants cell-walls in the apoplast route.
Passive water absorption involves apoplast movement of water through intercellular spaces and cell wall of cells.



119. By which mechanism, the salt resistant Plants can get rid off excess Na- ions to the outer side, through the roots?
(a) H^+ ATPase uniport system
(b) Na^+ ATPase uniport system
(c) $H^+ - Cl^-$ symport system
(d) $Na^+ - H^+$ antiport system

Manipal-2010

Ans. (d) : The salt resistant plants get rid of excess Na^+ ions to outside through the roots by $Na^+ - H^+$ antiport system, i.e. Na^+ ions move out through roots and H^+ ions move in.



120. Excess of one of them act as antitranspirant
(a) H_2 (b) CO_2
(c) SO_2 (d) O_2

Haryana PMT-2011

Ans. (b) : Antitranspirants are the chemical compounds or materials which are applied to the outer layer of leaves in order to reduce transpiration. Carbon dioxide concentration aspects stomatal opening in closed stomata external carbon dioxide has no effect.

121. When the temperature of soil is 0°C then the water absorption
(a) Increases
(b) Decreases
(c) Not affected
(d) Soil will lose capillary H_2O

Haryana PMT-2011

Ans. (b) : Increase in soil temperature up to about 30°C favours water absorption. At higher temperature water absorption is decreased. At low temperature also water absorption decreases so much so that at about 0°C.

122. The water vapour of a plant sample or water solution is measured by
(a) Auxanometer (b) Psychrometer
(c) Osmometer (d) Photometer

Haryana PMT-2011

Ans. (b) : The water vapour of a plant sample or water solution is measured by Psychrometer.
- Auxanometer - Measured growth in plant
- Osmometer - Measures the osmotic pressure of a solution.
- Photometer - Measures the strength of electromagnetic radiation.

123. Root pressure is measured by
(a) Potometer (b) Barometer
(c) Manometer (d) Auxanometer

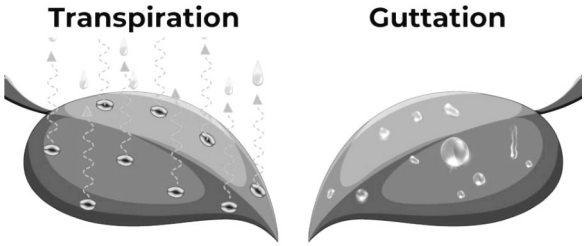
Manipal-2011
Uttarakhand-2005

Ans. (c) : Root pressure is measured by manometer. Root pressure is the pressure caused due to the active absorption of mineral salts leading to a passive flow of water into the roots from the soil solution.

124. Water lost in guttation is :
(a) Pure water (b) Impure water
(c) In vapour form (d) Either a and b

AMU-2005
Manipal-2004
Uttarakhand PMT-2004

Ans. (b) : Guttation is referred to as a process of secretion of water in the form of water droplets from the pores of vascular plants. The water lost in this process is a dilute solution containing mineral salts like potassium. Guttation is the loss of water that is impure.

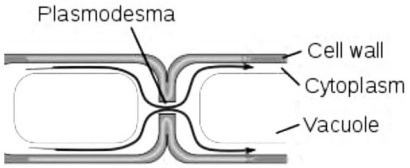


125. Plasmodesmata (1) also called tight junctions (2) increase area of absorption (3) are barriers for diffusion (4) five finger like folding
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2011

@apna_pdf

Ans. (d) : Plasmodesmata are called tight junctions which are barriers for diffusion. Plasmodesmata are structurally different from gap junctions but serve essentially the same functions.



126. When water enters in roots due to diffusion, it is termed as :

(a) Osmosis (b) Passive absorption
(c) Active absorption (d) Imbibition

BHU PMT-2001

Ans. (b) : Passive absorption occurs when the rate of transpiration is typically higher than normal.

- Rapid evaporation of water from the leaves during transpiration causes a buildup of water in the xylem of the leaves, which results in a buildup of pressure.
- When the water in the xylem of roots is stressed, it is upward to reach the transpiring surfaces.
- The force necessary for this water entry is generated in the leaves as a result of rapid transpiration, and as a result, the root cells remain passive throughout this pressure.

127. The water which cannot be absorbed by the plants is termed as:

(a) Field capacity (b) Holard
(c) Hygroscopic water (d) Capillary water

JIPMER-1998

Ans. (c) : The water which cannot be absorbed by the plants is termed as hygroscopic water.

This water is hold up in the soil particle with such a great imbibitions force, that it cannot be separated from it for the use of the plant. This is called hygroscopic water, which also cannot be absorbed from the soil by the plants.

• Each soil particle is surrounded by a loose film of water; this film is attracted by the capillary force to the soil particle, and such water film is called capillary water.

128. The cytoplasm of adjacent plant cells is connected to each other by

(a) Plasmalemma (b) Desmosome
(c) Plasmodesmata (d) Plasmotubule

DUMET-2010
AIPMT (Screening)-2010

Ans. (c) : The cytoplasm of adjacent plant cells is connected to each other by plasmodesmata.

Plasmodesmata are small channels that directly connect the cytoplasm of neighboring plant cells to each other establishing living bridges between cells.

Plasmalemma is a semipermeable membrane that encloses the cells cytoplasm and nucleoplasm and separates the cell from the extracellular.

129. The function of a vessel is:

(a) Conduction of food
(b) Conduction of water and minerals
(c) Conduction of hormones
(d) All of the above

JCECE-2005

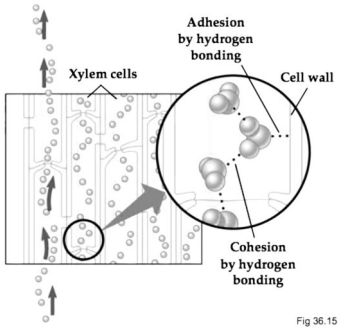
Ans. (b) : Vessels perform the function of conduction of water and minerals from the roots to the other parts of plants.

130. Cohesion and adhesion theory is otherwise called

(a) Relay pump theory
(b) Pulsation theory
(c) Root pressure theory
(d) Transpiration pull theory

J&K CET-2009

Ans. (d) : The loss of water from mesophyll cells of the leaf by transpiration creates transpiration pull or tension, which moves the water column upwards. Thus, the cohesive, adhesive forces and transpiration pull lift up the water through xylem element.



131. Percentage of water left in the soil when a plant wilts is known as:

(a) Turgidity coefficient
(b) Wilting coefficient
(c) Field capacity
(d) Water retaining capacity of the soil

JIPMER-1997

Ans. (b) : The percentage of water left in soil when plants begin to wilt is called as wilting coefficient. At wilting coefficient soil contains hygroscopic and chemically bound water. The permanent wilting point is the water content of the soil at –1.5 Mpa water potential.

132. The rupture or fractionation do not usually occur in the water column in vessel/tracheids during the ascent of sap because of

(a) Lignified thick walls
(b) Cohesion and adhesion
(c) Weak gravitational pull
(d) Transpiration pull

JIPMER-2012
BHU PMT (Screening)-2010

Ans. (b) : The rupture and fractionation do not usually occur in the water column in vessel/tracheids during the ascent of sap because of cohesion and tension. The water molecules have a great mutual attraction with each other or in other words we can say that they have tremendous cohesive power which is sometimes as much as 350 atmospheres. Thus, the transpiration pull develops a negative pressure in the uppermost xylem cells. It is transmitted from there into the xylem of stems, and from there to the roots.

@apna_pdf

133. Symplast
(a) Is living component of cell
(b) Consist of cytoplasm and cell membrane
(c) Both (a) and (b)
(d) None the above

VMMC-2008 / AMU-2008

Ans. (c) : Symplast is a living system formed by cytoplasm of cells through plasmodesmata. It consists of cytoplasm and cell membranes of adjacent cells during the symplastic movement water travels through the plasmodesmata.

134. Which one of the following forms of soil water can be readily absorbed by the roots?
(a) Capillary water (b) Hygroscopic water
(c) Run away water (d) Gravitational water

UP CPMT-2006
AP EAMCET-2005

Ans. (a): Capillary water is the form of water present in the space, formed among the soil particles. This is only form of water available to the plant for absorption.
Hygroscopic water – Water, which is absorbed by the particles of the dry soil from the atmosphere. Total water content of the soil when all process is filled with water.
Run away water – Water, when drained away from the soil surface along with slope, is known as runaway water.
Gravitational water – The water which percolates deep in the soil, due to gravity is called gravitational water.

135. Most accepted theory for ascent of sap is
(a) Capillarity theory (b) Root pressure theory
(c) Pulsation theory (d) Transpiration pull

JIPMER-2009

Ans. (d) : Transpiration pull cohesion theory of Dixon and Jolly is the most widely accepted theory for the ascent of sap in trees. This theory is based on three assumptions.
(1) Cohesion between water molecules.
(2) Continuity of water column and the transpiration pull.
(3) Transpiration pull is the principal method of water flow in plants, employing capillary action and the natural surface tension of water.

136. Loss of water from the tip of leaves is known as:
(a) Transpiration (b) Bleeding
(c) Exudation (d) Guttation

UP CPMT-2005

Ans. (d): Guttation is the process of loss of water droplets from pores and tip of leaves known as hydathodes.
- **Transpiration** is a process that involves loss of water vapours through the stomata.
- **Bleeding** occurs due to the pressure of sap within the tissues that conduct water and sugars around the plant.
- **Exudation** is the liquid that is secreted or leaked from the blood vessels in the adjoining tissues as a result of injury or inflammation. Exudate play an important role in the healing of the wound.

137. Passive absorption of water by the root system is the result of
(a) Forces created in the cells of the root
(b) Increased respiratory activity in root cells
(c) Tension on the cell sap due to transpiration
(d) Osmotic force in the shoot system

Karnataka CET-2006

Ans. (c) : Passive absorption of water by the root system is the result of tension on the cell sap due to transpiration. Transpiration is a process that involves loss of water vapour through stomata of plants. Transpiration performed through stomata.

138. Water is lost in a liquid state in some plants through hydathodes. These hydathodes
(a) Remain closed at night
(b) Remain closed during day
(c) Remain always open
(d) Do not show any specificity in opening and closing

Karnataka CET-2006

Ans. (c) : Loss of water in form of liquid dropletes is called guttation. Hydathode is a plant organ responsible for guttation in vascular plants. It always open in plants. Hydathodes are located along the margin and on surface of leaves. Guttation is common in humid tropic.

139. The magnitude of root pressure ranges from:
(a) 2-5 atm (b) 1-5 atm
(c) 0.1-0.2 atm (d) 4-6 atm

JIPMER-2004

Ans. (b) : The original term pressure was used by Stephen Hales (1727).The magnitude of the original pressure is 1-2 atm and very rarely 5 atm. Root pressure a manifestation of active water absorption is a positive pressure which is developed in the xylem sap of root of the same plant.

140. A cell 'A' with D.P.D. = 8 is surrounded by three cells 'B', 'C' and 'D' with D.P.D. respectively 4, 6 and 5. What shall be the direction of water movement
(a) B → A ← C
↑
D
(b) A → B → C → D
(c) D → C → B ← A
(d) A → B ← C → D

AIPMT-1998

Ans. (a) : A cell 'A' with D.P.D. = 8 is surrounded by three cells 'B', 'C' and 'D' with D.P.D. respectively 4, 6 and 5, the direction of water will be water moves from a cell with lower DPD to a cell with higher DPD.

B → A ← C
↑
D

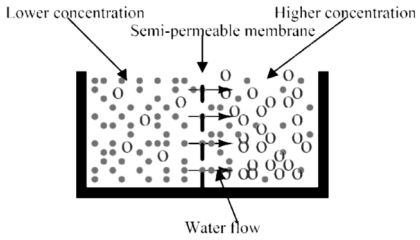
- Since we are provided with the arrangement of the cell and with the DPDs of all cells
- We find that in arrangement of A cell at centre and B, C and D cell surrounding it.
- Water movement in A from all the cells.

141. When water moves through a semipermeable membrane then which of the following pressure develops : -
(a) O.P. (b) S.P.
(c) T.P. (d) W.P.

AIPMT-2001

@apna_pdf

Ans. (a) : Osmotic pressure is the pressure in atmospheric pressure, which is required in opposite direction, so as stop entry (solvent) molecules, when a semipermeable membrane separates concentrated solution from weaker solution.



142. Path of water movement soil to xylem is

(a) Soil → Root hair → Cortex → Pericycle → Endodermis → Metaxylem → Protoxylem
(b) Soil → Root hair → Cortex → Endodermis → Pericycle → Protoxylem → Metaxylem
(c) Soil → Root hair → Epidermis → Endodermis → Phloem → Xylem
(d) Soil → Root hair → Epidermis → Cortex → Phloem → Xylem
(e) Soil → Root hair → Cortex → Protoxylem → Phloem → Metaxylem

Kerala PMT-2008

Ans. (b) : Plant absorb water that is present in the soil through root hairs. The root hairs are extensions of the epidermis of the root that helps increasing the surface area to volume ratio thereby increasing the absorption of water from the soil. The water absorbed through root hairs enters into the root that moves horizontally through the cortex, endodermis and pericycle before reaching the xylem. So, the path of water movement from soil to xylem is

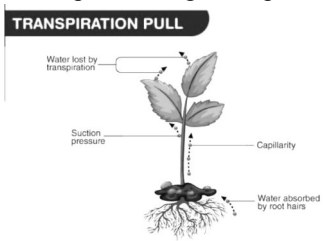
Soil→ Root hair→ Cortex → Endodermis → Pericycle → Protoxylem → Metaxylem

143. In tall plants, because of which factor, continuous water column extends upward?

(a) Atmospheric pressure (b) Osmotic pressure
(c) Suction pull (d) Root pressure

GUJCET-2011

Ans. (c) : Transpiration pull and cohesion – tension theory was proposed by Dixon and Jolly. The molecules form a continuous column by cohesion. The cell walls of xylem vessels have a strong affinity for water molecules. Loss of water from aerial parts through transpiration.



144. Which is essential for root hair growth ?

(a) Zinc (b) Calcium
(c) Molybdenum (d) Sulphur

JIPMER-2010

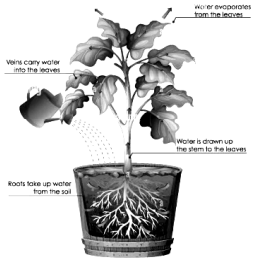
Ans. (b) : Growth of root hairs is occur due the presence of essential macromolecule calcium. Deficiency of calcium cause distorted growth in some regions because of damaged cell wall synthesis particularly in root tips, early leaves and shoot tips. Source of calcium is water and fertilizers.

145. Transpiration and root pressure cause water to rise in plants by :

(a) Pulling and pushing it, respectively
(b) Pushing it upward
(c) Pushing and pulling it, respectively
(d) Pushing it upward

AIPMT-2015

Ans. (a) : Transpiration causes water to rise in plant by pulling through xylem elements. Root pressure causes water to rise in plants by pushing water in xylem components. So the rise of water in plants is done by pulling and pushing via transpiration and root pressure respectively.



146. Root pressure develops due to:

(a) Increase in transpiration
(b) Active absorption
(c) Low osmotic potential in soil
(d) Passive absorption

AIPMT (Re-Exam)-2015
Rajasthan PMT-1999

Ans. (b) : Root pressure develops due to active absorption. During active absorption, water is absorbed from the roots due to force develop in the root system. It is triggered by the energy molecule (ATP), released during metabolic activity of root cells such as respiration.

147. The force responsible for upward conduction of water against gravity comes from .....

(a) transpiration (b) photosynthesis
(c) translocation (d) respiration

Karnataka CET-2011

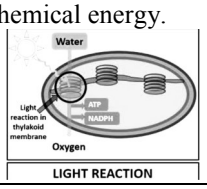
Ans. (a) : The force responsible for upward conduction of water against gravity comes from transpiration.

148. The light phase of photosynthesis is called:

(a) Hill reaction (b) photo action
(c) pigment action (d) chorophyllous process

JIPMER-2006

Ans. (a) : The hill reaction suggests that a sufficient terminal electron acceptor is necessary for the light-dependent reaction of photosenthesis to take place and this reaction is the end product of a redox process. Thus by reducing NADP to NADPH, solar energy is transformed into chemical energy.



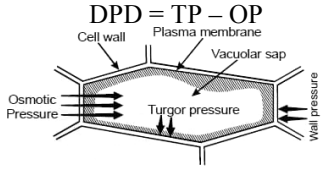
@apna_pdf

149. If turgor pressure becomes equal to the wall pressure, then
(a) Water leaves the cell
(b) Water enters the cell
(c) No exchange of water takes place
(d) Solute goes from the cell into water.

AIIMS-2002

Ans. (c) : When water enters the cell of a plant cytoplasm and exerts an outward pressure and that pressure is called turgor pressure. Due to turgor pressure, rigid cell wall offers resistance. This resistance works in a direction opposite to turgor pressure. But it is equal to turgor pressure and is called wall pressure. In this condition, no exchange of water takes place.

DPD = TP – OP



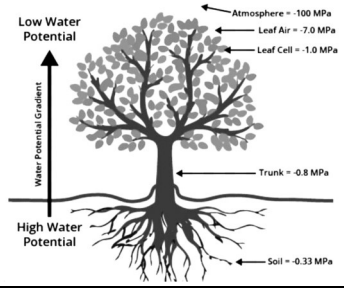
TURGOR PRESSURE

150. In plants, water moves from
(a) Less negative to more negative gradient
(b) More negative to less negative gradient
(c) Same gradients
(d) None of the above.

AIIMS-2001

Ans. (a) : In plants, water is absorbed by roots from the soil and it has to get transported to all parts of the plant. The pressure gradients needed to move water through the xylem could result from the generation of positive pressure at the base of the plant or negative pressure at the top of the plant.

• The water at the top of a free develops a large tension and this tension pulls water though the xylem. The xylem tensions needed to pull water from the soil level up in leaves as a consequence of transpiration.



151. The movement of water, from one cell of cortex to adjacent one in roots, is due to
(a) accumulation of inorganic salts in the cells
(b) accumulation of organic compounds in the cells
(c) water potential gradient
(d) chemical potential gradient

AIPMT-1995

Ans. (c) : The movement of water, from one cell of cortex to adjacent one in roots, is due to water potential gradient. Movement of water always occurs from low diffusion pressure deficit to high diffusion pressure deficit. During water absorption by roots water as well as solutes enter through root hair. After absorption of water by root hair, its turgor pressure in increased and thus diffusion pressure deficit is decreased.

152. Which of the following maintain the Shape of cell ?
(a) Osmotic pressure (b) Turgor pressure
(c) Wall pressure (d) Osmosis

Punjab MET-2006

Ans. (b) : Turgor pressure is the pressure exerted by the fluid (usually water) inside the plant cell against its cellule. It is the force that keeps the wall rigid and maintains the shape of the cell. Without turgor pressure, plant cells would collapse and lose their shape.

153. Select the correct statement :
(a) Absorption of water by seeds and dry wood are examples of facilitated diffusion
(b) The apoplast is the system of interconnected protoplasts
(c) Pinus seeds cannot germinate and establish without the presence of mycorrhizae
(d) The translocation in phloem is unidirectional whereas in the xylem it is bidirectional
(e) In plants, the water loss in its liquid phase is known as transpiration

Kerala PMT-2011

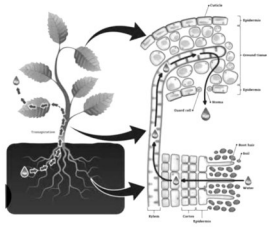
Ans. (c) : Pinus seeds cannot germinate without my corrhizal due to lack of water. As the mycorrhizal symbiotic association helps the plant in formation of root, mycorhizal fungi, which aid in the uptake of water and nutrients from the soil.

154. Which of the following is the most accepted theory for movement of water through plants?
(a) Cohesion theory (b) Capillarity
(c) Passive transport (d) Root pressure

DUMET-2011

Ans. (a) : The most accepted theory of ascent of sap is transpiration pull theory or cohesion-tension theory proposed by Dixon and Jolly (1894). According to this theory, water molecules are attracted to each other and to the walls of the xylem tubes which creates a continuous water column from the roots to the leaves. The tension created by transpiration pulls the water column upwards, against the force of gravity.

PLANT COHESION



155. If the humidity of the atmosphere suddenly increases substantially, the water flow in the xylem will
(a) increase
(b) decrease
(c) remain unaltered
(d) increase sharply and then reduce slowly to the pre-existing level

KVPY SB & SX-2014

Ans. (b) : If the humidity of the atmosphere suddenly increases substantially, the water flow in the xylem will decrease.

@apna_pdf

156. The continuation of excretion of watery liquid for sometime from the stump of a well watered pot plant after cutting off the shoot slightly above the base is due to:
(a) transpiration pull
(b) root pressure
(c) cohesive force of water
(d) absorption of minerals by roots

AP EAMCET-1998

Ans. (b) : The continuation of excretion of watery liquid for sometime from the stump of a well watered pot plant after cutting off the shoot slightly above the base is due to root pressure. Root pressure is generated by active uptake of minerals by root, which lowers water potential of root cells and water, flows inside in cells along its concentration gradient.
Thus, on the cutting of shoot, excretion of watery substance from cut side occurs.

157. Active absorption of water is affected by :
(a) osmosis in cytoplasm (b) transpiration pull
(c) osmotic tissue (d) none of the above

Rajasthan PMT-1999

Ans. (b) : Active absorption of water is affected by transpiration pull. The force which pull water from roof to the leave is known as transpiration pull or the suction force.

158. The movement of water from higher water potential to lower water potential through a semi-permeable membrane is called
(a) osmosis (b) diffusion
(c) plasmolysis (d) imbibitions

J&K CET-2010

Ans. (a) : The flow of water from a region of higher water potential to a region of lower potential, when the two solutions are separated by a semi or differentially permeable membrane is known as osmosis.
Plasmolysis- plasmolysis is the process in which cells loose water in a hypertonic solution.

159. Passage cells help in
(a) transport of water towards pericycle
(b) transport of water towards epiblema
(c) abosrption of water from soil
(d) passage of Co_2 towards stomata

WB JEE-2015

Ans. (a) : Passage cells help in the passage of water towards the pericycle. Passage cells are specialized cells that occur in the endodermis, which is a single layer of cells the surrounds the vascular cylinder. These cells have thin and porous cell walls. Which allow water and dissolved minerals to move through them easily.

160. Wilting of plant is because:
(a) xylem is blocked
(b) phloem is blocked
(c) epidermis and few roots are removed
(d) pith is removed

WB JEE-2008
Rajasthan PMT-2005

Ans. (a) : Wilting of plant is because xylem is blocked. Xylem is responsible for transport of water. If xylem is blocked, the plant will undergo wilting due to lack of proper transport of water.

E. Osmosis and Plasmolysis

161. Osmotic pressure of a solution is
(a) Greater than pure solvent
(b) Less than pure solvent
(c) Equal to pure solvent
(d) Less than or greater than pure solvent

JIPMER-2010
BHU PMT (Screening)-2007
BVP-2004
DUMET-2003

Ans. (a) : Osmotic pressure of a solution is always higher than that of pure water. However, osmotic potential is always negative of less than of pure water.

162. Root hair absorbs water from soil through
(a) Turgor pressure (b) Ion exchange
(c) Osmosis (d) DPD

MHT CET-2019
JIPMER-2008
BHU PMT (Screening)-2007
VMMC-2007

Ans. (c) : The root hairs take water from the soil through osmosis. In osmosis, water molecules move from a region of higher concentration to a region of lower concentration through a semi-permeable membrane. The concentration of the water molecules is lower in the root hair than in the soil.

163. Four cells A, B, C and D are placed in different water potentials solutions given below. Choose the pair of cells which exhibit same type of osmic flow

Cell	Solution
A : $\psi = -0.05$	$\psi = -0.2$
B : $\psi = -0.2$	$\psi = -0.001$
C : $\psi = -0.001$	$\psi = -0.3$
D : $\psi = -0.6$	$\psi = -0.05$

(a) A and C: Exosmosis
(b) B and C : Endosmosis
(c) B and D : Exosmosis
(d) A and D : Endosmosis

TS EAMCET-10.05.2023, Shift-II

Ans. (a) : Osmotic flow is the movement of water across a semi-permeable membrane from an area of high water potential to an area of low water potential.

164. Which of the following statements truly justifies osmosis of water through a selectively permeable membrane?
(a) Movement of solvent from a region of higher solvent concentration to a region of lower solvent concentration
(b) Movement of solvent from a region of lower free energy or chemical potential
(c) Movement of solvent from a region of higher solute concentration to a region of lower solute concentration
(d) Movement of solvent from a region of lower water potential to a region of higher water potential

TS EAMCET-11.05.2023, Shift-II

@apna_pdf

Ans. (a) : Movement of solvent from a region of higher solvent concentration to a region of lower solvent concentration.

- The term osmosis was first given by "Wilhelm Pfeffer in 1977".
- In the body, the homeostasis is maintain by osmosis.

165. Which one of the following processes would be an immediate effect on a plant if there is a sudden and large increase in soil salinity?

(a) Plasmolysis of root cells
(b) Closure of stomata
(c) Increase in transpiration
(d) Increase in root turgidity

KVPY (SA)-2021

Ans. (a) : Plasmolysis of root cells would be an immediate effect on a plant if there is a sudden and large increase in soil salinity when there is an increase in soil salinity, When there is an increase in soil salinity the concentration of salt in the soil solution becomes higher than the concentration of salt in the plant cells. As a result, water moves out of the plant cells, causing them to shrink and lose turgor pressure. This process is known as plasmolysis and it can lead to a decrease in plant growth and lead to a decrease in plant growth and even death if the salinity levels are high enough.

166. Choose the correct statements.

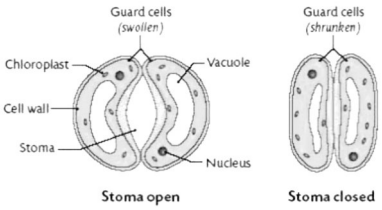
(A) Concentration gradient must already present for molecules to diffuse even if facilitated by proteins.
(B) A seed may appear dry as it has no water.
(C) The absorbance of water by corn plant is 5 liters in a day
(D) Numerically osmatic pressure is equal to osmatic potential with change in sign.
(E) Transpiration is affected by root/shoot ratio

(a) A, B, C only (b) A, D, E only
(c) B, C, E only (d) C, D, E only

TS EAMCET-29.09.2020 Shift-I

Ans. (b) : The correct option is ,

- Concentration gradient must already present for molecules to diffuse even if facilitated by proteins.
- Numerically osmatic pressure is equal to osmatic potential with change in sign.
- Transpiration is affected by root/shoot ratio.



167. The salting of pickles is an example for

(a) Deplasmolysis (b) Plasmolysis
(c) Flaccidity (d) Turgidity

AP EAMCET-24.09.2020 Shift-I

Ans. (b) : The salting of pickles is an example of plasmolysis.
Plasmolysis is the characteristic feature of living walled cells. All living cells (which has cell wall) plasmolyse when kept in a hypertonic solution.

168. During phase of cell enlargement in plant growth, solute concentration favours_____.

(a) endosmosis (b) plasmolysis
(c) imbibition (d) exosmosis

MHT CET-01.10.2020 Shift-I

Ans. (a) : During the phase of cell enlargement in plants growth, the solute concentration inside the cell is higher than outside the cell. This creates a hypertonic environment outside the cell and a hypertonic environment inside the cell which favors the process of endosmosis.

169. Pickles are preserved for longer period by the addition of salt. Which process is involved here?

(a) Osmosis (b) Guttation
(c) Plasmolysis (d) Imbibition

TS EAMCET-29.09.2020 Shift-II
Karnataka CET-2000

Ans. (c) : Pickles are preserved for longer period by the addition of salt. The process is involved here Plasmolysis. When salt is added to the pickling solution, it creates a hypertonic environment, causing the water to be drawn out of the cells of the food being pickled. This makes it difficult for bacteria and other microorganisms to grow thus preserving the food for a longer period.

170. What will be the direction of flow of water when a plant cell is placed in a hypotonic solution ?

(a) No flow of water in any direction
(b) Water will flow in both directions
(c) Water will flow out of the cell
(d) Water will flow into the cell

NEET (Odisha)-2019

Ans. (d) : When a plant cell is placed in hypotonic solution water will flow into the cell as water moves from high water potential to low water potential. The behaviour of plant cells with regards to water movement depends on the surrounding solution. Thus, when a plant cell is placed in hypotonic solution, the water will flow into the cell and the cell will swell. Water will enter into the cell due to endosmosis and turgor pressure of cell will increase. As wall pressure is equal and opposite to the turgor pressure. The wall pressure will increase.

171. Cell placed in hypertonic solution is shown by

(a) 
(b) 
(c)

(d) Both (a) and (b)

JIPMER-2019

@apna_pdf

Ans. (b) : Cell placed in hypertonic solution is shown by diagram (b). Hypertonic solution of the cell, if the concentration of solutes is higher compared to inside the cells. The cell will shrink because water moves out, firstly from the cytoplasm and then from the vacuole. This process is called as exosmosis which leads to the plasmolysis.

172. Which of the following are required for chemiosmosis?
I. A membrane
II. A neutron pump
III. An electron gradient
IV. ATPase
The correct answer is:
(a) I & II (b) II & III
(c) I & III (d) I & IV

TS EAMCET-08.05.2019 Shift-II

Ans. (d) : Chemiosmosis needs a membrane proton pump a proton gradient for making ATP with the help of ATPase enzyme.
ATP synthesis is connected with the development of proton gradient across membrane in both photosynthesis and respiration. Chemoiosomis is the ion movement across a semi permeable membrane against proton gradients.

173. Find the correct answer
(a) Water movement is against concentration gradient in Imbibition
(b) Addition of solute particles to a solution enhances water potential
(c) Rate of osmosis depends on both the pressure gradient and concentration gradient
(d) Pressure potential is negative in sieve tubes

AP EAMCET-25.04.2018 Shift-II

Ans. (c) : The rate of osmosis always depends on both pressure and concentration gradient. Osmosis occurs spontaneously in response to a driving force. The net direction and rate of osmosis depends on both the pressure gradient and concentration gradient.

174. When a freshwater protozoan possessing a contractile vacuole, is placed in a glass containing marine water, the vacuole will
(a) increase in number (b) disappear
(c) increase in size (d) decrease in size

Manipal-2007

Ans. (b) : When a freshwater protozoan possessing a contractile vacuole, is placed in a glass containing marine water, the vacuole will disappear. Contractile vacuoles serves function of osmoregulation. When these protozoan are placed in marine water i.e. hypertonic water, the cell stant to lose water through the process of exosmosis.

175. RBC and a plant cell (with thick cell wall) are placed in distilled water. The solute concentration is the same in both the cells. What changes would be observed in them?
(a) Both plant cell and RBC would not undergo any change.
(b) The RBC would increase in size and burst while the plant cell would remian about the same size.
(c) The plant cell would increase in size and burst while the RBC would remain about the same size.
(d) Both plant cell and RBC would decrease in size and collapse.

Manipal-2009

Ans. (b) : When RBC and a plant cell (with thick cell wall) are placed in distilled water, endosmosis (movement of water molecules from higher concentration (distilled water) to lower concentration) takes place and the result of which RBC would increase in size and burst, while the plant cell would remain about the same size because of the presence of a rigid cell wall.

176. The values of osmotic potential (Pi) and pressure potential (p) of cells A, B, C and D are given below.

	π
Cell A	**– 1.0**
Cell B	**– 0.6**
Cell C	**– 1.2**
Cell D	**– 0.8**

Identify the correct sequence that shows the path of movement of water from among the following
(a) $D \rightarrow C \rightarrow A \rightarrow B$ (b) $B \rightarrow D \rightarrow A \rightarrow C$
(c) $B \rightarrow C \rightarrow D \rightarrow A$ (d) $C \rightarrow B \rightarrow A \rightarrow D$

VMMC-2010

Ans. (b) : The flow of water occurs from a high potential to a lower potential.

Cell	Water potential (Osmotic potential + Pressure potential)
A	–1 + 0.5 = – 0.5
B	– 0.6 + 0.3 = – 0.3
C	– 1.2 + 0.6 = – 0.6
D	– 0.8 + 0.4 = – 0.4

177. The risk of spoilage is less in salted pickles because of:
(a) guttation (b) plasmolysis
(c) imbition (d) diffusion

AP EAMCET-2002
Uttarakhand PMT-2010

Ans. (b) : The risk of spoilage is less in salted pickles because of plasmolysis. Plasmolysis is the process of shrinkage of protoplasm away from the cell wall. The fluid content of the cell is removed due to the process of exosmosis. Due to the salt, the concentration outside is hypertonic and the water from the pickle is removed out. The dry pickle is less prone to spoilage and can be stored for longer.

178. Excess salt inhibits growth in pickles by
(a) endosmosis (b) exosmosis
(c) oxidation (d) denaturation

KVPY SA-2015

Ans. (b) : The excessive salt is used for the presser vation of the pickles for long period of time. The high concentration of salt in the pickles causes the removal of the water from the bacterial cells resulting plasmalysis.
Due to hypertonic solution outside the bacterial cell, bacteria will die by plasmolysis.

@apna_pdf

179. Osmosis involves

(a) flow of water without a membrane
(b) flow of solute from a semipermeable membrane
(c) flow of solvent (H_2O) through semi-permeable membrane
(d) None of the above

BHU-PMT (Screening)-2008

Ans. (c) : Osmosis is the term used to refer specifically to the diffusion of water across a differentially or semi permeable membrane. Osmosis occurs spontaneously in response to a driving force. The net direction and rate of osmosis depends on both the pressure gradient and concentration gradient. Water will move from its region of higher chemical potential or concentration to its region of lower chemical potential untill equilibrium is reached. At equilibrium the two chambers should have the same water potential. .

180. If flowers are cut and dipped in dilute NaCl solution then

(a) Transpiration is law
(b) Endosmosis
(c) No bacterial growth takes place
(d) Absorption of solute inside flower cell takes place

BCECE-2008

Ans. (b) : Dilute NaCl solution acts are hypotonic solution Endosmosis occurs is flower cells. Endosmosis it's the process of osmotic entry of solvent or water into a cell or system when it is in contact with hypotonic solution or pure solvent. Endosmosis makes the flowers cells turgid.

181. A cell swells up when kept in

(a) Hypotonic solution (b) Hypertonic solution
(c) Isotonic solution (d) All of the above

BCECE-2008
UP CPMT-2007

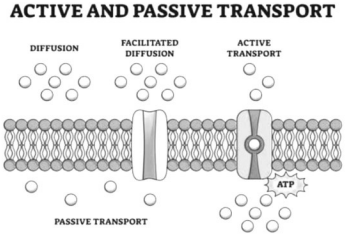
Ans. (a) : A cell swells up when kept in a hypotonic solution due to the process of endosmosis.
Endosmosis is the movement of water into the cell and such a plant cell is referred to turgid.

182. Movement among cells against concentration gradient is called.

(a) osmosis (b) active transport
(c) diffusion (d) Passive transport

AFMC-2007
BCECE-2004

Ans. (b) : Active transport is the movement of the molecules or ions of a substance from a region of their lower concentration to a region of then higher concentration region against the concentration gradient by using energy.



183. Isotonic solutions have same

(a) Normality (b) pH
(c) Temperature (d) Osmolarity

BCECE-2009
J&K CET-2005

Ans. (d) : Isotonic solutions have same osmotic pressure at a given temperature and have same molar concentration i.e. same osmolarity. Osmolarity is measure of concentration per litre of water.

184. The osmotic parameter determining the flow of water from one cell to another is

(a) OP (b) DPD
(c) TP (d) Hydrostatic pressure

AMU-2003
Rajasthan PMT-2000

Ans. (b) : Diffusion pressure deficit (DPD) is the force that determines the flow of water from one cell to the another, it is the difference in diffusion pressure between osmosis pressure and turgor pressure.

185. The plants may face wilting due to use of excess fertilizers because of

(a) endosmosis (b) exosmosis
(c) imbibition (d) transpiration

AMU-2002

Ans. (b) : The plants may face wilting due to use of excess fertilizers because of exosmosis.
It is the movement of water outside the cells when a cell is placed in a hypertonic solution.

186. Living cells placed in isotonic solution (0.9% saline) retain their size and shape. This is based on the concept of

(a) Osmosis (b) Diffusion
(c) Facilitated diffusion (d) Transpiration

WB JEE-2012

Ans. (a) : When living cells are placed in isotonic solution, they retain their shape and size as such because no osmotic movement of water molecules takes place. If a plant cell is placed in hypertonic solution, the cell gets plasmolysed due to exosmosis. On the other hand, if a plasmolysed cell is placed in hypotonic solution, endosmosis occurs and the cell gets deplasmolysed.

187. When the cell is fully turgid, its

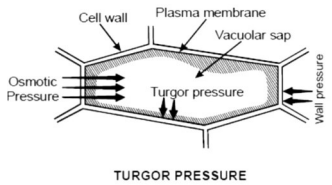
(a) DPD = OP (b) DPD = zero
(c) WP = TP (d) OP = zero

WB JEE-2010

Ans. (c) : When a cell is fully turgid, its walls and membranes are completely stretched. At this time osmotic pressure of the cell will be equal to turgor pressure.

OP = TP so DPD = 0
WP = OP – DPD
WP = OP
WP = TP

Water always flows from the lower DPD to higher DPD. The TP is equal & opposite indirection of WP.



@apna_pdf

188. Which of the following maintain the shape of cell?
(a) Osmotic pressure (b) Turgor pressure
(c) Wall pressure (d) Osmosis

Rajasthan PMT-2004

Ans. (b) : Turgor pressure of maintain the shape of a cell. Turgor is generated through an osmotically driven in flow of water into cells across a plasma membrane.

189. Exchange of substances between individual cells and their environments taken place by:
(a) osmosis (b) active transport
(c) diffusion (d) all of these

BHU PMT-2002

Ans. (d) : Diffusion :- Diffusion is the movement of molecules (solid, liquid, gas) from a region of higher concentration to a region of lower concentration till a level of equilibrium is reached.
Osmosis :- Osmosis is the movement of a solvent across a semi permeable membrane towards a higher concentration of solute.
Active transport :- Active transport is a kind of cellular transport where substances move against a concentration gradient.

190. In osmosis there is movement of
(a) solute only
(b) solvent only
(c) both (a) and (b)
(d) neither solute nor solvent

DUMET-2005 / UP CPMT-2003

Ans. (b) : Osmosis is a movement of solvent from their high concentration to low concentration or higher water potential to lower potential or high solute potential to low solute potential through semipermeable membrane.

191. Active K^+ exchange mechanism for opening and closing of stomata was given by
(a) Darwin (b) Levitt
(c) Scarth (d) Khorana

BVP-2012 / MGIMS Wardha-2007

Ans. (b) : This mechanism of stomatal opening and. closing was first given by Levitt. It state that an increase in potassium (K) ion makes the guard cells hypertonic so that more water can enter inside the cells.

192. Which of the following characteristics are associated with hydrophytes ? (1) Water and mineral nutrients are absorbed through general body surface (2) Osmotic concentration or osmotic potential of cell is equal to or slightly higher than external water (3) Presence of weak and negatively geotropic roots (4) Presence of mucilage to hold water
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2009

Ans. (b) : Some of the major features of hydrophytes are as follows.
- Water and mineral nutrients are absorbed through general body surface.
- Osmotic concentration or osmotic potential cells is equal to or slightly higher than external water.
- Reduced root system

Therefore correct answer is option (b).

193. Solute potential of a solution is always
(a) = 0 (b) > 0
(c) < 0 (d) Between 0 - 1

DUMET-2010

Ans. (c) : Solute potential of a solution is less than zero that is always negative. Its magnitude depends on the concentration of solute particles in the solution.

194. Which of the following statements about plasmolysis is/are true?
(i) Plasmolysis occurs when water moves into the cell
(ii) Cells shrink in hypotonic solutions
(iii) If the external solution balances the osmotic pressure of the cytoplasm, it is said to be isotonic
(a) i only (b) ii only
(c) iii only (c) i and ii only
(e) ii and iii only

Kerala PMT-2015

Ans. (c) : Plasmolysis is the process of shrinking of plasma membrane from the cell wall then the cell is placed in a hypertonic solution. This happens due to exosmosis as water moves out of cell into the solution. When the cell (or tissue) is placed in an isotonic solution, these is no net flow of water towards the inside or outside. If the external solution balances the osmotic pressure of the cytoplasm it is said to be isotonic.

195. The sign of osmotic potential is :
(a) (–) (b) (+)
(c) $(\times)$ (d) $(\div)$

Rajasthan PMT-1998

Ans. (a) : Osmotic potential (Ψ_s) results from dissolved solution in cell sap and is proportional to solute concentration and inversely proportional to cell water volume. Ψ_s in plants is always negative and decreases as solutes concentrate during plant dehydration means no solute present in water hence its symbol is negative (–).

Directions: In the following question more than one of the answers given may be correct. Select the correct answer and mark it according to the code:

196. Which one is a colligative property ?
(1) Osmotic pressure
(2) Vapour pressure
(3) Cohesion force
(4) Surface tension
(a) 1, 2 and 3 are correct. (b) 1 and 2 are correct.
(c) 2 and 4 are correct. (d) 1 and 3 are correct.

BHU PMT (Mains)-2008

Ans. (b) : The properties when depend only upon the number of solute particles present in the solution irrespective of their nature are called colligative properties. Lowering in vapour pressure, elevation in boiling point, depression in freezing point and osmotic pressure are colligative properties.

197. All the following involves osmosis except which case:
(a) water entering from soil into root hair
(b) water passing from root hair to an adjacent cell

@apna_pdf

(c) water passing up on xylem vessel element to xylem vessel element above
(d) water entering a mesophyll cell from the xylem vessel

Haryana PMT-1999

Ans. (c) : Osmosis is defined as the movement of solvent or water along the concentration gradient across living semi permeable membrane. Osmosis involve,
- Water entering from soil into root hair.
- Water passing from root hair to an adjacent cell
- Water entering a mesophyll cell from the xylem vessel
- All of the above involves the osmosis except the water passing from one xylem vessel element to another xylem vessel element.

198. A Red Blood Cell (RBC) was kept in a certain solution for few minutes and it got burst. The said solution was
(a) isotonic (b) concentrated sugar solution
(c) hypertonic (d) hypotonic

AMU-2005

Ans. (d) : When an red blood cell (RBC) is kept in a hypotonic solution then, water enters the RBC by the process of osmosis (Endosmosis). The RBC will increase in size and ultimately burst. Osmosis is the movement of solvent particles from hypotonic to hypertonic medium through semipermeable membrane.

199. If water enters in a cell, the pressure exerted by its swollen protoplast is:
(a) turgor pressure (b) DPD
(c) osmotic pressure (d) imbibtion

AFMC-2004

Ans. (a) : The turgidity of cell increases, if water enters in a cell. As a result of turgidity turgor pressure is exerted by its swollen protoplast.

200. Assertion: Passive process like diffusion and osmosis do not require energy.
Reason: Because the plasma membrane is a static structure.
(a) Both Assertion and Reason are true and Reason is the correct explanation of Assertion
(b) Both Assertion and Reason are true but Reason is not the correct explanation of Assertion
(c) Assertion is true but Reason is false
(d) Assertion is false but Reason is true

VMMC-2011

Ans. (c) : Diffusion process is a passive transport because it does not require energy. In osmosis process the solvent molecules move from lower solute concentration to higher solute concentration through a semi permeable membrane. This process does not require energy.

201. Flaccid cell means ….
(a) Plasmolysed cell
(b) Cell with turgidity
(c) The cell in which water flows in and out of cell are in equilibrium
(d) The cell kept in hypotonic solution

GUJCET-2014

Ans. (c) : Flaccid cell means the cell in which the water flow in and out of the cell and is in equilibrium. When a cell is place in an hypertonic solution water is transported out of the cell and the cell shrink or shrivel or plasmolysed. When the cell is placed in hypotonic solution the water flows into the cell causing the cell to swell and however the cell are placed in isotonic solution there will be continuous flow of water in and out of the cell and the cell is said to be in flaccid condition.

202. Compare the Statement A and B.
Statement A : To counteract the increase in turgor pressure in plant cells, the cell wall produces an equal and opposite pressure i.e. wall pressure.
Statement B : When plant cells undergo endosmosis, they swell but do not burst.
(a) Statement A is correct and B is wrong
(b) Both the statements A and B are correct and A is the reason for B.
(c) Both the statements A and B are correct and A is not the reason for B.
(d) Statement A is wrong and B is correct.

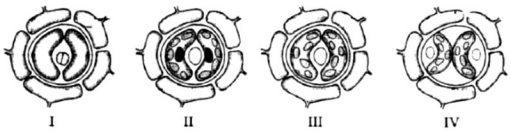
Karnataka CET-2010

Ans. (b) A hydrostatic pressure or turgor pressure develops in the confined part of an osmotic system due to osmotic entry to water into it. Due to turgor pressure the protoplast of a plant cell will press the cell wall to the outside. The cell wall being elastic presses the protoplast with an equal and opposite force. The force exerted by the cell wall over the protoplast is called wall pressure.

203. A leaf peeling of Tradescantia is kept in a medium having 10% NaCl. After a few minutes, if we observe the leaf peel under the microscope, we are likely to see
(a) Diffusion of NaCl into the cell
(b) Exit of water from the cell
(c) Entry of water into the cell
(d) The cells bursting out

Karnataka CET-2008

Ans. (b) : A leaf peeling of Tradescantia is kept in a medium having 10% NaCl. After a few minute if we observe the leaf peel under the microscope, we are likely to see exit of water from the cell. This process is known as exosmosis.



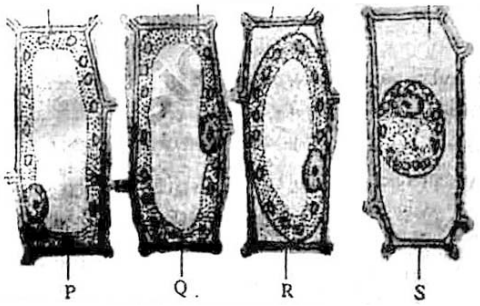
204. Response of plants due to reversible turgor change in pulvinus is
(a) Nyctinastic (b) Seismonastic
(c) Heptonastic (d) Photonastic

BCECE-2012

Ans. (b) : Seismonastic movements are due to the touch, shock, rain electric currents. The best example of seismonastic movement is the leaves of sensitive plant Mimosa pudica the movement is produced due to turgor changes in the cells of pulvinus or swollen area lying at the base of petiole pinnae and pinnules.

@apna_pdf

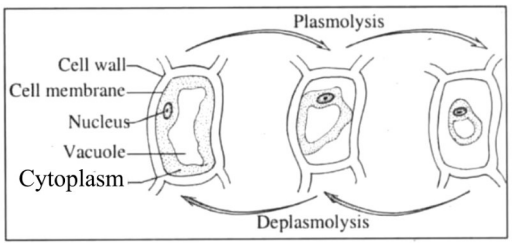
205. In the given figure, which is the initial condition of plasmolysis?



(a) P (b) Q
(c) R (d) S

GUJCET-2016

Ans. (b) : In the initial phase of plasmolysis the cell loses water and just loses its turgidity. There is little bit change in shape and cell membrane makes gap with cell wall. Image Q represents this stage. Image P represents turgid cell. Image R and S are the middle and final stages of plasmolysis.

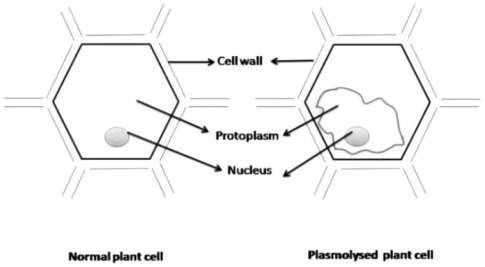


206. When plant cells are kept in a concentrated solution, they are

(a) deplasmolysed (b) plasmolysed
(c) Remains as such (d) becomes turgid

BVP-2000

Ans. (b) : When plant cells are kept in a concentrated solution, they become plasmolysed. Plasmolysis occurs when the cell loses water and the plasma membrane pulls away from the cell wall.



207. The most abundant intracellular cation is:

(a) K^+ (b) Na^+
(c) Ca^{++} (d) H^+

NEET-2013

Ans. (a) : Most abundant intracellular cation is K^+, It is involved in guard cell movements and many other plant movements. Na^+ is the most abundant extracellular cation. Both maintain osmotic balance, both involved in nerve conduction and maintenance of membrane protein in animal, living cells regularly throw out sodium and take in potassium ions.

208. Which one of the following doesn't help in molecule transport?

(a) Diffusion (b) Osmosis
(c) Surface tension (d) Active transport

JIPMER-2005

Ans. (c) : Surface tension does not help in molecules transport. Surface tension is a type of force which tends to minimize the surface area of liquid as possible. Diffusion, osmosis and active transport are the different types of molecule transport system.

209. A plasmolysed cell can be deplasmolysed by placing it in

(a) isotonic solution
(b) saturated solution
(c) pure water or hypotonic solution
(d) hypertonic solution.

AIIMS-2016 / Karnataka CET-2011 JCECE-2006

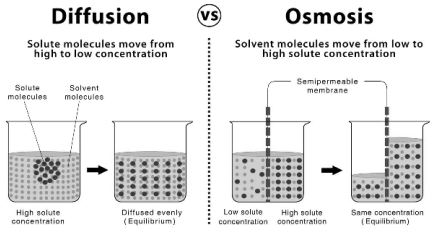
Ans. (c) : A plasmolysed cell can be deplasmolysed by placing it in pure water or hypotonic solution. Deplasmolysis is possible only immediately after plasmolysis otherwise the cell protoplast becomes permanently damaged. During deplasmolysis water diffuse into protoplast.

210. Osmosis is a type of

(a) Imbibitions of solution
(b) Diffusion of solvent
(c) Evaporation of water
(d) Diffusion of solute

AIIMS-2014

Ans. (b) Osmosis is a type of diffusion of solvent. The molecule or atom move from an area of high concentration to an area of low concentration.



211. Solution outside a cell has higher concentration than cytoplasm. Then the solution is:

(a) isotonic (b) acidic
(c) hypotonic (d) hypertonic

AFMC-2003

Ans. (d) : The solution outside a cell has a higher concentration than the cytoplasm, it means that the solution has a lower water concentration and a higher solute concentration compared to the cytoplasm. This type of solution is called hypertonic.

212. Who coined the term chemiosmosis?

(a) P. Mitchell (b) Hill
(c) Priestley (d) Calvin

Manipal-2002

Ans. (a) : The term chemiosmosis was coined by P. Mitchell in 1961. Peter Mitchell was a British biochemist who proposed the chemiosmotic theory which describes the mechanism by which ATP is synthesized in the mitochondria and chloroplasts of eukaryotic cells.

@apna_pdf

213. The process by which water is absorbed by solids like colloids causing them to increase in volume is called :

(a) Osmosis (b) Plasmolysis
(c) Imbibition (d) Diffusion
(e) Facilitated diffusion

Kerala PMT-2011

Ans. (c) : The process by which water is absorbed by solids like colloids causing them to increase in volume is called imbibition. Imbibition is an essential process in the germination of seeds, and it also plays a crucial role in the absorption of water by plant roots.

214. When a cell is fully turgid which of the following will be zero:

(a) W.P. (b) O.P.
(c) T.P. (d) DPD

JIPMER-1996

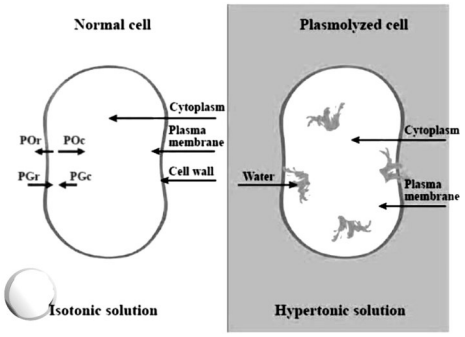
Ans. (d) : When a cell is fully turgid, the pressure potential or hydrostatic pressure inside the cell is at its maximum, and this pressure is equal and opposite to the external pressure, so the net pressure difference (DPD) is zero. Therefore, DPD is also zero when a cell is fully turgid.

215. Plasmolysis is the result of

(a) exosmosis (b) endosmosis
(c) reverse osmosis (d) diffusion

JCECE-2012

Ans. (a) : Plasmolysis is the result of exosmosis. Exosmosis is a type of osmosis where water diffuses out of a cell into a hypertonic solution, i.e.a solution with a higher concentration of solutes than the cell.



216. A plant cell becomes turgid due to

(a) plasmolysis (b) exosmosis
(c) endosmosis (d) electrolysis

WB JEE-2011

Ans. (c) : A turgid plant cell is defined as a cell which has a turgor pressure or force that is exerted by the fluid in a cell which pushes the cell membrane against the cell wall. When a plant cell is kept in hypotonic solution, i.e. solution with lesser solute concentration than cell than endosmosis will occur. Endosmosis is a process in which the water molecules move from surrounding solution to the cell through cell membrane. Due to this, the plant cell becomes turgid.

217. A plant cell is placed in a solution whose solute concentration is twice as great as the concentration of the cell cytoplasm. The plasma membrance is selectively permeable, allowing water but not solutes to pass through. What will happen to the cell ?

(a) The cell will swell because of endosmosis
(b) The cell will shrivel because of exosmosis
(c) The cell will shrivel because of active transport of water
(d) No change will occur because of hard impervious cell wall present

MGIMS Wardha-2015

Ans. (b) : A plant cell is placed in a solution whose solute concentration is twice as great as the concentration of the cell cytoplasm. The plasma membrance is selectively permeable, allowing water but not solutes to pass through. The cell will shrivel because of exosmosis.

218. Which statement is correct?

(a) Osmotic pressure of solution is greater than pure solvent
(b) Osmotic pressure of solution is lower than the pure water
(c) Osmotic pressure of solution is equal to the pure water
(d) None of the above

DUMET-2004

Ans. (a) : As more and more solute is dissolved in the solvent, the concentration of the solution goes on increasing. With the increase in concentration of the solution, the osmotic pressure of the solution, the osmotic pressure of the solution increases. Thus the osmotic pressure of solution is greater than the pure solvent. Osmotic pressure is the pressure created by water moving across a membrane due to osmosis.

219. Direction: In the given questions a statement of Assertion (A) is given and a corresponding statement of Reason (R) is given just below it of the statement, mark the correct answer as: Assertion : Plasmolysis occurs when plant cells are placed in concentrated salt solution. Reason: Concentrated salt solution is a hypotonic solution.

(a) If both (A) and (R) true and (R) is the correct explanation of (A)
(b) If both (A) and (R) are true but (R) is not correct explanation of (A)
(c) If (A) is true but (R) is false
(d) If both (A) and (R) are false
(e) If (A) is false but (R) is true

Haryana PMT-2001

Ans. (c) : Plasmolysis occurs when plant cells are placed in a hypertonic solution. Not hypotonic solution In a hypertonic solution, the concentration of solutes outside the cell is higher than inside the cell protoplasm and causing water move out through diffusion into the extracellular (outside cell) fluid causes the protoplasm to strink away from the walls. So the correct answer: (A) is true but (R) is false. The concentrated salt solution is a hypertonic, not phypotonic, and it causes plasmolysis by drawing water out of the plant cells.

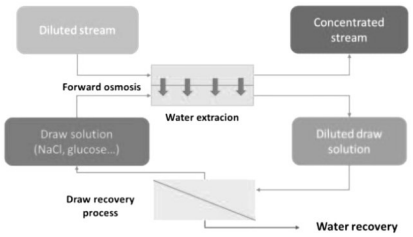
220. Which of the following has maximum water potential?

(a) Pure water
(b) 2% sucrose solution
(c) 4% glucose solution
(d) 10% sodium chloride solution

J&K CET-2003

@apna_pdf

Ans. (a) : Pure water has the maximum water potential, which is defined as the potential energy of water molecules in a solution compared to pure water, which has a water potential zero. It is denoted by symbol Ψ (psi) and measured in units of pressure such as pascals. Water molecules possess kinetic energy. The greater the concentration of water in a system, of pure water.



221. The process by which water enters into plant cell is called :
(a) diffusion (b) osmosis
(c) endosmosis (d) both (b) and (c)

Rajasthan PMT-2001

Ans. (c) : The process in which water molecules enter the cell is called endosmosis. It happens due to presence of hypotonic solution on the outside. Endosmosis is a type of osmosis where water moves from a region of high water concentration to a region of low water concentration across a selectively permeable membrane, such as the cell membrane of a plant cell. Water move by osmosis which is a type of diffusion.

222. If a cell shrinks when placed in a solution, this solution is:
(a) hypotonic (b) hypertonic
(c) isotonic (d) mesotonic

JCECE-2003

Ans. (b) : In a hypertonic solution, the concentration of solutes outside the cell is higher than inside the cell protoplasm. As a result, water moves out of the cell by osmosis, causing the cell to shrink or undergo plasmolysis.

223. Water can be absorbed from a hypertonic external solution by :
(a) adding more water in the external solution
(b) auxin treated cells
(c) adding a buffer in the external solution
(d) cytokinin treated cells

BVP-2006

Ans. (b) : The auxin treated cells show an increase in their metabolism. Respiration in these cells increases and more energy is provided for the absorption of water, Auxin is a plant hormone that can stimulate the activity of proton pumps on the cell membrane, which in turn, acidifies the cell wall. This acidification leads to the activation of aquaporin channels, which facilitate the movement of water molecules into the cell. As a result, auxin-treated cells are better able to absorb water from hypertonic solution, helper them to maintaing turgor pressure and avoid damage.

224. Which of the following is true regarding guttation? (1) Occurs through stomata (2) Occurs through hydathodes (3) Loss of pure water (4) Occurs mostly during night and early morning
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2007

Ans. (c) : Guttation occurs through small openings on the leaf margin called hydathodes. The correct answer is occurs through hydathocles and occurs mostly during the night and early morning. The cause of guttation is mainly root pressure.

225. Ascent of sap in plants was demonstrated by
(a) Girdling experiment
(b) Ganongs experiment
(c) Went experiment
(d) Lever auxanometer

BCECE-2012

Ans. (a) : Ascent of sap in plant was demonstrated by girdling experiment. The Girding/Ringing experiment involves the removal of all the tissue outside to vascular cambium (bark, cortex, and phloem) in woody stems except xylem.

F. Transport of Mineral Nutrients

226. Assertion (A) : Tonoplast facilitates the transport of ions against concentration gradient. Reason (R) : Concentration of ions is significantly higher in the vacuole than cytoplasm
(a) (A) and (R) are true. (R) is the correct explanation for (A)
(b) (A) and (R) are true, but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-10.05.2023, Shift-II

Ans. (a) : Tohoplast is the membrane sorounding of vacoule. Vacoule help in maintaining cell volume and cell turgor. The regulation of cytoplamic ions and pH.
• Tonoplast help in the transport of ions and minerals against the concentration gradient into the vacoule utilizing energy in the form of ATP.

227. Match the following

List – I		List - II		List - III	
A.	Photo autotrophs	i.	Oxidation of inorganic substances	P.	Bacillus
B.	Photo heterotrophs	ii.	Organic detritus	Q.	Beggiota
C.	Chemo autotrophs	iii.	Organic CO_2	R.	Chromatium
D.	Saprophytes	iv.	Atmospheric CO_2	S.	Rhodospirillum

(a) A – iv – R, B – iii – S, C – i – Q, D – ii – P
(b) A – iv – R, B – i – Q, C = iii – S, D – ii - P
(c) A – iv – P, B – i – S, C – ii – Q, D – iii - R
(d) A – iv – S, B – iii – P, C – ii – R, D – i - Q

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : • **Photoautotrophs–** An organism that can synthesize organic compounds from inorganic substance using light as a source of energy- It include chromatium, algae, plants etc.
• **Chemoautotrophs–** They formed organic compounds from inorganic substances using chemical energy. They include some bacteria, Beggiota etc.

@apna_pdf

• **Photoheterotrophs–** They formed organic compounds from organic compounds using light as a source of energy. It include Rhodospirillum.

• **Saprophytes–** An organism that break down dead organic matter and absorb the released nutrients. It include-fungi and bacillus.

228. Substances that undergo upward or downward transport

(a) Organic and mineral nutrients
(b) Water and minerals
(c) Minerals and plant growth regulators
(d) Hormones and amino acids

AP EAPCET-23.05.2023, Shift-I

Ans. (d) :

229. Given below are two statements :

Statement I: The process of translocation through phloem is unidirectional but through xylem, it is bidirectional.

Statement II: The most readily mobilized elements are phosphorus, sulphur, nitrogen and potassium.

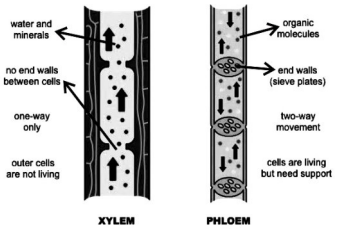
In the light of the above statements, choose the most appropriate answer from the options given below :

(a) Both Statement I and Statement II are correct
(b) Both Statement I and Statement II are incorrect
(c) Statement I is correct but Statement II is incorrect
(d) Statement I is incorrect but Statement II is correct

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) : Phloem translocation is bidirectional i.e. both in upward and downward directional (source to sink). This process requires ATP.

• Phosphorus, S, N, K most readily mobilize.



230. Select the incorrect statement.

(a) Elements most easily mobilized in plants from one region to another are : phosphorus, sulphur, nitrogen and potassium
(b) Transport of molecules in phloem can be bidirectional
(c) Movement of minerals in xylem is unidirectional
(d) Unloading of sucrose at sink does not involve the utilization of ATP

NEET-2020 Phase-II

Ans. (d) : Unloading of sucrose at sink is an energy dependent process.

- It is done actively with the utilization of ATP
- Sucrose is moved out of the phloem sap and transfer into the other plant cell that will use the sugar. Sugars moved out to the sink leads to the low osmotic pressure. Transfer of sugar from phloem sap to other plants cell (root, stem) is called unloading of phloem.

231. Assertion (A): Ions and organic material concentration is higher in cytoplasm than vacuole.
Reason (R): Tonoplast facilitates the transport of ions and other materials against concentration gradient into the vacuole.
Options:

(a) (A) and (R) are correct. (R) is the correct explanation to (A).
(b) (A) and (R) are correct. (R) is not the correct explanation to (A).
(c) (A) is true, (R) is false.
(d) (A) is false, (R) is true.

AP EAMCET-24.04.2019 Shift-II

Ans. (d) : Vacuoles are non-cytoplasmic areas present inside the cytoplast of plant cells. The sap vacuoles are fluid- filled vacuoles which are separated by tonoplast, (a special type of membrane) from the cytoplasms. They contain various inorganic salts and ions. Soluble pigments like anthocyanins, different types of organic acids are also found inside the sap vacuoles. These salts and ions can be transported through the tonoplast.

232. Select the incorrect statements from the following

(I) In plasmamembrane hydrophilic polar heads of lipids arrange towards the outside and the hydrophobic tail towards the innerside
(II) In plasmamembrane peripheral proteins lie on the surface of membrane while the integrated proteins are buried in the membrane
(III) Neutral solutes may move across the membrane by the process of simple diffusion against the concentration gradient
(IV) Polar molecules can pass through the non-polar lipid bilayer and do not require a carrier proteins

The correct answer is
Options:

(a) I, II (b) III, IV
(c) II, III (d) III, I

AP EAMCET-24.04.2019 Shift-I

Ans. (b) : Statement III is incorrect because the neutral solutes may move across the membrane by the process of simple diffusion along the concentration gradient, i.e. from higher concentration to the lower.
Statement IV is incorrect because polar molecules can not pass through the non-polar lipid bilayer and require a carrier protein or channel protein to move across the membrane.

233. Munch hypothesis is based on

(a) Translocation of food due to Turgor Pressure (TP) gradient and imbibition force
(b) Translocation of food due to Turgor Pressure (TP) gradient
(c) Translocation of food due to imbition force
(d) None of the above

JIPMER-2017

Ans. (b) : Munch hypothesis is based on Translocation of food due to Turgor Pressure (TP) gradient.
The mass flow of organic solutes takes places from the site of higher concentration (source) to the site of lower concentration (sink). Munch hypothesis also know as pressure flow hypothesis or mass flow hypothesis.

@apna_pdf

234. The first acceptor of electrons from an excited chlorophyll molecule of photosystem-II is
(a) cytochrome (b) iron-sulphur protein
(c) ferredoxin (d) plastoquinone
JCECE-2015

Ans. (d) : Plastoquinone is the first acceptor of electrons from an excited chlorophyll molecule of photosystem-II. But ferredoxin is the iron-containing sulphur protein which is first pigment that accept electrons in PS-I
Light reaction of the photosynthesis start from the excitation of chlorophyll by a photon.

235. Which one of the following theories for ascent of sap was proposed by an eminent Indian scientist JC Bose?
(a) Relay pump theory
(b) Pulsation theory
(c) Root pressure theory
(d) Transpiration pull theory
VMMC-2013

Ans. (b) : The theory says that the innermost cortical cells of the root absorb water from the outer side and pump the same into xylem channels. The theory of ascent of sap was put forward by J.C Bose in 1923 which is called the vital force theory of pulsation theory.

236. Glycolate induces opening of stomata in
(a) presence of oxygen
(b) low CO_2 concentration
(c) high CO_2 concentration
(d) absence of CO_2
Manipal-2012

Ans. (b) : Glycolate includes the opening of stomata in low carbon dioxide concentration. Light causes photosynthesis which leads to reduction in concentration CO_2.

237. The cohesive force existing between molecules of water is contribution to:
(a) plasmolysis (b) translocation
(c) ascent of sap (d) osmosis
Karnataka CET-2002

Ans. (c) : This cohesive force in water molecules is essential for the ascent of the sap because of higher transpiration rate.
The force allows the water separation between them and it arises because of the hydrogen bond between the water molecules. Cohesion force holds similar molecules together. In water it is strong because the presence of hydrogen bond.

238. Minerals are absorbed by plants in
(a) Colloidal form (b) Ionic form
(c) Preciplated form (d) None of these
UP CPMT-2011

Ans. (b): The inorganic essential element which are obtained from soil are called **mineral element**. Plant absorbs the minerals in form of ion. The movement of ion is called flux and absorbed by passive absorption.

239. The movement of ions against the concentration gradient will be:
(a) Active transport (b) Osmosis
(c) Diffusion (d) All
AIPMT-2000

Ans. (a) : The movement of molecules across a cell membrane in the direction against their concentration gradient using energy is called active transport.
- Diffusion is the movement of a substance from an area of high concentration to an area of low concentration.
- Osmosis is the movement of a solvent or water across a semi permeable membrane towards a higher concentration of solute.

240. Passive absorption of minerals depend on
(a) Temperature
(b) Temperature and metabolic inhibitor
(c) Metabolic inhibitor
(d) Humidity
AIPMT-2001

Ans. (a) : Passive absorption of minerals depend on temperature.
- These carriers are required for active transport of salts from outer space in inner space.
- Rate of diffusion of ions and molecules increases at enhanced temperature due to their increased kinetic activity. Thus passive salt absorption will increase.

241. Who said that "transpiration is a necessary evil"?
(a) Curtis (b) Steward
(c) Andersen (d) J.C. Bose
JIPMER-2006

Ans. (a) : Curtis called transpiration a necessary evil because.
- It cause about 90% of water loss for the plant.
- But it is necessary for plant sucking the mineral and nutrition with water pull
- If transpiration is high than cause the wilting of leave.
- But transpiration lead cooling the plant.

242. Which of the following exhibits a direct porportionality to transpiration?
(a) Light and RH
(b) Temperature and RH
(c) Temperature and wind
(d) RH and wind
JIPMER-2006

Ans. (c) : Temperature and wind have the direct porportionality to transpiration.

243. The percentage of cell surface that is impenetrable for ions is
(a) 1% (b) 99.9%
(c) 90% (d) 73%
AIIMS-2011

Ans. (b) : Less than 0.1% of plasma membrane is perforated, which allow the ions to pass through. The transport of most ions occurs more slowly than the non-electrolytes. But H^+, OH^- penetrate all cell membrane easily. The red blood cells is easily penetrated by Cl^- and HCO_3^-.

In case of ions, especially, Na^+ and K^+, the permeability is very small. The high concentration of K^+ and low concentration of Na^+ which are often found in cells are maintained by special mechanism which involve the expenditure of energy.

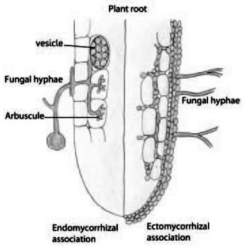
@apna_pdf

244. Which one of the following pairs is correctly matched:

(a) Rhizobium – Parasite in the roots of leguminous plants
(b) Mycorrhizae – Mineral uptake from soil
(c) Yeast – Production of biogas
(d) Myxomycetes – The disease ring worm.

AIIMS-2003

Ans. (b) : Mycorrhiza is a symbiotic association of a fungus with the roots of a higher plant like Alnus, Myrica, Casuarina called **Ectomycorrhiza,** which lie on surface of the root, help in direct absorption of minerals from the soil over a large area.



- **Rhizobium** is a symbiotic nitrogen-fixing bacteria
- **Methanogenic** bacteria help in production of biogas.

245. Poisons like cyanide inhibit Na^+ efflux and K^+ influx during cellular transport. This inhibitory effect is reversed by an injection of ATP. This demonstrates that

(a) ATP is the carrier protein in the transport system
(b) Energy for $Na^+ - k^+$ exchange pump comes from ATP
(c) ATP is hydrolysed by ATP ase to release energy
(d) Na^+–k^+ exchange pump operates in the cell.

AIPMT-1994

Ans. (b) : Poisons like cyanide inhibit Na^+ efflux and K^+ influx during cellular transport. This inhibitory effect is reversed by an injection of ATP. This demonstrates that Energy for $Na^+ - k^+$ exchange pump comes from ATP.

246. Na^+, K^+ dependent ATP are activity helps in transport of:

(a) K^+ inward, Na^+ outward
(b) K^+ inward only
(c) Na^+ inward only
(d) K^+ outward, Na^+ inward

DUMET-2004

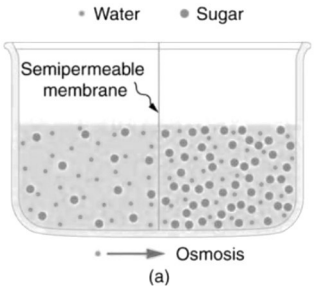
Ans. (a) : $Na^+ - K^+$ ATpase pushes potassium inside the cell membrane against the concentration gradient while simultaneously pumping sodium out of the cell. Pumping against a concentration gradient utilizes ATP energy, making the action of an active transport.
It moves $3Na^+$ out of the cell and $2K^+$ in to the cell per ATP molecules hydrolyzed.

247. Two different concentration solutions are separated by a semipermeable membrane which statement is correct?

(a) Solute will move towards solutions of higher concentration
(b) Solvent will move towards solution of higher concentration
(c) Both solute and solution will move towards higher concentration
(d) None of these

Rajasthan PMT-1997

Ans. (b) : Solvent will move towards the solution of higher concentration. This process is known as osmosis, which is the movement of solvent molecules (usually water) from an area of lower solute concentration across a semipermeable membrane. The solvent moves in order to balance the concentration of solute on both sides of the membrane. The solute itself does not move, as it movement would be prevented by the membrane.



248. The main force for translocation is :

(a) Cohesion force (b) Endosmosis
(c) Electro - magnetic (d) Osmotic power

Rajasthan PMT-1999

Ans. (a) : The cohesion and adhesion forces are an important mechanism in phloem transport. During translocation cohesive force present between water molecules provides stability to them. With the help of adhesive force water molecules stick to the wall of the plant surface resulting information of water column for better translocation in phloem. Translocation refers to the movement of organic nutrients, such as sugars and amino acids, for sources to sink in plants.

249. Casparian strip is made up of

(a) Lignin (b) Pectin
(c) Suberin (d) Cellulose
(e) Starch

CMC Vellore-2008

Ans. (c) : The casparian strip composed of suberin, which is a waxy substance. Suberin is a complex polymer that helps in the waterproofing of plant tissues, particularly in the endodermis of roots. The casparian strip is a specialized band of cell wall material that encircles the endodermal cells in the root of vascular plants. It acts as a barrier, preventing the free movement of water and solutes though the endodermis.

250. The continuous excretion of water substance from stump of a well-watered pot plant after cutting off the shoot slightly above the base is due to :

(a) Root pressure (b) Guttation
(c) Transpiration (d) Imbibition

Punjab MET-2004

Ans. (a) : Root pressure is a physiological process takes place in the xylem tissue of plant roots. The transfer of water from the surrounding soil into the root is caused by the upward force generated by the constant flow of mineral ions into the root cells. The osmotic gradient produced by the accumulation of ions inside the root cells is essentially propels this process the most.

@apna_pdf

G. Transpiration

251. Transpiration is measured by

(a) potometer (b) porometre
(c) auxanometre (d) respirometre

UP CPMT-2014 / J&K CET-2013
Punjab MET-2009 / Rajasthan PMT-2009
UP CPMT-2009 / CMC Vellore-2009
Uttarakhand PMT-2006 / Haryana PMT-2005
JIPMER-2005 / JCECE-2003
BHU PMT-2003 / Rajasthan PMT-2002
AIPMT-1992 / Rajasthan PMT-2000, 1998

Ans. (a) : Transpiration is measured by potometer .The rate of loss of water from the leaves of a plant. It is also known as transpirometer.

252. Water reaches to the top of tress of more than 100 feet against gravity, which one of the following is the main phenomenon responsible for this ?

(a) Exudation (b) Guttation
(c) Root pressure (d) Transpiration pull

MHT CET-06.10.2020 Shift-I / JIPMER-2006
BVP-2005 / Haryana PMT-2004
Manipal-2003 / JIPMER-1995

Ans. (d) : Transpiration pull is the suction pressure developed in the plant parts due to transpiration and this is much larger force which makes possible to reach the water at the top of very tall plants.

253. An antitranspirant is

(a) Cobalt chloride (b) Mercury
(c) Potassium (d) Phenyl mercuric acetate

AP EAMCET-25.09.2020 Shift-II / BVP-2012
MGIMS Wardha-2007 / Karnataka CET-2006
AIIMS-1998 / AIPMT-1988

Ans. (d) : An antitranspirant is a substance that is used to reduce the rate of transpiration in plants.
Fungicide PMA-phenyl mercuric acetate act as antitranspriants helps in stomatal activity.

254. Which factor is most important in regularity transpiration?

(a) Temperature (b) Atmospheric Humidity
(c) Light (d) Wind

Manipal-2012 / CG PMT-2011
Karnataka CET-2006 / DUMET-2005
UP CPMT-2003 / AFMC-2002 / AIPMT-1988

Ans. (b) : Transpiration is mainly governed by the vapour pressure gradient between the internal environment of leaf mesophyll tissue and the environment. Thus the most important factor that affects the process of transpiration is the atmospheric humidity.

255. The shade of a tree is cooler than the shade of a roof due to

(a) guttation (b) green leaves
(c) transpiration (d) photosynthesis

J&K CET-2013 /AMU-2011
BHU PMT (Mains)-2006 / AIIMS-1995

Ans. (c) : The loss of water in the form of vapour from the aerial parts of plant (leaves, stem flower and fruits) is called transpiration. 98.99% of total absorbed water is losses only 1-2 % water is used in various metallic active therefore –
Curtis called – *Transpiration is the necessary evil.*
Steward called – *Transpiration is the unavailable evil.*
Shade from trees and plants is actually cooler than the shade from a sunshade, and this is due to the tree transpiration process. This is when a tree releases water vapour from its leaf, and it cools the air around it.

256. Assertion (A) : Epidermis of hydrophytes is useful for absorption and assimilation
Reason (B) : In hydrophytes epidermal cells are devoid of cuticle and contains chloroplasts.

(a) Both A and R are correct and R is the correct explanation of A.
(b) Both A and R are correct but R is not the correct explanation of A
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct

AP EAPCET-22.05.2023, Shift-I

Ans. (a) : Epidermis of hydrophytes is very thin and is devoid of cuticle. This allows the easy absorption of water and dissolved nutrient. The epidermis cells also have chloroplasts, which allows them to carry out photosynthesis. Epidermis is also useful in for absorption and assimilation.
Hence, (a) one is a correct answer.

257. The reaction that do not contribute for proton gradient across thylokoid membrane

(a) Splitting of water molecule on inner side of membrane
(b) Quinone cycle
(c) Removal of protons from stroma for the reduction of NADP
(d) Electron transport from plastocyanin to PST

AP EAPCET-23.05.2023, Shift-I

Ans. (d) : Across thylakoid membranes, the light induced-proton gradient is essential for ATP synthesis. As a result of proton pumping into the thylakoid lumen, an alkaline stromal pH develops, which is required for full activation of pH-dependent Calvin Benson cycle enzymes. Electron transport from plastocyanin to PST reaction do not contribute for proton gradient across thylokoid membrane.
Rest of the other options are contribute for proton gradial across thylokoid membrane.

258. Given below are two statements :
Statement I :The forces generated by transpiration can lift a xylem-sized column of water over 130 meters height.
Statement II : Transpiration cools leaf surfaces sometimes 10 to 15 degrees, by evaporative cooling.
In the light of the above statements, choose the most appropriate answer from the options given below :

(a) Statement I is incorrect but Statement II is correct.
(b) Both Statement I and Statement II are correct.
(c) Both Statement I and Statement II are incorrect.
(d) Statement I is correct but Statement II is incorrect.

NEET (UG) 07.05.2023

@apna_pdf

Ans. (b) : Translocation is the movement of substance from one place to another place.

- Xylem transports water from roots to all part of the plant through xylem.
- Phloem transports food material to all part of the plant.
- Xylem and Phloem are two conducting tissues which play an important role in this process. Both are called as Vascular bundles.
- Trees having heights more than a hundred meters have been surviving with the same transpiration pull that keeps any other plant alive. Ex- Red wood.
- The rate of molecular transport is significantly faster at higher temperature. Temperature controlled transportation involves the safe transport of items that can be damaged by extreme temperature. This includes both refrigerated shipping and heated transport.

259. In dicots transpirational loss of water is minimized to the possible extent by

(a) Epidermis (b) Stomata
(c) Cuticle and Trichomes (d) Lenticels

AP EAMCET-11.07.2022 Shift-II

Ans. (c) : In dicot, transpirational loss of water is minimized to the possible extent by cuticle and trichomes. Cuticle is waxy layer, covers leaf surface and reduces the rate of water loss. While trichomes are a small hair like structure to prevent excessive water loss as well as protecting the plant from excessive moisture.

260. The physiological phenomenon which is considered as necessary evil in plants is _____

(a) Photosynthesis (b) Respiration
(c) Transpiration (d) Translocation

AP EAPCET-07.09.2021 Shift-I

Ans. (c) : The loss of water in the form of vapour from the arial parts of plants (stem, leaves, flowers & fruits) is called **transpiration**.

98-99% total absorbed water is lossed only 1-2% water is used in various metabolic activities therefore –

Curtis called – **Transpiration is the necessary evil** and **Steward** called–**Transpiration is the unavailable evil.**

261. The process responsible for facilitating loss of water in liquid form from the tip of grass blades at night and in early morning is

(a) Root pressure (b) Imbibition
(c) Plasmolysis (d) Transpiration

NEET-2020 Phase-I

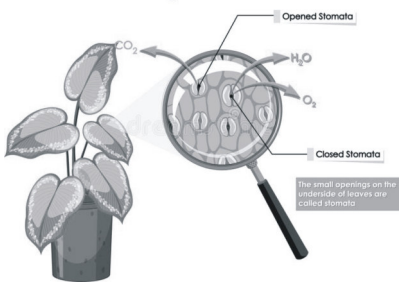
Ans. (a) : The process of Guttation is caused due to root pressure. Root pressure is positive hydrostatic pressure. In this process water is lost from the grass blades tip during night and in early morning.

262. Assertion : Transpiration occurs through stomata.
Reason : Guttation is due to root pressure.

(a) Both A and R are true and R is the correct explanation of A
(b) Both A and R are true but R is not correct explanation of A
(c) A is true but R is false
(d) A and R are false

AIIMS-26.05.2018 Shift-I

Ans. (b) : Transpiration is the process of water movement through a plant and its evaporation from aerial parts, such as leaves, stem and flowers. It occurs mostly at the leaves while their stomata are open for the movement of CO_2 and O_2 during photosynthesis. At night in some plants, root pressure caused guttation of drops of xylem sap from the tips of leaves. Xylem sap will exude from the cut stem for hours or days due to root pressure.



263. Stomatal movement is not affected by

(a) Temperature
(b) Light
(c) CO_2 concentration
(d) O_2 concentration

NEET-2018

Ans. (d) : The opening and closing of stomata are affected by light, temperature, mineral element and CO_2 concentration. But the stomata opening and closing not depend upon O_2 concentration.

Blue and red light plays important role in photosynthesis and stomata opening.

Deficiency of certain minerals elements like nitrogen phosphorus and potassium affect the opening and closing of stomata.

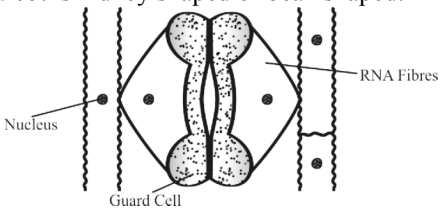
Low CO_2 concentration includes stomata opening and high CO_2 concentration referred stomata close.

264. Stomata in grass leaf are

(a) Dumb-bell shaped (b) Kidney shaped
(c) Barrel shaped (d) Rectangular

NEET-2018

Ans. (a) : Grass leaf belong to the monocot, and guard cell in monocot is dumb-bell shaped where as the guard cell of dicot is kidney shaped or bean shaped.



Dumb-bell shaped guard cell in monocot

Stomata are tiny pore or holes found to be present in the epidemic of leaves.

The major function of stomata is to regulate the gaseous exchange and process of transpiration.

265. Which of the following facilitates opening of stomatal aperture?

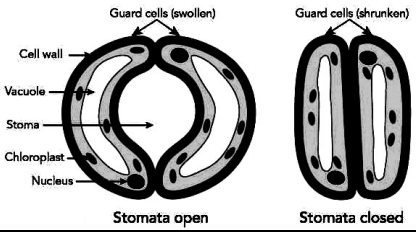
(a) Contraction of outer wall of guard cells
(b) Decrease in turgidity of guard cells
(c) Radial orientation of cellulose microfibrils in the cell wall of guard cells.

@apna_pdf

(d) Longitudinal orientation of cellulose microfibrils in the cell wall of guard cells

NEET-2017

Ans. (c) : Radial orientation of cellulose microfibrils in the cell wall of guard cells facilitates opening of stomatal aperture. In the guard cells of stomata the microfibrils are made up of cellulose oriented radically rather than longitudinally which help to stomatal opening.



266. Wilting of leaves at noon and their recovery toward evening is known as

(a) Incipient wilting (b) Temporary wilting
(c) Midday desiccation (d) Permanent wilting

MGIMS Wardha-2009

Ans. (b) : Wilting of leaves at noon and their recovery toward evening is known as temporary wilting.
Wilting – It is term commonly used to describe the drooping or sagging of plants leaves due to lack of water or other environmental stress factor.

267. Transpiration facilitates

(a) Electrolyte balance
(b) Opening of stomata
(c) Absorption of water by roots
(d) Excretion of minerals

Manipal-2009 / Karnataka CET-2009

Ans. (c) : Transpiration facilitates Absorption of water by roots. The roots to other section of the plant is aided by transpiration.

268. Maximum transpiration occurs in :

(a) Algal cells (b) Xerophytic plants
(c) Mesophytic plants (d) Hydrophytic plnats

DUMET-2001

Ans. (c) : Transpiration occurs in almost all plants, but maximum transpiration is seen in Mesophytes. In Mesophytes, stomata are present on either side of the leaf resulting maximum transpiration whereas in xerophytes minimum transpiration occur because of sunken stomata present in the leaf.

269. Stroma in the chloroplasts of higher plants contains

(a) Light-independent reaction enzymes
(b) Light-dependent reaction enzymes
(c) Ribosomes
(d) Chlorophyll

Haryana PMT-2010

Ans. (a) : Light independent reaction enzymes are found in stroma of chloroplast when dark reaction is occurs.

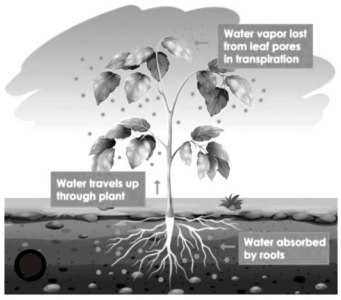
- Light depended reaction enzyme are found in grana of chloroplast where light reaction is occurs and ATP, NADPH is formed.
- Ribosomes are a part of cell content where protein synthesis is occurs.

270. Wilting occurs when there is

(a) Transpiration higher than absorption.
(b) Absorption higher than transpiration.
(c) Higher relative humidity of atmosphere.
(d) Excess root pressure.

AMU-2008 / VMMC-2008 / AFMC-2004

Ans. (a) : In summer due to excessive transpiration maximum water loss occur in plants. The amount of water lost during transpiration is much greater than amount of water absorbed by root from the soil. As a result turgidity of non woody parts lost due to loss in turgor pressure of non lignified cells. Wilting destroy the ability of plant to grow and transpire. If it present for a long time it may lead to death of plant.



271. Element which regulates stomatal movement

(a) Potassium (b) Sodium
(c) Sulphur (d) Phosphorus

BCECE-2015
J&K CET-2007
Haryana PMT-2005

Ans. (a) : The guard cells contain phototropic proteins which sense light and the transpiration is triggered. The potassium ion channels in the guard cells are activated by calcium and not by potassium as potassium only creates a potential difference for closing and opening of stomata.

272. If concentration of CO_2 in atmosphere is increased, the stomata are closed in

(a) dark (b) light
(c) Both[a] and [b] (d) None of the above

CG PMT-2011

Ans. (c) : Usually, the stomata open during the day time and close during the night time. But this is not generally seen in desert plants like a cactus. They are also known as succulent plants. This is because of very high temperatures and scarcity of water in deserts. During the day time the stomata remain close but at night when the temperatures reduce the stomata opens to carry out photosynthesis. Such behavior of stomata is an adaptation of plants for the survival in place like deserts.

273. Transpiration rate in Sorghum is comparatively higher than maize. This is due to

(a) Increased shoot/root ratio
(b) Increased rate of respiratory quotient
(c) Increased rate of photosynthesis
(d) Decreased root/shoot ratio

BVP-2013

Ans. (a) : Due to increased shoot / root ratio sorghum has extensive root system as compared to maize hence it has more rate of transpiration.

@apna_pdf

274. Transpiration differ from evaporation in
(a) rate of water loss
(b) transpiration is a physiological process whereas, evaporation is physical process
(c) transpiration is a physical process, while evaporation is physiological process
(d) frequency of water loss

BVP-2012 / MGIMS Wardha-2007

Ans. (b) : Transpiration differ from evaporation in transpiration is a physiological process whereas, evaporation is physical process.

275. Plants growing on hills show
(a) higher rates of transpiration
(b) lower rates of transpiration
(c) same rate of transpiration as in plants
(d) lower rate of transpiration provided the stomata are sunken

CMC Ludhiana-2007

Ans. (a) : Plants growing on hills show higher rates of transpiration due to less atmospheric pressure. As the atmospheric pressure decreases density of external environment increases. This allow rapid diffusion of water and increase the rate of transpiration.

276. Wilting in plant occurs due to:
(a) blockage of xylem
(b) blockage of phloem
(c) both a and b
(d) increased transpiration

AMU-2011 / AFMC-2005, 2001

Ans. (a) : Wilting in plant occurs due to blockage of xylem. Wilting is the visible mark of a plant loosing more water through transpiration. Wilting in plant occurs due to increased transpiration.

277. Lenticels and hydathodes are small pores with which of the following common attributes?
(a) They allow exchange of gases
(b) Their opening and closing is not regulated
(c) They always remain closed
(d) They are found on the same organ of plants

Uttarakhand PMT-2007 / UP CPMT-2001

Ans. (b) : Hydathodes are water secreting pores found on leaves and remain always open, while lenticels are found on bark and fruits and allow gaseous exchange. Opening and closing of both is not regulated in contrast to stomata.

278. Transpiration rate is depended upon : (1) stomata frequency (2) Position of stomata (3) state of stomata (4) epidermal cells
(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2005

Ans. (a) : Transpiration rate is depended upon: Stomata frequency, position of stomata and state of stomata.

279. Water lost by transpiration is:
(a) rich in dissolved minerals
(b) rich in solutes
(c) pure water
(d) rich in dissolved salts

Karnataka CET-2002

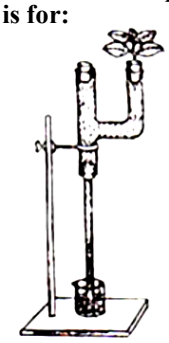
Ans. (c) : The loss of water in the form of vapour from the aerial parts of plant (leaves, stem flower and fruits) is called transpiration. 98.99% of total absorbed water is losses only 1-2% water is used in various metallic active.
Water lost by transpiration in the form of water vapour. Water vapour is almost completely devoid of dissolved salts or solutes, therefore water lost by transpiration is for all practical purposes, pure water.

280. During hot days, the leaves wilt because :
(a) the heat affects the chloroplasts
(b) of excess of transpiration
(c) of excess of photosynthesis
(d) too much CO_2 is given out

JIPMER-1999

Ans. (b) : The loss of water in the form of vapour from the aerial parts of plant (leaves, stem flower and fruits) is called transpiration. 98.99% of total absorbed water is losses only 1-2% water is used in various metallic active.
During hot days or dry day (or after several days with no rain or watering), transpiration causes more water to be lost and the water balance within the plant can get thrown off. In plants wilting is a condition to lose the turgidity of cells and young leaves and stem droop. It happens because of the excess of transpiratory water loss over absorption.

281. The experimental set up shown in the adjacent diagram is for:



(a) The demonstration of development of suction force due to transpiration
(b) Measuring the rate of transpiration
(c) The demonstration of ascent of sap.
(d) The demonstration of anaerobic respiration

Karnataka CET-2003

Ans. (b) : The experimental set up shown in the diagram is a simple potometer used for measuring the rate of transpiration.
In a elementary potometer, water lost by the plant is replaced by water taken from the glass tube, which causes the mercury column to rise.
The rate of loss of water and entrance of CO_2 is called the transpiration ratio.
In C_3 plants 200-400 mole H_2O losses per CO_2 mole enter.
The rate of transpiration is directly proportional to the temperature.

282. Primitive types of stomata are found in the
(a) leave of moss of plant
(b) axis of the moss plant
(c) apophysis of capsule of moss
(d) All of the above

CG PMT-2007 / AIIMS- 1998,99

@apna_pdf

Ans. (c) : Primitive types of stomata are found in the apophysis of capsule of masses. Primitive forms of stomata are visible in the spore bearing capsules of mosses. These type of stomata present in the epidermal layer of the leaves, stem, or other vegetative parts.

283. The condition under which transpiration would be most rapid
(a) high humidity
(b) excess of water in soil
(c) low humidity, high temperature, guard cells are turgid (open) and moist soil
(d) low velocity of wind

Manipal-2013

Ans. (c): The following condition under which transpiration would be most rapid such as low humidity, high temperature, guard cells are turgid (open) and moist soil.
The rate of temperature is directly proportional to the temperature increase the temperature, increase the rate of transpiration. If water is available in the soil, rate of transpiration increase.

284. Scotoactive stomatal movement can be observed in the leaves of:
(a) Vallisneria (b) Potamogeton
(c) Bryophyllum (d) Nerium

AP EAMCET-2001

Ans. (c) : Scotoactive stomata are the stomata that open in the dark or open during the night in absence of the sunlight to reduce the rate of transpiration it is xerophytic feature. These stomata are found in plants like Bryophyllum. These stomata perform their activity during the night and close during the day in presence of the sunlight.

285. Forces generated by transpiration can create pressure sufficient to lift water even upto height of
(a) 130 feet (b) 130 metre
(c) 230 feet (d) 230 metre

AMU-2012

Ans. (b) : The loss of water in the form of vapour from the aerial part of plant is called transpiration. Transpiration pull results from the evaporation of water from the surface of cells in the leaves.
Force generated by transpiration can create pressure to lift water up to 130 meters.

286. Hydathode are found in
(a) leaf (b) stem
(c) flower (d) root

CG PMT-2006

Ans. (a) : The Hydathodes are also known as the water stomata, commonly found in angiosperm. They are found at the tips of the veins of the leaves. It is type of secretary tissue in leaves that secretes water through pores in the epidermis of leaves. It is mainly found in aquatic plants such as Ranunculus fluitans.

287. Water is released as droplet, this is known as
(a) Root pressure (b) Transpiration
(c) Guttation (d) Evaporation

VMMC-2011

Ans. (c) : Guttation is the process of secretion of water in the form of droplets from the plants. In this process water lost mostly from margin of leaves. The process of guttation was first absorbed by Berger Stein in 1887.

288. Of all the environmental factors which is the most influential in determining the rate of transpiration?
(a) Relative humidity of atmosphere
(b) Temperature
(c) Light
(d) Water

Karnataka CET-2008

Ans. (a) : Relative humidity of atmosphere is the most influential in determinig the rate of transpiration. Transpiration is the evaporation of water from plants occurring through stomata. As the relative humidity of the air surrounding the plant rises the transpiration rate falls.

289. Transpiration is manifestation of
(a) turgor pressure (b) wall pressure
(c) root pressure (d) None of these

UP CPMT-2011

Ans. (a): Transpiration is the manifestation of turgor pressure. Turgor pressure is the water pressure within the stomata regulates the opening and closing of stomata.
• **Wall pressure** It is the pressure exerted on the content of a plant cell by the cell wall that is equal in force and opposite in direction to the turgor pressure.
• **Root Pressure** in plant force that help to drive fluid upward into the water-conducting vessels (xylem).

290. Potometer works on the principle of
(a) amount of water absorbed equals the amount transpired
(b) osmotic pressure
(c) root pressure
(d) potential difference between the tip of the tube and that of the plant

JIPMER-2007

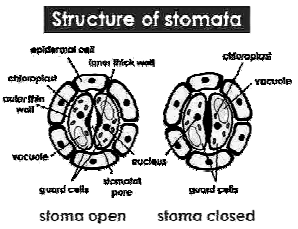
Ans. (a) : Potometer is a type of measuring instrument which is used to measure the rate of transpiration. Poto meter works on the principle of amount of water absorbed equal to the amount of water lost through transpiration. Potometer is made up of glass and consist of a long tube which is bent at the right angles.

291. Which of the following statements is not true for stomatal apparatus?
(a) Inner walls of guard cells are thick
(b) Guard cells invariably possess chloroplasts and mitochondria
(c) Guard cells are always surrounded by subsidiary cells
(d) Stomata are involved in gaseous exchange

NEET (Karnataka)-2013

Ans. (c) : Stomatal aperture is present between the guard cells. Guard cells are not always surrounded by accessory cells or subsidiary cells.
The pore and guard cells together called the stomata. It consists of two specialized epidermal cells called guard cell. Each guard cell has inner thick non elastic wall towards the concave side and outer thin elastic wall towards convex side. Both guard cells are surrounded by modified epidermal cells called subsidiary cells or accessory cells but in monocots guard cells are thick in the middle and thin at the end.

@apna_pdf



292. Which condition favours guttation?

(a) High humidity (b) Low humidity
(c) More transpiration (d) Bright sunlight

UP CPMT-2013

Ans. (a) : High humidity is the condition that favours guttation. When the humidity is high, the moisture in the air reduces the rate of water loss through transpiration. This allows the plant to accumulate water in its tissues, and excess water can then be forced out through specialized structure called hydathodes, resulting in guttation. It is due to the root pressure.

293. Select the correct statement: (1) Lenticel is the exit route for transpiration (2) The action spectra of transpiration is blue and red (3) Transpiration helps the plant to remain cool (4) Transpiration can be measured by photometer

(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 1, 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2006

Ans. (b) : The loss of water in the form of vapour from the aerials parts of a plants is called transpiration.
Lenticels are the pores, on the bark of woody stem. The transpiration through the lenticels called lenticular transpiration. 0.1-1% of total transpiration occurs through lenticels it is continuous throughout the day and night.

- Most of the transcription is stomatal the action spectrum of transpiration.
- A photometer is used to determine the intensity of light.
- Transpiration can be measured by potometer.

294. Lenticels are involved in:

(a) Photosynthesis (b) Transpiration
(c) Gaseous exchange (d) Food transport

NEET-2013 / AIPMT-2002

Ans. (c) : Lenticels are involved in Gaseous exchange. It function as a pore providing a pathway for the direct exchange of gases between the interval tissue and atmosphere. The lenticels found in the epidermis of different plant organ (stem petiole fruits) made up of parenchymatous cell.

295. Which one of the following is NOT an antitranspirant?

(a) PMA (b) BAP
(c) Silicon oil (d) Low viscosity

Karnataka CET-2011

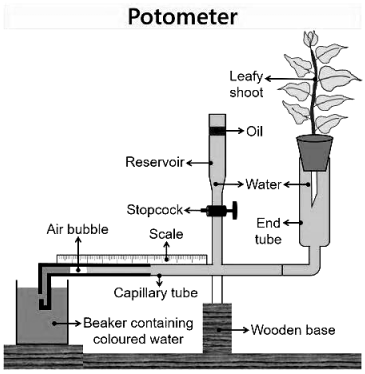
Ans. (b) : When excessively transpiration occurs in the plant which increase the loss of water in the form of vapour which is not desired. Chemical applied on the leaves of plant reduce the rate of transpiration that is called antitranspirant. Antitranspirant are used to improve the crop yield in drought affected area, PMA (Phenyl mercuric acetate) and silicon oil are Antitranspirants BAP (Benzylaminopurine) is not an Antitranspirants.

296. Potometer works on the principle of –

(a) Potential difference between the tip of the tube and that of the plant
(b) Amount of water absorbed equals the amount transpired
(c) Osmotic pressure
(d) Root pressure

Uttarakhand PMT-2010
AIPMT-2005

Ans. (b) : The potometer is an instrument used to measure the rate of water uptake or transpiration in plants.



Principle - It works on the principle that the amount of water absorbed by a plant shoot is almost equal to water lost through transpiration.
Evaporation of water in the form of vapours from aerial parts of living plants is known as transpiration.
In transpiration 98-99% of total absorbed water is lossed only 1-2% water is used in various metallic activity.

297. Stomata of a plant open due to:

(a) Influx of potassium ions
(b) Efflux of potassium ions
(c) Influx of hydrogen ions
(d) Influx of calcium ions

AIPMT-2003

Ans. (a): Stomata of a plant open due to the influx of K^+ ions. K^+ ions enter into the guard cell and form potassium malate therefore, increased osmotic concentration and endosmosis occur, turgor pressure increase and guard cells becomes turgid and stomata open.

298. In succulent plants the stomata open in night and close in day. Which among the following would be best hypothesis to explain the mechanism of stomatal action in night only?

(a) CO_2 accumulates, reduces pH, stimulate enzymes resulting in accumulation of sugars
(b) increase in CO_2 concentration, conversion of organic acids into starch resulting in the increased conversion into sugars resulting in K^+ transport
(c) low CO_2 concentration accumulates organic acids resulting in the increased conversion into sugar resulting in K^+ transport
(d) low CO_2 concentration accumulates organic acids resulting in the increased concentration of cell sap

AIIMS-2008

@apna_pdf

Ans. (b) : In succulent plants, stomata open during the night and closed during the day time such stomata are called Scotoactive stomata.

(1) In these plant, in night acidification occurs due to the incomplete oxidation of carbohydrate

(2) During the night acidifications occurs and form malic acid which enter the vacuole and stomata open.

(3) During night –

$$2C_6H_{12}O_6 + 3O_2 \rightarrow 3C_4H_6O_5 + 3H_2O$$

Malic acid (leading stomata open)

During day time-

$$C_4H_6O_5 + 3O_2 \rightarrow 4CO_2 + 3H_2O$$

(Leading stomata close)

299. Match the Column-I with Column-II.

Column-I	Column-II
A. Bulliform cells	**1. Stomata**
B. Guard cells	**2. Aerating pore**
C. Lenticels	**3. Accessory cells**
D. Subsidiary cell	**4. Isobilateral leaf**

(a) A-1, B-2, C-3, D-4 (b) A-3, B-1, C-2, D-4

(c) A-4, B-1, C-2, D-3 (d) A-4, B-3, C-2, D-1

AIIMS-2014

Ans. (c)

A. Bulliform cells	4	Isobilateral leaf
B. Guard cells	1	Stomata
C. Lenticels	2	Aerating pore
D. Subsidiary cell	3	Accessory cells

- **Bulliform cells** are large, bubble shaped epidermal cell found on the top surface of leaves in monocot. It also called as motor cell. They are essential for water storage.
- **Lenticel** It is porous tissue which contain cells with large intercellular space. The main function is gaseous exchange.

300. Stomata opens

(a) In day time – For gaseous exchange

(b) In day time – No gaseous exchange

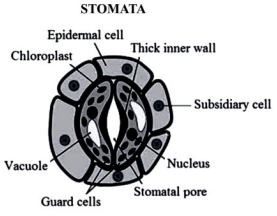
(c) In night time only – For gaseous exchange

(d) In night time only – No gaseous exchange.

AIIMS-2001

Ans. (a) : Stomata are open for gaseous exchange, but are also the main source of transpiration. In majority of plants stomata open in the presence of light. i.e. open in daytime and close in darkness (night).

Usually stomata open during the day time and closed in night such stomata are called **photoactive stomata**. But in succulent plant stomata open during night and close during the day time such stomata are called **scotoactive stomata**.



301. Stomata open and close due to

(a) circadian rhythm

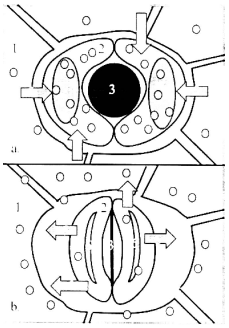
(b) genetic clock

(c) pressure of gases inside the leaves

(d) turgor pressure of guard cells

AIPMT-1988

Ans. (d) :



Mechanism of opening and closing of stomata:-

Opening and closing of stomata depends upon the turgidity and flaccidity of guard cells and the flaccidity of guard cells depends upon the osmotic concentration of guard cells. Usually during the day time stomata open.

The osmotic pressure of the guard cells become high as compression to subsidiary cells or surrounding cells than water enters from low osmotic pressure to high osmotic pressure i.e. water moves from surrounding cells into the guard cells by the process **endosmosis** and guard cells becomes turgid and stomata open.

During the night stomata close, the osmotic pressure of guard cells low as compression to surrounding cells. Water losses from the guard cells to the subsidiary cells or surrounding cells by the **exosmosis** guard cells becomes flaccid and stomata close.

Exception:- In succulent, xerophytic plants stomata open during night called scotoactive stomata.

302. In guard cells when sugar is converted into starch, the stomatal pore

(a) Closes completely (b) opens partially

(c) opens fully (d) remains unchanged

AIPMT-1992

Ans. (a) : In guard cells when sugar is converted into starch, the stomatal pores close completely.

Starch $\rightleftharpoons$ Sugar interconversion theory:-

Initially this theory was proposed by Lloyd 1908 and finally by the scarth 1932.

According to scarth (1932)- During day time photosynthesis and respiration both occurs CO_2 is utilized in photosynthesis and number of hydrogen ions decreases and pH increases. Stomata open but during the night no photosynthesis, only respiration occurs. CO_2 released not utilized but number of H^+ ions increase and pH decrease thus stomata close.

303. At constant temperature, the rate of transpiration will be higher at

(a) sea level (b) 1 km below sea level

(c) 1 km above sea level (d) 1.5km above sea level

AIPMT-1992 / BVP-2006

Ans. (d) : Mean sea level is an average surface level of one or more among Earth's coastal bodies of water from heights such as elevation may be measured. At constant temperature, the rate of transpiration will be higher at 1.5 km above the sea level.

@apna_pdf

304. Conversion of starch to organic acids is required for

(a) stomatal opening (b) stomatal closing
(c) stomatal formation (d) stomatal activity

AIPMT-1992

Ans. (a) : Stomata are pores on the leaf surface, which are formed by the pair of curved, tubular guard cells an increase in turgor pressure deform the guard cells, resulting in the opening of the stomata.

During stomatal opening starch get converted into organic acids like malic acid.

305. In terrestrial habitats, temperature and rainfall conditions are influenced by

(a) water transformations (b) transpiration
(c) thermoperiodism (d) translocation

AIPMT-1992

Ans. (b) : The loss of water in the form of vapour from the aerial parts of plant (leaves, stem flower and fruits) is called transpiration. 98.99% of total absorbed water is losses only 1-2% water is used in various metallic active.

- In terrestrial habitats, temperature and rainfall conditions are influenced by transpiration.

Transpiration increases with increase in temperature and decrease with rainfall condition.

The rate of transpiration is directly proportional to the saturation deficit of atmosphere.

306. Transpiration is a necessary evil, this statement belongs to:

(a) Burgerstein (b) Reschke
(c) Curtis (d) Willmer

CG PMT-2005
Manipal-2002

Ans. (c) : Transpiration may be regarded as beneficial to the plants due to its role in ascent of sap absorption and transpiration of mineral salts and in the regulation of temperature of plant tissues, but transpiration also causes loss of water i.e. 98-99% of total absorbed water is losses only 1-2% water is used in various metabolic activity therefore, Curtis called **transpiration is a necessary evil**.

307. Lenticular transpiration takes place in

(a) fruits (b) woody stems
(c) leaves (d) all of these

WB JEE-2007

Ans. (b) : Lenticular transpiration takes place in the woody stem.

Lenticels are the pores, on the bark of woody stem.

The transpiration through the lenticels called **Lenticular Transpiration.** 0.1 – 1% of total transpiration occur through Lenticels it is continuous throughout the day and night.

308. Stomatal opening is affected by

(a) nitrogen concentration, carbon dioxide concentration and light
(b) carbon dioxide concentration, temperature and light
(c) nitrogen concentration, light an temperature
(d) carbon dioxide concentration, nitrogen concentration and temperature

DUMET-2011

Ans. (b) : Stomatal opening, which refers to the process by which stomata regulate gas exchange in plants, can be influenced by various factors. Stomata tend to open in response to light. Temperature can affect stomatal opening indirectly which impact on the rate of transpiration.

309. Transpiration occurs maximum when:

(a) high humidity present in atmosphere
(b) high water present in soil
(c) dry environment with high temperature
(d) wind is not blowing

Rajasthan PMT-1997, 1999

Ans. (c) : Transpiration in plants can vary depending on various factors. There are few conditions under which transpiration tends to occur at its maximum rate. High temperature generally increase transpiration rate. As temperature rise, the water potential gradient between the plant and atmosphere increases. Transpiration rates are typically higher in drier environments with lower humidity.

310. In which of the following plants, there will be no transpiration ?

(a) Plants living in deserts
(b) Aquatic, submerged plants
(c) Plants growing in hilly regions
(d) Aquatic plants with floating leaves

Karnataka CET-2005

Ans. (b) : There will be no transpiration occurs in aquatic, submerged plant because in hydrophytic plants stomata are completely absent in the leaves. Transpiration is a process that involves loss of water vapour through the stomata of plants. It helps in regulating temperature of plant.

311. Which one is not related to transpiration

(a) Regulation of plant body temperature
(b) Absorption and distribution of mineral salts
(c) Circulation of water
(d) Bleeding

CG PMT-2004

Ans. (d) : Bleeding is the release of blood from a broken blood vessels, either inside or outside of the human body but transpiration is related to elimination of excess water from the plant body. It is generally the evaporation of water from the surface of the leaves.

312. Which of the following theory gives the latest explanation for the closure of stomata?

(a) ABA theory
(b) Munch theory
(c) Starch glucose theory
(d) Active K^+ transport theory

Manipal-2008
BHU PMT-2001

Ans. (d) : The active potassium transport theory given by Levitt and detail study by Raschke 1975 and Bolwing 1976 it is the most widely accepted theory for opening and closing of stomata.

313. Opening and closing of stomata is controlled by

(a) abscisic acid (b) CO_2 concentration
(c) light intensity (d) All of these

WB JEE-2015

@apna_pdf

Ans. (d) : The opening and closing of stomata is controlled by the light intensity, humidity carbon dioxide concentration, water and Abscisic acid. When the root system scoured the in availability of water, then plant release of Abscisic acid, which control stomata closing.

314. Guttation is a process of loss of water in
(a) liquid form containing dissolved minerals
(b) liquid form without dissolved minerals
(c) vapour form with minerals
(d) vapour form without minerals

WB JEE-2015

Ans. (a) : Guttation:- During the early morning or night, worm soil and high humidity more absorption of water, less transpiration water comes out in the form of liquid on the margin of lamina and the tip of the veins in the form of droplets without injured is called the guttation. Gutted water is impure has salt, sugar, inorganic and organic substances.

315. Opening and closing of stomata is due to
(a) hormonal change in guard cells
(b) change in turgor pressure of guard cells
(c) gaseous exchange
(d) respiration

Rajasthan PMT-2007

Ans. (b) : The opening and closing of stomata depend on the turgor pressure caused by the osmotic flow of water in the guard cells.

H. Phloem Transport : Flow from source to sink

316. In which form does the food transported in plants?
(a) Sucrose (b) Fructose
(c) Glucose (d) Lactose

Assam CEE-2014 / JIPMER-2010
JIPMER-2009 / UP CPMT-2008
Rajasthan PMT-2008 / CG PMT-2008
BVP-2006/UP CPMT-2006/BHU PMT (Screening)-2005
DUMET-2002 / Haryana PMT-2000 / AIPMT-1993

Ans. (a) : The glucose synthesized in the leaves by the process of photosynthesis. The glucose are transported to other regions of the plant body after conversion to sucrose. Since it is non-reducing and water soluble it can be transported easily too. Therefore, food is transported in plants in the form of sucrose.
In most of the species, sucrose is the principal form of carbohydrate translocated throughout the plant by the phloem. Starch is an insoluble stable carbohydrate reserve that is present in almost all plants.

317. Identify the correct statements regarding Mass flow hypothesis.
(A) Mass flow is faster than diffusion.
(B) Mass flow is the result of pressure difference between the end points.
(C) Different substances involved in mass flow move at different paces.
(D) Mass flow can result through either a positive or a negative hydrostatic pressure gradient
Choose the correct answer from the options given below:
(a) (A), (B), (C) only (b) (A), (B), (D) only
(c) (A), (C), (D) only (d) (B), (C), (D) only

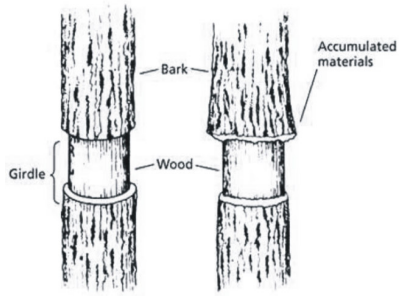
RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : German plant physiologist Ernst Munch proposed 'The mass flow hypothesis' in 1930, in this hypothesis movement of sap through the phloem tissue in the plants.
• The mass flow hypothesis states that a never ending flow of water plus (+) dissolved nutrients between source and sink.

318. "Girdling Experiment" was performed by Plant Physiologists to identify the plant tissue through which:
(a) osmosis is observed
(b) water is transported
(c) food is transported
(d) for both water and food transportation

NEET-2022

Ans. (c) : The experiment that is used to identify the tissue through which food is transported is girdling experiment. In this experiment, the removal of all the tissues outside the vascular cambium (bark , cortex, and phloem) in woody stem except for the xylem. Since the woody xylem part present on the inner side remains interact, water and nutrient reach in leaves.
But after photosynthesis food is not transported to other parts below the girdle since the phloem part is removed. So it is observed that there is an accumulation of the food/sugar just above the girdle region.
This experiment shows that the phloem tissue aids food transport.
In vascular plants xylem is main water conducting tissue
Osmosis It is a special type of diffusion occurs through the membrane when two solution are separated by a semi permeable membrane the water (solvent) moves from low concentration solution towards the high concentration.



319. The ascent of xylem sap in plants is mainly accomplished by the:
(a) size of the stomatal aperture
(b) distribution of stomata on the upper and lower epidermis
(c) cohesion and adhesion between water molecules
(d) root pressure

NEET (Re-Exam)-04.09.2022

Ans. (c) : The upward movement of water against gravity or ascent of sap in plants depends on mainly cohesion and adhesion of water molecules.
Force of attraction between molecules of the same substance is called cohesive force. Force of attraction between molecules of different substances is called adhesive force.

@apna_pdf

The transpiration pull or tension, cohesion properly of water and hydration of cell wall (adhesion) are collectively responsible for ascent of sap.

320. In sieve tubes source to sink pressure gradient is maintained by

(a) Phloem parenchyama (b) Sieve cells
(c) Sieve tubes only (d) Companion cells

AP EAPCET-12.07.2022 Shift-I

Ans. (d) : The companion cells help in maintaining the pressure gradient in the sieve tube, the pressure gradient can be defined as differences in pressure that decide the direction of liquid flow.

Phloem parenchyma store food and other substances like resin, latex and mucilage. Sieve tubes are responsible for the transport of food throughout the plant body.

Sieve cells are less specialized cells for the transport of food.

321. Choose the correct order of statements regarding the translocation of sucrose.

(A) Loading of sugars into phloem setup a water potential gradient that facilitates mass movement in phloem
(B) Sucrose moves into companion cell and then to phloem sieve tube cell by active transport
(C) A hypertonic condition in phloem facilitating water from the xylem into phloem by osmosis.
(D) All sink sugars are transported out of the phloem producing high water potential with returning of water to xylem.
(E) With increase in hydrostatic pressure in phloem pressure flow begin and sap moves through phloem.

Options:

(a) B, C, D, A, E (b) A, C, B, D, E
(c) A, C, D, B, E (d) E, B, C, A, D

TS EAMCET-28.09.2020 Shift-I

Ans. (a) : Sucrose is actively transported from source cells into companion cells and then into the sieve tube elements then hypertonic condition in phloem. The facilitating water from xylem into phloem by osmosis then sink sugar transported out of the phloem producing high water potential loading, of sugar into phloem setup water potential gradients and hydrostatic pressure in phloem in phloem pressure.

322. Which of the following is the sink end of the plant?

(a) Stem tuber (b) Cotyledon
(c) Leaf (d) Apical bud

MHT CET-2019

Ans. (d) : In the phloem sugar move from "source" to "sink" because plant need an energy source to grow. Sugar produced photosynthesis by leaves and transported to sits of growth where sugar need.

- According to sugar deliver like root, young shoot, flower, seed, and fruits, root, tubers and bulbs are called sinks.
- Stomata and mature leaves are not sinks

323. Arrange the given events that occur in phleom for removal of water from phleom to xylem

(I) Incoming sugars are actively transported out and removed as complex carbohydrate
(II) Increase of water potential
(III) Increase of hydrastatic pressure in seive tubes
(IV) Transport of water in to sieve tubes by osmosis

Options:

(a) IV III I II (b) IV I III II
(c) IV II III I (d) I II III IV

AP EAMCET-24.04.2019 Shift-I

Ans. (c) : The translocation of sugars from source to sink is called the pressure flow hypothesis.

Sugar is transported to phloem sieve tube in the form of sucrose. This process of loading at source produces a hypertonic condition in phloem. Water moves into phloem by osmosis.

The loading of the phloem sets up a water potential gradient that facilitates the mass movement in the phloem.

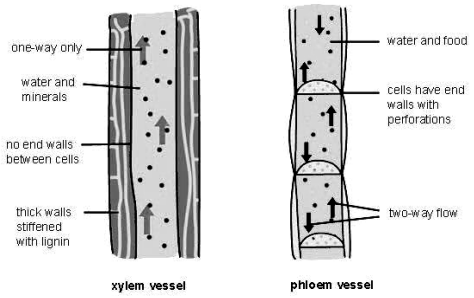
As hydrostatic pressure in the sieve tube of phloem increases. Mean while, at the sink, incoming sugars are actively transported out of the phloem.

324. What is the direction of movement of sugars in phloem?

(a) Upward (b) Downward
(c) Bi-directional (d) Non-multidirectional

NEET-2019
AIPMT-1997

Ans. (c) : The phloem transport is bidirectional,l because sucrose gets accumulated in the phloem tissue and absorbs water creating high turgor pressure.



325. Fensom and Jones suggested which of the following method for translocation of solute ?

(a) Osmosis (b) Plasmolysis
(c) Diffusion (d) Electro-osmosis

Haryana PMT-2004
Manipal-2003

Ans. (d) : The theory of electro-osmosis was proposed by Fensom (1957) and Jones (1958). According to this theory the solute moves in positive direction of electrical gradient along with K^+ ions.

326. In higher plants, transport of food material occurs through

(a) Companion cells (b) Sieve element
(c) Tracheids (d) Transfusion tissue

Rajasthan PMT-2011

@apna_pdf

Ans. (b) : Sieve element are consists of sieve cells. These are the main component of phloem tissue and help in transport of food materials (sugar, amino-acids, fatty acids, etc) in different area of the plants. In angiosperms sieve. Element are companion cells and sieve tubes. Whereas in pteridophytes and gymnosperms they posses sieve cells.

327. Removal of ring wood of tissue outside the vascular cambium from the tree trunk kills it because

(a) water cannot move up
(b) food does not travel down and roots become starved
(c) shoot become starved
(d) annual ring are not produced

Uttarakhand PMT-2007

Ans. (b) : Term phloem was used by Carl Nageli on the basis of origin phloem is two types primary phloem and secondary phloem.

Phloem is present above the vascular cambium, that helps in transports of food materials to the roots. If the outer ring along with phloem is removed, than root will be starved and the food material will not be distributed to the roots.

328. The translocation of organic solutes in sieve, tube members is supported by

(a) P-proteins
(b) mass flow involving a carrier and ATP
(c) cytoplasmic streaming
(d) root pressure and transpiration pull

Manipal-2012

Ans. (b) : The translocation of organic solutes in sieve, tube members is supported by the mass flow process, which is an energy dependent process that require ATP and carrier molecules. The food is transported from the source area (synthesizing site) to sink area (utilization site) of different part of the plants. The food is synthesized in the form of glucose by photosynthesis. Glucose is converted into sucrose after conversion of sucrose it moved into the sieve tube cells by active transport. It causes an influx of water from the xylem, thus increase the hydrostatic pressure. The solution in the phloem then moves to the sink the sucrose is actively transported out from the phloem.

329. Phloem sap is mainly made up of

(a) Water and sucrose
(b) Water and minerals
(c) Oligosaccharides and hormones
(d) None of the above

AMU-2012

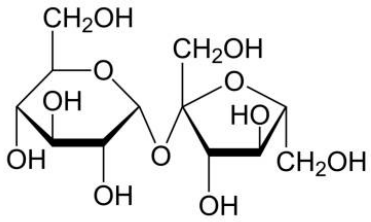
Ans. (a) : The phloem sap contain high quantities of sugar which dissolved in water. Its transport from the source of supply end (region of manufacture or storage) to the region of utilization or sink. The sucrose (non reducing sugar) is a more stable compound and suitable for long distance transport. Phloem sap travels from a location with higher osmotic pressure to an area with law pressure.

330. Carbohydrates is synthesised by process of photosynthesis mainly by leaves of green plants. In which form of sugars, the manufactured, carbohydrates is translocated to another region of plants?

(a) Glucose (b) Sucrose
(c) Maltose (d) Fructose

UP CPMT-2014

Ans. (b): Translocation of photosynthesis products (organic food) usually takes place in form of sucrose, as it is a non-reducing sugar and is chemically stable. Due to this property, this principal from of carbohydrates does not react with other substances during translocation from leaves to non-photosynthetic organs like roots. The sucrose is transported through sieve elements.



SUCROSE

331. Direction of translocation of organic food or solutes is

(a) upward (b) downward
(c) radial (d) All of these

UP CPMT-2011

Ans. (d): The food material synthesized in the leaves of green plant and from seed during germination is translocated to the growing regions and storage organs of plant. The translocation of organic food is in all direction in the different parts of plant.

332. In hypertonic solution, water potential of cell

(a) increases
(b) decreases
(c) first increases and then decreases
(d) remains unchanged

Uttarakhand PMT-2011

Ans. (b) : When a solution is high concentrated to the other solution such solution is called hypertonic solution.

A hypertonic solution has a higher solute concentrated than another solution and solvent. When the cell placed in hypertonic solution the water potential of the cell decrease due to high conc. of solute.

333. The translocation of organic solutes in sieve tube members is supported by-

(a) Root pressure and transpiration pull.
(b) P-proteins
(c) Mass flow involving a carrier and ATP.
(d) Cytoplasmic streaming.

AIPMT-2006

Ans. (c) : Organic solutes are transported from the source site of production to the sink (utilization site) is a plant by the mass flow process, glucose synthesised in the leaves is converted to sucrose.

- The sucrose is then moved to the sieve tube cells by active transport. This causes an inflow the water from the xylem, thus, increasing the hydrostatic pressure.

The sieve tube develops from the meristematic cells which divides vertically large sieve tube element , initial cells and small companion initial cell.

@apna_pdf

The companion cell may divides transversely or may not divide sieve tube initial enlarge size, at the maturity nucleus completely disintegrate and end walls perforated to form sieve plate and in some dicots proteinaceous slimy discreet bodies form called P_1 protein later on P_2 protein are form, there function is sealing of the pores and transport of the food.

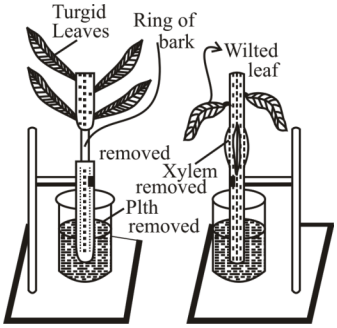
334. Translocation of photosynthetic products in sieve tubes is

(a) 3-5 mm/h (b) 3-5 cm/h
(c) 1-15 cm/h (d) 60-100 cm/h

AIIMS-2011

Ans. (d) : The prepared food materials are transported by phloem. Collateral vascular bundle having only a single patch of phloem but bicollateral vascular bundle having more patch therefore it can transport high amount of the suger. The maximum average rate of translocation of sugers is 100 cm/hour or 1 meter/hour.

335. Identify the process taking place in this experiment.



(a) Ringing experiment for translocation of sap
(b) Demonstration of root pressure
(c) Eosin test to demonstrate ascent of sap
(d) Demonstration of transpiration

AIIMS-2015

Ans. (a) : The vertical movement of water and dissolve substances from root hair to the top of the plants against force of gravity is called the ascent of sap. The different experiments conducted time to time which demonstrated that path of ascent of sap.

Ringing experiment:- In the first step of stem removed not xylem leaf remains turgid.

In second step xylem removed in upper leaves wilting occurs.

It proved that path of ascent of sap is xylem.

The ringing experiment is not applicable in monocot stem.

336. Which is correct about transport of conduction of substances?

(a) Organic food moves up through phloem
(b) Organic food moves up through xylem
(c) Inorganic food moves upwardly and downwardly through xylem
(d) Organic food moves upwardly and downwardly through phloem

AIPMT-1991

Ans. (d) : Correct about transport of conduction of substance is organic food moves upwardly and downwardly through phloem.

Phloem is a complex permanent tissue that helps in the transport of food materials. Phloem is also called bast or laptone. It is a type of vascular tissue. Phloem fibres provide strength and pliability.

Xylem is the vascular tissues that transport H_2O or nutrients from the soil to the stems and leaves.

337. Death of protoplasm is a pre-requisite for a vital function like

(a) transport of sap (b) transport of food
(c) absorption of water (d) gaseous exchange

AIPMT-1989

Ans. (a) : Sap is fluid transported in xylem or phloem cell.

- Sap is distinct from latex, resin, or cell sap.
- Sap is two types - xylem sap is consists of hormones mineral elements and other nutrients and characterized by movement from root towards the leaves.
- Phloem sap consist of sugar, hormone and elements dissolved in H_2O it flow where carbohydrates or produced source to where are use sinks.

338. Phloem conducts food by :

(a) perforated sieve plates
(b) bast fibres
(c) xylem parenchyma
(d) xylem fibres

DUMET-2005

Ans. (a) : In phloem, food is transported through which they have perforated structures at their end walls known as sieve plates.

339. Which of the following required in translocation of food in plants?

(a) Xylem (b) Phloem
(c) Sclerenchyma (d) Collenchyma

DUMET-2003, 2002

Ans. (b) : The movement of food (sugar) through phloem take place in many direction. The phloem is concerned mainly with the transport of soluble organic material made during photosynthesis. This process of transportation of food from source to sink called translocation. Term phloem was used by Carl Nageli.

Collenchyma:- Term collenchyma coined by Schleiden. It is living mechanical tissue not universal found in the herbaceous dicot stem, and absent in the mature or woody dicot stem, monocot stem and root. In dicot stem it forms hypodermis.

Schlerenchyma:- Term used by Mettenius. It is main mechanical and dead mechanical tissue. In monocot stem it form the hypodermis.

340. Translocation of minerals takes place through :

(a) phloem (b) xylem
(c) cambium (d) wood parenchyma

Manipal-2001

Ans. (b) : Translocation in Vascular plants means the movements of Organic molecules and some mineral ions Movement of water and mineral and also provide support and from the soil to the leaves occur in xylem. Term xylem was given by Nageli.

@apna_pdf

I. Mass Flow Hypothesis

341. During symport two different molecules move across the membrane

(a) in same direction with the help of same carrier
(b) in opposite direction with the help of same carrier
(c) in same direction with the help of different carriers located at a common site
(d) in same direction with the help of different carriers located at different sites in the same cell

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : The movement of two molecules in same direction is called **symport**.

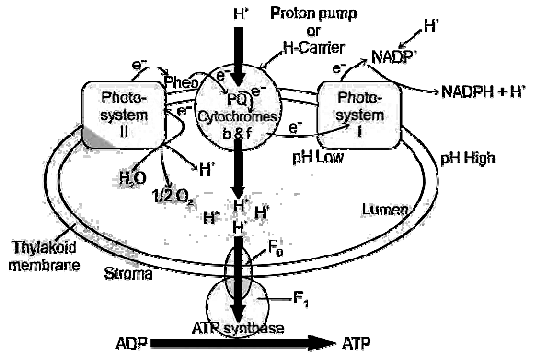
- Movement of two molecules in the opposite direction is called **antiport**.
- When a molecule moves across a membrane independent of other molecule, the process is called **uniport**.

342. Which one of the following is not true regarding the release of energy during ATP synthesis through chemiosmosis? It involves:

(a) Reduction of NADP to $NADPH_2$ on the stroma side of the membrane
(b) Breakdown of proton gradient
(c) Breakdown of electron gradient
(d) Movement of protons across the membrane to the stroma

NEET-2022

Ans. (c) : The actual production of ATP is cellular respiration takes place through the process of chemiosmosis, chemiosmosis involves the pumping of protons through special channels in the membrane to create a gradient or concentration of proton (H^+) within the thyakoid lumen.



ATP synthesis through chemiosmosis (in noncyclic photophosphorylation)

343. In " pressure Flow" hypothesis, sugars are transported from 'source' to 'sink'. The initial steps which occur during this physiological process are shown here.

I. In leaves glucose is converted to sucrose.
II. Sucrose moves from sieve tube cells to companion cells by active transport.
III. Loading of sucrose produces a hypotonic condition in the phloem.
IV. Water in the adjacent xylem moves into phloem by osmosis.

Identify the above correct statements:

(a) I and III (b) II and III
(c) I and IV (d) II and IV

TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Pressure flow hypothesis for ascent of sap is the accepted mechanism used for the translocation of sugars from source to sink was given by munch.
As the glucose and fructose is prepared in the leaves by photosynthesis then it is converted to sucrose. So, water in the adjacent xylem moves into the phloem by Osmosis.
Sucrose moves from companion cells to sieve tube by active transport.
Loading of sucrose produces a hypertonic condition in the phloem.

344. Munch hypothesis is based on

(a) Translocation of food due to Turgor Pressure (TP) gradient.
(b) Translocation of food due to imbibition force.
(c) Translocation of food due to TP gradient and imbibition force.
(d) None of these

Karnataka CET-2007

Ans. (a) : The munch's hypothesis is based on the translocation by mass flow from sources to sinks and osmotic mechanism of pressure flow gradient between source organs and sink organs.
Mass flow hypothesis or munch hypothesis is given by German Scientist Ernst munch in 1930.

345. Translocation of organic materials in plants is explained by :

(a) active transport
(b) transpiration pull
(c) inhibition theory
(d) mass flow hypothesis

Punjab MET-2006
AIIMS-1997

Ans. (d) : Mass flow Hypothesis theories have been put forward to explain the mechanism of translocation of organic nutrients through the phloem. Mass flow hypothesis was given by Munch.

346. Which of the following is not correct in mass flow hypothesis?

(a) The sugar is moved bidirectionally.
(b) Loading of the phloem sets up a water potential gradient that facilitates the mass movement in the phloem.
(c) As hydrostatic pressure in the phloem sieve tube increases pressure flow stops and sap is accumulated in phloem.
(d) The sugar which is transported is sucrose.

Karnataka CET-2015

Ans. (c) : The mass flow hypothesis is relation between source and sink. Hydrostatic pressure in the sieve tube of phloem increases, pressure flow begins, and sap moves through phloem. Meanwhile, at the sink, incoming sugars are actively transported out of phloem and removed as complex carbohydrates.

@apna_pdf

12 MINERAL NUTRITION

A. Study about the Mineral Requirements of Plants

1. Match the following

List - I (Element)	List-II (Significance)
A. P	I. Stabilizing protein structure
B. S	II. Maintain anion cation balance
C. N	III. Constituent of certain proteins
D. K	IV. Constituent of vitamins

(a) A-III, B-I, C-IV, D-II
(b) A-IV, B-III, C-I, D-II
(c) A-III, B-II, C-I, D-IV
(d) A-III, B-IV, C-II, D-I

TS EAMCET-10.05.2023, Shift-II

Ans. (a) : Sulphur is essential for many growth functions in plants including nitrogen metabolism enzyme activity and protein and oil synthesis.

- **Phosphorus–** It constituent certain protein such as nucleic acid and ATP.
- Nitrogen is an essential nutrient for the production of all proteins and some vitamins.
- K (potassium) main role is body it is help in maintain anion and cation balance.

2. Maximum percentage of which occur in plant ash?

(a) Mg (b) Zn
(c) K (d) Ca

UP CPMT-2006

Ans. (d): The plant ash contains oxides of essential elements like silicon, sodium, calcium, potassium and magnesium.
Much wood ash contains calcium carbonate as its major component, representing 25 or even 45 percent of total ash.
The calcium is involved in organization of spindle and act as enzyme activators.
The deficiency of calcium cause death of meristems found in shoot, leaf, root tips and chlorosis margine of younger leaves.

3. Minerals known to be required in large amounts for plant growth include:-

(a) calcium, magnesium, manganese, copper
(b) potassium, phosphorus, selenium, boron
(c) magnesium, sulphur, iron, zinc
(d) phosphorus, potassium, sulphur, calcium

AIPMT-2015

Ans. (d) : Minerals are those required by plants in quantity of more than 1 milligram/gram or 10 m mole/kg of dry matter called macro element.
Macro element are nine in number- C, H, O, N, P, K, S, Mg, and Ca. Silicon and Sodium occur in some plant in range of macronutrients.

Phosphorus- Phosphorus is a constituent of cell membranes, certain proteins, all nucleic acid and nucleotides, and is required for all phosphorylation reactions.
Potassium- In plant, this is required in more abundant quantities in the meristematic tissues, buds, leaves and root tips.
Sulphur- Sulphur is present in two amino acid- cysteine and methionine and is the main constituent of several coenzymes, vitamins and ferredoxin.
Calcium- Calcium is required by meristmatic and differentiating tissue. It is involved in the normal functioning of the cell membranes.

4. The major portion of the dry weight of plants comprises of: -

(a) Nitrogen, phosphorus and potassium
(b) Calcium, magnesium and sulphur
(c) Carbon, nitrogen and hydrogen
(d) Carbon, hydrogen and oxygen

AIPMT-2003
Rajasthan PMT-2007

Ans. (d): There are three elements are taken by plant in the form of CO_2 and H_2O.
- All living organism contain major elements C, H, O.
- Oxygen is terminal electron acceptor in respiration and Ph is finally governed by hydrogen ion concentration.

5. The technique of growing plants, in water culture, is called

(a) tissue culture (b) aero culture
(c) hydroponics (d) cell culture

Uttarakhand-2005
Punjab MET-1999

Ans. (c) : The technique of growing plants, in water culture, is called hydroponics. This technique was first used and given by Julius Von Sachs. Nutrients are supplied along with the solution without the use of soil.

6. Which of the following element is maximum in plants?

(a) Carbon (b) Zinc
(c) Calcium (d) Magnesium

VMMC-2011 / UP CPMT-2010

Ans. (a) : Plants absorb minerals and nutrients for the growth and development which is known as "mineral Nutrition."
- It is of 2 types → Micronutrients and Macronutrients.
- Macronutrients present in more than 1 milligram/gram or 10 m mole/kg of dry matter called macro element.
  Macro element are nine in number- C, H, O, N, P, K, S, Mg, and Ca. Silicon and Sodium occur in some plant in range of macronutrients among them C is maximum in plant.
- Micronutrients present in less than 1 milligram/gram or 10 m mol/kg of dry matter micronutrients are eight in number - Fe, Mn, Zn, Cu, Mo, B, Cl and Ni.

Hence carbon is maximum in plants.

@apna_pdf

7. The amount of which of the following elements greatest in protoplasm

(a) hydrogen (b) oxygen
(c) nitrogen (d) carbon

CG PMT-2007

Ans. (b) : Oxygen is present abundantly in protoplasm as it constitutes 62% of protoplasm.

Elements	Percentage
Carbon	20%
Hydrogen	10%
Oxygen	62%
Nitrogen	3%

8. Choose the genetically engineered variety of organisms created to deal with the problem of oil leakage

(a) Agrobacterium rhizogenes
(b) Agrobacterium tumefaciens
(c) Escherichia coli
(d) Pseudomonas putida

CMC Ludhiana-2014

Ans. (d) : Genetically variety of organisms created to deal with the problem of oil leakage is pseudomonas putida. It is also known as "superbug" or "oil eating bug." It is genetically engineered by "Prof. Anand Mohan Chakrabarty".

9. This bacteria produces a well known insecticide

(a) B. Thuringiensis (b) B. polymyxa
(c) B. brevis (d) B. licheniformis

BCECE-2009

Ans. (a) : The bacteria which produces an insecticide is bacillus thuringiensis. This bacteria produces a kind of protein which have capacity to kill insects. When an insect ingests the insecticide its remain in inactive form and it is converted to active in alkaline environment form which leads to death.

B. Essential Mineral elements and Criteria of Essentiality

10. Which of the following mineral-nutrients plays an important role in biological nitrogen fixation?

(a) Zinc (b) Iron
(c) Molybdenum (d) Magnesium

DUMET-2009 / Punjab MET-2003
AIPMT-1995 BVP-2006 / JIPMER-2002
BVP-2006 / Rajasthan PMT-2007 /AIPMT-2003

Ans. (c) : An element playing important role in nitrogen fixation is molybdenum. Molybdenum is a component of nitrogenase and nitrate reductase involved during N_2 fixation.

11. The first clinical gene therapy was performed to cure

(a) SCID (b) AIDS
(c) Phenylketonuria (d) Sickle cell anaemia

TS EAMCET 10.05.2023 Shift-I

Ans. (a) : The first clinical gene therapy was performed to cure SCID (Severe Combined Immuno Deficiency). SCID is a type of genetic disorder that affects the body's ability to fight infection. People with SCID are very susceptible to infections and often die in early childhood.

12. Hydroponics was first demonstrated by

(a) Daniel E. Koshland (b) Cornelius Van Niel
(c) Julius Von Sachs (d) T.W. Englemann

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : Julius Von Sachs was a German botanist who first demonstrated the technique of hydroponics in 1860. In his experiment he grew bean plants in a nutrient solution and showed that they could grow and flower normally without soil.

13. Match List I with List II

	List I		List II
A.	Iron	I.	Synthesis of auxin
B.	Zinc	II.	Component of nitrate reductase
C.	Boron	III.	Activator of catalase
D.	Molybdenum	IV.	Cell elongation and differentiation

Choose the correct answer from the options given below

(a) A-II, B-IV, C-I, D-III
(b) A-III, B-II, C-I, D-IV
(c) A-II, B-III, C-IV, D-I
(d) A-III, B-I, C-IV, D-II

NEET (UG) 07.05.2023

Ans. (d) : Plants are living organisms and they also require nutrients like us in order to survive, grow, reproduce and development. Macronutrients provide energy to the plants and required in larger amounts to maintain their development and growth.

- Micronutrients are trace elements that help in growth or metabolism.
  Boron- (B) Boron is important for sugar transport, amino acid production, cell wall formation, pollen tube germination, cell elongation and differentiation.
- Iron (Fe)- Iron play a vital role in chlorophyll Production, photosynthesis, lignin formation, Activator of cataloes.
- Zinc (Zn)- Zinc is important to plants for activity of auxins, early growth stage, photosynthesis, etc.
- Molybdenum (Mo) - Molybdenum is component of nitrate reductase.

14. _____element is not required by plants for their normal healthy growth

(a) Phosphorous (b) Potassium
(c) Calcium (d) Lead

AP EAMCET-11.07.2022 Shift-II

Ans. (d) : Lead is not required by plants for their normal healthy growth, because Pb toxicity causes inhibition of ATP production, lipid peroxidation and DNA damage by over production of lead. Lead strongly inhibits seed germination, root elongation, transpiration etc.

15. Match the following:

	List-I		List-II
A	Manganese	i	Kinase reaction and turgidity of cells
B	Magnesium	ii	Water splitting in oxygenic photosynthesis

@apna_pdf

C	**Sulphur**	**iii**	**Nitrate reductase**
D	**Molybdenum**	**iv**	**Chlorophyll**
		v	**Disulphide bonds to stabilize the protein structure**

The correct match is:

	(A)	(B)	(C)	(D)
(a)	ii	iv	v	i
(b)	i	ii	iii	v
(c)	iii	i	ii	iv
(d)	ii	iv	v	iii

TS EAMCET-09.05.2019 Shift-I

Ans.(d):

List - I	List-II
(A) Manganese	Water splitting in oxygenic photosynthesis
(B) Magnesium	Chlorophyll
(C) Sulphur	Disulphide bonds to stabilize the protein structure
(D) Molybdenum	Nitrate reductase

16. Consider the following statements i, ii and iii regarding criteria for essentiality of the nutrients in plants:

i. The presence of elements is must for plants to complete their life cycle.

ii. The role of the element can be replaced by another element.

iii. The element must be directly involved in the metabolism of the plant.

Choose the correct statements:

(a) i and ii (b) ii and iii

(c) i and iii (d) iii only

Karnataka CET-2019

Ans. (c) : The presence of elements is essential for plants to complete their life cycle and the elements are directly involved in the metabolism of the plant. The role of the element can be replaced by another element is not true regarding the criteria for essentiality of the nutrients in plants.

Hence, statements I and III are correct only.

17. Which option is correct for the correctly matched pairs of the following mineral ions and their importance?

Mineral ions		Importance	
(i)	**Chlorine**	**(p)**	**For germination of pollen grain**
(ii)	**Boron**	**(q)**	**For synthesis of nucleic acid**
(iii)	**Zinc**	**(r)**	**For cell-division**
(iv)	**Magnesium**	**(s)**	**For the synthesis of Auxin**

(a) (i – r) (ii – p) (iii – s) (iv – q)

(b) (i – r) (ii – q) (iii – s) (iv – p)

(c) (i – q) (ii –s) (iii – r) (iv – p)

(d) (i – s) (ii – r) (iii – q) (iv – p)

GUJCET-2019

Ans. (a) : Chlorine– Cl^- determines increased fresh and dry biomass, greater leaf expansion, increased elongation of leaf and root cell (cell-division), improved water relation, higher mesophyll diffusion to Co_2, and better water-and Nitrogen-metabolism.

Boron– Boron plays an important role in regulating plants hormone level and promoting proper growth. Boron increases power production and retention, pollen tube elongation and germination and seed and fruit development.

Zinc– Zinc is essential element for auxin biosynthesis. Zinc play role in protein synthesis and also acts as enzyme activator and deficiency causes shortening of internodes.

Magnesium– Magnesium is an essential element for the synthesis and salvage of purine and pyrimidine nucleotides. It plays an important role in the structure of nucleic acid and affects their interaction with proteins and other ligands.

18. Match the following :

List-I	List-II
(A) Manganese	**(i) It activates carboxylases**
(B) Magnesium	**(ii) Splits water to liberate oxygen**
(C) Zinc	**(iii) Involved in the synthesis of DNA and RNA**
(D) Nickel	**(iv) Activator for urease enzyme**
	(v) Helps in stabilizing the protein structure

The correct answer is

	A	B	C	D
(a)	(iii)	(iv)	(ii)	(i)
(b)	(iv)	(i)	(v)	(iii)
(c)	(i)	(ii)	(v)	(iv)
(d)	(ii)	(iii)	(i)	(iv)

TS EAMCET-02.05.2018 Shift-II

Ans. (d) :

List – I		List - II
a.	Manganese	Splits water to liberate oxygen
b.	Magnesium	Involved in the synthesis of DNA and RNA
c.	Zinc	It activates carboxylase
d.	Nickel	Activator for urease enzyme

19. Which one of the following elements is activator for both ribulose bisphosphate, carboxylase oxygenase and phosphoenolpyruvate carboxylase in photosynthetic carbon fixation ?

(a) Mg^{2+} (b) Zn^{2+}

(c) Mn^{2+} (d) Cl^- and K^+

JIPMER-2016

Ans. (a) : Ribulose bisphosphate, carboxylase oxygenase and phosphoenol pyruvate carboxylase are critical enzymes in photosynthetic carbon fixation Mg^{2+} ion is activator for Ribulose bisphosphate and carboxylase oxygenase enzymes.

20. A plant requires magnesium for:

(a) Cell wall development

(b) Holding cells together

@apna_pdf

(c) Protein synthesis
(d) Chlorophyll synthesis

AIPMT-2007

Ans. (d) : One atom of magnesium is directly coordinated to the four pyrrole rings in the cyclic tetrapyrrole head. Thus mg^{2+} is the most important structural component of chlorophyll molecules.

21. An essential mineral nutrient of plant, responsible for meristematic activity, metabolism of fat, lipid, hormone and nitrogen also facilitate translocation of photosynthetic product, i.e., organic food, that essential element is
(a) Mo (b) Boron
(c) Cu (d) Zn

UP CPMT-2014

Ans. (b): An essential mineral nutrient of plant, responsible for meristematic activity, metabolism of fat, lipid, hormone and nitrogen also facilitate translocation of photosynthetic product, i.e., organic food, that essential element is Boron.

22. Plastocyanin contains
(a) copper (b) iron
(c) calcium (d) potassium

UP CPMT-2011

Ans. (a): Plastocyanin is a copper-containing protein that mediates electron-transfer where it participates in photosynthesis. It is a prototype of blue copper proteins which is a family of intensely blue-colored metallo proteins.

23. Which ion help in opening and closing of stomata?
(a) Mn^{+} (b) Mg^{2+}
(c) Ca^{2+} (d) K^{+}

UP CPMT-2011

Ans. (d): K^{+} plays an important role in the opening and closing of stomata. As per K^{+} theory, the movement of K^{+} ions across the cell membranes of the guard cell of the stomata leads to changes in the osmotic pressure of the surrounding cells.

24. An element playing important role in nitrogen fixation is:
(a) Molybdenum (b) Copper
(c) Manganese (d) Zinc

AIPMT (Screening)-2010

Ans. (a) : Molybdenum plays an important role in N_2 fixation.
The enzyme complex nitrogen consists of two protein dinitrogenase reductase (component 1) that binds N_2 and a smaller iron protein (component 2) that acts as electron donor to MO-Fe Protein.

25. An essential element is that which
(a) is found in plant ash.
(b) is available in the soil.
(c) improve health of the plant.
(d) is irreplaceable and indispensable for growth of plants.

Karnataka CET-2007

Ans. (d) : An essential element is that which is irreplaceable and mandatory for growth of plants. They help in normal growth and reproduction of plants and also play vital role in life cycle and setting the seeds. Some essential elements are such as C, H, Ca, N, P, K, Ca, Mg, Fe, Cu, Zn, etc.

26. Plants take zinc in form of:
(a) $ZnSO_4$ (b) Zn^{++}
(c) ZnO (d) Zn

AIPMT-2000

Ans. (b) : Plants take zinc in form of Zn++. It helps in growth and development of plants. The primary function of zinc is to help the plant to produce chlorophyll.

27. When the plants are grown in magnesium deficient but urea rich soil; the symptoms expressed are:
(a) Yellowish leaves (b) Colourless petiole
(c) Dark green leaves (d) Shoot apex die

AIPMT-2000

Ans. (a) : When the plants are grown in magnesium deficient but urea rich soil; the symptoms expressed are yellowish leaves.

28. Best defined function of Manganese in green plants is:
(a) Nitrogen fixation (b) Water absorption
(c) Photolysis of water (d) Calvin cycle

AIPMT (Screening)-2012

Ans. (c) : Manganese (Mn^{2+}) is used for photolysis of water to produce Oxygen and electrons during light reaction of photosynthesis in chloroplast.
Mn catalyses the photosynthesis process by splitting of water after photosystem-II fixes light to initiate the conversion of CO_2 and water into carbohydrates.

29. Which of the following elements is a constituent of biotin?
(a) Sulphur (b) Magnesium
(c) Calcium (d) Phosphorus

NEET (Karnataka)-2013

Ans. (a) : Sulphur is present in two amino acid- cystein and methionine. It is the main constituent of several coenzyme, vitamins (thiamins, biotin, coenzyme A) and ferredoxin.
Plants obtain sulphur in the form of sulphate $\left(SO_4^{2-}\right)$.

30. Study the following lists.

List I	List II
(A) Sulphur	(i) Cytochrome-c oxidase
(B) Molybdenum	(ii) IAA synthesis
(C) Copper	(iii) Biotin
(D) Manganese	(iv) Dinitrogenase
	(v) Oxygen evolving complex

The correct match is :

	A	B	C	D
(a)	3	4	2	1
(b)	4	3	1	2
(c)	3	4	1	5
(d)	4	1	2	5

AP EAMCET-2010

Ans. (c) :

List-I	List-II
(A) Sulphur	Biotin
(B) Molybdenum	Dinitrogenase
(C) Copper	Cytochrome-C-Oxidase
(D) Manganese	Oxygen evolving Complex

@apna_pdf

31. Molybdenum is the essential constituent of
(a) nitrogenase (b) respiratory chain
(c) growth regulators (d) chlorophyll
AP EAMCET-2011

Ans. (a): Molybdenum is an essntial component in two enzymes that convert nitrate into nitrite and then into ammonia. It also needed by symbiotic nitrogen fixing bacteria in leagumes to fix atmospheric nitrogen.

32. Plants require one of these for the formation of ATP :
(a) N, Ca (b) N, P
(c) N, Cu (d) K
BHU PMT (Screening)-2007
AFMC-2000

Ans. (b) : Plants require Nitrogen and Phosphorus for the formation of ATP. Phosphorus is an energy carrier and forms part of ATP, NADP and ADP.
Plants absorb phosphorus in the form of phosphate.

33. Which of the following elements are used up in phosphorylation?
(a) N and P (b) I and P
(c) Ca and Mg (d) Ca and S
BCECE-2011

Ans. (a) : Elements used in phosphorylation are Nitrogen and Phosphorus.
Phosphorus is a constituent of cell membranes, certain proteins, all nucleic acids and nucleotides, and is required for all phosphorylation reactions.

34. The number of essential nutrients needed in plants is:
(a) 16 (b) 5
(c) 4 (d) 8
Haryana PMT-2005
BHU PMT-2003
AP EAPCET-11.07.2022 Shift-I

Ans. (a) : Essential nutrients in plants are of 16 in number, which is divided into 2 types :
Macronutrients : C, H, O, N, P, K, Mg, Ca, S
Micronutrients : B, Zn, Mn, Cu, Mo, $C\ell$, Fe etc

35. Which of the following is not trace element?
(a) Mg (b) Zn
(c) B (d) Cu
Rajasthan PMT-1996

Ans. (a) : Micronutrients are also known as "trace elements". Trace elements are required by plants in small quantities (> less than 1 ppm).
Example- B, Zn, Cu, Mo, Mn, Cl, Fe, Ni, etc.
Hence, Mg is a macronutrient so, it is not trace element.

36. Fertilizers providing N,P, K all essential elements to plants are called :
(a) complete fertilizers
(b) incomplete fertilizers
(c) manure
(d) compost
BHU PMT-2001

Ans. (a) : Nitrogen, Phosphorus and Potassium are called " complete fertilizers", as they are primary or macronutrients of the plant.
As these elements (N, P, K) are beneficial for plants growth and development.

37. Which one of the following elements is almost non-essential for plants?
(a) Ca (b) Mo (c) Zn (d) Na
JIPMER-2003 /AIPMT-1996

Ans. (d) : Sodium is almost non-essential for plant because it does not comes under the criteria of plant nutrient, as plants can also complete their life cycle without sodium.

38. Which of the following is a component of middle lamella in plant cells ?
(a) Fe (b) K (c) Ca (d) Cu
BHU PMT (Screening)-2010
JIPMER-2000 / Haryana PMT-1999

Ans. (c) : Calcium is found in middle lamella of a plant in the form of "Calcium pectate".
Calcium acts as a cementing material between two different cells wall. It also stimulates root hair development in plants.

39. The essential element needed for water splitting in photosynthesis leading to O_2 evolution is
(a) Mo (b) Mn
(c) Mg (d) K
AMU-2012

Ans. (b) : Manganese activate many enzymes involved in photosynthesis, respiration and nitrogen metabolism. The best defined function of manganese is the splitting of water to liberate oxygen during photosynthesis.
It is absorbed in the form of manganous ion (Mn^{2+})

40. For chlorophyll formation most important elements are
(a) iron and Ca (b) iron and Mg
(c) Mg and Ca (d) iron and Na
Haryana PMT-2011 / CG PMT-2006

Ans. (b) : Iron and Magnesium are essential for formation of chlorophyll. Mg is present in tetrapyrrole ring of chlorophyll. Mg forms integral component of chlorophyll.
Iron maintains structural integrity of chloroplast (where chlorophyll is present).
Iron is an important constituent of proteins involved in the transfer of electrons like ferredoxin and cytochromes.

C. Deficiency Symptoms of Essential Element

41. Insectivorous plant grow generally in soil that are deficient in
(a) water (b) nitrogen
(c) potassium (d) calcium
Manipal-2002,2012 / CG PMT-2009
Haryana PMT-2009, 1999 / CMC Ludhiana-2008
BCECE-2007, 2006 / AMU-2001,2004,2006,2009
VMMC-2004,2005 / UP CPMT-2001
Punjab MET-2004,2008 / BVP-2001, 2003
KVPY SB and SX-2016 / JIPMER-2002,2006
BHU PMT (Screening)-2006 / AIPMT-1999

Ans. (b) : Insectivorous plant grow generally in soil that are deficient in nitrogen because they trap and digest insects to suck up nutrient. For example- Venusflytrap, pitcher plant etc. are a number of insectivorous plants. They are often called carnivorous plants.

@apna_pdf

42. Die back of citrus and reclamation of legumes and cereals is due to deficiency of :

(a) copper (b) zinc
(c) sodium (d) Molybdenum

AFMC -2011 / AMU-2015
MHT CET-2019 / WB JEE-2015 / Punjab MET-2011

Ans. (a) : Deficiency of copper in plants leads to "Die Back disease" in which necrotic lesions develops near leaf tip.

- In cereals and legumes, Cu deficiency causes "Reclamation disease" in which leaf tightly rolled and apical buds die.
- Deficiency of Cu, also causes "Exanthema disease" in which bark splits up at places to exude gum, resins.

43. Toxicity of which micronutrient induces deficiency of iron, magnesium and calcium?

(a) Boron (b) Zinc
(c) Molybdenum (d) Manganese

Karnataka CET-20.05.2023

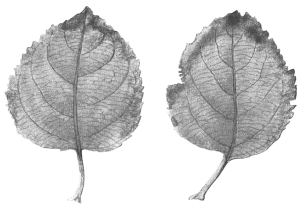
Ans. (d) : Manganese toxicity can induce deficiency of iron, magnesium and calcium because it completes with these micronutrients for uptake by the plants. Manganese can also inhibit the enzymes that are involved in the absorption and utilization of iron, magnesium and calcium.

44. Deficiency symptoms of nitrogen and potassium are visible first in:

(a) Sensecent leaves (b) Young leaves
(c) Roots (d) Buds

AIPMT-2014

Ans. (a) : The elements that are actively mobilised within the plants that show the deficiency lead to the death of the plant. The defincicney of potassium in plants in first visisble in the old leaves because they are mobile elements. similarly Nitrogen is mobile elements and its deficiency first visible is old leaves (senseecent leaves).



45. Plants deficient of element zinc, shows its effect on the biosynthesis of plant growth hormone –

(a) Auxin (b) Cytokinin
(c) Ethylene (d) Abscissic acid

AIPMT-2003

Ans. (a): Plants require zinc for the synthesis of tryptophan, a key amino acid in the synthesis of the Auxin indoleacetic acid (IAA). Therefore, zinc also operates in the control of plant development through its indirect action on auxins.

46. Internal cork disease in apple is due to the deficiency of

(a) iron (b) copper
(c) boron (d) phosphorus

Uttarakhand PMT-2007
BVP-2008

Ans. (c) : "Internal cork Disease" in apple is due to deficiency of Boron. It forms lesions in internal fleshy part and affects the quality of fruit.
Round marks appear on flesh, spots dry up and colour turns darker from centre to outward.
Symptoms are seen within 6 - 8 weeks.

47. The deficiency of this micro-nutrient results in little leaf disease

(a) Copper (b) Zinc
(c) Boron (d) Iron

Haryana PMT-2011
JandK CET-2008

Ans. (b) : Deficiency of Zinc, causes "little leaf" disease.
It also "Suppresses seed formation".
Symptons includes – plants become dwarf, leaves become mottled and yellowish in colour.

48. Molybdenum causes

(a) Mottling (b) Wilting
(c) Reclamation (d) Chloros is

BHU PMT (Screening)-2007

Ans. (a) : Molybdenum causes mottling, plants become stunted, leaves turn yellow in colour in legumes.
Its deficiency leads to "whiptail Disease" in cabbage.
Symptoms includes interveinal chlorosis, Nitrate reduction suppressed.

49. Match the Column I with that of Column II and choose the correct combination from the options given.

Column-I Essential elements		Column II Deficiency causes	
p.	**N, K, Mg, S, Fe, Mn, Zn, and Mo**	**1.**	**Inhibit cell division**
q.	**N, K, S and Mo**	**2.**	**Necrosis**
r.	**Ca, Mg, Cu and K**	**3.**	**Delay in flowering**
s.	**N, S and Mo**	**4.**	**Chlorosis**

(a) (p) - (4), (q) - (3), (r) - (2), (s) - (1)
(b) (p) - (1), (q) - (2), (r) - (3), (s) - (4)
(c) (p) - (4), (q) - (1), (r) - (2), (s) - (3)
(d) (p) - (2), (q) - (3), (r) - (4), (s) - (1)
(e) (p) - (3), (q) - (4), (r) - (2), (s) - (1)

Kerala PMT-2015

Ans. (c) : Essential Elements	Deficiency
(i) N, K, Mg, S, Fe, Mn, Zn, Mo	Chlorosis
(ii) N, K, S and Mo	Inhibit cell division
(iii) Ca, Mg, Cu, K	Necrosis
(iv) N, S, Mo	Delay in flowering

50. Chlorosis is produced in leaves due to deficiency of Fe, Mg, Mn, N or S. of these essential element those that are exclusive constituents of chlorophyll molecules are

(a) Fe and S (b) N and S
(c) Mg and S (d) Mg and N

JIPMER-2015
AMU-1998

@apna_pdf

Ans. (d) : Chlorophyll contains Mg and N. The general formula of chlorophyll is $C_{55}H_{72}O_5N_4Mg$.
Chlorosis is a condition in which leaves produce insufficient chlorophyll. i.e. pale yellow. Chlorosis is caused by deficiency of Iron, magnesium, Zinc, Manganese, Nitrogen, Sulphur.

51. Grey spots of oat are caused by deficiency of
(a) Cu (b) Zn
(c) Mn (d) Fe
AMU-2007 / CG PMT-2007

Ans. (c) : Grey spots of Oats are caused by deficiency of Manganese (Mn). Mn produces a condition known as "Grey speck" with patches. Oats becomes pale green and young leaves have spots of grey or brown necrotic tissue with orange margins.

52. Motile leaf in citrus plants is due to deficiency
(a) boron (b) magnesium
(c) zinc (d) None of these
CG PMT-2007

Ans. (c) : Motile leaf in citrus plants is due to deficiency of Zinc (Zn).
Zn deficiency causes chlorosis (absence of chlorophyll). i.e. yellowing of leaves.

53. For good growth of pollen tube, necessary element is
(a) Ca (b) B
(c) Mg (d) Mo
Haryana PMT-2009 / CG PMT-2009

Ans. (b) : Boron is required for uptake and utilization of Ca^{2+}, and proper membrane functioning, pollen germination, cell elongation, cell differentiation and carbohydrate translocation.

54. The plants growing in magnesium-deficient soil, but sprayed with urea would show
(a) deep green foliage
(b) loss of pigments in petals
(c) early flowering
(d) yellowing of leaves
Haryana PMT-2010

Ans. (d) : Magnesium deficiency leads to "Interveinal chlorosis" of leaves results in defoliation due to break down of chlorophyll. It characterized by yellowing of leaf veins and early leaf fall. It is still yellow in colour because urea does not contains Mg. Urea comprises mixture of Ammonium Nitrate and lime.
Hence, plants show yellowing of leaves.
Epsom salts (magnesium sulfate) dissolved in water, sprayed on leaves will cure its deficiency.

55. Which of the following is not caused by deficiency of mineral?
(a) Chlorosis (b) Etiolation
(c) Shortening of internodes (d) Necrosis
JIPMER-2008 / AIPMT-1997 / Haryana PMT-2008

Ans. (b) : Deficiency of Minerals leads to chlorosis, shortening of internodes, Necrosis respectively due to the lack of Fe, K and N, S, Mo. .
- But etiolation is a process in which plants grown in partial or complete absence of light.
- Etiolation is characterized by weak stems, smaller leaves, longer internodes, pale yellow colour. Development of seeding in dark is known as "Skotomorphogenesis" and leads to etiolated seedling.
- Simply etiolation means growth of plants in absence of sunlight.

56. Yellowish edges appear in leaves deficient in
(a) Ca^{++} (b) Mg^{++}
(c) K^+ (d) Sulphur
AMU-2008 / VMMC-2008

Ans. (c) : Potassium is abundant in young parts of plants eg. Buds, root tips and shoot tips. It help in maintaining anion-cation balance and turgidity in cells.
- Potassium helps in control of respiration, closing an opening of stomata.
- Symptoms includes, dead tissue at tips, between veins, margins of leaves, plants are more prone to disease due to potassium deficiency in plants.

57. Mottled chlorosis on the leaves occurs due to the deficiency of
(a) Nitrogen (b) Phosphorus
(c) Potassium (d) Sulphur
JandK CET-2007

Ans. (c) : Mottled chlorosis refers to yellowing and curling of leaves, loss of apical dominance etc.
- It is due to potassium deficiency.
- Foliage leaves suffers first and tips become scorched and margins become dull yellow in colour.
- Deficiency shows decrease in protein synthesis failure of cells to divide which become elongated.

58. Browning of cauliflower is a
(a) fungal disease (b) bacterial disease
(c) physiological disease (d) viral disease
CG PMT-2011

Ans. (c) : Browning of Cauliflower is a physiological disease.
- It is caused due to deficiency of Boron.
- Symptoms of Boron deficient plants are – water soaked regions appear on the stem and curd.
- Stem becomes hollow as plant grows and soaking water tissue covers inner walls of cavity.

59. White -bud condition in maize is produced due to the deficiency of
(a) iron (b) molybdenum
(c) zinc (d) boron
CG PMT-2011

Ans. (c) : White bud condition in maize is due to deficiency of Zinc [Zn] in plants.
- Zn is a trace element i.e. required in low amount Symptoms include chlorotic pale, yellow midrib from base of the leaves.
- Younger leaves totally becomes yellowish in colour i.e. chlorosis occurs.
- Internode growth reduced and leads to stunted plant growth.

60. Tea yellow is a disease of tea plants produced due to the deficiency of
(a) phosphorus (b) sulphur
(c) potassium (d) nitrogen
CG PMT-2011

@apna_pdf

Ans. (b) : Tea yellow is a disease of tea plants produced due to deficiency of sulphur.

- It is characterised by progressive degradation of tree, leaves become yellowish in colour i.e. chlorosis in leaf (absence of chlorophyll)
- Small, rolling of leaf and finally abscise [shedding off).
- Yellow tea Disease is also known as foria foot disease of tea.

61. Chlorosis in leaf occurs due to the deficiency of:

(a) Chloride (b) Magnesium
(c) Phosphate (d) Molybdenum

Rajasthan PMT-2006, 2000
JCECE-2007 / JandK CET-2010

Ans. (b) : Chlorosis means a state where leaves are unable to produce sufficient chlorophyll due to deficiency of iron, Magnesium, Zinc, Manganese, Nitrogen and Sulphur.

- Magnesium plays an important role in formation of chlorophyll as it is present in tetrapyrrolic ring of chlorophyll.
- Formula of chlorophyll is $C_{55}H_{72}O_5N_4$ Mg.

62. Assertion: Deficiency of sulphur causes chlorosis in plants.
Reason: Sulphur is a constituent of chlorophyll, proteins and nucleic acids.

(a) If both assertion and reason are true and reason is the correct explanation of assertion
(b) If both assertion and reason are true but reason is not the correct explanation of assertion
(c) If assertion is true but reason is false
(d) If both assertion and reason are false

VMMC-2005

Ans. (c) : Deficiency of sulphur leads to chlorosis in plants i.e. insufficient/chlorophyll is not formed in plants.

- Sulphur is absorbed as sulphate ions and it is a component of protoplasm.
- Sulphur is essential for formation of vitamins and coenzymes
- Sulphur is essential for root formation and its deficiency leads to retardation of cell division and stops formation of fruits in plants.
- Hence, it is not a direct component of chlorophyll out indirectly affects the growth of a plant.

63. Opening and closing of stomata is due to

(a) Ca^{2+} (b) Na^{+}
(c) K^{+} (d) Cl^{-}

BCECE-2008

Ans. (c) : Opening and closing of stomata is due to potassium (K^{+}).

- It plays an important role in osmotic regulation and hydration.
- Potassium is main component of active transport mechanism of stomatal closing and opening.
- Potassium regulates the opening and closing of plant stomata. Stomates are the pores on plant leaves that allow for gas and water vapor exchange. When the plants have adequate potassium, the guard cells swell and allow for complete closure of the stoma opening.

D. Macro and Micronutrient and its Function

64. Which elements are essential for photolysis of water during photosynthesis process?

(a) Mn and Mg (b) Mn and Cl
(c) Mg and Ca (d) P and Mg

VMMC-2014 / AMU-2005 / Uttarakhand PMT-2004
BVP-2006 / CG PMT-2004/ AIPMT (Re-Exam)-2015

Ans. (b) : Photolysis occurs in the granum of a chloroplast where light reabsorbed by chlorophyll. Photolysis is the process by which water is split into oxygen, which is released into the atmosphere and hydrogen.

- Mineral ions required for photolysis of water are manganese, calcium and chlorine. From this process, the oxygen released as a by product while the reduced hydrogen acceptor makes its way to the second stage of photosynthesis and chlorine cycle.

65. Which of the following is are not an essential micro nutrient ?

(a) Boron (b) Nickel and cadmium
(c) Molybdenum (d) Zinc

HP CET-2011 / VMMC-2005
AMU-2004 / BVP-2003

Ans. (b) : Nickel and Cadmium is not on essential micronutrient.

- All the elements are classified as follows –

Micronutrients	Macronutrients
Boron	Carbon
Zinc	Hydrogen
Manganese	Oxygen
Copper	Nitrogen
Molybdenum	Phosphorus
Chlorine	Potassium
Iron	Magnesium, Sulphur, Calciums

66. Deficiency of the following causes Necrosis or death of leaf tissue

(a) N, K, S, Mo (b) N, S, Mo, Ca
(c) Ca, Mg, Cu, K (d) Mg, S, Mn, Zn

AP EAPCET-22.05.2023, Shift-II

Ans. (c) : Necrosis or death of leaf tissue is caused by the deficiency of certain elements like Ca, Mg, Cu and K. These elements are involved in many important plant functions, including cell structure, photosynthesis and water transport.

67. Which of the following mineral ion is not remobilized in plants?

(a) Nitrogen (b) Phosphorus
(c) Potassium (d) Calcium

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) : Calcium is the elements in plants which is not mobilized because it is a structural component.

- Calcium is associated with the cell plate in plants.
- Phosphorus, nitrogen and potassium are the elements that are most easily mobilized.

@apna_pdf

68. Match List-I with List-II

	List-I		List-II
(A)	Manganese	(i)	Activates the enzyme catalase
(B)	Magnesium	(ii)	Required for pollen germination
(C)	Boron	(iii)	Activates enzymes of respiration
(D)	Iron	(iv)	Functions in splitting of water during photosynthesis

Choose the correct answer from the options given below :

(a) (A)-(iii), (B)-(i), (C)-(ii), (D)-(iv)
(b) (A)-(iii), (B)-(iv), (C)-(i), (D)-(ii)
(c) (A)-(iv), (B)-(iii), (C)-(ii), (D)-(i)
(d) (A)-(iv), (B)-(i), (C)-(ii), (D)-(iii)

NEET-2022

Ans. (c) : Manganese - Manganese is a micronutrient for plants, it is required for functioning of many enzymes of respiration photosynthesis and nitrogen metabolism.

e.g- splitting of water during photosynthesis required manganese

- **Magnesium** - It helps in the activation of enzymes involved in photosynthesis and respiration.

→ It is involved in the synthesis of DNA and RNA.
→ It is constituent of the structure of chlorophyll.
→ It helps in maintaining the ribosome structure.

- **Boron** - Boron is one of the essential nutrients for the optimum growth development yield and quality of crop. It performs many important functions in plants and is mainly involved in cell wall synthesis and structural integration also required for pollen germination.
- **Iron** - Iron is also required for photosynthesis and chlorophyll synthesis and also activates the enzyme catalase.

69. Which one of the following elements is an essential micronutrient for plants ?

(a) Nitrogen (b) Potassium
(c) Calcium (d) Boron

Tripura JEE-2021

Ans. (d) : Boron is an essential micronutrient for plants and C, H, O, N, P, K, Ca, Mg, S are macronutrients.

- Boron absorbed by plants in the form of borate or tetraborate ions.
- It is decreases with increase in pH.
- B is necessary for meristematic activity and for nodule formation in leguminous plants.
- It facilitates translocation of sugars in plants.
- Also helpful in salt absorption, photosynthesis and hormone regulation, flowering and fruiting.

70. Lack low levels of Potassium, Nitrogen, Sulphur an Molybdenum causes_____

(a) Chlorosis
(b) Necrosis
(c) Premature leaf fall
(d) Inhibition of cell division

AP EAMCET-24.09.2020 Shift-I

Ans. (a): Chlorosis or loss of chlorophyll leads to the yellowing of leaves. It is caused by the deficiencies of nitrogen, Potassium, magnesium, sulphur, iron, Manganese, zinc and Molybdenum.

Premature leaf fall is due to deficiency of phosphorus. Necrosis is due to deficiency of Mg, Ca, Cu, K. Inhibition of cell division is due to deficiency of N, S, Mo.

71. Match the following concerning essential elements and their functions in plants

(A)	**Iron**	**(i)**	**Photolysis of water**
(B)	**Zinc**	**(ii)**	**Pollen germination**
(C)	**Boron**	**(iii)**	**Required for chlorophyll biosynthesis**
(D)	**Manganese**	**(iv)**	**IAA biosynthesis**

Select the correct option

	(A)	(B)	(C)	(D)
(a)	(iv)	(iii)	(ii)	(i)
(b)	(iii)	(iv)	(ii)	(i)
(c)	(iv)	(i)	(ii)	(iii)
(d)	(ii)	(i)	(iv)	(iii)

NEET-2020 Phase-I

Ans. (b) :

Iron- It activates catalase enzyme and is essential for the formation of chlorophyll.

Zinc- It activates carboxylase enzyme and also needed in the synthesis of Auxin (IAA).

Boron- It is required for uptake and utilization of Ca^{2+}, membrane functioning, pollen germination, cell elongation, cell differentiation and carbohydrate translocation.

Manganese- The best defined function of Mn is in the splitting of water to liberate O_2 during photosynthesis.

72. Study the following lists concerning the deficiency diseases and role of elements

	List -I		List - II
(A)	**Die-back in citrus**	**(I)**	**Urease**
(B)	**Mottled leaf**	**(II)**	**Hexokinase**
(C)	**Mouse ear in pecan**	**(III)**	**Nitrogenase**
(D)	**Whip tail in cauliflower**	**(IV)**	**Cytochrome 'C' oxidize**
		(V)	**Carboxypeptidase**

	(A)	(B)	(C)	(D)
(a)	(V)	(III)	(II)	(IV)
(b)	(III)	(II)	(IV)	(I)
(c)	(IV)	(V)	(I)	(III)
(d)	(IV)	(I)	(III)	(V)

AP EAMCET-2014
AP EAMCET-25.09.2020 Shift-II

Ans. (c) : After read the following table option (c) is the correct answer.

List-I		List-II		Element
(A)	Die-back in citrus	(IV)	Cytochrome 'C' oxidize	Cu
(B)	Mottled leaf	(V)	Carboxypeptidase	Zn
(C)	Mouse ear in pecan	(I)	Urease	Ni
(D)	Whip tail in cauliflower	(III)	Nitrogenase	Mo

@apna_pdf

73. Which of the following is a group of micronutrients for plants?

(a) Fe, Mn, Cu, Mo, Zn (b) Fe, Mn, Cu, O, C
(c) Cu, B, Cl, Fe, Ca (d) Ca, Mg, Fe

AIIMS-2016 / AIIMS-2007
AIIMS-25.05.2019 Shift-II

Ans. (a)

Micronutrients	Macronutrients
• micronutrients are required in small quantities.	• Macronutrient are required in large amount.
• They are present in low concentration in plant.	• They are present in excessive concentration in plant.
• Also called Trace elements.	• Also called major elements.
like– Fe, Mn, Cu, Zn, Mo, B, Cl and Ni.	**like–** C, H, N, O, P, K, Ca, S and Mg.

74. Which of the following is microelement?

(a) Ca (b) Mg
(c) Mn (d) S

AIIMS-25.05.2019 Shift-I

Ans. (c) : Micronutrients or trace element are needed in very small amounts (less than 10m mole Kg^{-1} of dry matter). They are- Fe, Mn, Mo, Ni, Zn, B, Cl, Cu

• Manganese (Mn) is an important micronutrient for plant growth and development and sustains metabolic roles within different plant cell compartments. The metal is an essential cofactor for the oxygen-evolving complex (OEC) of the photosynthetic machinery, catalyzing the water-splitting reaction in photosystem II(PS II).

75. Which of the following is correct set of macronutrients?

(a) K, B, C, H (b) K, H, Mn, N
(c) C, Zn, H, N (d) C, H, Mg, N

AIIMS-25.05.2019 Shift-I

Ans. (d) : Carbohydrates, fat and protein are called macronutrients. They are the nutrients you use in the largest amounts. Macronutrients are the cornerstones of your diet. Macronutrients are the nutritive components of food that body needs for energy and to maintain the body's structure and systems.

• The macronutrients include carbon (C), Hydrogen (H), Oxygen (O) , Nitrogen (N), Phosphorous (P), Sulphur (S), Potassium (K), Calcium (Ca) and Magnesium (Mg).

76. Which of the following is not a micronutrient?

(a) B (b) Zn
(c) Mn (d) Mg

JIPMER-2019
AIPMT (Screening)-2010

Ans. (d) : • Mg in not a micronutrient

• Micronutrients are essential elements required by organism in varying quantities throughout life to carry a range of physiological functions to maintain health.

Micronutrients - Boron (B), Zinc(Zn), Manganese (Mn), iron(Fe), Copper(Cu), Molybdenum(Mo), Chlorine(Cl), Nikel (Ni).

Macronutrients - Magnesium(Mg), Calcium(Ca) Potassium(K), Sulphur(S), Phosphorus(P), Nitrogen(N), Carbon(C), Hydrogen(H), Oxygen(O), So, Magnesium come under Macronutrient.

77. Match the following

	List-I		List-II
(p)	**Chlorine**	**(i)**	**Helps to maintain an anion-cation balance and is involved in protein synthesis.**
(q)	**Sulphur**	**(ii)**	**Helps in determining the solute concentration**
(r)	**Potassium**	**(iii)**	**It is the main constituent of several coenzymes and vitamins.**
(s)	**Nickel**	**(iv)**	**Found to induce disease resistance in some plants.**
		(v)	**Structural component of Cytochrome 'C' oxidase.**

	(p)	(q)	(r)	(s)
(a)	(iv)	(ii)	(iii)	(v)
(b)	(ii)	(iii)	(i)	(iv)
(c)	(i)	(iv)	(ii)	(iii)
(d)	(ii)	(v)	(iii)	(iv)

TS EAMCET-02.05.2018 Shift-I

Ans. (b) :

- Chlorine-Helps in determining the solute concentrate ion.
- Sulphur-It is the main constituent of several coenzyme and vitamins
- Potassium-Helps to maintain anion-cation balance and is involved in protein synthesis
- Nickel-Found to induce disease resistance in some plants.

78. Select the incorrect statement:

(a) Microelements involve N, P, Mn, Cu, Mo.
(b) The concentration of microelements is 10 m mole/kg.
(c) If the concentration is more than 10 m mole/kg. They becomes toxic.
(d) The deficiency of microelements causes symptoms of disease

AIIMS-27.05.2018 Shift-II

Ans. (a) : Macronutrients are generally present in plant tissue in large amount (in excess of 10m mole kg^{-1} of dry matter). They are- C, O, H, N, P, S, K, Mg, Ca

• Microelements or trace elements are needed in very small amounts (less than 10m mole kg^{-1} of dry matter) for the healthy development of plant. These include- Fe, Mn, Mo, Ni, Zn, B, Cl, Cu

Hence, Mg, is a macronutrients not a micronutrient.

79. In which of the following forms is iron absorbed by plants?

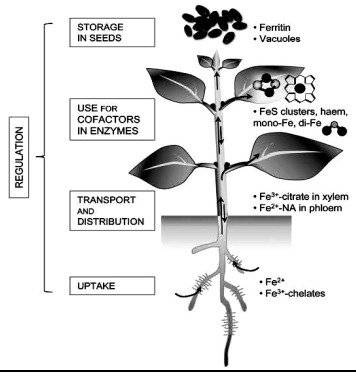
(a) Ferric (b) Ferrous
(c) Both ferric and ferrous (d) Free element

NEET-2018

@apna_pdf

Ans. (a) : It is absorbed in the form of ferric ions (Fe^{3+}) and as opposed to other micronutrients, it is needed in larger quantities.

- It is often used in redox reactions due to presence of two oxidation states.
- It also serves a catalyst for chlorophyll synthesis. Plants absorb iron in the form of Fe^{3+} from the soil. But in some cases plant root absorb ferrous (Fe^{2+}) ions



80. Which one of the following elements is not an essential micronutrient for plant growth?

(a) Ca (b) Mn
(c) Zn (d) Cu

AIPMT-2007

Ans. (a) : There are 17 essential nutrients required by plants for its healthy and proper growth. Now these nutrients are divided in to two categories.

Macronutrients or Macroelements-

These are the elements which are present in quantity of 1-10 mg per gram of dry weight of the cell.

They are- C, O, H, N, P, S, K, Mg, Ca

Micronutrients or Microelements or Trace element-

These are the elements which are present in a quantity equal to or less 1 mg per gram of dry weight of the cell.

They are- Fe, Mn, Mo, Ni, Zn, B, Cl, Cu

- Ca is an important essential macronutrient required by plants in large quantities primarily for cell wall synthesis.

81. In which of the following, all three are macronutrients

(a) Nitrogen, Potassium, phosphorus
(b) boron, zinc, manganese
(c) Iron, copper, molybdenum
(d) Molybdenum, magnesium, manganese

NEET-2016 Phase-I

Ans. (a) : Macronutrients: The elements which are required in large amounts by plants are known as macronutrients. It includes carbon, Hydrogen, Nitrogen, Oxygen, Phosphorus, potassium, calcium, Magnesium and Sulphur.

82. Study the following lists

List I	List II
(A) Photolysis of water	**1. Zinc**
(B) Diazotrophy	**2. Copper**
(C) Cytochrome C oxidase	**3. Manganese**
(D) Biosynthesis of IAA	**4. Molybdenum**
	5. Boron

	A	B	C	D
(a)	3	2	1	5
(b)	3	4	2	1
(c)	5	2	3	4
(d)	4	1	3	2

AP EAMCET-2009
BHU PMT (Mains)-2011

Ans. (b) : Manganese (Mn)- It is absorbed in the form of Mn^{2+}. It activates many enzymes involved in photosynthesis, respiration and nitrogen metabolism. The best defined function of Mn is in the splitting of water liberate O_2 during photosynthesis.

- Molybdenum fixes atmospheric N_2 i.e. diazotrophy.
- Complex- IV is a cytochrome C oxidase enzyme. It consist of cytochrome- a, cytochrome a_3, haem and **Copper** ions as prosthetic group.
- **Zinc -** Plant absorb zinc from the soil as **zinc ions**. It activates enzymes like carboxylase. It is required for the synthesis of auxin **i.e. IAA.**

83. The most abundant element present in the plant is :-

(a) Nitrogen (b) Manganese
(c) Iron (d) Carbon

AIPMT-2004

Ans. (d) : Carbon found in all organic molecules. Carbon is most abundant element found in plants. Carbon is one of the macronutrient.

- Plants use carbon dioxide during photosynthesis they take in carbon dioxide and convert it into energy for growth.
- When the plant dies CO_2 is given off from the decomposition of plant.

Carbon is constituent of organic compounds. It is one of the non-mineral element.

84. Which one of the following is not a microelement for plants?

(a) Cu (b) B
(c) Zn (d) Cr

AIIMS-2009

Ans. (d) : Cr is not a microelement for plant. Plant require many organic and inorganic nutrients to complete their life-cycle. It has been estabilized that some elements are required by plants in relatively large amount and are called **major elements** or **macronutrients**, e.g., C, H, O, N, S, P, K, Ca and Mg.

Microelements or minor elements or trace elements are required by plants in very small amount, less than 1 ppm, e.g., Fe, Cu, B, Zn, Mn, Mo, Cl.

85. Plants require sulphur for:

(a) DNA replication (b) protein synthesis
(c) synthesis of glucose (d) formation of ATP

DUMET-2002

Ans. (b) : Plant required sulphur for protein synthesis. Sulphur (S) is an essential macronutrient for plant growth and development. It is mainly involved in the formation of proteins and enzymes.

86. Minamata and itai-itai ('ouch - ouch') disease, respectively are caused due the metal pollution of:

(a) Mercury and Cadmium
(b) Mercury and Nickel

@apna_pdf

(c) Mercury and Copper
(d) Mercury and Zinc

MP PMT-2013

Ans. (a) : Minamata- It is neurological syndrome caused by severe mercury poisoning.
Itai - Itai disease is caused by cadmium (Cd) exposure, produced as a result of human activites related to industrialization, and this condition was first recognized in Japan in the 1968s.

87. The macronutrient which is an essential component of all organic compounds, yet not obtained by plants from soil, is
(a) Carbon (b) Nitrogen
(c) Magnesium (d) Phosphorous

Karnataka CET-2005

Ans. (a) : Carbon is a macronutrient which not obtained from soil. It is obtained from the air in the form of CO_2 gas. Those nutrient which required by the plants in large amount is called macronutrients.
Ex. C, H, O, P, K, N, S etc

88. Match the following:

List A	List B
(A) Mg	(i) Splitting of H_2O during photosynthesis
(B) Mo	(ii) Germination of Pollen grain
(C) Mn	(iii) Constituent of chlorophyll
(D) B	(iv) Component of Nitrate reductase
	(v) Synthesis of Auxins

	A	B	C	D
(a)	(ii)	(v)	(iv)	(i)
(b)	(iii)	(iv)	(ii)	(i)
(c)	(iii)	(v)	(iv)	(i)
(d)	(iii)	(iv)	(i)	(ii)

AP EAMCET-2015

Ans. (d) : Magnesium(Mg)- Constituent of the ring structure of chlorophyll
Molybdenum(Mo)- Component of Nitrate reductase and nitrogenase enzyme of nitrogen metabolism.
Maganese(Mn)-Splitting of H_2O during photosynthesis
Boron(B)- Germination of Pollen grain.

89. A plant require magnesium (Mg) for
(a) holding cells together
(b) protein synthesis
(c) chlorophyll synthesis
(d) cell wall development

JIPMER-2011

Ans. (c) : Magnesium is the central core of the chlorophyll molecule in plant tissue. So, magnesium is an important constituent of chlorophyll molecule. Thus plant requires magnesium for chlorophyll synthesis.

90. Some effects of sulphur dioxide and its transformation products on plant include
(a) plasmolysis
(b) golgi body destruction
(c) protein dis-integration
(d) chlorophyll destruction

Manipal-2008

Ans. (d) : A high atmospheric concentration of sulphur dioxide results in extensive tissue damage because the sulphur dioxide reacts with the plant water to form sulphuric acid that damages plant cells by the breakdown of chlorophyll molecule due loss of Mg^{++} leading to decreased photosynthesis.

91. When one element is involved in opening and closing of stomata, the other helps to maintain\ the ribosome structure. They are
(a) Potassium and calcium
(b) Phosphorus and sulphur
(c) Potassium and magnesium
(d) Iron and magnesium
(e) Calcium and sulphur

Kerala PMT-2014

Ans. (c) : Potassium Plays an important role in the opening and closing of stomata. It changes the turgor pressure of the guard cells causing the closing and opening of stomata.
Magnesium plays an important role in the association of subunits of ribosomes during protein synthesis and in general maintains the structure of ribosome.

92. Which of the following groups of minerals are micronutrients?
(a) Magnesium, Manganese, Copper, Boron and Phosphorus
(b) Manganese, Copper, Magnesium, Zinc and Boron
(c) Nitrogen, Potassium, Manganese, Copper and Iron
(d) Iron, Manganese, Copper, Molybdenum and Zinc
(e) Carbon, Potassium, Phosphorus, Nitrogen and Oxygen

Kerala PMT-2014

Ans. (d) : A micronutrient is a chemical element or substance required in trace amount for the normal growth and development of living organism. E.g. Boron (B), Zinc (Zn), Maganese (Mn), Iron (Fe), Copper (Cu), Molybdenum (Mo), chlorine (Cl).
• Macronutrients are generally present in plant tissues in large amount (In excess of 10 m mole kg^{-1} of dry matter). The macro nutrients are- C, H, O, N, P, S, K, Ca, Mg.

93. The principal cation in alkaline soil, is
(a) Na^+ (b) K^+
(c) Ca^{2+} (d) None of these

VMMC-2011

Ans. (c) : Principal cation in alkaline soil is Ca^{2+} (Calcium).
- Alkaline soil refers to a soil with a high pH level (~ 7.3)
- It is caused by the receiving water of a soil contains highly alkaline substance i.e. Ca or Mg carbonates.
- High content of calcium prevents plants from absorbing most of other nutrients.

94. A metal ion involved in stomatal regulation is
(a) iron (b) potassium
(c) zinc (d) magnesium

MGIMS Wardha-2004
UP CPMT-2004

@apna_pdf

Ans. (b) : Metal ion involved in stomatal regulation is Potassium (K^+).

- Two guard cells surrounding leaves and control closing and opening of stomata via increase in solute content during closing.
- Decrease in solute content during opening. Potasium helps to maintain an anion-cation balance in cells, opening and closing stomata.
- Guard cells accumulates potassium resulting stomatal opening.
- Release of K^+ resulting Stomata closing.

95. Which one is the cofactor of carbonic anhydrase?

(a) Iron (Fe) (b) Zinc (Zn)
(c) Copper (Cu) (d) Magnesium (Mg)

WB JEE-2010

Ans. (b) : Zinc is the cofactor of carbonic anhydrase.

- Carbonic anhydrases are enzymes which acceleration the interconversion between CO_2 and HCO_3^- (bicarbonate)
- Zinc is a cofactor for enzyme carbonic anhydrase which is essential to uptake of carbon during photosynthesis.
- Cofactor are the non- proteinaceous part of enzyme necessary for activity of an enzyme. E.g. Zn is cofactor necessary for the activity of carbonic anhydrase enzyme.

96. Which is the importance of molybdenum in plants metabolism ?

(a) Sulphur reduction
(b) Carbon assimilation
(c) Nitrate reduction
(d) None of these

Punjab MET-1999

Ans. (c) : Molybdenum is an essential micronutrient required for Nitrogen metabolism.

- Mo plays on important role in Nitrogen assimilation, purine degradation, phytohormone synthesis.
- In non-leguminous plants, Mo regulates conversion of nitrates into proteins.
- It is necessary for the function of Nitrogenase activity of leguminous plants.

97. Which of the following minerals helps in N_2 fixation?

(a) Copper (b) Zinc
(c) Manganese (d) Molybdenum

Manipal-2012
AFMC-2002
JandK CET-2009

Ans. (d) : Molybdenum plays an important role in N_2 fixation as it regulates conversion of nitrates into protein.

- Required for the activity of nitrogenase enzyme activity in leguminous plants.
- It is vital for reduction of nitrate → nitrite.
- Important role in protein synthesis, Nitrogen fixation deficiency causes whiptail disease in cabbage.

98. Reduced availability of nitrogen during late growth causes :

(a) increase in the carbohydrate content of fruits and storage organs
(b) decrease in the carbohydrate content of fruits and storage organs
(c) increase in the ethylene content of fruits and storage organs
(d) decrease in the ethylene content of fruits and storage organs

BHU PMT (Mains)-2005

Ans. (a) : During late growth of plants, reduced availability of Nitrogen causes increase in Carbohydrate content of fruits and storage organs of plants.

- N helps in protein synthesis, reduced availability of H causes low protein content in storage organs of plants.
- When N is low, plant roots also grow laterally.
- Low N content causes low protein levels in grains e.g. Corn and Wheat.

99. The mineral constituent of the cell wall is

(a) Fe (b) Mg
(c) K (d) Ca

BHU PMT (Mains)-2011
Haryana PMT-2008
JIPMER-2008

Ans. (d) : Mineral component of cell wall is "Calcium".

- Ca stabilizes cell wall structures, acidic growth ion exchange property.
- Ca needed for growth and development of plants under stress conditions and also in non-stressed conditions.
- Ca is a macronutrient and helps in structural components of cell wall in the form of calcium pectate.
- Main constituent of cell wall which holds cell wall together and keeps it rigid and provide mechanical strength.

100. Whiptail disease is caused by the deficiency of:

(a) Zn (b) Bo
(c) Mo (d) Mn

JIPMER-1998

Ans. (c) : Whiptail disease in cabbage is due to deficiency of Molybdenum (Mo)

- Mo plays important role in Nitrogen fixation.
- Symptoms includes chlorosis of leaf margins and whitening and yellowing of whole leaves, stunted growth.
- In sever condition deficiency, only midrib is formed. Leaf blades do not develop properly and become strap like and growing point is deformed hence condition known as "Whiptail".

101. One among the following is a micronutrient?

(a) Mg (b) Ca
(c) S (d) Cu

UP CPMT-2012

Ans. (d) : Copper is micronutrient are also known as trace elements as they are required in very low content. Hence, called "Micronutriens".

- Other micronutrients are – Boron, Manganese, Zinc, Copper, Molybdenum, Chlorine, Nickel.
- Deficiency of Cu leads to following disease –

Plants	Disease
Citrus plant	Die Back disease
Cereals and Legumes	Reclamation disease

@apna_pdf

102. Assertion : Deficiency of sulphur causes chlorosis in plants.
Reason : Sulphur is a constituent of chlorophyll, proteins and nucleic acids.
(a) If both assertion and reason are true and reason is the correct explanation of assertion
(b) If both assertion and reason are true but reason is not correct explanation of assertion
(c) If assertion is true but reason is false
(d) If both assertion and reason are false

HP CET-2011

Ans. (c) : Deficiency of sulphur leads to chlorosis in plants i.e. insufficient chlorophyll is formed.
- If is essential for root formation and formation of vitamins and coenzymes.
- S leads to retardation in cell division and stops fruit formation in plants.
- Sulphur is not a constituent of chlorophyll but it is a component of protoplasm.

103. Function of zinc in plants is
(a) sugar transport
(b) activation of enzymes
(c) cell elongation
(d) pollen germination

JandK CET-2014

Ans. (b) : Function of Zinc in plants is activation of enzymes and it is essential for the synthesis of tryptophan which is precursor of IAA/Auxin.
- If also involved in activation of several enzymes like carboxylases and alcohol dehydrogenases.
- Deficiency causes little leaf of Apples and Peeches and it suppresses seed formation in plants.

104. Which one of the following element is not an essential micronutrient for plant growth?
(a) Manganese (b) Zinc
(c) Copper (d) Calcium

Rajasthan PMT-2010

Ans. (d) : Calcium is not an essential micronutrients because it is a macronutrients.
- Macronutrients are required in large amount by the plants.
- Macronutrient includes - C, H, O, N, P, K, Mg, Ca, S
- Calcium plays an important role in middle lamella and cell wall formation and also stimulates development of root hairs.
- Involved in apical meristem growth and in cell division.

105. Micronutrients are needed in amounts equivalent to
(a) 8 m mole/kg of dry matter
(b) 18 m mole/kg of dry matter
(c) 25 m mole/kg of dry matter
(d) 30 m mole/kg of dry matter

AMU-2010

Ans. (a) : Micronutrients are needed in very small amount i.e. 8 m mole/kg of dry matter.
- These elements are required by plants in small amount less than 10 m mole/kg of dry matter.

106. Macroelements must generally be present in the plant tissues in concentration of at least
(a) 0.001 mg/g dry matter
(b) 0.01 mg/g dry matter
(c) 0.1 mg/g dry matter
(d) 1.0 mg/g dry matter.

AMU-1998

Ans. (d) : Macronutrients are required by plants in large amounts i.e. 1.0 mg/g dry matter.

Elements	% of dry weight
C	45%
O	45%
H	6%
N	1.5%
K	1%
C	0.5%
Mg	0.2%
P	0.2%
S	0.1%

107. Potassium is useful in development of
(a) fibre (b) pith
(c) parenchyma (d) None of these

CG PMT-2007

Ans. (a) : Potassium is useful in development of fibre.
- It is important for producing a high quality, high yielding cotton crop.
- K improves soil fertility and soil nutrition and boost cotton yield.
- K affects fibre quality micronized, length and strength.

108. Plants absorb sulphur in the form of
(a) SO_4 from soil (b) SO_2 from air
(c) Both (a) and (b) (d) SO_3 from soil

CG PMT-2007

Ans. (c) : Plants need sulphur in the form of sulpate (SO_4^{2-}) This is the only form of sulphur which can be taken up by the roots and is the form in which it is used within the plants. Small amounts of sulfur dioxide gas can be absorbed through leaves, but this is of little consequence in the overall S nutrition of plants.

109. Vitamin containing cobalt is:
(a) A (b) B_6
(c) B_1 (d) B_{12}

Uttarakhand-2005
VMMC-2014

Ans. (d) : Vitamin containing cobalt is vitamin B_{12}. Vitamin B_{12}, also known as cyanocobalamine.
- It is a cobalt containing ring contravened modified tetrapyrrole.
- Main active biological forms of cobalamin are - Methylcobalamin and adenosylcobalamin.
- Methylcobalamin acts as cofactor in number of methyl transferase reaction.

110. Which of the following is a macronutrient ?
(a) Mo (b) Ca
(c) Zn (d) Mn

Haryana PMT-2007

@apna_pdf

Ans. (b) : Macronutrients are present in large quantity in plants.

- C, H, O, N, P, K, Mg, Ca, S are macronutrients.
- Calcium is obtained from soil in the form of calcium ion (Ca^{2+}).
- Main constituent in cell wall formation and middle lamella.
- As it is a mobile element, helps in translocation of food and minerals in plants.
- Important for apical meristem and growth of root hairs.
- Involved in mitosis division and thus growth of plant.

111. Which one of the following is not a micronutrient for plants?

(a) Magnesium (b) Molybdenum
(c) Boron (d) Zinc

JandK CET-2015
Rajasthan PMT-2000

Ans. (a) : Magnesium is a macronutrient not micronutrient.

- Magnesium is required in high quantity by plants.Since, Mg is main component of chlorophyll, it is necessary for green plants to perform photosynthesis.
- Mg is important part of respiratory enzymes, helps in synthesis of nucleoproteins.
- Deficiency of Mg leads to interveinal chlorosis in plants.

112. Micronutrients are

(a) Mn, Ni and Zn (b) O, Cu and B
(c) Mg, Mn and Mo (d) Ca, S and Fe

AMU-2012

Ans. (a) : Micronutrients are also known as trace elements as required in very low amount.

• The micronutrients are – Iron (Fe), Manganese (Mn), Copper (Cu), Molybdenum (Mo), Zinc (Zn), Boron (B), Chlorine (Cl), Nickel (Ni).

113. Which one of the following nutrients serve as microelements for plant growth?

(a) Manganese, copper, calcium
(b) Sodium, potassium, boron
(c) Sodium, nickel, chlorine
(d) Copper, molybdenum, zinc

CG PMT-2006

Ans. (d) : Copper, molybdenum, Zinc are microelements.

- Cu is component of plastocyanin acts as an activator of several enzymes, required for synthesis of vitamin C.
- Deficiency of Cu leads to chlorosis and Die Back disease in citrus and reclamation disease of legumes and aerials.
- Mo plays important role in modulation for leguminous plants. Mo helps in nitrogen fixation and deficiency leads to whiptail disease of crucifers.
- Zn is essential for synthesis of tryptophan and deficiency of Zn causes Mottled leaf disease and Little leaf disease of apple and peach and Khaira disease of rice.

114. Which one of the following micronutrient is required by plants in least quantity?

(a) Mo (b) B
(c) Zn (d) Mn

BHU PMT (Screening)-2011

Ans. (a) : Micronutrient that is required by plants in least quantity is Molybdenum (Mo).

- It is required by plants in 0.0001% of dry weight.
- Since, it is trace elements but plays an important role in modulation in Leguminous plants.
- Helps in the activity of "Nitrate reductase" enzyme.

115. Sleeping movements in Samanea saman leaves are regulated by:

(a) nitrogen (b) potassium
(c) phosphorus (d) magnesium

AP EAMCET-2002

Ans. (b) : Sleeping movements in samanea saman leaves are regulated by potassium.

- Sleeping movement/nyctinasty is movement of leaves and flowers of some species which take up sleeping position at night are known as "Nyctinastic movement" of plants.
- Samanea Saman is a tropical tree. It is also observed in leguminous plants i.e. Albizia, Cassia.
- Swelling and Shrinking of motor cells at the base of leaf induces nyctinastic motion and is totally depends upon differential turgor movements in specialized organ known as Pulvinus.
- Turgar movement is regulated by potassium (K^+) ions.

116. Match the words in column I with phrases in column II. Choose the correct combination from the given option.

Column - I	Column - II
A. Sulphur	**1. Found in plant hormone**
B. Zinc	**2. Important component for animals**
C. Magnesium	**3. Found in amino acid like methionine**
D. Iodine	**4. Component of sugar**
E. Manganese	**5. Nitrogenous component**
F. Molybdenum	**6. Structural component of photosynthetic pigment**

Codes

(a) A-3 B-1 C-6 D-2 E-4 F-5
(b) A-5 B-1 C-6 D-2 E-5 F-4
(c) A-3 B-6 C-1 D-2 E-4 F-5
(d) A-3 B-1 C-2 D-6 E-4 F-5

BVP-2013

Ans. (a) :

(a)	Sulphur	Found in amino acid methionine
(b)	Zinc	Found in plant hormone
(c)	Magnesium	Structural component of photosynthetic pigment.
(d)	Iodine	Important component for animals.
(e)	Manganese	Component of sugar
(f)	Molybdenum	Nitrogenous component

@apna_pdf

117. Micro - nutrients are

(a) as important as macro-nutrient but are required in small amount
(b) less important than macro-nutrient
(c) called micro as they play only a minor role in plant nutrition
(d) none of the above

VMMC-2007 / JIPMER-2006
Rajasthan PMT-2005

Ans. (a) : Micronutrients are required in low amount but it is important as macronutrients.

- The concentration of micronutrients is less than 1 mg/gm of dry matter.
- They are toxic when it is used in excess amount
- Boron, Manganese, Iron, Zinc, Copper, Molybdenum, Chlorine, Nickel are micronutrients.

Micro Elements	Functions
Boron	Meristematic
Manganese	Activator of enzymes,Chlorophyll synthesis
Zinc	Synthesis of tryptophan (Auxin)
Copper	Component of plastocyanin.
Molybdenum	Nodule formation , H_2 fixation
Chlorine	Photolysis of water
Iron	Structural compound of porphyrine Cytochrome, Cytolase, Peroxide and Leghaemoglobin.

118. Insectivorous plant eats the insect for

(a) Na-K (b) nitrogen
(c) chlorine (d) phosphorus

BHU-PMT (Screening)-2008

Ans. (b) : They are strong plants that capture insects by an ingenious trap and digest them for nutrients. These plants are called insectivores plants. Insectivorous plants feed on insects to obtain nutrients, especially nitrogen. This is because they grow on soil poor in their nitrogen content.

119. Nickel contributes to the formation of one of the following

(a) urease (b) dehydrogenase
(c) rubisco protein (d) nitrate reductase

Haryana PMT-2011

Ans. (a) : Nickel contributes to formation of Urease

- Urease enzyme hydrolysis of urea into ammonia and carbon dioxide.

$$\text{Urea} \xrightarrow[\text{Urease}]{\text{Ni}} NH_3 + CO_2$$

- It plays an important role in mobilization of nitrogenous compounds in plants.
- Besides, Ni plays an important role in seed germination
- Deficiency of Ni causes chlorosis, narcotic lesions on leaves, seedling lost etc.

120. What is common in NAD, ATP and FMN?

(a) Zn (b) P
(c) Ca (d) Mg

Haryana PMT-2011

Ans. (b) : NAD, ATP and FMN is formed by phosphorous.

- Plants absorb phosphorus in the form of phosphate ions.
- Phosphorus is found abundantly in growing and storing organs of plants.
- Phosphorus is an energy carrier and forms part of ATP, NAD, FMN.

E. Technique of Absorption of Elements

121. Which among the following helps in absorption of phosphorus from soil by plants?

(a) Frankia (b) Rhizobium
(c) Glomus (d) Anabaena

JCECE-2018

Ans. (c) : Glomus is an arbuscular endomycorrhizal fungi and helps to absorb phosphorus from soil by mutual association of roots of higher plants and fungi. It is a best example of symbiotic association known as "Mycorrhiza".

- Term "Mycorrhiza" refers Mykos to "fungi" and rhiza means "roots".
- Phosphorus is essential for cell division and development of growing tip of plant.

122. Which of the following is not used as bioweapon?

(a) Bacillus anthracis
(b) Botulmum toxin
(c) Bacilius thuringiensis toxin
(d) Smallpox

DUMET-2010

Ans. (c) : Biological weapons are the most horrifying tools today. The biological weapons convention (BWC) of 1975 instructs all signatories to forego any biological weapon program. They are relatively cheap. A small private airplane with 100 kilograms of Anthrax can kill a million people on a day with moderate wind.

- Bacillus thuringiensis toxins used as bio insecticide against catterpillars, betels and flies.

123. Boron in green plants assists in: -

(a) Activation of enzymes
(b) Acting of enzyme cofactor
(c) Photosynthesis
(d) Sugar transport

AIPMT-2003 / Rajasthan PMT-2007

Ans. (d): Boron occurs in the soil, as a part of silicates boric acid, calcium borate and magnesium borate. It is available to the plants as boric acid and borates of calcium and magnesium. It plays a role in carbohydrate metabolism and translocation of sugar, is facilitated through the cell membrane through the agency of borate ion as it forms complex with the carbohydrate.

@apna_pdf

124. Mineral salt from soil enters into the cell in the form of:

(a) Salts (b) Molecules
(c) Ions (d) None of these

Rajasthan PMT-1995
JIPMER-1996

Ans. (c) : Plants absorb minerals in the form of ions from the soil. Minerals are the elements that are necessary for the proper functioning of the body. They are defined as the naturally occurring inorganic nutrients found in the soil.

125. The plant ash is an indication of

(a) organic matter of plant
(b) waste product
(c) mineral salts absorbed by plants
(d) None of the above

MGIMS Wardha-2004
UP CPMT-2004

Ans. (c) : Plant ash is an indication of mineral salts absorbed by plants. Plant ash is formed when plant are heated to high temperatures and water evaporates it gives plant ash.

- Plant ash contains less than 10% potash, 1% phosphate and trace amount of micronutrient such as Fe, Mn, B, Cu and Zn.
- Essential elements seen in plant ash are – Ca, Mg, Fe, S, P, Cl.

126. Which one of the following elements is not remobilised in leaf?

(a) Nitrogen (b) Phosphorus
(c) Potassium (d) Calcium

AMU-2010

Ans. (d) : Calcium is not remobilized in leaf. Soil is reservoir of nutrients for plants. In higher plants nutrients are mobilized from older, (senescing leaves) to younger leaves. This is known as Remobilization.

- The main motive of remobilization is to minimize mineral nutrient deficiency. It can be seasonal.
- Calcium is a structural component of middle lamella and cell wall. Thus remobilization of Ca does not takes place.

127. Which part of the root is most active in absorption of phosphate?

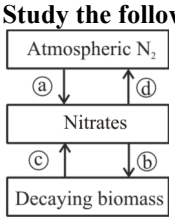
(a) Root cap (b) Meristematic zone
(c) Root hairs (d) Root apex

CG PMT-2010

Ans. (c) : Root hairs is a part of root which is most active in absorption of phosphate. Roots hairs cells improve plant water absorption by increasing root surface area to volume ratio which allows the root hair cells to take in more water when phosphorus moves to the root surface through osmosis. The presence of mycorrhizal fungi shows a symbiotic relationship with plant roots and extended thread like hyphae into the soil. Hence the uptake of phosphorus absorption is most active in root hairs.

F. Metabolism of Nitrogen and Nitrogen Cycle

128. Study the following model of Nitrogen cycle



Identify the concerned bacterium in step ⓓ

(a) Nitrosomonas (b) Nitrobacter
(c) Nitrosococcus (d) Thiobacillus

AP EAMCET-25.04.2018 Shift-II
TS EAMCET-31.07.2022 Shift-II

Ans. (d) : Denitrifying bacteria are microorganisms whose action results in the conversion of nitrates in the soil to free atmospheric nitrogen. Example - *Thiobacillus denitrificans.*

129. Study the following illustration of nitrogen cycle and identify A, B and C in it.

	A	B	C
(a)	Denitrification	Producer biomass	Decomposing
(b)	Ammonification	Denitrification	Nitrification
(c)	Denitrification	Ammonification	Animal biomass
(d)	Nitrification	Denitrification	Recycling

TS EAMCET-09.08.2021 Shift-II

Ans. (c) : Nitrogen exists as two nitrogen atoms joined by a very strong triple covalent bond (N≡N). The process of conversion of nitrogen (N_2) to ammonia is termed as nitrogen fixation. In nature, lightning and ultraviolet radiation provide enough energy to convert nitrogen to nitrogen oxides (NO, NO_2, N_2O). Industrial combustions, forest fires, automobile exhausts and power- generating station are also sources of atmospheric nitrogen oxides. Decomposition of organic nitrogen of dead plants and animals into ammonia is called ammonification.

@apna_pdf

130. The most quickly available source of nitrogen to plants are

(a) Amide fertilizers
(b) Ammonia fertilizers
(c) Nitrate fertilizers
(d) Ammonia nitrate fertilizers

SRM JEEE-2019

Ans. (c) : Plants are obtain or absorb nitrogen from the soil in the form of nitrates.
Nitrate fertilizers are preferred due to the highest absorbing ability of nitrates by plants, than in any other form.
The nitrate is mostly used in the fertilizers. Nitrate is also used by the plants as the source of the food which help them in their development.

131. Study the cycle shown below and select the option which gives correct words for all the four blanks A, B, C and D.

	A	B	C	D
(a)	Denitrification	Nitrificaiton	Plants	Animals
(b)	Nitrification	Ammonification	Animals	Plants
(c)	Denitrification	Ammonification	Plants	Animals
(d)	Nitrification	Denitrification	Animals	Plants

AIPMT (Mains)-2010
TS EAMCET-28.09.2020 Shift-I

Ans. (c) : Among all gaseous cycle, nitrogen cycle plays very important role in an ecosystem. The conversion of nitrogen into nitrate via denitrification process, plant absorbs nitrate with later transported into leaves after nitrate reduced into ammonia via ammonification. Thiobacillus and Pseudomonas carries denitrification process, Nitrosomonas carries nitrification process as it oxidised ammonia into nitrite form.

132. Micorrhiza is useful for plants mainly due to

(a) Fixing atmospheric nitrogen
(b) Killing insect pests
(c) Providing resistance for abiotic stress
(d) Enhanced absorption of nutrients from soil

UP CPMT-2013

Ans. (d) : Mycorrhiza is a symbiotic association between higher plant roots and fungi. Their major role is to enhance nutrient and water uptake by the host plant by exploiting a larger volume of soil than roots alone can do.

133. An insectivorous plant having glandular structures on its leaf secreting stickly fluid is

(a) sundew plant (b) aldrovanda
(c) venus fly trap (d) all of these.

AIIMS-1997

Ans. (a) : The upper surface of leaf blade or lamina of Sundew bears a number of 100-200 club-shaped hair or tentacles. Their tips are swollen glandular and reddish. The glandular heads of the tentacles secrete a thick sticky juice which shines in the Sun like few drops.

- Dionaea muscipula or vinus fly trap have leaves with trigger by thin hairs on their inner surfaces.
- Aldrovanda vesiculosa or water wheel plant have trap mechanism like Dionaea. The genus Aldrovanda belongs to the family Droseraceae.

134. Insectivorous plants digest insects to get an essential nutrient. Other plants generally get this nutrient from the soil. What is this nutrient?

(a) Oxygen (b) Carbon dioxide
(c) Nitrogen (d) Phosphates

KVPY (SA)-2010

Ans. (c) : Insectivorous plants generally grow in the nutrient deficient soil (mainly nitrogen deficient) and hence it requires a different source for its nutrients. The plant gains required nutrients (mainly nitrogen) by digesting the trapped insects.

135. In which one of the following nitrogen is not a constituent: -

(a) Idioblast (b) Bacteriochlorophyll
(c) Invertase (d) Pepsin

AIPMT-2003

Ans. (a): A idioblast is an isolated plant cell that differs from neighbouring tissues. They have various functions such as storage of reserves, excretory materials, pigments and minerals. They could contain oil, latex gum, resin, tanin or pigments.
Invertase and pepsin are enzymes and they contain nitrogen. Bacteriochlorophyll are photosynthetic pigments that occur in various phototrophic bacteria.

136. The conversion of ammonia into nitrites and nitrates is called:

(a) ammonification (b) nitrification
(c) denitrification (d) none of these

JandK CET-2005

Ans. (b) : Nitrifying bacteria in the soil transform ammonia into nitrite. The nitrite is subsequently transformed into nitrate. This process is described as nitrification.

137. Higher plants obtain nitrogen from soil that has:

(a) Six forms (NO_3, NO_2, N_2O_2, N_2, NH_2OH, NH_3) of nitrogen with oxidation number ranging from +5 to –3
(b) Six forms (NO_3, NO_2, N_2O_2, N_2, NH_2OH, NH_3) of nitrogen with oxidation number ranging from +6 to –3
(c) Five forms (NO_3, NO_2, N_2, NH_2OH, NH_3) of nitrogen with oxidation number ranging from +5 to –3
(d) Five forms (NO_3, NO_2, N_2, NH_2OH, NH_3) of nitrogen with oxidation number ranging from +6 to –3

MP PMT-2013

@apna_pdf

Ans. (c) : Higher plants obtain nitrogen from soil that has five forms (NO_3, NO_2, N_2, NH_2OH, NH_3) of nitrogen with oxidation number ranging from +5 to –3.

138. Pseudomonas is an important component of nitrogen cycle. It
(a) fixes elemental nitrogen
(b) produces elemental nitrogen
(c) transfers elemental nitrogen
(d) changes ammonium nitrogen to nitrate state

JandK CET-2013

Ans. (b) : Pseudomonas is a denitrifying bacteria which convert ionic forms of nitrogen into nitrogen gas.

139. Conversion of organic nitrogen into Ammonia, N_2 gas into ammonia, nitrates into ammonia, ammonia into nitrates respectively known as
(a) Nitrogen fixation, nitrate reduction, Nitrification, ammonification
(b) Ammonification, Nitrogen fixation, Nitrate reduction, Nitrification
(c) Nitrification, Ammonification, Nitrogen fixation, Nitrate reduction
(d) Nitrogen fixation, Nitrate reduction, Denitrification, Ammonification

AP EAMCET-2015

Ans. (b) : Ammonificaiton- Nitrogen into ammonia.
Nitrogen fixation- N_2 gas into ammonia.
Nitrate reduction- Nitrates into ammonia.
Nitrification- Ammonia into nitrates.

140. Urea is used in the soil to supplement:
(a) phosphorus (b) nitrogen
(c) potassium (d) zinc

JandK CET-2003

Ans. (b) : Urea is a source of nitrogen, an essential nutrient for crop growth and development.
The agricultural uses urea, white crystalline solid have 46% Nitrogen.

141. Consider the following statements.
(i) Sulphur is present in two amino acids – cysteine and valine
(ii) Low level of N, K, S and Mo causes an inhibition of cell division
(iii) The microbe that produces nitrogen fixing nodules on the roots of non-leguminous plant "Alnus" is Frankia
(iv) Denitrification is carried by the bacteria Nitrosomonas and Nitrobacter
(a) (i) and (ii) alone are correct
(b) (i) and (iii) alone are correct
(c) (ii) and (iii) alone are correct
(d) (ii) and (iv) alone are correct
(e) (i) and (iv) alone are correct

Kerala PMT-2013

Ans. (c) :
(i) Sulphur is present in two amino acids-methionine and cysteine.
(ii) Low level of N,K,S and Mo causes an inhibition of cell division.
(iii) The Alnus genus forms symbiosis with the actinobacteria Frankia sp. Frankia is a soil actinomycetes that fix nitrogen, both under symbiotic and free-living aerobic condition.
(iv) Denitrification is carried by Bacteria Pseudomonas and Thiobacillus.

G. Biological Nitrogen Fixation

142. Free living, aerobic, non-symbiotic, non-photosynthetic nitrogen fixing bacteria in soils is
(a) Azotobacter (b) Rhizobium
(c) Clostridium (d) Anabaena

JandK CET-2004,2008 / CMC Vellore-2007,2008
AMU-2006 / Haryana PMT-2005, 2003, 2000
BHU PMT-2003 / VMMC-2003, 2002
DUMET-2009 / JIPMER-2005
AIPMT-1994, 1990,1997 / JandK CET-2005

Ans. (a) : Azotobacter is free – living, aerobic, non-photosynthetic, nitrogen fixing bacteria. These bacteria are present in soil. It converts atmospheric nitrogen into ammonia in the presence of oxygen for the further plant usage. Azotobacter do not form any symbiotic relationship. These are primitive type of bacteria.
- **Free living aerobic N_2 fixing Bacteria** :
- Photosynthetic : Chlorobium, chromatium
- Non-photosynthetic : Azotobacter, Derxia, Beijerinckia.

143. The conversion of NO_3 to N_2 is called
(a) nitrification (b) denitrification
(c) ammonification (d) nitrogen fixation

HP CET-2012 / CMC Ludhiana-2012
JCECE-2005 / UP CPMT-2003
DUMET-2001,2005 / Manipal-2000
Punjab MET-2004

Ans. (b) : Conversion of Nitrate to Nitrogen is called denitrification, which is anaerobic process. It is done by the thiobacillus bacterium also called "Denitrifying organisms".
E.g. *Thiobacillus*, *Pseudomonas.*
Pseudomonas species. is an excellent microorganism for use in bioremediation because of the flexibility and plasticity of its metabolic pathways.

144. A free living nitrogen fixing cyanobacterium which can also form symbiotic association with the aquatic fern Azolla is
(a) Tolypothnx (b) Chlorella
(c) Nostoc (d) Anabaena

Manipal-2012, 2007,2014 / AIPMT-2004
CMC Vellore-2012 / AFMC-2008
DUMET-2008 / JCECE-2012

Ans. (d) : Azolla are aquatic fern found in symbiotic association with Anabaena [Blue green Algae), which is free living Blue green algae, helps in nitrogen fixation.
- Anabaena contains filamentous thin walled will present lateral or terminal in a form of chain called heterocytsts.
- There heterocysts are the silte of N_2 fixation in B.G.A. and lacks photosystem II and acquires anaerobic condition for N_2 fixation. In this, glutamine is the main product which translocates from heterocyst to vegetative cell.
- Maltose is a photosynthetic product moves from heterocysts to vegetative cell.
- Nitrogenase plays important role in N_2 fixation in Cyanobacteria also.

@apna_pdf

145. Bacterium which reduces nitrates in soil to nitrogen is

(a) Nitrosomonas (b) Pseudomonas
(c) Rhizobium (d) Clostridium

Punjab MET-2008 / JandK CET-2012
AMU-2010 / AMU-2009
Manipal-2010 / HP CET-2018

Ans. (b) : *Pseudomonas aeruginosa* can reduce nitrate to nitrite and eventually to nitrogen gas by the denitrification patway thereby providing the organism with a mode of respiration and ATP generation in the absence of oxygen.

146. Nitrifying bacteria are those which can convert

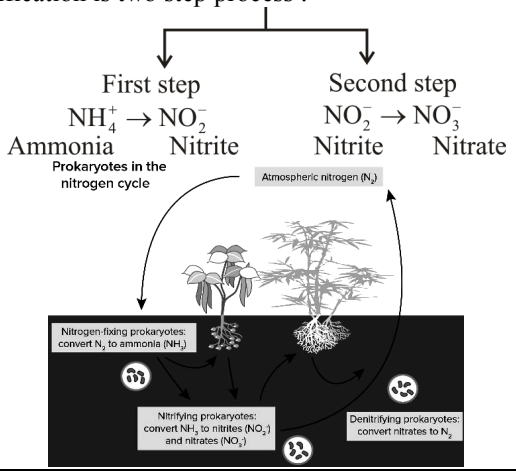
(a) atmospheric nitrogen into ammonia
(b) ammonia into nitrites
(c) nitrites into nitrates
(d) nitrates into ammonia

CG PMT-2006 / Haryana PMT-2008
JIPMER-2008 / Uttarakhand PMT-2006

Ans. (b) : Nitrifying bacteria are those bacteria which can convert ammonia into nitrites. The process of nitrification is an aerobic process and oxidative process.

- Nitrifying bacteria are chemolithotrophic organisms i.e. get their energy from oxidation of inorganic nitrogen compounds.
- Nitrifying bacteria are : Nitrosomonas, Nitrosococcus, Nitrobacter etc.

Nitrification is two step process :



147. The enzyme responsible for the reduction of molecular nitrogen to the level of ammonia in the leguminous root nodule is

(a) amminase (b) nitrogenase
(c) nitrate reductase (d) nitrite reductase

AMU-2006 / CMC Ludhiana-2008
Kerala PMT-2009 / AIIMS-2000

Ans. (b) : The enzyme Nitrogenase is responsible for reduction of molecular nitrogen to the level of ammonia in the leguminous root nodule. Nitrogenase comprises larger Mo-Fe protein and smallest Fe Protein.

- Fe Protein reacts with ATP and Mg^{2+} and receives electron from fesseaoxin when it is oxidized.
- Mo-Fe protein of Nitrogenase complex combines with reducing substrates i.e. H_2 and yields two molecules of NH_3.

$$H_2 + 16ATP + 8e + 10H^+ \xrightarrow{Mg^{2+}} 2NH_4^+ + H_2 + 16ADP + 16Pi$$

148. $2NH_3 + 3O_2 \xrightarrow{a} 2NO_2 + O_2 \xrightarrow{b} 2NO_3$ in the above reaction a and b are

(a) Thiobacillus and Nitrococcus
(b) Nitrosomonas and Nitrobactor
(c) Nitrococcus and Nitrosomonas
(d) Nitrobactor and Nitrosomonas

AP EAPCET-22.05.2023, Shift-I

Ans. (b) : The first reaction (a) is the oxidation of ammonia to nitrite by the bacteria Nitrosomonas. The second reaction (b) is the oxidation of nitrite to nitrate by the bacteria Nitrobacter.

149. Pseudomonas and Thiobacillus carry out the following

(a) Putrificaiton (b) Ammonificaiton
(c) Nitrification (d) Denitrificaiton

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : Pseudomonas and Thiobacillus are both denitrifying bacteria. They use nitrate as an electron acceptor, reducing it to nitrogen gas.

- Putrificaiton is the breakdown of organic matter by bacteria in the absence of oxygen.
- Ammonification is the conversion of organic nitrogen to ammonia by bacteria.
- Nitrification is the oxidation of ammonia to nitrate by bacteria.

150. Match Column-I with Column-II.

	Column-I		Column-II
(A)	Nitrococcus	(i)	Denitrification
(B)	Rhizobium	(ii)	Conversion of ammonia to nitrite
(C)	Thiobacillus	(iii)	Conversion of nitrite to nitrate
(D)	Nitrobacter	(iv)	Conversion of atmospheric nitrogen to ammonia

Choose the correct option

(a) (A)-(ii), (B)-(iv), (C)-(i), (D)-(iii)
(b) (A)-(i), (B)-(ii), (C)-(iii), (D)-(iv)
(c) (A)-(iii), (B)-(i), (C)-(iv), (D)-(ii)
(d) (A)-(iv), (B)-(iii), (C)-(ii), (D)-(i)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : Nitrococcus is a genus of Gram negative bacteria that oxidize ammonia to nitrous acid.

- Rhizobium is a genus of gram-negative soil bacteria that fix nitrogen (convert nitrogen gas into ammonia).
- Thiobacillus is a denitrifying bacteria that reduces soil nitrates and convert them into free nitrogen.
- Nitrobacter plays a role in the nitrogen cycle by oxidizing nitrite to nitrate.

151. Identify the correct combination from the following:

(a) Nostoc - Autotrophic - Fixes atmospheric N_2
(b) Glomus - Free living - Increases plant growth
(c) Azotobacter - Symbiont - Bioferitilizer
(d) Oscillatoria - Symbiont - Facilitates 'P'absorption by plants

TS EAMCET-31.07.2022 Shift-I

@apna_pdf

Ans. (a) : Nostoc belong to Cyanobacteria genus, and it can be used as biofertilizer. It is also called the blue-green algae. Nostoc converts atmospheric nitrogen into ammonia, which can be further converted to a suitable form for plant growth. Biofertilizers enhance the quality of plants and soil.

152. Which of the following pair represents free living nitrogen fixing aerobic bacteria?

(a) Rhizobium and Frankia
(b) Azotobacter and Beijerinckia
(c) Anabaena and Rhodospirillum
(d) Pseudomonas and Thiobacillus

NEET (Re-Exam)-04.09.2022

Ans. (b) : Two Kinds of nitrogen - fixing bacteria are recognized:-

(i) Free-living (non-symbiotic bacteria. including the cyanobacteria (or blue green algae) Anabaena and Nostoc and genera such as Azotobacter, Beijerinckia, and Clostridium.
(ii) Mutualistic (Symbiotic) bacteria such as Rhizobium associated with leguminous plants (e.g.:- Various members of the pea family), and certain Azospirillum species, associated with cereal grasses.

• Thiobacillus is gram negative Betaproteobacteria. Thiobacillus oxidizes sulphur compounds to reduction of oxidized nitrogen compounds to dinitrogen.

Frankia is symbiotic N2 fixing filamentous bacteria which is associates with non-leguminous plants as Alnus.

153. Nitrogen fixation in root nodules of *Alnus* is brought about by:

(a) *Frankia* (b) *Azorhizobium*
(c) *Bradyrhizobium* (d) *Clostridium*

NEET-2022 / AIPMT-2008 / JIPMER-2014

Ans. (a) : *Frankia* is a genus of nitrogen fixing, filamentous bacteria that live in symbiosis with actinorhizal plant but this is non-leguminous. Hence nitrogen fixation in root nodules of *Alnus* is brought about *Frankia*. The best known example in temperature involved in nodule formation is an Actinomycetes, called the *Frankia*.

154. Assertion (A) :- Some plants growing in N_2 rich soils can obtain their nitrogen from insects

Reason (R) : - Bacteria inhabiting the root system of Fabaceae plants can fix atmosphere nitrogen

The correct option among the following is

Options:

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-I

Ans. (d) : Some plants growing in N_2 deficient soil can obtain their nitrogen from insects. Family fabaceae is the family of leguminous plants. These plants have a symbiotic association with the bacteria called Rhizobium that live in their root nodules. They are capable of fixing atmospheric nitrogen into ammonia.

155. Assertion (A): Ammonia is first oxidized to nitrites by Nitrosomonas bacterium

Reason (R): Nitrites are further oxidized to nitrates with help of Nitrosococcus bacterium

(a) Both A and R are correct and R is the correct explanation of A
(b) Both A and R are correct and R is not the correct explanation of A
(c) A is correct but R is wrong
(d) A is wrong but R is correct

AP EAPCET-07.09.2021 Shift-I

Ans. (c) : Ammonia is first oxidized to nitrite by the bacteria Nitrosomonas and Nitrosococcus. The nitrite is further oxidized to nitrate with the help of the bacteria Nitrobacter.

156. Match Column-I with Column-II.

	Column-I		Column-II
(A)	**Nitrococcus**	**(i)**	**Denitrification**
(B)	**Rhizobium**	**(ii)**	**Conversion of ammonia to nitrite**
(C)	**Thiobacillus**	**(iii)**	**Conversion of nitrite to nitrate**
(D)	**Nitrobacter**	**(iv)**	**Conversion of atmospheric nitrogen to ammonia**

Choose the correct answer from options given below.

	(A)	(B)	(C)	(D)
(a)	(iv)	(iii)	(ii)	(i)
(b)	(ii)	(iv)	(i)	(iii)
(c)	(i)	(ii)	(iii)	(iv)
(d)	(iii)	(i)	(iv)	(ii)

NEET-2021

Ans. (b) :

(a)	Nitrococcus	(ii)	conversion of ammonia to nitrite.	Nitrifying bacteria
(b)	Rhizobium	(iv)	Conversion of atmospheric nitrogen to ammonia.	Endosymbiotic with root of legumes
(c)	Thiobacillus	(i)	Denitrification.	Free living N_2 fixer bacteria
(d)	Nitrobacter	(iii)	Conversion of Nitrite to nitrate	Chemoautotrophic bacteria

157. Which one of the following bacteria has potential for nitrogen fixation?

(a) Nitrosomonas (b) Nitrobacter
(c) Nitrosococcus (d) Rhizobium

CG PMT-2006
AP EAMCET-24.09.2020 Shift-II / BVP-2002

Ans. (d) : Rhizobium is the bacterium which fixes Nitrogen in Leguminous plant. Rhizobium is soil bacteria, gram – negative, aerobic rod-shaped, free living bacteria. Leguminous plants releases some chemotactic substances. Rhizobium attracts towards it and binds with the cells of root hairs of plant and causes curling in root hair, then bacterium invades root epidermis and multiplies and replicates. Formation of

@apna_pdf

infection threads occurs in cortex cell. Bacteria secretes kinetin, plant secretes Auxin and division of cortical cells occurs. Now, bacteria detaches from infection thread and forms peribacterial cells/bacteroids. These bacteroids forms nodule and helps in N_2 fixation by nitrogenase enzyme and leghaemoglobin protein

158. The following are the host plants along with the microorganisms which fix atmospheric nitrogen. Find out their correct match.

I. Frankia - Alnus

II. Rhizobium - Alfalfa

III. Anabaena- Wheat

IV. Rhodospirillum - Casuarina

(a) I and II only (b) I and III only

(c) II and III only (d) II and IV only

TS EAMCET-28.09.2020 Shift-II

Ans. (a) : • The Alnus genus forms symbiosis with the actinobacteria Frankia sps. and ectomycorrhizal fungi.

• Rhizobium has a symbiotic relationship with the root nodules of leguminous plant such as Garden pea, Alfalfa, Sweet clover etc.

159. Frankia fixing of N_2 occurs in which of the following non-leguminous plants?

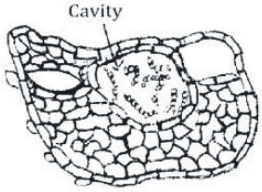
(a) Azolla (b) Pinus

(c) Alnus (d) Riccia

AP EAMCET-25.09.2020 Shift-I

Ans. (c) : *Frankia* is a nitrogen fixing microbe and it establishes a symbiotic relationship with the roots of trees belongs to the genus *Alnus*. It produce nitrogen fixing nodule on the roots of these plants. *Alnus* sps. are non-leguminous plants.

160. The figure given below is T.S. of Azolla leaf, the filaments present in the cavity of the leaf are of _____



T.S of Azolla leaf

(a) Nostoc (b) Tolypothrix

(c) Anabaena (d) Oscillatoria

MHT CET-04.10.2020 Shift-I

Ans. (c) : Azolla and the blue-green alga *Anabaena azollae* maintain a symbiotic relationship.

• The filaments present in the cavity of the leaf are Anabaena. Anabaena is genus of Nitrogen-fixing blue-green algae. They have bead like.

161. In which one of the following processes are the bacteria Nitrosomonas, Nitrosococcus and Nitrobacter involved ?

(a) Denitrification (b) Deamination

(c) Eutrophication (d) Nitrification

MHT CET-07.10.2020 Shift-I

Ans. (d) : Nitrification is the process in which conversion of Ammonia and Ammonium compounds are oxidized by nitrifying bacteria like Nitrosococcus, Nitrobacter, Nitrosomonas.

• Nitrosomonas is gram negative motile bacteria

• Nitrosococcus is large cocci, motile bacteria

• Nitrobacter is short rod – shaped bacteria motile/non-motile. And nitrosomonas converts Ammonia into nitrite.

$$2NH_3 + 3O_2 \xrightarrow[\text{nitrosococcus}]{\text{nitrosomonas}} 2NH_2OH + \text{Energy}$$

$$NH_2OH + H_2O \longrightarrow NO_2^- + 5H^+ + 4e^-$$

162. Assertion (A) : Free- living bacteria such as Rhizobium and Frankia can help in biological fixation of dinitrogen in the roots of angiospermic plants.

Reason (R) : Prokaryotes exclusively contain nitrogenase enzyme which can catalyze the oxidation reaction of dinitrogen to glutamate.

The correct answer is:

(a) Both (A) and (R) are true, (R) is the correct explanation of (A).

(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A).

(c) (A) is true but (R) is false.

(d) (A) is false but (R) is true.

TS EAMCET-08.05.2019 Shift-II

Ans. (c) : Assertion is true but Reason is false because glutamine synthetase enzyme is responsible for catalyzing the reaction that synthesizes glutamine from glutamate and ammonia. Enzyme nitrogenase catalyses the nitrogen fixation i.e. conversion of dinitrogen into ammonia.

163. Thiobacillus is a group of bacteria helpful in carrying out

(a) Chemoautotrophic fixation

(b) Nitrification

(c) Denitrification

(d) Nitrogen fixation

NEET-2019

Ans. (c) : Thiobacillus bacteria carries out denitrification process during nitrogen cycle. It reduces into free nitrogen.

- Nitrosomonas and Nitrobacter are chemoautotrophs that cause nitrification.
- Nitrogen fixing bacteria include species of Azotobacter, Bacillus, Clostridium, and Klebsiella.
- Nitrogen gas (N_2) is the ultimate end product of denitrification but other intermediate gaseous forms of nitrogen exist.

$$NO_3^- \rightarrow NO_2^- \rightarrow NO + N_2O \rightarrow N_2$$

$$2NO_3^- + 10e^- + 12H^+ \rightarrow N_2 + 6H_2O$$

- It is important to remove fixed nitrogen from the ecosystem and returns it to the atmosphere in a biologically inert form i.e N_2.

164. A Farmer has applied chemical fertilisers in his crop field for many successive seasons. In the next season, the crop growth was poor as soil lost its fertility. Suggest the suitable micro-organism that replenishes the fertility of soil in his field.

(a) Nostoc (b) Spirogyra

(c) Spirulina (d) Chlorella

Karnataka CET-2019

@apna_pdf

Ans. (a) : Blue green algae (Cyanobacteria) such as Nostoc, Anabaena, Oscillatoria, Aulosira (used in rice field) Cylindrospermum (used in maize and sugarcane field) are very good at fixing nitrogen in the soil.

165. One of the following is involved denitrification reactions:
(a) Nitrosomonas (b) Nitrobacter
(c) Thiobacillus (d) Rhodospirillum

AP EAMCET-2000
NEET (Odisha)-2019

Ans. (c) : Denitrification is an anaerobic process and occurs in absence of oxygen. This is conversion of Nitrate (NO_3^-) into dinitrogen (N_2 gas) occurs by the help of *Thiobacillus* bacterium, which are also known as "denitrifying organisms". These are 2 types of denitrifying bacteria :
Heterotrophs (*Pseudomonas denitrificans*)
Autotrophs (*Thiobacillus denitrificans*)
- Thiobacillus is gram negative Betaproteobacteria.
- Thiobacillus oxidizes sulphur compounds to reduction of oxidized nitrogen compounds to dinitrogen.
- It is also helps in environmental remediation for nitrate removal

166. The process of converting nitrogenous compounds to ammonia is called
(a) nitrification (b) ammonification
(c) denitrification (d) nitrate reduction

Tripura JEE-2019

Ans. (b) : Process of converting nitrogenous compounds to Ammonia is known as "Ammonification".
- Proteins of dead decay of animals and plants are breaked into amino acid known as Deamination and then into ammonia compounds called Ammonification.

167. Which of the following plants do not contain the N_2 - fixing cyanobacteria
(a) Azolla (b) Cycas
(c) Anthoceros (d) Gnetum

Tripura JEE-2018

Ans. (d) : N_2 fixing cyanobacteria are found in association with coralloid roots of cycas (Gymnaspermous plant)
- Azolla are aquatic fern found in symbiotic association with Anabaena [Blue green Algae), which is free living Blue green algae, helps in nitrogen fixation and of anthoceros (Bryophyta)
- Gnetum is not found associated with cyanobacteria.

168. The enzyme nitrogenase responsible for N_2 - fixation contain
(a) only iron
(b) only chromium
(c) both iron and molybdenum
(d) both nickel and chromium

Tripura JEE-2018

Ans. (c) : Nitrogen fixation is performed by Nitrogenase enzyme which contains both irons and molybdenum.
The structure of Nitrogenase enzyme comprises Mo. Fe Protein heterotetron Nitrogenase enzyme if of 3 types – Molybdenum, vanadium iron nitrogenase.
It is a complex that compsises metalloprotein of Mo. Fe protein and Nitrogenase reductase Fe protein.

169. Which of the following is nitrogen fixing algae
(a) Nostoc, Anabaena, Oscillatoria
(b) Azolla, Anabaena , Azotobacter
(c) Oscillatoria, Anabaena, Azolla
(d) Azolla, Nostoc, Oscillatoria

AIIMS-26.05.2018 Shift-I

Ans. (a) : Nostoc, Anabaena, and Oscillatoria are nitrogen fixing algae. All these are blue-green algae of group prokaryotes. Now days, blue-green algae are called as Cyanobacteria. They are capable for fixing atmospheric nitrogen as free-living forms and also in mutual association with the roots of plant.

170. Free living N_2 fixation bacteria:
(a) Anabaena, Azotobacter, Frankia
(b) Rhizobium, Azotobacter, Rhodospirllum
(c) Beijernickia, Azotobacter, Clostridium
(d) Nostoc, Frankia, Bacillus

AIIMS-27.05.2018 Shift-I

Ans. (c) : Azotobacter, Beijernickia (aerobic) and Clostridium (anaerobic) are saprophytic bacteria that perform nitrogen fixation. Nitrogen fixing bacteria are convert atmospheric nitrogen into inorganic compounds that can be used by plants. They are of two types -
Free living and symbiotic bacteria

171. Select the correct answer
(a) Absorbed Nitrogen is accumulated by the plants in the form of Ammonium ions
(b) In free living conditions nitrogenase is not operational in Rhizobium
(c) Nodules of soyabean export the fixed nitrogen as amides
(d) Amino group of Aspartic acid is replaced by hydroxyl group to form asparagine

AP EAMCET-25.04.2018 Shift-II

Ans. (b) : Rhizobium is a rod shaped symbiotic, aerobic, nitrogen fixing bacterium present in the root nodules of leguminous plants. It performs symbiotic nitrogen fixation in the root nodules of leguminous plants in presence of an enzyme nitrogenase.
Ureides (degraded urea) are employed as a means of nitrogen transport from the nodules of some legumes (Example - Soybean).

172. Most famous nitrogen fixing bacterium / biofertilizer is
(a) Nitrobacter (b) Nitrosomonas
(c) Nitrococcus (d) Rhizobium

SRM JEEE-2018

Ans. (d) : Rhizobium is the most famous nitrogen fixing bacterium/biofertilizer. It is genus of bacteria associated with the formation of root nodules on plants. These bacteria live in symbiosis with legumes. Rhizobium affects on plant growth stimulation, host defence against disease and survival under stress.

173. In paddy fields biological nitrogen fixation is chiefly brought by
(a) Cyanobacteria (b) Green algae
(c) Mycorrhiza (d) Rhizobium

Rajasthan PMT-2011
SRM JEEE -2017

@apna_pdf

Ans. (a) : In paddy fields, especially of Rice, biological nitrogen fixation is brought by cyanobacteria or Blue Green Algae.

- In cyanobacteria, there is a specialized structure known as Heterocysts which are the sites of N_2 fixation.
- Heterocysts lacks oxygen evolving photosystem II.
- Walls of heterocysts contains O_2 binding glycolipid which maintains anaerobic condition necessary for N_2 fixation.

174. Find out number of protons, electrons, and ATP molecules required and no. of ADP molecules released for the formation of 136 Ammonia molecules by symbotic N_2 fixation, based on the equation given below.

$68N_2 + \square H^+ + \square e^- + \square ATP \rightarrow 136NH_3 + 68H_2 + \square ADP$

(a) 272, 544, 1088, 544
(b) 544, 544, 1088, 1088
(c) 544, 272, 544, 1088
(d) 1088, 1088, 544, 544

AP EAMCET-28.04.2017 Shift-I

Ans. (b) : $68N_2 + 544\ H^+ + 544e^- + 1088ATP \rightarrow 136NH_3 + 68H_2 + 1088\ ADP$

175. In Aulosira, Tolypothrix and Nostoc,____are the sites for Nitrogen fixation.

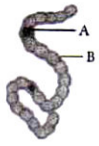
(a) Vesicles (b) Arbuscles
(c) Akinetes (d) Heterocysts

MHT CET-2017

Ans. (d) : Heterocyst present in Nostoc is specialized cell for Nitrogen Fixation. Cyanobacteria like Nostoc can fix nitrogen through a specific structure called **heterocyst**.

- Heterocyst are nitrogen-fixing cells generated by certain filamentous cyanobacteria, such as *Nostoc punctiforme, cylindrospermum stangale, Aulosira*, *Tolypothrix*, and *Anabaena sphaerica*, under nitrogen shortage.

176. Identify the labeled part in the given figure and select the correct option.



(a) A-Heterocyst; B-Mucilaginous sheath
(b) A-Mucilaginous; B-Heterocyst
(c) A-Heterocyst; B-Capsid
(d) A-Pseudopodia; B-Mucilaginous sheath

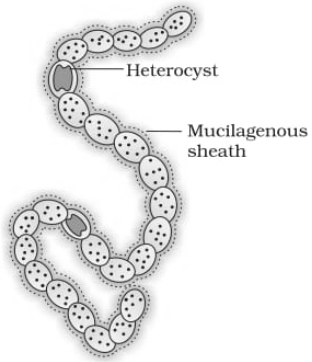
AIIMS-2017, 2016

Ans. (a) : Nostoc is a cyanobacteria. It has ability to fix atmospheric nitrogen. It converts nitrogen into ammonia. The **heterocysts** present in it are specialized for nitrogen fixation. It contains enzyme nitrogenase.

- Nitrogenase is inactivated by oxygen. Hence, the heterocyst must creates a micro anaerobic environment.

Mucilaginous sheath -

- It is also called the **slime layer.** It comprises the cellulose fibers aligned reticulately with in the matrix.
- In cyanobacteria, the cell wall is present in between the plasmalemma and mucilaginous sheath.



177. Nif genes occur in

(a) Rhizobium (b) Aspergillus
(c) Penicillium (d) Streptococcus

UP CPMT-2004
MHT CET-2017
WB JEE-2007

Ans. (a) : Nif genes occurs in Rhizobium sp. In leguminous plants, nitrogen fixation is done by nitrogenase enzyme complex. The Nif genes are found in both free living nitrogen-fixing bacteria and symbiotic bacteria.

The enzyme nitrogenase is a Mo-Fe protein and catalyses the conversion of atmospheric nitrogen to ammonia, the first stable product of nitrogen fixation.

178. Nitrite is converted to nitrate by

(a) Nitrosomonas (b) Nitrobacter
(c) Pseudomonas (d) Clostridium

JCECE-2008
UP CPMT-2007

Ans. (b) : Nitrite is converted to nitrate by nitrobacter bacterium

- In nitrogen cycle, nitrogen is converted to nitrite with the help of Nitrosomonas bacteria while nitrite into nitrate is transformed by nitrobacter bacterium.
- It is a process that converts ammonia to nitrite then nitrate is known as "Nitrification".
- It is an aerobic process and oxidative process.
- *Nitrobacter, Nitrococcus* are known as "Nitrifying Bacteria" or "Chemoautotrophic Bacteria".

179. Which of the following pair of bacteria is involved in two step conversion of NH_3 into nitrate?

(a) Azotobacter and Nitrosomonas
(b) Nitrosomonas and Nitrobacter
(c) Azotobacter and Achromobacter
(d) Pseudomonas and Nitrobacter

UP CPMT-2004
MGIMS Wardha-2013

Ans. (b) : Nitrosomonas and Nitrobacter are the bacteria involved in two step conversion of NH_3 into nitrate. Nitrosomonas converts nitrogen gas into nitrite.

- The conversion of Nitrite to Nitrate is done by the nitrobacter bacterium.
- The whole process is known as Nitrification process.
- It is an aerobic and oxidation process.

@apna_pdf

- The conversion of Ammonia from dead decaying matter is known as Ammonification.
- The whole N_2 metabolism involves
  - Ammonification
  - Nitrification
  - Denitrification
  - N_2 - Fixation
  - N_2 - Assimilation

180. Atmospheric N_2 fixation is carried on by
(a) Anabaena (b) Funaria
(c) Chlamydomonas (d) none of these
Punjab MET-1999

Ans. (a) : Atmospheric nitrogen fixation is carried by Anabaena
- Anabaena is a cyanobacteria which has specialized organ termed as "Heterocysts", In Nostoc and Anabaena the main site of Nitrogen fixation is 'Heterocysts'.
- Anabaena fix N_2 in specialized thick walled cells which lacks photosystem II are known as heterocysts.
- Heterocysts fixes N_2 only under anaerobic conditions.
- "Beijerinck" in 1901 carried out a discovery that prokaryotes i.e. cyanobacteria utilize enzyme Nitrogenase to catalyze the conversion of atmospheric Nitrogen to Ammonia.
- Conversion of atmospheric nitrogen to ammonia is a complex process, which involves many steps.

181. The element related with nitrogen metabolism is
(a) manganese (b) magnesium
(c) zinc (d) molybdenum
AMU-2015

Ans. (d) : Elements related with N_2 metabolism is Molybdenum because it is a main component of Nitrogenase enzyme complex.
- It also functions as a cofactor.
- Dinitrogenase protein of Nitrogenase enzyme contains Fe and Mo.
- Mo-Fe cofactor is the site of N_2 fixation.

182. Under anaerobic conditions, denitrifying bacterium Pseudomonas changes
(a) nitrate to molecular nitrogen
(b) nitrate to ammonia
(c) nitrate to nitrite
(d) nitrite to nitrate
BHU PMT (Mains)-2009

Ans. (a) : Under anaerobic condition, denitrifying bacterium Pseudomonas changes nitrate to molecular nitrogen and process is known as denitrification.
- It is anaerobic process i.e. occurs in absence of oxygen.
- There are 2 types of denitrifying organisms
  - Autotrophs
  - Hetrotrophs
- Autotrophic denitrifying organisms – *Thiobacillus denitrificans*
- Heterotrophic denitrifying organisms - *Paracoccus denitrificans* and *Pseudomonas denitrificans*

183. Nitrification is the process of conversion of
(a) NH_3 (b) NO_2
(c) NO_3 (d) All of these
DUMET-2008

Ans. (d) : Nitrification is the process of conversion of Ammonium ion (NH_4^+) into nitrite (NO_2^-) and then nitrite into nitrate (NO_3^-).
- Conversion of ammonium ion into nitrite is performed with the help of nitrifying bacteria Nitrosomonas, Nitrosococcus
$$2NH_3 + 3O_2 \xrightarrow[\text{Nitrosococcus}]{} 2HNO_2 + 2H_2O + \text{Energy}$$
- Conversion of Nitrite into nitrate is done by nitrobacter bacterium.
$$2HNO_2 + O_2 \xrightarrow{\text{Nitrobacter}} 2HNO_3 + \text{Energy}$$
- Nitrifying bacteria are chemoautotrophs i.e. obtains energy from oxidized inorganic substances.

184. The process of decay of dead organic matter is known as
(a) Denitrification (b) Nitrification
(c) Nitrogen fixation (d) Ammonification
BHU PMT (Screening)-2007

Ans. (d) : The process of decay of dead organic matter i.e. plants and animals is known as Ammonification.
- The process of ammonification of compounds is performed by *Bacillus mycides*, *B. ramosus, B. vulgaris*. These bacteria are also known as "Putrefying Bacteria".
- Proteins are breaked into amino acid process known as deamination and then into ammonia compound by bacteria through a process called Ammonification.

$$\text{Proteins from dead animals \& plants wastes} \xrightarrow[\text{decomposition}]{\text{microbial}} \text{Amino acid}$$

$$\text{Amino acid} \xrightarrow[\text{decomposition}]{\text{microbial}} \text{Ammonia}$$

185. Most plants obtain their nitrogen from the soil in the form of
(a) Nitric acid (b) Free nitrogen gas
(c) Nitrates (d) Nitrite
JandK CET-2015

Ans. (c) : Plants absorb Nitrogen from soil mainly in the form of nitrates (NO_3^-). In low concentration, ammonium ions can also be absorbed very easily.
- In high concentration, ammonium ions are very toxic
- The nitrogen in the form of nitrite (NO_2^-) not absorbed by plants. Hence they are oxidized into Nitrate (NO_3^-) by nitrifying bacter i.e. Nitrobacter.
$$2HNO_2 + O_2 \xrightarrow{\text{nitrobacter}} 2HNO_3 + \text{Energy}$$

186. In the higher plants, nitrate ions absorbed from the soil are converted to ammonia in two steps. In second step, the electrons required for reduction of nitrite ions are donated by
(a) cytochrome P_{450} (b) nitrate reductase
(c) ferredoxin (d) nitrite reductase
BHU PMT (Screening)-2011

Ans. (c) : In higher plants, nitrate ions absorbed from soil are converted to Ammonia in two steps :

$$\text{Amino acids} \xrightarrow[\text{decomposition}]{\text{microbial}} \text{Ammonia}[NH_3]$$

$$2NH_3 + 3O_2 \xrightarrow[\text{nitrosococcus}]{\text{nitrosomonas}} 2NHO_2 + 2H_2O + \text{Energy}$$

@apna_pdf

$$2HNO_2 + O_2 \xrightarrow{\text{nitrobacter}} 2HNO_3 + \text{Energy}$$

- Nitrate is first reduced to nitrite before assimilated by plants.
- In second step, nitrite is reduced to ammonia by nitrate reductase
- Both these reactions are occur in cytosal and chloroplast respectively Nitrate Reductase is composed of 2 identical submits, containing FAD, then and Mo.

$$NO_3^- \xrightarrow[\text{Nitrate reductase}]{} NO_2^- \xrightarrow[\text{nitrate reductase}]{\text{ferredoxin}} NH_4^+$$

187. $N_2 + 8e^- + 8H^+ + 16ATP \rightarrow 2NH_4 + H_2 + 16ADP + 16Pi$

The above equation refers to

(a) ammonification (b) nitrification
(c) nitrogen fixation (d) denitrification
(e) reductive amination

VMMC-2015

Ans. (c) :

$N_2 + 8e^- + 8H^+ + 16ATP \rightarrow 2NH_4 + H_2 + 16ADP + 16Pi$

- This equation represents Nitrogen fixation.
- N_2 fixation is a process in which N_2 is fixed (converted) into ammonia then into nitrates. As plants, cannot directly use atmospheric N_2.
- N_2 fixation is of 2 types : Biological N_2 fixation and non Biological N_2 fixation
- Biological N_2 fixation can be either symbiotically or non-symbiotically
- N_2 fixation requires Mo-Fe as essential component and nitrate reductase enzyme also helps in N_2 fixation.

188. Enzyme nitrogenase is responsible for

(a) Nitrification (b) Nitrogen fixation
(c) Nitrite reduction (d) Nitrate reduction

JandK CET-2007

Ans. (b) : Enzyme Nitrogenase is responsible for N_2 fixation symbiotically or asymbiotically. It converts N_2 into NH_3. It acts as a catalyst and reduces activation energy.

189. Nitrogen is absorbed by plants in form of

(a) NO_3^- (b) NH_3
(c) NO_2^- (d) Both (a) and (c)

AFMC-2010

Ans. (d): Nitrogen is absorbed by plants in the form of Nitrites and Nitrate, Mostly in the form of nitrate (NO_3^-)

- Nitrate moves freely towards plant roots as they absorb water
- Nitrogen demand increases with their size
- The whole process of conversion of nitrite into nitrate and nitrate into dinitrogen gas (N_2) is known as Nitrification.

190. Non-symbiotic nitrogen fixation takes place by:

(a) Nostoc, Azotobacter, Clostridium
(b) Anabena, Nostoc, Rhizobium
(c) Azotobacter, Nitrosomonas, Rhizobium
(d) Anabena, Nitrosomonas, Pseudomonas

GUJCET-2014

Ans. (a) : The fixation of atmospheric N_2 by soil bacteria that are free-living is known as non-symbiotic N_2 fixation.
Nostoc is a free living cyanobacteria and azotobactor is obligate aerobic bacteria. Clostridium is anaerobic bacteria. These organisms live freely in the soil and fix the atmospheric nitrogen.

191. Nostoc fixed dinitrogen in symbiotic association with the following:

1. Alnus **2. Gunnera**
3. Anthoceros **4. Casuarina**

The correct combination is:

(a) 1 and 2 (b) 2 and 3
(c) 1 and 3 (d) 1 and 4

AP EAMCET-2005

Ans. (b): Nostoc is a blue-green alga or Cyanobacteria. It is a filamentus and in most causes Clonial blue-green alga. It has symbiotic association with Anthoceros (bryophyte) or with *Gunnera manicata* (an angiospermic marsh plant).

- Nostoc and anabena is cyanobacteria. It is converts atmospheric nitrogen into ammonia.

192. Which of the following is a flowering plant with nodules containing filamentous nitrogen-fixing microorganism ?

(a) *Cicer arietinum*
(b) *Casuarina equisetifolia*
(c) *Crotalaria juncea*
(d) *Cycas revoluta*

AIPMT-2007

Ans. (b) : *Casuarina equisetifolia*, common names- Australian- pine tree beach she-oak, common ironwood. Plant absorb atmospheric Nitrogen in form of NO_3^-, NO_2^- and NH_4^+ ion. In root nodules of casuarina and Alnus filamentus frankia are present

193. Which of the following is responsible for biological nitrogen-fixation?

(a) Nif gene
(b) Nitrogenase
(c) yeast alanin tRNA synthetase
(d) RNA synthetase

JIPMER-2014

Ans. (a) : The nitrogen fixation enzymes are encoded by Nif genes that are present in both free living and are symbiotic nitrogen fixing bacteria. Root nodules primarily contain the enzyme nitrogenase.
It catalyzes the conversion of nitrogen to ammonia. This ammonia produced is used for the synthesis of amino acids and finally into proteins by joining several amino acids.

194. Which of the following is non-symbiotic nitrogen fixer organism?

(a) VAM (b) Azotobacter
(c) Anabaena (d) Rhizobium

JIPMER-2014

Ans. (b) : Only Azotobacter is a non-symbiotic free - living nitrogen - fixing bacteria. They are aerobic and can survive only if there is presence of oxygen. It helps in fixing nitrogen by converting atmospheric nitrogen to ammonia. Thus it is an example of non-symbiotic nitrogen fixing bacteria.

@apna_pdf

195. The common nitrogen-fixer in paddy fields is –
(a) Rhizobium (b) Azospirillum
(c) Oscillatoria (d) Frankia

AIPMT (Screening)-2010

Ans. (b) : Azospirillum is a nitrogen fixing bacterium in paddy fields. It is very useful for soil and root bacterium and it is used as biofertilizer in Rice fields.
• Some other example of nitrogen fixer bacteria are - Azotobacter, Frankia, Rhizobium.

196. One of the free-living anaerobic nitrogen-fixer is
(a) Beijernickia (b) Rhodospirillum
(c) Rhizobium (d) Azotobacter

AIPMT (Screening)-2010

Ans. (b) : Rhodospirillum is a free living anaerobic nitrogen fixer bacteria also it can synthesize its food in presence of light under anaerobic condition.
• Rhizobium species from on endosymbiotic nitrogen fixing association with roots of legumes.
• Free living aerobic nitrogen fixers includes the cyanobacteria (Anabaena and Nostoc), Azotobacter, Beijerinckia and clostridium.

197. Which of the following is a symbiotic nitrogen fixer ?
(a) Azolla (b) Glomus
(c) Azotobacter (d) Frankia

AIPMT-2009

Ans. (d) : Frankia is a symbiotic nitrogen fixing bacteria. It induces root nodules just like *Rhizobium.* It is associated symbiotically with the root nodules of several **non-legume plants like Casuarinas, Alnus etc.** It cannot fix nitrogen in freestate.

198. What are the names of free living aerobic and anaerobic nitrogen fixation bacteria respectively?
(a) Rhizobium - Clostridium
(b) Azotobacter - Clostridium
(c) Azotobacter - Agrobacterium
(d) Agrobacterium - Clostridium

GUJCET-2016

Ans. (b) : Azotobacter and Clostridium are the free-living aerobic and anaerobic nitrogen-fixing bacteria respectively. N_2 fixing bacteria possess nitrogenase enzyme which helps them in N_2 fixation. These bacteria are either free living or in a symbiotic relationship with the roots of plants.

199. Which bacterium is responsible for oxidation of ammonia to nitrite in soil?
(a) Nitrobacter (b) Clostridium
(c) Nocardia (d) Nitrosomonas

UP CPMT-2013

Ans. (d) : Nitrosomonas is responsible for oxidation of ammonia to nitrite in soil.

$$NH_3 + 3O_2 \rightarrow 2NO_2^- + 2H^+ + 2H_2O$$

200. Nodules which are present in leguminous plants are meant for fertilizers and are found in/on :
(a) certain leguminous plants
(b) aeschynomene
(c) Sesbania rostrata
(d) all of the above

Uttarakhand PMT-2006

Ans. (d) : Root nodules are commonly found in the root of leguminous plants. They are formed due to association with a nitrogen-fixing bacteria Rhizobium.

201. Which one of the following is an amide involved nitrogen assimilation by plants?
(a) Glutamate (b) Alanine
(c) Asparagine (d) Serine
(e) Glycine

Kerala PMT-2009

Ans. (c) : Nitrogen is absorbed by plants as nitrate ion. This nitrate is internally converted to ammonia ions through the plants enzymes nitrate reductase and nitrite reductase. The ammonia ions are then incorporated in amides like asparagines and glutamine.
• Asparagine is the primary assimilation product from N_2 fixation in temperature legumes and the predominant N_2 transport product in many plant species.

202. Which one of the following statements about nitrogenase is correct?
(a) It is sensitive to CO_2 and therefore present in isolated nodules.
(b) It requires O_2 and therefore functional during the day.
(c) It is sensitive to O_2 and therefore is functional in anaerobic environments
(d) It is sensitive to light and therefore functions only in dark.

KVPY SB and SX-2013

Ans. (c) : Enzymes required for N_2 fixation are Nitrogenase.
Enzyme nitrogenase is oxygen labile. Oxygen will make the enzyme irreversibly inactive. So, the nitrogen-fixing bacteria needs to protect the nitrogenase enzyme from oxygen.
Many Nitrogen-fixing bacteria grow in anaerobic conditions or respire to bring down O_2 levels.

203. During biological nitrogen fixation, inactivation of nitrogenase by oxygen poisoning is prevented by :
(a) Cytochrome (b) Leghaemoglobin
(c) Xanthophyll (d) Carotene

AIPMT (Re-Exam)-2015

Ans. (b) : During biological nitrogen fixation, inactivation of nitrogenase by oxygen poisoning is prevented by leghaemoglobin.
Leghaemoglobin is red pigment filled outside the peribacteroid space in the cytosol of nodule cells.
It is similar to haemoglobin of red blood cells.
Biological nitrogen fixation occurs when atmospheric nitrogen is converted to ammonia by an enzyme called nitrogenase.

204. Which bacteria is utilized in Gober gas plant :
(a) Methanogens
(b) Nitrifying bacteria
(c) Ammonifying bacteria
(d) Denitrifying bacteria

AIPMT-2002

@apna_pdf

Ans. (a) : Methanogens bacteria utilized in the gobar gas plant. Methanogens are anaerobic, autotrophic eukaryote that converts CO_2 and H_2 into methane gas.

- Chemolithotrophic bacteria that reduce the organic nitrogen into ammonia are termed as ammonifying bacteria.
- The chemolithotrophic bacteria that convert ammonia NH_3 into No_3^- are termed as nitrifying bacteria; it includes **Nitrosomonas** and **Nitrobacter.**
- The chemolithotrophic bacteria that reduce the nitrates into nitrogen are termed as denitrifying bacteria.

Nitrifying, Ammonifying and Denitrifying bacteria are component of Nitrogen cycle. They do not play any role in gobar gas production.

205. Which of the following species does not have the ability to fix atmospheric nitrogen?

(a) Azotobactor (b) Anabaena
(c) Nostoc (d) Spirogyra

AIPMT-1994

Ans. (d) : The filamentous alga is genus *spirogyra*. Its name to the characteristic spiral shape of the chloroplasts possessed by it's members.

206. The enzyme responsible for atmospheric nitrogen fixation is :

(a) nitrogenase (b) hydrogenase
(c) oxygenase (d) carboxylase

JIPMER-2006

Ans. (a) : Nitrogenase is the key enzyme for biological nitrogen fixation. Nitrogenase is a Mo-Fe protein that helps in the conversion of nitrogen to ammonia.

$N_2+8e^-+8H^+ + 16ATP \rightarrow 2NH_3+H_2+16ADP$

207. The non-photosynthetic, non-symbiotic N_2 fixing bacteria are

(a) Rhodobacter (b) Spirillum
(c) Azotobacter (d) All of these

JIPMER-2005

Ans. (c) : Azotobacter is non-photosynthetic, non-symbiotic and aerobic nitrogen fixing bacteria. Plants cannot use atmospheric nitrogen directly. So, some bacteria that are present is environment convert atmospheric nitrogen into ammonia which is then able to be used by the plants.

208. Nitrifying bacteria are able to

(a) convert atmospheric nitrogen into soluble forms
(b) convert ammonia to nitrate
(c) ammonia to nitrogen
(d) nitrate to nitrogen

JIPMER-2008

Ans. (b) : Nitrifying bacteria convert the most reduced form of soil nitrogen, ammonia, into its most oxidized form, nitrate. In itself, this is important for soil ecosystem function, in controlling losses of soil nitrogen through leaching and denitrification of nitrate.

Nitrosomonas and Nitrobacter are the two examples of nitrifying bacteria.

$$NH_3 + O_2 + 2e^- \xrightarrow[\text{Monoxygenase}]{\text{Ammonia}} NH_2OH + H_2O$$

$$NH_2OH + H_2O \xrightarrow[\text{oxireductase}]{\text{hydroxylamine}} NO_2^- + 5H^+ + 4e^-$$

209. The function of leghaemoglobin during biological nitrogen fixation in root nodules of legumes is to

(a) Convert atmospheric N_2 to NH_3
(b) Convert ammonia to nitrite
(c) Transport oxygen for activity of nitrogenase
(d) Protect nitrogenase from oxygen

AIIMS-2006
JandK CET-2015

Ans. (d) : Leghaemoglobin is a **pink-coloured pigment** that is present in the root nodules of leguminous plants.

It combines with oxygen and protects nitrogenase, which catalyses the fixation of nitrogen under anaerobic conditions.

210. Leghaemoglobin is produced in response to

(a) respiration (b) photosynthesis
(c) fatty acid synthesis (d) N_2 fixation

AIIMS-2012

Ans. (d) : Leghaemoglobin has closed structural similarity with haemoglobin. It is also red in colour. Leghaemoglobin is an oxygen carrier and haemoprotein. Leghaemoglobin is produced by legumes in response to the roots being colonized by nitrogen-fixing bacteria, termed rhizobia, as part of symbiotic interaction between plant and bacterium.

211. Which cell in cyanobacteria performs nitrogen fixation?

(a) Heterocysts (b) Akanite
(c) Filament (d) Nodule

MHT CET-2010

Ans. (a) : Heterocyst is a transparent thick walled empty cell which is present in intermediate position in filaments of blue green algae (cyanobacteria). They are the site of nitrogen fixation.

212. Which one of the following can utilize molecular nitrogen (N_2) as nutrient for growth?

(a) Rhizobium (b) Spirogyra
(c) Mucor (d) Methanococcus

CG PMT-2005

Ans. (a) : Rhizobium is a bacterium found in soil that helps in fixing nitrogen in leguminous plants. It attaches to the roots of the leguminous plant and produce nodules. These nodules fix atmospheric nitrogen and convert it into ammonia that can be used by the plant for its growth and development.

213. During symbiotic nitrogen fixation, how many moles of ATP are used in fixing one mole of N_2?

(a) 8 (b) 16
(c) 5 (d) 10

BCECE-2015

Ans. (b) :

$N_2 + 8e^- + 8H^+ + 16\ ATP \rightarrow 2NH_3 + H_2 + 16\ ADP + 16Pi$

Thus, one mole of nitrogen is converted into two molecules of ammonia by the use of 16 ATPs.

214. Actinomycetes which is a symbiotic nitrogen fixing organism in many plants:

(a) Streptomyces (b) Anabaena
(c) Frankia (d) Rhizobium

DUMET-2006

@apna_pdf

Ans. (c) : Frankia is a nitrogen fixing multicellular actinomycete which establishes root nodule symbiosis with actinorhizal plants.

215. The nitrogen fixed in the nodules of *Glycine max* is exported to other parts of the plant as

(a) Nitrates (b) Ammonia
(c) Ureides (d) Aspargine

TS EAMCET-15.05.2016

Ans. (c) : In *Glycine max*, ammonia formed as a product of nitrogen fixation is converted to ureides and transported to the other parts of the plant.
Glycine max is a botanical name of soyabean plant.

216. Which of the following is considered to be the best chemical method of fixing atmospheric nitrogen ?

(a) Fisher method
(b) Decan method
(c) Haber-Bosch method
(d) Parnas-Meyerhof method

BVP-2007 /Manipal-2008 / BHU PMT-2004

Ans. (c) : Haber-Bosch method is used for manufacturing ammonia from atmospheric nitrogen.
$N_2 + 3H_2 \rightleftharpoons 2NH_3$. This reaction is exothermic and reversible in nature.

217. Azotobacter and Beijernickia are the examples of

(a) Symbiotic nitrogen- fixers
(b) Non-symbiotic nitrogen- fixers
(c) Ammonifying bacteria
(d) Disease causing bacteria

BHU PMT (Mains)-2007

Ans. (b) : Azotobacter and Beijernickia are the examples of non-symbiotic nitrogen-fixers. They are able to convert atmospheric nitrogen to ammonia.

218. The bacterium capable of anaerobic N_2 fixation is known as

(a) Clostridium (b) Bacillus
(c) Azotobacter (d) Rhizobium

CG PMT-2004 / AMU-1998

Ans. (a) : *Clostridium botulinum* are capable of nitrogen fixation and are an anaerobic bacterium. They are saprophytic bacteria that grows in conditions that are devoid of oxygen.

219. Nif genes are fixing genes for

(a) Nitrogen (b) Oxygen
(c) Carbon (d) Nitrate

CMC Vellore-2011

Ans. (a) : The nif genes are genes encoding enzymes involved in the fixation of atmospheric nitrogen. Nif genes are found into living organism i.e. nitrogen fixing bacteria and cyanobacteria.

220. Nitrates are converted into N_2 by

(a) N_2 fixing bacteria
(b) sulphur fixing bacteria
(c) denitrifying bacteria
(d) none of these

VMMC-2004
CG PMT-2004

Ans. (c) : Denitrifying bacteria are a diverse group of bacteria that encompass many different phyla whose action results in the conversion of nitrates in the soil to free atmospheric nitrogen.

221. Nitrogen fixation means:

(a) N_2 changes in NO_3^-
(b) N_2 changes in NH_3
(c) NO_2^- changes into nitrates
(d) none of these

VMMC-2004

Ans. (b) : The fixation of atmospheric nitrogen into ammonia by living organisms is called biological nitrogen fixation. In this process N_2 (di-nitrogen) changes in NH_3 (ammonia)

222. The aquatic fern, which is an excellent biofertilizer is :

(a) Azolla (b) Salvinia
(c) Marsilea (d) Pteridium

Haryana PMT-2000

Ans. (a) : Azolla is a pteridophyte or aquatic plant float on the surface of water and used as a biofertilizer because it has association with nitrogen fixing cyanobacteria.

223. Which of the following gene is responsible for biological nitrogen fixation ?

(a) Nitrogenase
(b) Nif gene
(c) Yeast alanine t – RNA synthetase
(d) RNA synthetase

Punjab MET-2005

Ans. (b) : The nif genes are genes involved in nitrogen fixation. They are found in nitrogen fixing bacteria

224. Free living nitrogen fixing aerobic bacterium is

(a) Rhodospirillum (b) Anabaena
(c) Nostoc (d) Beijernickia
(e) Rhizobium

Kerala PMT-2014

Ans. (d) : Beijerinckia is a free living nitrogen-fixing aerobic microbe. It has aboundant of nitrogenase enzyme capable of nitrogen reduction.

225. Match the items in column I with those in column II and choose the correct answer.

Column I		Column II	
A.	**Thiobacillus**	**1.**	**Nitrogen-fixation**
B.	**Nitrosomonas**	**2.**	**Ammonification**
C.	**Azotobacter**	**3.**	**Nitrification**
D.	**Pseudomonas**	**4.**	**Denitrification**

(a) A-4B-3C-1D-2 (b) A-3B-4C-1D-2
(c) A-4B-2C-1D-3 (d) A-2B-1C-3D-4

WB JEE-2015

Ans. (a) :

Column-I	Column-II
Thiobacillus	Denitrification
Nitrosomonas	Nitrificaiton
Azotobacter	Nitrogen-fixation
Pseudomonas	Ammonificaiton

@apna_pdf

226. Match the items in Column I with Column II and choose the correct answer.

Column I		Column II	
a.	Free living aerobic nitrogen fixers	i.	Anabaena and Nostoc
b.	Anaerobic nitrogen fixers	ii.	Pseudomonas and Thiobacillus
c.	Nitrogen fixing cyano-bacteria	iii.	Nitrosomonas and Nitrococcus
d.	Denitrifying bacteria	iv.	Azotobacter and Beijernickia
e.	Nitrifying bacteria	v.	Rhodospirillum

(a) a – 4, b – 5, c – 1, d – 2, e – 3
(b) a – 5, b – 4, c – 1, d – 3, e – 2
(c) a – 4, b – 5, c – 2, d – 3, e – 1
(d) a – 4, b – 3, c – 1, d – 2, e – 5
(e) a – 4, b – 5, c – 3, d – 2, e – 1

Kerala PMT-2013

Ans. (a) : Free living aerobic Nitrogen fixer bacteria are Azotobacter and Beijernickia.
- Anaerobic nitrogen fixing bacteria is Rhodospirinllum.
- Nitrifying bacteria are Nitrosomonas and Nitrosococcus.
- Denitrifying bacteria are Pseudomonas and Thiobacillus.
- Nitrogen fixing cyanobacteria are Anabacena and Nostoc.

227. Certain bacteria living in the soil poor in oxygen, convert nitrates into nitrites and then to free nitrogen and such bacteria are termed as
(a) nitrogen fixing bacteria
(b) denitrifying bacteria
(c) ammonifying bacteria
(d) saprophytic bacteria

AFMC -2009, 2006

Ans. (b) : Denitrifying bacteria are present in soil and convert nitrate and ammonia into atmospheric free elemental N_2 such process is known as Denitrification. These bacteria grow very well in soil where water is more and oxygen is low.
- Denitrifying bacteria uses nitrates instead of O_2 as an electron acceptor during respiration e.g. Thiobacillus denitrificans.

228. Nitrifying bacteria are
(a) autotrophs (b) chemoautotrophs
(c) heterotrophs (d) phototrophs

UP CPMT-2012

Ans. (b) : Nitrifying bacteria are chemoautotrophic organisms that includes nitrosomonas, Nitrosococcus, Nitrobacter.
- These bacteria get their energy from oxidation of N_2 compounds
- These bacteria are of 2-types (i) ammonia oxidizing bacteria [AOB]
  (ii) nitrite oxidizing bacteria [NOB]
- These bacteria converts most reduced form of soil nitrogen, ammonia into oxidized form i.e. nitrate.

229. A bacterium which fixes atmospheric nitrogen in non-leguminous plant is:
(a) Azotobacter (b) Rhizopus
(c) Azospirillum (d) E. coli

VMMC-2006

Ans. (c) : Bacterium fixes atmospheric nitrogen in non-leguminous plant is Azospirillum. It is a gram negative aerobe. That is rod shaped and has a polar flagellum. It increases yields of cereals by fixing Nitrogen. It synthesizes phytohormones like IAA or Auxin and supposed to increase biotic and abiotic stress tolerance. Azospirillum appear to colonize crop plants as well as weeds, and are also found in caves of marine mangroves.

230. The source of energy for non-biological nitrogen fixation is:
(a) By ionizing events such as lightning and effect of cosmic rays
(b) Ferredoxin enzyme and nitrogenase
(c) By reduction of proteins to ammonia
(d) By oxidation of ammonia to protein

Karnataka CET-2003

Ans. (a) : Source of energy for non biological nitrogen fixation is by ionizing agents such as lightning and effect of cosmic rays
- Due to thunder storm or lightening atmospheric N_2 combines with oxygen to form nitric oxide (NO), which finally oxidized to nitrogen dioxide (NO_2) which reacts with sum water in presence of oxygen to form nitric acid. This nitric acid comes to earth, reacts with substances of soil and form nitrates (the source of N. m plants.)

Step (i) $N_2 + O_3 \xrightarrow[\text{lightening}]{} 2NO_3$
Nitric oxide

Step (ii) $2NO + O_2 \longrightarrow 2NO_2$
Nitrogen peroxide

Step (iii) $H_2O + 3NO_2 \longrightarrow 2HNO_3 + NO$
Nitric acid

Step (iv) $HNO_3 + NH_3 \longrightarrow NH_4NO_3$
Ammonium nitrate

Reactions of Non-Biological Nitrogen fixation

231. The odd one among following is
(a) Nitrococcus, Nitrobacter, Nitrosomonas
(b) Rhizobium, Aulosira, Bacillus, Polymyxa
(c) Clostridium, Rhizobium, Nostoc
(d) Anabaena, Nastoc, Azotobacter, Clostridium

BHU PMT (Screening)-2011

Ans. (b) : Bacteria is related to nitrogen fixation, nitrification and denitrification. Only Rhizobium is associated with N_2 fixation.

@apna_pdf

232. Nostoc fixes dinitrogen in symbiotic association with the following

I. Alnus **II. Gunnera**
III. Anthoceros **IV. Casuarina**
The correct combination is

(a) I and II (b) II and III
(c) I and III (d) I and IV

VMMC-2010

Ans. (b) : Gunnera develops a complex and symbiosis with N_2 fixing cyanobacteria of Nostoc. Nostoc–Gunnera symbiosis exhibits unique feature i.e. cyanobacterium infects specialized glands located on the stems of the host and once it has passed into interior of the gland. Nostoc also enters Gunnera cells and begins to differentiate highest frequency of heterocysts which is necessary for N_2 fixation in Nostoc (BGA).

• *Nostoc-Anthoceros* relationship is also example of symbiosis. *Anthoceros* is also known as "Hornwort".

233. The unique property of legumes, is the assimilation of nitrogen in the form of:

(a) molecular nitrogen (b) ammonia
(c) nitrates (d) organic nitrogen

AP EAMCET-1997

Ans. (b) : In legumes and other plants, bacteria lives symbiotically in roots and forms nodules called Root nodules. Within this nodule, N_2 fixation occurs and Ammonia (NH_3) is produced and absorbed by plants.

• N_2 assimilation requires reduction of nitrates to ammonium and then ammonium assimilation into amino acid by GS–GOGAT pathway [Glutamine Synthetase–Glutamine 2 oxoglutarate amino transferase).

234. Which one depicts nitrogen fixation ?

(a) $N_2 \rightarrow NH_3$ (b) $N_2 \rightarrow NO_3$
(c) $N_2 \rightarrow$ Amino acids (d) Both (a) and (b)

VMMC-2008 / AMU-2008 / HP CET-2012

Ans. (d) : Nitrogen fixation is a process of conversion of atmospheric Nitrogen into Ammonia and represented as –

$$N_2 + 3H_2 \xrightarrow{16ATP} \underset{\text{Ammonia}}{2NH_3}$$

$$2NH_3 + 3O_2 \longrightarrow 2NO_2^- + 2H^+ + 2H_2O$$

$$2NO_2^- + O_2 \longrightarrow 2NO_3^-$$

Ammonia is first oxidized to nitrite by the bacteria nitrosomonas or nitrococcus. The nitrite is further oxidized to nitrate with the help of the bacterium nitrobacter.

235. Root of which plant contains a red pigment that has affinity for oxygen?

(a) Carrot (b) Soyabean
(c) Mustard (d) Radish

CG PMT-2011

Ans. (b) : Legumes or Soyabean plant contains a red pigment or pink pigment like Haemoglobin called "Leghaemoglobin (LHb)". It is red in colour due to presence of iron, first isolated and crystallized from soyabean roots. It regulates oxygen concentration as bacteroids are aerobic and consume oxygen. LHb promotes oxygen utilization in bacteroids and favours N_2 fixation. It facilitates the movement of oxygen to O_2 deficient tissues. Leg Hb combines with oxygen to form Oxyleghaemoglobin. OLHb maintains O_2 tensed environment and allow nitrogenase to function properly.

236. Nitrites converted to nitrates by

(a) Nitrobacter bacteria (b) Nitrocystis bacteria
(c) Pseudomonas bacteria (d) Both (a) and (b)

CMC Ludhiana -2013

Ans. (d) : Nitrites converted into nitrate by nitrifying bacteria eg. Nitrobacter and Nitrocystis bacteria process known as "Nitrification". In this process, there are two steps.

- In the first step, ammonium ion is converted into nitrite.
- In the second step, nitrite ion is converted into nitrate.

e.g. Nitrobacter, Nitrococcus, Nitrospira, Nitrosomonas.

237. The major chunk of nitrogen in nature is fixed by

(a) Lightning (b) Symbiotic bacteria
(c) Denitrifying bacteria (d) Chemical industries

Haryana PMT-2011

Ans. (b) : Major chunk of N_2 fixation is by Symbiotic Bacteria, i.e. Rhizobium sp. It forms root nodules in leguminous plants with the help of Nitrogenase enzyme and nitrate reductase enzyme.

• The genes required for nitrogen fixation is Nif gene i.e. Nitrogen fixing gene and fix gene i.e. fixatory gene which regulates activity of nif genes.

A symbiotic relationship is a type in which both partners gets benefitted and is called mutualism.

H. Nodule Formation and fate of Ammonia

238. Nodules with nitrogen fixing bacteria present in roots of

(a) cotton (b) gram
(c) wheat (d) maize

CG PMT-2007 / VMMC-2008
AMU-2008 / Manipal-2002

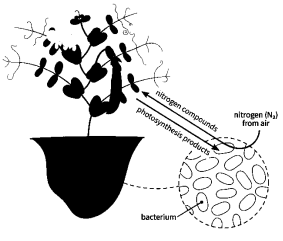
Ans. (b) : The nitrogen fixing bacteria are found in the roots of legumes in special structures called root nodules. Nodules with nitrogen fixing bacteria present in roots of gram.

239. In root nodules of legumes, leg-haemoglobin is important because

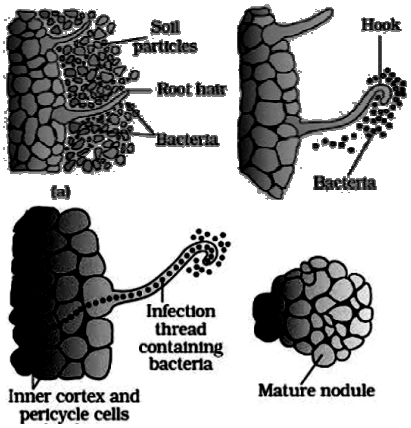
(a) it transports oxygen to the root ule
(b) it acts as an oxygen scavenger
(c) it provides energy to the nitrogen fixing bacterium
(d) it acts as a catalyst in transamination

DUMET-2009/ Rajasthan PMT-2011
CMC Ludhiana-2014 / AIIMS-2007,2014 /
DUMET-2011

Ans. (b) :



@apna_pdf



In root nodules of legumes, leghaemoglobin is important because it acts as an oxygen scavenger. Leghaemoglobin combines with oxygen to form oxyleghaemoglobin. Oxyleghaemoglobin maintains O_2 anaerobic condition necessary for the activity of Nitrogenase enzyme complex. Hence, Leghaemoglobin acts as oxygen scavenger and makes environment anaerobic.

240. Which of the following protects nitrogenase inside the root nodule of a leguminous plant?

(a) Catalase
(b) leg haemoglobin
(c) Transaminase
(d) Glutamate dehydrogenase

NEET (Re-Exam)-04.09.2022

Ans. (b) : The leghaemoglobin is responsible for creating anaerobic conditions in the root nodules of the legume plant. It acts as oxygen scavenger and protects enzyme nitrogenase from oxygen and help in proper functioning of the enzyme.

241. The treatment with ___induces nodule formation in the roots of leguminous plants

(a) Zeatin
(b) Indole-3-acetic acid
(c) Ethylene
(d) Abscisic acid

AP EAMCET-11.07.2022 Shift-II

Ans. (b) : Treatment with Indole-3-acetic acid induces nodule formation in the roots of leguminous plants. Indole-3-acetic acid (IAA) is an auxin plant hormone produced by terrestrial plants which altered cell orientation, organ development, fertility and cell-elongation.

242. Match List - I with List - II:

List-I		List-II	
A.	Porins	i.	Pink coloured nodules
B.	leg haemoglobin	ii.	Lumen of thylakoid
C.	H^+ accumulation	iii.	Amphibolic pathway
D.	Respiration	iv.	Huge pores in outer membrane of mitochondria

Choose the correct answer from the options given below:

(a) (A) - (ii), (B) - (i), (C) - (iv), (D) - (iii)
(b) (A) - (iv), (B) - (i), (C) - (ii), (D) - (iii)
(c) (A) - (iii), (B) - (iv), (C) - (ii), (D) - (i)
(d) (A) - (ii), (B) - (iv), (C) - (i), (D) - (iii)

NEET (Re-Exam)-04.09.2022

Ans. (b) : In the outer membranes of plastids, mitochondria and some bacteria porins are present. They allow molecules, upto size of small proteins to pass through.

- The root nodules of leguminous plants contain the enzyme nitrogenase and a pink-coloured pigment leghaemoglobin.
- Protons accumulate inside the lumen of thylakoids due to splitting of water. Water splitting complex is associated with PS-II and is located on the inner side of the thylakoid membrane (facing the lumen of thylakoids)

- An amphibolic pathway is a biochemical pathway that includes both anabolic and catabolic processes.
- This process of synthesis is termed as anabolism. Thus we can say respiration is the sum process of catabolism and anabolism products of the Krebs cycle and glycolysis act as a precursor. For the synthesis of fats, proteins etc. Hence, the respiratory pathway is known as an amphibolic pathway.

243. The product(s) of reaction catalyzed by nitrogenase in root nodules of leguminous plants is/are

(a) Nitrate alone
(b) Ammonia and oxygen
(c) Ammonia and hydrogen
(d) Ammonia alone

NEET-2020 Phase-I

Ans. (c) : Nitrogenase enzyme cataylses the nitrogen fixation in root nodules of leguminous plants. The reaction is as follows.

$$N_2 + 8e^- + 8H^+ + 16ATP \longrightarrow 2NH_3 + H_2 + 16ADP + 16Pi$$

So, Products of nitrogen fixation are both ammonia and hydrogen.

244. In Glycine max, the product of biological nitrogen fixation is transported from the root nodules to other parts as

(a) Ureides (b) Ammonia
(c) Glutamate (d) Nitrates

NEET-2020 Phase-II

Ans. (a) : The nodules of some plants (e.g., soyabean) export the fixed nitrogen as ureides. The ureides are translocated to the various plant parts as a source of Nitrogen.

- Ureides are nitrogenous compounds derived from purine catabolism which contribute to nitrogen recycling in plants.

245. Rhizobium forms symbiotic association with roots in legumes and fixes atmospheric nitrogen. Which one of the following statement is correct about this process?

@apna_pdf

(a) Activity of nitrogenase is sensitive to oxygen
(b) Activity of nitrogenase is insensitive to oxygen
(c) Anaerobic conditions allow ATP independent conversion of nitrogen to ammonia
(d) Under aerobic conditions, atmospheric nitrogen can be converted to nitrates by Rhizobium

KVPY SB and SX-2019

Ans. (a) : Rhizobium forms symbiotic association with root nodules of legumes and nitrogenase is the main enzyme responsible for N_2 fixation is sensitive to oxygen. Nitrogenase converts atmospheric Nitrogen to Ammonia. Nitrogenase requires anaerobic condition for its activity which is fulfilled by pink coloured pigment called Leghaemoglobin. Leghaemoglobin maintains anaerobic condition for Nitrogenase.

246. Which of the following scientist first showed mutually beneficial relationship between bacteria and leguminous plants?
(a) Hellriegel and Wilfarth
(b) Nocard and Roux
(c) Winogradsky and Beijerinck
(d) Welch and Nuttall

SRM JEEE-2018

Ans. (c) : Winogradsky and Martinus Beijerinck first showed mutually beneficial relationship between bacteria and leguminous plants.
• Beijerinck discovered new types of bacteria from soil and described biological nitrogen fixation. He is called as the father of virology.
• Winogradsky was a Russian microbiologist, ecologist and soil scientist who discovered the biological process of nitrification.

247. Identify incorrect statement
(a) Free living Rhizobia are aerobes and have Nitrogenase in inactive state
(b) Nodules have direct vascular connection with the host and possess enzyme Nitrogenase and Leghaemoglobin
(c) Nitrogenase reduces N_2 to Ammonia under aerobic conditions
(d) Soyabean export the fixed nitrogen as ureides, which have high nitrogen to carbon ratio

AP EAMCET-28.04.2017 Shift-II

Ans. (c) : The nodule contains all the necessary biochemical components, such as the enzyme nitrogenase and leghaemoglobin. The enzyme nitrogenase is a Mo-Fe protein and catalyses the conversation of atmospheric nitrogen to ammonia. It is first stable product of nitrogen fixation. The enzyme nitrogenase is highly sensitive to the molecular oxygen. It requires anaerobic condition.

248. Select the mismatch:
(a) Frankia - Alnus
(b) Rhodospirillum - Mycorrhiza
(c) Anabaena - Nitrogen Fixer
(d) Rhizobium - Alfalfa

NEET-2017

Ans. (b) : Rhodospirillum is anaerobic, free living nitrogen fixer which help in the conversion of atmospheric nitrogen into Ammonia. It is not associated with roots of the vascular plant as mycorrhiza.
• Mycorrhiza is a symbiotic relationship between fungi and roots of higher plants (algae).

249. The first stable product of fixation of atmospheric nitrogen in leguminous plant is
(a) NO_2^- (b) Ammonia
(c) NO_3^- (d) Glutamate

JIPMER-2017
NEET-2013

Ans. (b) : Ammonia is the first stable product of fixation of atomospheric nitrogen in leguminous plants. this is catalysed by nitrogenase enzyme.

250. Identify the role of lectins in the formation of root nodules in legumes.
(a) Formation of shephered's crook
(b) Recognition of compatible Rhizobium by host
(c) Formation of peribacteroid membrane
(d) Formation of infection thread

AP EAMCET-2013

Ans. (b) : In the plant lecting of a given species can interact with polysaccharides of only a particular plant. Lecting is participates in plant defence against predators and pathogen. It is participates in symbiotic interaction between Host plant and symbiotic microbes. Its including mycorrhizal fungi and Nitrogen fixing Rhizobium.

251. Assertion (A): Azolla is used as biofertiliser in rich fields.
Reason (R): Azolla contains nitrogen fixing cyanobacteria in its root nodules.
The correct answer is
(a) Both (A) and (R) are true, and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, and (R) is not the correct explanation of (A)
(c) (A) is false, but (R) is true
(d) (A) is true, but (R) is false

AP EAMCET-2013

Ans. (a) : (A) *Azolla,* is a floating pteridophyte that is utilized as a biofertilizer due to its symbiosis with cyanobacteria in the rice fields.
(R) *Anabaena* is a nitrogen fixing cyanobacterium that is associated with *Azolla* and are together found in rice field.

252. Leguminous plants are able to fix atmospheric nitrogen through the process of symbiotic nitrogen fixation.
Which one of the following statements is not correct during this process of nitrogen fixation
(a) Nitrogenase is insensitive to oxygen
(b) Leghaemoglobin scavenges oxygen and is pinkish in colour
(c) Nodules act as sites nitrogen fixation
(d) The enzyme nitrogenase catalyses the conversion of atmospheric N_2 to NH_3

AIPMT (Mains)-2010

@apna_pdf

Ans. (a) : Leguminous plants one able to fix atmospheric nitrogen. It is participates in symbiotic nitrogen fixation. The enzyme nitrogenase is sensetive to molecular oxygen. The enzyme requirs anaerobic condition during nitrogen fixation, but live as aerobic under free living condition. Leg-haemoglobin scavenger of oxygen and it is pinkish in colour. Leg-haemoglobing provides anaerobic condition to the enzyme nitrogenase. Nodules contain biochemical components so that helps in fixing atomospheric nitrogen to ammonia. They act as sites of nitrogen fixation.

253. Legume plants are important for atmosphere because they

(a) Help in NO_2 fixation
(b) Do not help in NO_2 fixation
(c) Increase soil fertility
(d) Help in N_2 Fixation

VMMC-2007
Rajasthan PMT-2005,2006
UPCPMT-2002

Ans. (d): Legume plants belongs to Fabaceae family having root nodules found in symbiotic association with nitrogen fixing bacteria such as *Rhizobium.*

Several species of *Rhizobium,* grow over the root hairs release nod factors that cause curling of root hairs around the bacteria

The bacteria fixes the atmospheric nitrogen with the help of enzyme **nitrogenase** and they also increase the soil fertility.

254. What happened when we inoculated Rhizobium in wheat field?

(a) No increase in production (nitrogen content of soil remains same)
(b) A lot of increase in production (nitrogen content of soil increase)
(c) Fertility of soil decreases
(d) Fertility of soil increases

JIPMER-2008

Ans. (a) : If Rhizobium is inoculated in the wheat field, they won't be able to infect wheat plant and form root nodules as wheat is not a leguminous plant. Consequently, soil fertility will not change. Rhizobium is a proteobacterium. It is a genus of gram-negative bacteria. Gram-negative bacteria are those bacteria that do not retain the colour of the crystal violet stain, that is used for the gram staining of the bacteria.When we inoculated Rhizobium in wheat field, there is no increase in production, because wheat has no root nodules for fixing nitrogen content. Therefore, nitrogen content of soil will remain same.

255. Which is essential for the growth of root tip?

(a) Zn (b) Fe
(c) Ca (d) Mn

NEET-2016 Phase-II

Ans. (c) : Calcium is essential for the growth of root tips.

Calcium is involved in the formation of middle lamella of the cell wall and growth of root tip.

- Zinc is used in the formation of chlorophyll and auxins.
- Iron is essential for chlorophyll formation.
- Manganese is required during photolysis reaction in the process of photosynthesis.

256. For its action, nitrogenase requires

(a) Mn^{2+}
(b) Super oxygen redicals
(c) High input of energy
(d) Light

AIPMT (Mains)-2012

Ans. (c) : Nitrogenase require high input of energy and anaerobic condition. The enzyme nitrogenase is a Mo and Fe.

- They catalyses the conversion of atmospheric N_2 to NH_3 as.

$$N_2 + 8e^- + 8H^+ + 16ATP \longrightarrow 2NH_3 + H_2 + 16ADP + 16Pi$$

Enzyme nitrogenase functions under anaerobic condition and the pigment leghaemoglobin protect it from oxygen.

257. Which one of the following statements is correct?

(a) Legumes fix nitrogen only through the specialized bacteria that live in their roots.
(b) Legumes fix nitrogen independently of the specialized bacteria that live in their roots.
(c) Legumes fix nitrogen only through specialized bacteria that live in their leaves.
(d) Legumes are incapable of fixing nitrogen

AIPMT-1994
Manipal-2007

Ans. (b) : Legumes are able to form a symbiotic relationship with nitrogen-fixing soil bacteria called rhizobium.

258. Which of the following plants does not have Rhizobium containing root nodules?

(a) Phaseolus (b) Pinus
(c) Pisum (d) Cicer

JandK CET-2003

Ans. (b) : Pinus does not have Rhizobium containing root nodules because pinus is the sole genus in the subfamily pinoideae. Pinus is a gymnosperm. The root of pinus form mycorrhizal association with fungus.

259. Nodulated roots are found in:

(a) Malvaceae (b) Leguminosae
(c) Solanaceae (d) Compositae

Rajasthan PMT-1995

Ans. (b) : Nodulated roots are bead-like structures on the roots and found in plants that are associated with symbiotic nitrogen fixing bacteria. The root nodules contain nitrogen and Rhizobia. They are found in the family of Leguminosae.

260. Which of the following is a flowering plant with nodules containing filamentous nitrogen-fixing microorganism?

(a) Casuarina equisetifolia
(b) Crotalariajuncea

@apna_pdf

(c) Cycaservoluta
(d) Cicer arietinum

BCECE-2012

Ans. (a) : Nitrogen fixation is a process of conversion inert atmosheric nitrogen and utilizable compound of nitrogen like Ammonia, nitrites, and nitrates filamentous frankia occurs in root nodules of casuarina and Alnus.

261. Which bacterium is associated with the roots of legumes ?
(a) Spirogyra (b) Rhizobium
(c) Clostridium (d) Nostoc

Punjab MET-1999
CG PMT-2004

Ans. (b) : Rhizobium is associated with the roots of legumes. Rhizobium lives inside root nodules of legumes and provides N_2 to the plants while leguminous plants supplies carbohydrate to bacteria and establishes Symbiotic Relationship.

262. Select the correct statement about leghaemoglobin.
(1) Leghaemoglobin is a source of energy.
(2) Leghaemoglobin is a pinkish coloured pigment found in the root nodules.
(3) Leghaemoglobin is activated by the presence of Mg^{2+} ions.
(4) Leghaemoglobin protects the nitrogen fixing enzyme nitrogenase from oxygen
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct

BHU PMT (Mains)-2009, 2007

Ans. (c) : In the above statement, only statement 2 and 4 are correct because presence of leghaemoglobin is characteristic of healthy root nodule. It is similar to Haemoglobin. Leghaemoglobin regulates oxygen concentration and consume Oxygen. Leghaemoglobin combines with oxygen and form oxyleghemoglobin and this oxyleghemoglobin maintains O_2 deficient environment which is necessary to the activity of Nitrogenase enzyme.

263. The haemoglobin like pigment can be traced in
(a) seeds of legumes
(b) Clostridium
(c) Rhizobium
(d) leguminous root nodules

AMU-2011

Ans. (d) : Leghaemoglobin (LHb) is the pink coloured pigment present in root nodules of leguminous plant, similar to Haemoglobin.
• LHb maintains anaerobic condition which is necessary for Nitrogenase enzyme to function properly. Leghaemoglobin function to facilitate movement of oxygen to bacteroid and other oxygen deficient tissues and thus maintains anaerobic condition.

264. Metabolic water is the one
(a) used during trans amination
(b) used during photosynthesis
(c) produced during aerobic utilisation of glucose
(d) produced during condensation or polymerization

CMC Vellore-2014

Ans. (c) : Metabolic refers to chemical reactions take place in living organism for vital functioning of body. Metabolic water produced by energy of food through an oxidation process. During cellular respiration, water gets produced by oxidation of fat and carbohydrate whereas during heavy exercise, water gets bonded with glucose and gets released after oxidation. Metabolic water produced during aerobic utilization of glucose.

265. Mycorrhiza helps in:
(a) Respiration
(b) Water absorption
(c) Nutrient absorption
(d) Phosphate absorption

Rajasthan PMT-2006
AIIMS-1999

Ans. (c) : Mycorrhiza is an association between fungus and roots of higher plants. It is an example of symbiotic association. The roots that are associated with fungi are thick, short. The function of mycorrhiza is to absorb water and minerals (nutrient absorption).

266. Select the correct statement
(a) Legumes are incapable of fixing nitrogen
(b) Legumes fix nitrogen through bacteria living in fruits root
(c) Legumes fix nitrogen only by bacteria present in nodules
(d) None of the above

BCECE-2007

Ans. (c) : Legumes fix nitrogen only by bacteria present in nodules. Rhizobium is present in root nodule of leguminous plant. Rhizobium is free living, gram negative, non-sporulating, aerobic and motile rod-shaped bacterium resides in soil.

267. Which of the following is an ammonifying bacterium?
(a) Clostridium (b) Azotobacter
(c) Nitrosococcus (d) Bacillus ramosus

AMU-2002

Ans. (d) : Ammonifying bacteria converts the organic nitrogen of dead plants and animals into ammonia or ammonium ions. Ammonium is then available to be assimilated and incorporated into amino acid for other metabolic purposes. Ammonifying bacteria may be either symbiotic or non- symbiotic. It provides ammonia to the plants. *Bacillus vulgaris* and *Bacillus ramosus* are ammonifying bacteria i.e. they release ammonia from dead decay of organic Nitrogen.

@apna_pdf

13 PHOTOSYNTHESIS IN HIGHER PLANTS

A. Photosynthesis and its Experiment

1. Law of limiting factor of photosynthesis was proposed by

(a) Von Mayer (b) Arnon
(c) FF Blackmann (d) Hill

DUMET-2008 / Punjab MET-2008
BHU PMT (Screening)-2006
UP CPMT-2001, 2008 / JIPMER-2006
AIPMT-1996 / Rajasthan PMT-2007, 1998
Manipal-2005,2014 / VMMC-2012
AMU-2009 / MGIMS Wardha-2008

Ans. (c) : In 1905, F.F. Blackman proposed the "Law of limiting factor" according to this law of limiting factors, suggests that the factor which is most closest to its minimum level will limit the overall process, even if other factors are in abundance.

- **Von mayer:** A German chemist, considered as father of photosynthesis. He discovered that plants use light to convert CO_2 and water into oxygen and carbohydrates.
- **Arnon:** An American biochemist, discovered that plants use light energy to split water molecules into oxygen and hydrogen.
- **Hill:** An English plant Physiologist, discovered the hill reaction, which is the first step in photosynthesis.

2. Who proved that oxygen evolved in photosynthesis comes from water?

(a) Mayer (b) Calvin
(c) Ruben, Hassid and Kamen (d) Blackman

CG PMT-2011 / Manipal-2011
MGIMS Wardha-2009 / Haryana PMT-2003
JCECE-2004

Ans. (c) : In 1948, Ruben, Hassid and Kamen, using heavy isotope, O^{18} proved that in photosynthesis, oxygen comes from water.

3. Oxygen which is liberated during photosynthesis, comes from

(a) CO_2 (b) H_2O
(c) chlorophyll (d) phosphoglyceric acid

CG PMT-2010 / Uttarakhand PMT-2008
BVP-2007 / BHU PMT-2004
BCECE-2002 / Manipal-2008

Ans. (b) : Oxygen, which is liberated during photosynthesis, comes from the hydrolysis of water in the green plants. Cornelius Van Niel, in his study based on purple and green bacteria, demonstrated that in photosynthesis oxygen liberated from water and not from CO_2.

4. The source of oxygen evolved during photosynthesis is _____

(a) light (b) chlorophyll
(c) CO_2 (d) water

MHT CET 5.10.2020 Shift-I/ JIPMER-2000
J&K CET-2000 / Rajasthan PMT-1999

Ans. (d) : Oxygen is evolved during photosynthesis as a result of the light-dependent reactions. Light energy is used to split water molecules through a process called photolysis, releasing oxygen as a byproduct.

5. Study the following and pick up the correct statements :

I. Oriented locomotor movement of an organism towards or away from light is called photokinesis.
II. Influence of light on non directional movement of organism is known as phototaxis.
III. The orientation to light of a non-motile organism (such as plant or plant part) is known as phototropism
IV. The response of organisms for the photoperiod is known as photoperiodism

(a) I, II (b) III, IV
(c) I, III (d) II, IV

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : Statement-I : Photokinesis refers to oriented locomotor movement of an organism towards or away from light.
Statement-II : Phototaxis is one of the different forms of taxis. It is characterized by the directional movement of a cell in response to light.
Statement-III : Phototropism is the orientation to light of a non-motile organism, like a plant or plant part.
Statement-IV : Photoperiodism is the response of organisms to the duration of light and darkness.
Therefore, the correct answer is option (b) III, IV.

6. Match the following scientists with the discoveries in photosynthesis

A.	T.W. Engelmann	I.	Glucose production during photosynthesis
B.	Julius Von Sachs	II.	H_2 reduces CO_2 into carbohydrate
C.	Carolius Von Neil	III.	Green plants release O_2
D.	John Inzenhousz	IV.	Photosynthesis in Cladophora

(a) A-ii, B-i, C-iv, D-iii
(b) A-iv, B-ii, C-i, D-iii
(c) A-i, B-iv, C-ii, D-iii
(d) A-iv, B-i, C-ii, D-iii

TS EAMCET-11.05.2023, Shift-II

Ans. (d) :

A.	T.W. Engelmann	IV.	Photosynthesis in Cladophora
B.	Julius Von Sachs	I.	Glucose production during photosynthesis
C.	Carolius Von Neil	II.	H_2 reduces CO_2 into carbohydrate
D.	John Inzenhousz	III.	Green plants release O_2

@apna_pdf

7. The reaction center in PS II has an absorption maxima at

(a) 780 nm (b) 680nm
(c) 700 nm (d) 660 nm

NEET (UG) 07.05.2023

Ans. (b) : Photosystem II is involved only in non-cyclic photophosphorylation.
This system is responsible for the photolysis of water and involves the evolution of molecular oxygen. PS II is located on the inner surface of the thylakoid i.e in the stroma and non - appressed region of grana.
The reaction centre of PS II is P680.
Chlorophyll A with peak absorption at 680nm.

8. Choose the correct statements among the following

(A) Chlorophyll is the major pigment responsible for trapping of light, accessory pigment also participate
(B) In green plants, H_2O is the hydrogen donor
(C) In purple sulphur bacteria the oxidation product is carbon
(D) Radioisotope studies proved water as source of O_2 release in photosynthesis

(a) A, B, C
(b) A, C, D
(c) A, B, D
(d) B, C, D

TS EAMCET-10.08.2021 Shift-I

Ans. (c) : Chlorophyll is the chief pigment green plants, which are responsible for trapping energy from sun light. Other thylakoid pigment like chlorophyll-b, xanthophylls, and carotenoids, which are called **accessory pigments** also absorb light and transfer the energy to chlorophyll-a.

- In green plants, water (H_2O) is the hydrogen donor and is oxidized to O_2 (oxygen).
- When H_2S is hydrogen donor for purple sulphur bacteria, the oxidation product is sulphur or sulphate.
- **Photolysis** of water is a part of the light-dependent reaction of the photosynthesis process. By using radioactive isotopes, they found that oxygen come from water.

9. Match the following?

Column - I	Column - II	Column - III
(a) Joseph Priestly	(i) Glucose production	(p) Photo-synthesis
(b) Julius Von Sachs	(ii) Role of sun light	(q) Plants restore air
(c) Jan Ingenhousz	(iii) Role of air	(r) Green parts of plants
(d) T. W. Engelmann	(iv) Action of spectrum	(s) Release of O_2

(a) (a – i – s), (b – iv – q), (c – iii – r), (d – ii – p)
(b) (a – iv – r), (b – iii – s), (c – ii – p), (d – i – q)
(c) (a – ii – p), (b – i – q), (c – iv – r), (d – iii – s)
(d) (a – iii – q), (b – i – r), (c – ii – s), (d – iv – p)

AP EAMCET-03.09.2021 Shift-I

Ans. (d) : Joseph Priestley: considered that plants purifying the air CO_2 into O_2 conduct his experiment on mint plant with mouse and candle.

- **Julius von Sachs:** Photosynthesis occur in the chloroplast and starch stored in the chloroplast.
- **Jan Ingenhousz:** Only green plant have capacity to purify the air in the presence of light.
- **T.W. Engelmann:** action of spectrum of photosynthesis.

10. Identify the wrong statements.

(A) Cytochrome C is a small protein attached to inner surface of the outer membrane.
(B) Electrons from complex I are transferred to ubiquinone located within the inner membrane.
(C) The temperature optimum for photosynthesis of different plants does not depend on the habitat that they are adapted to.
(D) There is no linear relationship between incident light and CO_2 fixation rates at low light intensities.

Options:

(a) A, B, C (b) B, A, D
(c) C, B, D (d) A, C, D

TS EAMCET-09.08.2021 Shift-I

Ans. (d) : The cytochrome complex, or cyt c, is small hemeprotein found loosely associated with the inner membrane of the mitochondrion.

- Electrons from complex I are transferred to ubiquinone located within the inner membrane.
- The temperature optimum for photosynthesis of different plants also depends on the habitat that they are adapted too. Tropical plants have a higher temperature optimum than the plants adapted to temperate climates.
- There exists a linear relationship between incident light and CO_2 fixation rates at low light intensities. At higher light intensities, gradually the rate does not show further increase as other factors become limiting.

11. Out of the 56% of sunlight reaching the earth's atmosphere _____ is used for photosynthesis.

(a) 0.05 % (b) 0.02 %
(c) 10 % (d) 0.2 %

MHT CET 5.10.2020 Shift-I

Ans. (d) : 0.2 % is used for photosynthesis because plants do not absorb all incoming sunlight and do not convert all harvested energy into biomass.

12. On land, plants get carbon from _____.

(a) carbonate rocks in the surroundings
(b) supplements added to the soil
(c) the CO_2 dissolved in soil water
(d) fixation of atmospheric CO_2 during photosynthesis

MHT CET-06.10.2020 Shift-I

Ans. (d) : Plants on land obtain carbon from atmospheric CO_2 fixation through photosynthesis, which is subsequently transmitted on to all living things. Soil holds a large amount of active carbon on earth. Plants take carbon from the air and convert it to plant tissue, some of which returns to the soil as plant residue.

@apna_pdf

13. Percentage of the total incident solar radiation the percentage Photosynthetically Active Radiation (PAR) captured by the plants.

(a) 2 – 10% of PAR only
(b) 30 – 40% of PAR only
(c) 10 – 20% of PAR only
(d) 0 – 10% of PAR only

Karnataka CET-2019

Ans. (a) : Around 50% of the total radiation from sunlight falls under photosynthetically active radiation and supports the process of photosynthesis. Out of which only 2- 10% are captured by plants rest are absorbed by chlorophyll.
Photosynthesis is the conversion of light energy into the chemical energy which is stored in the bond of chemical.

14. The amount of CO_2 and H_2O absorbed to produce 180 g of glucose are

(a) 193 and 264 grams respectively
(b) 108 and 264 grams respectively
(c) 264 and 108 grams respectively
(d) 162 and 264 grams respectively

TS EAMCET-02.05.2018 Shift-II

Ans. (c) : To produce 180 grams of glucose through photosynthesis, the chemical reaction can be represented as:
$6CO_2 + 6\ H_2O$ + light energy + Chl$\rightarrow$ $C_6\ H_{12}O_6 + 6O_2\uparrow$.
From this equation, it can be determined that for 180 grams of glucose:
• 6 moles of CO_2 are needed (6×44 g/mole = 264 g)
• 6 moles of H_2O are needed (6×18 g/mole = 108g).
So, the correct option is (c) 264 and 108 gm respectively.

15. 'In the presence of bright sunlight small bubbles are formed around green parts of the plant'. Who showed this?

(a) Joseph Priestley (b) Robert Hill
(c) Jan Ingenhousz (d) Julius Von Sachs

GUJCET-2018

Ans. (c): Jan Ingenhousz , a Dutch – British scientist, conducted experiments in the late 18th century that led to the discovery of photosynthesis. In 1779 he observed that when green aquatic plants were exposed to sunlight, they released tiny bubbles of oxygen gas. He found that these bubbles were produced in the presence of sunlight and that they originated from the green parts of the plant.

16. Three cellular processes are listed below. Choose the correct combination of processes that involve proton gradient across the membrane.

(i) Photosynthesis (ii) Aerobic respiration
(iii) Anaerobic respiration

(a) ii and iii (b) i and ii
(c) i, ii and iii (d) i and iii

KVPY (SA)-05.11.2017

Ans. (b) : In photosynthesis, photo-phosphorylation and in aerobic respiration, oxidative phosphorylation occurs that requires proton gradient across the membrane.

• The photosynthesis is the process by which green part of the plant synthesis organic compound (carbohydrate) by using simple inorganic compound ($H_2O + CO_2$) in the presence light and by product H_2 O and CO_2 released in the atmosphere.

17. Match the following lists

List I	List II
(A) A.G. Tansley	(i) Classified plant communities
(B) Wanning	(ii) "Structure and function of Nature"
(C) Odum	(iii) Term-'Biosphere'
(D) Reiter	(iv) Term – 'Ecology'
	(v) Term –'Ecosystem'

The correct match is

	A	B	C	D
(a)	(v)	(i)	(ii)	(iv)
(b)	(ii)	(v)	(i)	(iii)
(c)	(iv)	(iii)	(v)	(ii)
(d)	(iv)	(iii)	(v)	(i)

AP EAMCET-2013

Ans. (a):
(a) A.G. tansley - Term 'Ecosystem'
(b) Wanning - Classified Plant Communities
(c) Odum - Structure and function of nature
(d) Reiter - Term 'Ecology' (1885)

18. Which statement about photosynthesis is false?

(a) Photosynthesis is a redox process in which water is oxidized and carbon dioxide is reduced.
(b) The enzymes required for carbon fixation are located only in the grana of chloroplasts.
(c) In green plants both PS I and PS II are required for the formation of $NADPH + H^+$.
(d) The electron carriers involved in photophosphorylation are located on the thylakoid membranes.

Manipal-2009
Karnataka CET-2009

Ans. (b) : The the statement that the enzymes required for carbon fixation are located only in the grana of chloroplasts is not true. The light independent reactions, which included the calvin cycle and carbon fixation, occur in the stroma.

19. Which one group of plants were introduced by Otto Warburg and others for advanced study of photosynthesis?

(a) Chlorella and Ulva
(b) Chlorella and volvox
(c) Scenedesmus and Chlorella
(d) All of the above

UP CPMT-2014

Ans. (c): Warburg effect is the inhibitory effect of high oxygen concentrations on photosynthesis. He was a German scientist, who reported in chlorella algae and scenedesmus, that high O_2 level inhibit rate of photosynthesis.

20. A plant is provided with ideal conditions for photosynthesis and supplied with isotope $^{14}CO_2$. When the products of the process are analysed carefully, what would be the nature of products?

@apna_pdf

(a) Both glucose and oxygen are labelled.
(b) Only oxygen is labeled but glucose is normal.
(c) Both glucose and oxygen are normal.
(d) Only glucose is labeled and oxygen is normal

Karnataka CET-2016

Ans. (d) : When a plant provided with $^{14}CO_2$ indicates that the CO_2 contains a radioactive isotope of carbon (C), only glucose will be labeled with radioactive carbon. This is because during photosynthesis, plants use CO_2 to synthesize glucose.

21. Maximum photosynthesis takes place by
(a) Phytoplankton (b) Zooplankton
(c) Marsh plants (d) Woody plants

AIPMT-1999

Ans. (a) : Maximum photosynthesis takes place by phytoplankton.
Phytoplankton are the microscopic algae found in ocean, seas and freshwater. They possess more photosynthesis as they contain chlorophyll in large amounts.

22. Emerson's enhancement effect and Red drop have been instrumental in the discovery of:
(a) Oxidative phosphorylation
(b) Photophosphorylation and non-cyclic electron transport
(c) Two photo systems operating simultaneously
(d) Photophosphorylation and cyclic electron transport

NEET-2016 Phase-I

Ans. (c) : Emerson's enhancement effect and the red drop experiment were crucial in revealing that photosynthesis relies on two photosystem operating together: Photosystem I (PS-I) and photosystem II (PS-II). These system work simultaneously to convert light energy into chemical energy which produce ATP and NADPH, essential for the process of photosynthesis.

23. Photosynthetic Active Radiation (PAR) has the following range of wavelengths
(a) 400 - 700 nm (b) 450 - 950 nm
(c) 340 - 450 nm (d) 500 – 600 nm

JIPMER-2007

Ans. (a) : Photosynthesis Active Radiation (PAR) has the 400 - 700 nm range of wavelengths.

24. For assimilation of one CO_2 molecule; the energy required in form of ATP & $NADPH_2$
(a) 2 ATP & 2 $NADPH_2$
(b) 5 ATP & 3 $NADPH_2$
(c) 3 ATP & 2 $NADPH_2$
(d) 18 ATP & 12 $NADPH_2$

AIPMT-2000

Ans. (c) : Photosynthesis is actually an oxidation-reduction process in which water is oxidized and CO_2 is reduced to carbohydrates. The reduction of CO_2 to carbohydrates needs assimilatory powers i.e. ATP and $NADPH_2$.
In the calvin cycle, CO_2 acceptor molecule is RuBP or RuDP. The enzyme catalyzing this reaction is RuBP - carboxylase/oxygenase (RuBisCO). As Calvin cycle takes in only one carbon (as CO_2) at a time, it takes six turns of the cycle to produce a net gain of six carbons (i.e., hexose or glucose). In this cycle, for the formation of one mole of hexose sugar (glucose), 18 ATP and 12 $NADPH_2$ are used. For 6 molecules of CO_2, it needs 18 ATP and 12 $NADPH_2$ molecules. So for the assimilation of one molecule of CO_2, it needs 3 ATP and 2 $NADPH_2$ molecules.

25. The first step for initiation of photosynthesis will be:
(a) Photolysis in water
(b) Excitement of chlorophyll molecule due to absorption of light
(c) ATP formation
(d) Glucose formation

AIPMT-2000

Ans. (b) : Plant leaves contain chloroplasts, which contain red, to green pigments known as chlorophylls where photosynthesis occurs. The photon of light that the chlorophyll absorbs causes it to become excited and release electrons.
Hence, the first step in photosynthesis is the excitement of an electron of chlorophyll by a photon of light.

26. Total amount of energy trapped by green plants in food is called
(a) Gross primary production
(b) Net primary production
(c) Standing crop
(d) Standing state

AIPMT-1998

Ans. (a) : Gross primary productivity:- It is the rate of the production of organic matter during photosynthesis, showing total solar energy converted into chemical energy. So the total amount of energy trapped.
- Gross primary productivity (GPP) is the rate at which solar energy is captured in sugar molecule during photosynthesis.

27. Match the columns.

Column I (Scientists)		Column II (Discoveries)	
A.	Stephan Hales	1.	Importance of light and chlorophyll
B.	Ingenhousz	2.	Presence of chlorophyll in plants
C.	Von Mohl	3.	Product of photosynthesis is starch
D.	Sach	4.	Air and light control plant growth

Code

	A	B	C	D
(a)	4	1	2	3
(b)	3	2	1	4
(c)	2	3	4	1
(d)	4	3	2	1

AIIMS-2011

Ans. (a) : Stephan Hales→ Air and light control plant growth
Ingen Housz→ Importance of light and chlorophyll
Von Mohl→ Presence of chlorophyll in plants
Sach→ Product of photosynthesis is starch

28. A photosynthesising plant is releasing ^{18}O more than the normal. The plant must have been supplied with

@apna_pdf

(a) O_3 (b) H_2O with ^{18}O
(c) CO_2 with ^{18}O (d) $C_6H_{12}O_6$ with ^{18}O

AIPMT-1993

Ans. (b) : The water molecule breaks up into hydrogen and oxygen in the illuminated chloroplasts, which is called photolysis of water.
A Photosynthesizing plant is reclosing ^{18}O, more than the normal. The plant must have been supplied with ^{18}O with H_2O.

29. In photosynthesis electron transport system, manganese ions are associated with:
(a) oxygen evolving complex
(b) CF_0 - CF_1 complex
(c) cytochrome b_6 –f complex
(d) plastoquinones

AP EAMCET-2002

Ans. (a) : In PS - II there is a complex of proteins with Mn^{2+} known as the water splitting center, which extracts the electrons from water with the release of oxygen and protons (H^+) and passes them on to P_{680} molecules.

30. Photosynthetic enhancement with flashing light was first observed by :
(a) Benson and Calvin (b) Hill and Calvin
(c) Hatch and Slack (d) Emerson and Arnold

JCECE-2007 / AFMC-2006

Ans. (d) : Photosynthetic enhancement with flashing light was first observed by Emerson and Arnold. Robert Emerson and his coworkers gives the evidence of two pigment system in light reaction of photosynthesis. These are photosystem I and photosystem II.

31. Most effective wavelength of light for photosynthesis is
(a) green (b) violet
(c) red (d) yellow

BVP-2012 / MGIMS Wardha-2006

Ans. (c) : The most effective wavelength of light for photosynthesis is red. The red wavelength range is 660 - 760 nm. Red light has the highest absorption by chlorophyll, it is the most effective wavelength for photosynthesis.

32. Primary acceptor of CO_2 in photosynthesis is:
(a) Phosphoric acid
(b) Rlbulose phosphate
(c) Glucose
(d) Ribulose 1, 5 biphosphate

Rajasthan PMT-2006
J&K CET-2006

Ans. (d) : Ribulose - 1, 5 - biphosphate acts as CO_2 acceptor and 6 moles of RuBP react with 6 moles of CO_2 and 6 moles of water giving rise to 12 moles of 3-phosphoglyceric acid.
Ribulose - 1, 5 - biphosphate (6 moles) + $6CO_2$ + 6 $H_2O \xrightarrow{\text{Carboxydismutase}}$ 3- phosphoglyceric acid(12 moles)

33. In which plant, Calvin experimented by radioactive isotopy to discover the stable product of C_3–cycle?
(a) Chlorella (b) Cycas
(c) Carrot (d) Tabacco

Manipal-2010

Ans. (a) : In 1954, Calvin, Benson, and their coworkers worked out the path of carbon. This path of carbon was studied with the help of radioactive tracer technique using Chlorella, a unicellular green alga, and CO_2 with C^{14} atomic weight.

34. How much energy is used in photosynthesis ?
(a) 50% (b) 35%
(c) 10% (d) 1 to 2%

Rajasthan PMT-2000

Ans. (d) : Between 98 to 99 percent of solar energy reaching earth is reflected from plants parts and absorbed by other molecules, which convert it into heat. Thus, only 1 to 2 percent of the available energy is used in photosynthesis.

35. Assimilatory power in photosynthesis refers to
(a) ATP + $NADPH_2$ + CO_2
(b) ATP + $NADPH_2$
(c) ATP
(d) $NADPH_2$

AMU-2003

Ans. (b) : Melvin Calvin used the term assimilatory power for ATP + $NADPH_2$· NADPH alone act as a reducing agent. ATP and NADPH molecules transfer the energy of sunlight into dark reactions, leading to the formation of high-energy carbon containing compounds, mainly sugars.

36. In photosynthesis carbon dioxide is converted to carbohydrates. It is a ..... process.
(a) reductive (b) oxidative
(c) catabolic and exergonic (d) None of the above

JIPMER-2013

Ans. (a) : In photosynthesis, carbon dioxide is converted into carbohydrates through a reductive process. This process involves the reduction of carbon dioxide using energy from sunlight, which is captured by chlorophyll and other pigments in plants. The reduction of CO_2 leads to the production of glucose and other carbohydrates, which store energy from sunlight for later use by the plant.

37. Phenomenon which converts light energy into chemical energy is:
(a) respiration (b) photosynthesis
(c) transpiration (d) none of these

AFMC-2005

Ans. (b) : Photosynthesis literally means 'synthesis using light'.

$$6CO_2 + 12H_2O \xrightarrow[\text{Chlorophyll}]{\text{Light}} C_6H_{12}O_6 + 6H_2O + 6CO_2 \uparrow$$

In this process, the green part of the plant captures photons of light and converts their radiant energy into a chemical form of energy.

38. Energy transfer in photosynthesis occure as:
(a) phycoerythrin→ phycocyanin→ carotenoid→ Chlorophyll-a
(b) chlorophyll-b→ carotenoid→ phycoerythrin→ chlorophyll-a
(c) phycocyanin→ phycoerythrin→ carotenoid→ chlorophyll-a
(d) chloroiphyll-b→ carotenoid→ phycocyanin→ chlorophyll-a

JIPMER-2005 / BHU PMT-2003

@apna_pdf

Ans. (c) : The energy transfer sequence in photosynthesis is: Phycocyanin → Phycoerythrin → carotenoid → chlorophyll-a.
This sequence describes how light energy is absorbed and transferred among pigment to eventually reach chlorophyll-a, which is crucial for photosynthesis.

39. In photosynthesis action and absorption spectrum were related by:
(a) Von Helmont (b) Engelmann
(c) Emerson (d) Lavosier

Haryana PMT-2005
JIPMER-2005
BHU PMT-2003

Ans. (b) : A German biologist, Theodore Engelmann, gives the first action spectrum of photosynthesis. Using aerobic bacteria and filamentous algae spirogyra or Cladophora.

40. In photosynthesis there is
(a) reduction of H_2O (b) oxidation of H_2O
(c) oxidation of CO_2 (d) oxidation of NO_2

DUMET-2005
UP CPMT-2003

Ans. (b) : In photosynthesis, oxidation of H_2O take place, which means it loses electrons and reduction of CO_2, which means it gains electrons. The process of photosynthesis is commonly written as:-

$$6CO_2 + 6H_2O \longrightarrow C_6H_{12}O_6 + 6O_2$$

41. Which of the following elements is an activator for both ribulosbiphosphate carboxylase oxygenase and phosphoenol pyruvate carboxylase in photosynthetic carbon fixation?
(a) Mg^{2+} (b) Zn^{2+}
(c) Ca^{2+} (d) SO_4^{2-}

AFMC -2009

Ans. (a) : Magnesium is a macronutrients usually present in the plant tissues. Mg^{2+} act as a co-factor and help to activate the both enzymes, ribulose bisphosphate carboxylase/oxygenase and phosphoenolpyruvate carboxylase. Both enzymes are essential for the photosynthetic CO_2 fixation.

42. A student sets up an experiment on photosynthesis as follows :
He takes soda water in a glass tumbler and a chlorophyll extracts into the contents and keeps the tumbler exposed to sunlight hoping that he has provided necessary ingredients for photosynthesis to proceed (viz., CO_2, H_2O, chlorophyll and light). What do you think what will happen after, say, a few hours of exposure of light ?
(a) Photosynthesis will take place and glucose will be produced
(b) Photosynthesis will take place and starch will be produced which will turn the mixture turbid
(c) Photosynthesis will not take place because CO_2 dissolved in soda water escapes into the atmosphere
(d) Photosynthesis will not take place because intact chloroplasts are needed for the process

HP CET-2011

Ans. (d) : Photosynthesis will not take place because intact chloroplasts are needed for the process. Without intact chloroplasts, which contain the necessary pigments and enzymes for photosynthesis, the process cannot occur effectively, even if all other necessary ingredients (CO_2, water and light) are present.

43. The role of phycobilins in photosynthesis to
(a) absorb and transfer energy to chlorophyll
(b) donate electrons to the electron transport system
(c) fix carbon dioxide
(d) carry hydrogen or electrons

CG PMT-2007

Ans. (a) : Phycobilins are water soluble accessory photosynthetic pigment in plants.
- Phycobilins are present in blue-green-algae and Red algae.
- Three pigments (chlorophyll, caretenoids, and phycobilins) help in the absorption of light energy to synthesize complex organic material.

44. In photosynthesis energy from light reaction to dark reaction is transferred in the form of
(a) ADP (b) ATP
(c) RuBP (d) Chlorophyll

AMU-2007

Ans. (b) : In light reaction, $NADPH_2$, ATP and oxygen are formed. Oxygen is released into atmosphere while $NADPH_2$ and ATP are utilized for reduction of CO_2 to carbohydrate in the dark reaction.

45. Solar radiation of wave length less than 360 millimicrons is:
(a) ultraviolet radiation (b) infrared radiation
(c) radio waves (d) visible light

AP EAMCET-2004

Ans. (a) : The band of color is the visible spectrum. i.e., they absorb light and transfer it to chlorophyll. The complete visible spectrum is composed of the seven color (VIBGYOR), starting with the shortest rays, violet, indigo, blue, green, yellow, orange, and red. Beyond the red are still longer invisible rays called infrared, and beyond violet are shorter invisible rays are called ultraviolet.

46. The isotope of carbon used extensively for studies in photosynthesis is:
(a) ^{13}C (b) ^{14}C
(c) ^{15}C (d) ^{16}C

Haryana PMT-2002

Ans. (b) : Calvin traced the path of carbon in photosynthesis and gave the C_3 cycle. He traced the metabolic pathway by using the radioactive isotope C^{14}.

47. Which one of the following categories of organisms do not evolve oxygen during photosynthesis?
(a) Red algae
(b) Photosynthetic bacteria
(c) C_4 plants with Kranz anatomy
(d) Blue green algae

Haryana PMT-2004

@apna_pdf

Ans. (b) : Van Neil proved that sulfur bacteria use H_2S in place of water and CO_2 to synthesize carbohydrates, as follow.

$$6CO_2 + 12\ H_2S \longrightarrow C_6H_{12}O_6 + 6H_2O + 12S$$

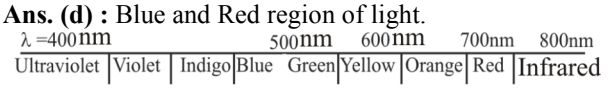
So, No oxygen is evolved as it does not involve splitting water.

48. Maximum photosynthetic activity occur in

(a) green and yellow region of light
(b) blue and orange region of light
(c) violet and orange region of light
(d) blue and red region of light

VMMC-2014
Rajasthan PMT-1998

Ans. (d) : Blue and Red region of light.



Electromagnetic spectrum of light

49. In the overall process of photosynthesis, the number of CO_2, water, sugar and O_2 molecules utilized and produced is

(a) 12 (b) 13
(c) 19 (d) 31

AMU-2012

Ans. (d) : $6CO_2 + 12\ H_2O \longrightarrow C_6H_{12}O_6 + 6H_2O + 6O_2$

In photosynthesis reaction to produce one molecule of carbohydrates, totally 6 molecules of CO_2 and 12 molecules of water are required-

1 glucose molecule = 6 molecules of CO_2 and 12 molecules of H_2O required.

$= 6 + 12 + 1 + 6 + 6 = 31$

50. Isotopes used in photosynthesis are

(a) C^{11} and P^{32} (b) C^{15} and P^{32}
(c) C^{16} and N^{15} (d) C^{14} and O^{18}

CG PMT-2006

Ans. (d) : The isotopes used in photosynthesis are C^{14} and O^{18}. Carbon-14 is used by Melvin Calvin to track the CO_2 uptake and incorporation into organic molecules during photosynthesis.

Oxygen-18 is used by Ruben and Kamen to study the oxygen exchange and release during photosynthesis.

B. Where does photosynthesis takes place

51. Quantasome are present in

(a) chloroplast (b) mitochondria
(c) Golgi body (d) lysosome

BHU PMT (Screening)-2009
Uttarakhand PMT-2009, 2007
VMMC-2007 / JIPMER-2012

Ans. (a) : Chloroplast double membrane bounded structure outer and inner membrane about are 50Å in thickness and made up of lipoprotein. Quantasomes are particles found in the thylakoid membrane of chloroplasts. They are embedded in a paracrystalline array on the surface of thylakoid discs in chloroplast. It is the photosynthesis units present in the thylakoids of chloroplast. Each of the quantasomes contains about 250-300 chlorophyll molecules.

- Mitochondrion is absent in the prokaryotic cells and also absent in mature RBC in humans and present in both plant and animals.
  Kolliker (1882) first observed mitochondria in striated muscles in insects. But credit of discovery was given to Flemming (1882) and Altman (1894). The term mitochondrion was given by Benda (1897).
- Aerobic reaction occurs in the mitochondria and production of ATP therefore mitochondria is called power house of the cell.
- **Camillo Golgi (1898)** first observed densely stained reticular structures near the nucleus. These were later named Golgi bodies after him. They consists of many flat, disc-shaped-sacs or cistrernae. Golgi apparatus principally performs the function of packaging materials, to be delivered either to the intracellular targets or secreted outside the cell.

52. In plants sugar synthesis takes place in

(a) Grana of chloroplast
(b) Stroma lamella of chloroplast
(c) Mitochondrial matrix
(d) Stroma of chloroplast

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Sugar synthesis in plants primarily occurs in the strome of chloroplasts, specifically during the light-independent reactions of photosynethesis, which is also known as the Calvin cycle.

53. During CO_2 fixation of photosynthesis, Oxaloacetic acid is formed in which cells?

(a) Mesophyll cells of C_3 plants and bundle sheath cells of CAM plants
(b) Bundle sheath cells of both C_4 plants and C_3 plants
(c) Mesophyll cells of both CAM plants and C_4 plants
(d) Mesophyll cells of CAM plants and bundle sheath cells of C_4 plants

TS EAMCET-11.05.2023, Shift-II

Ans. (c) : Oxaloacetic acid is formed in the mesophyll cells of both CAM plants and C_4 plants. In CAM plants, oxaloacetic acid is formed during the night and then decarboxylated during the day. In C_4 plants, oxaloacetic acid is formed during the day and decarboxylated in the bundle sheath cells.

54. Functions of lamellae of grana and stroma lamellae of chloroplast during photo phosphorylation

(a) Both release $NADPH_2$ and ATP
(b) Former release $NADPH_2$ and ATP, later splits water
(c) Former splits water, later produce ATP
(d) Both splits water and release ATP

AP EAMCET-25.04.2018 Shift-II

Ans. (c) : The stroma lamellae act as the skeleton of chloroplast. The stroma lamellae help absorb maximum sunlight so as to increase the rate of photosynthesis. It also helps increase the efficiency of photosynthesis by keeping the grana at a particular distance. Cyclic Photophosphorylation takes place in chloroplasts in the leaves. It takes place in the stroma lamellae memberane of chloroplasts.

@apna_pdf

55. Find out the location of the following molecules in different compounds of chloroplast :

List-I	List-II
(A) NADP reductase	(i) Embeded in the membrane of Thylakoid
(B) Protons produced by	(ii) Lumen of the Thylakoids
(C) F_0 component of the ATPase	(iii) Outer surface of the Thylakoid membrane
(D) F_1 component of the ATPase	(iv) Stroma side of the membrane

The correct answer is

	A	B	C	D
(a)	(iv)	(ii)	(i)	(iii)
(b)	(ii)	(iii)	(i)	(iv)
(c)	(iv)	(i)	(iii)	(ii)
(d)	(i)	(iv)	(ii)	(iii)

TS EAMCET-02.05.2018 Shift-II

Ans. (a) :

	List – I	List - II
a.	NADP reductase	Stroma side of the membrane
b.	Protons produced by	Lumen of the thylakoids
c.	F_0 component of the ATPase	Embeded in the membrane of thylakoid
d.	F_1 component of the ATPase	outer surface of the thylakoid membrane

56. Which of the following cell organelles is responsible for extracting energy from carbohydrates to form ATP?

(a) Lysosome (b) Ribosome
(c) Chloroplast (d) Mitochondrion

NEET-2017

Ans. (d) : Mitochondria are the cell organelles responsible for extracting energy form carbohydrates through a process called cellular respiration. This process occurs in the presence of oxygen and takes place in the mitochondria's inner membrane. During cellular respiration, glucose is broken down into carbon dioxide and water, and in this process, energy is released and captured in the form of ATP.

57. In a Chloroplast the highest number of protons are found in

(a) Antennae complex (b) Stroma
(c) Lumen of thylakoids (d) Inter membrane space

NEET-2016 Phase-I

Ans. (c) : The highest number of protons is found in the lumen of thylakoid of the chloroplast during the day time due to **photolysis of water** and active transport of protons by plastoquinone from stroma to the lumen of the thylakoid.
So, when the splitting of water molecules occurs, the hydrogen ions or protons get accumulated on the inner side of the membrane.

58. Stroma in the chloroplast of higher plant contains

(a) Chlorophyll
(b) Light-independent reaction enzymes
(c) Light-dependent reaction enzymes
(d) Ribosomes

AIPMT-2009

Ans. (b) : The stroma of the chloroplast contains light independent reaction enzymes, ribsomes and DNA. Chlorophyll is found in the thylakoid memebrane which is flattened sac that is stacked together to form grana. The light dependent reactions of photosynthesis takes place in the thylakoid membrane.
Chlorophyll is a photosynthetic pigment and ribosomes are sites for protein synthesis.

59. Chlorophyll in chloroplasts is located in

(a) grana (b) pyrenoid
(c) stroma (d) both (a) and (c)

JIPMER-2007

Ans. (a) : Chlorophyll is present in the grana of the chloroplast. Grana refers to the stacks of thylakoids embedded in the stroma of a chloroplast.

60. What change occurs during conversion of proto chlorophyll to chlorophyll

(a) Addition of 2H in one pyrrole ring
(b) Loss of 2H
(c) Addition of Mg
(d) Loss of Mg

AIPMT-1998

Ans. (a) : The conversion of proto chlorophyll to chlorophyll involves the addition of two hydrogen atoms to one of the pyrrole rings. This changes the structure of the ring and makes it more stable. The magnesium atom is not added until later in the process.
The chemical reaction-
Protochlrophyllide + 2H $\rightarrow$ chlorophyllide
chlorophyllide $+Mg^{2+} \rightarrow$ chlorophyll.
• Protochlorophyllide is the precursor to chlorophyll. It is a colorless compound that is converted to chlorophyll in the presence of light and magnesium ions.

61. In chloroplasts, chlorophyll is present in the :-

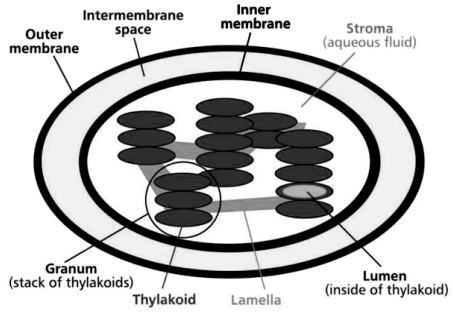
(a) Inner membrane (b) Thylakoids
(c) Stroma (d) Outer membrane

AIPMT-2004

Ans. (b) : In chloroplast, chlorophyll is present in the Thylakoid.

- Thylakoide are found inside the chloroplast. It is round, flat, and membrane-bound structures within the chloroplast.
- Stroma refers to a colourless jell-like matrix of chloroplast in which the dark reaction of photosynthesis take place.

The cavity of chloroplast have stroma and lamellar system.



@apna_pdf

62. In photosynthesis, the light-independent reactions take place at

(a) Stromal matrix (b) Thallacoid lumen
(c) Photosystem I (d) Photosystem II

AIPMT (Re-Exam)-2015

Ans. (a) : Light Independent reaction or Dark reaction occur in stroma or stromal matrix. During these reactions carbon dioxide is reduced to carbohydrates.
The phtosystem I and photosystem II are located in the thylakoid membranes, and they are involved in the light dependent reaction.

63. Chloroplast has maximum quantity of.....in stroma.

(a) Dehydrogenase (b) RuBP carboxylase
(c) Pyruvic carboxylase (d) Hexokinase

MGIMS Wardha-2011

Ans. (b) : RuBP carboxylase is the enzyme that catalyzes the first step of the Calvin cycle, which is the light independent reactions of photosynthesis. It is the most abundant protein on earth, and it is found in the stroma of the chloroplast.

- Dehydrogenase is an enzyme that catalyzes the oxidation- reduction reactions of cellular metabolism.
- Hexokinase is an enzymes that catalyzes the carboxylation of pyruvic acid.

64. Grassland with scattered tress is

(a) savannah (b) deciduous forest
(c) evergreen forest (d) tropical rain forest

BVP-2012

Ans. (a) : Savannah are warm climate plains having coarse grass with scattered tree on the masgin of tropics. Average total rainfall is 100 – 150cm. Most of these grass species show C_4 photo- synthesis cycle.

65. In the process of photosynthesis water molecule breaks is:

(a) red drop (b) photolysis
(c) phosphorylation (d) carbon assimilation

JCECE-2005

Ans. (b) : Photolysis is the process of splitting water molecules into hydrogen and oxygen using light energy. It occurs in the thylakoid membrane of the chloroplast, which is where the light dependent reactions of photosynthesis takes place.

- Red drop is a phenomenon that occurs in the absorption spectrum of chlorophyll when the light intensity is very high.

66. Oxygen is released from:

(a) cytoplasm (b) golgi body
(c) chloroplast (d) mitochondria

VMMC-2002

Ans. (c) : The oxygen released during photosynthesis is a byproduct of light-dependent reactions, which take place in the thylakoid membranes of the chloroplast. The light energy is used to split water molecules into oxygen and hydrogen ions. The oxygen is released to into atmosphere, while the hydrogen ions are used to produces ATP.
The oxygen released by plant is essential for life on earth.

67. The creation of proton gradient across the thylakoid membrane is a result of

(a) decrease in proton number in stroma
(b) accumulation of protons in the lumen
(c) decrease in the pH in the lumen
(d) All of the above

AMU-2010

Ans. (d) : Protons $[H]^+$ move from a higher concentration in the lumen through the ATP synthetase into the stroma, thereby driving the phosphorylation process. ATP synthetase is bound to the stroma side of the thylakoid membrane in the presence of the proton gradient from ATP inorganic phosphate and ADP.

68. Agranal chloroplast is common in:

(a) C_3 plants (b) Hydrophytes
(c) C_4 plants (d) Succulents

VMMC-2006

Ans. (c) : Agranal chloroplasts are found in the bundle sheath cells of C_4 plants. C_4 plants are a type of plant that has a special mechanism for fixing carbon dioxide. They have two types of cells in their leaves, the Mesophyll cells and Bundle sheath cells.
The mesophyll cells contains granal chloroplast, which are the normal type of chloroplasts that are found in plants. The bundle sheath cells contains agranal chloroplasts, which do not have grana.

69. C_{40} H_{56} is the empirical formula of:

(a) carotene (b) chlorophyll-b
(c) xanthophyll (d) anthocyanin

Haryana PMT-2002

Ans. (a) : Carotenoid protect the chlorophyll. molecule from the photo-oxidation they act as shield pigment. Carotenoid are two types – Carotein & Xanthophylls.
Carotenes are photosynthetic pigments. They are lipid-soluble and present in all photosynthetic organisms, therefore they are called universal accessory pigments.
Xanthophulls – These are yellow in colour many different types lutin, viloxanthin, fucoxanthin etc. out of these lutin is most common, formula $C_{40}H_{56}O_2$.

70. Photochemical reactions in the chloroplasts are directly involved in

(a) fixation of carbon dioxide
(b) synthesis of glucose and starch
(c) formation of phosphoglyceric acid
(d) photolysis of water and phosphorylation of ADP to ATP

AMU-2005

Ans. (d) : The photochemical reaction takes place in the grana of the chloroplast and includes those activities for light which is essential. The splitting of water during photosynthesis is called photolysis. In this process, light energy is converted to chemical energy, which is stored in the form of ATP.

@apna_pdf

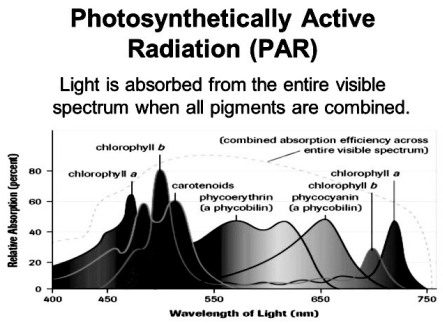
C. Pigments Involved in Photosynthesis

71. The chemical formula of chlorophyll-b is:
(a) $C_{55}H_{72}O_5N_5Mg$ (b) $C_{55}H_{72}O_5N_4Mg$
(c) $C_{55}H_{70}O_6N_4Mg$ (d) $C_{55}H_{70}O_5N_5Mg$
JIPMER -2018 / BHU PMT(Mains)-2005
VMMC-2003 / Haryana PMT-2001
Karnataka CET-2000

Ans. (c) : Chlorophyll 'b', Molecular formula – $C_{55}H_{70}O6\ N_4\ Mg$
Found in all the green algae, bryophytes, pteridophytes, gymnosperms and angiosperms where reserve food is starch 25% has CHO (aldehyde) group at the 3-carbon position and absorb 453, 430, 642 nm wavelength of light.
Chlorophyll 'a'– Molecular formula – $C_{55}H_{72}O_5N_4Mg$
It is universal pigment found in all the green plants, which evolve O_2 bactera. It occurs 75% and has– CH_3 group at the 3–carbon position and absorb–429, 410, 660, 680 nm wave length of light.

72. Wavelength of visibile light/PAR is
(a) 200 - 400 nm (b) 700 - 900 nm
(c) 400 - 700 nm (d) 100 - 200 nm
Uttarakhand PMT-2010 / DUMET-2008
AIIMS-2007 / AIPMT-2005,2004

Ans. (c) :



Photosynthetically active radiation range -
The solar radiation absorbed for the photosynthesis process is in the range of 400-700 nm wavelength, i.e. the visible light spectrum. It is the optical range, which is not harmful for living organisms.
Shorter wavelength are damaging to cells and are filtered by the ozone layer while longer wavelengths have less energy to carry out photosynthesis.
Some bacteria like cyanobacteria can use extended spectral regions.

73. The colour of chlorophyll b" in the chromatogram.
(a) Yellow orange (b) Yellow
(c) Bright or blue green (d) Yellow green
AP EAPCET-22.05.2023, Shift-II

Ans. (d) : Chlorophyll-b is in chromatogram show yellow-green color. Chlorophyll-b is a green pigment that absorbs blue and red light. It helps chlorophyll-a for absorbing light energy.
- Yellow-orange, is the color of carotenoids.
- Yellow is the color of xanthophylls.
- Bright or blue green is the color of chlorophyll-a.

74. Chlorophyll-a is _____ in colour.
(a) yellow (b) blue green
(c) orange (d) yellow green
MHT CET-06.10.2020 Shift-I

Ans. (b) : Chlorophyll-a is the universal photosynthetic pigment. Chlorophyll-a is bluish green in colour chlorophyll-a absorb Red and Blue light.

75. Photosystem II occurs in
(a) stroma (b) cytochrome
(c) grana (d) mitochondrial surface
SRM JEEE-2018

Ans. (c) : Photosystem II occurs in grana. It is the first step in the chain of photosynthesis. It is responsible for capturing light energy and using it to initiate the flow of electrons by extracting them from water molecules through a process called photolysis. The water-splitting and oxygen evolving reaction is catalyzed by photosystem II. While in photosystem I process it generates the reducing power for the reduction of $NADP^+$ to NADPH.

76. The wavelength of light absorbed by Pr form of phytochrome is:-
(a) 620 nm (b) 640 nm
(c) 680 nm (d) 720 nm
AIPMT-2007

Ans. (c) : Phytochrome is basically a type of photoreceptor pigment, it's also help in controlling the flowering.
- Phytochrome are two types.
- Pr types and pfr types.
- Pr is a blue form that absorb red light (wavelength of light 660-680nm). and Pfr is a blue-green form that absorbs far - red light (wavelength of light 730 nm).
- Pr type of light absorb a wavelength 660-680 nm.

77. Phytochrome is present in
(a) vascular cryptogam (b) prokaryotes
(c) flowering plants (d) algae
JIPMER-2008

Ans. (c) : Plants have a blue-green pigment called phytochrome. It is found in almost flowering plants or Angiosperms. Which is utilized to sense light. Acting as a photoreceptor and it controls a number of plant function, including flowering, pigment production, stem growth, and seed germination. It is present in various flowering plants where it helps in the regulation of the time of flowering based on the length of day and night.

78. Phytochrome is a
(a) flavoprotein (b) glycoprotein
(c) lipoprotein (d) chromoprotein
NEET-2016 Phase-II

Ans. (d) : Phytochrome is a chromoprotein, which controls photoperiodism in plants.
- It exist in two forms - P_r and P_{fr} forms. These two forms are interconvertible.
- P_r is a blue form that absorbs red light (660nm) and P_{fr} is a blue-green form that absorbs far-red light (730nm).
- When plants receive red light P_r converts to P_{fr} and vice versa.

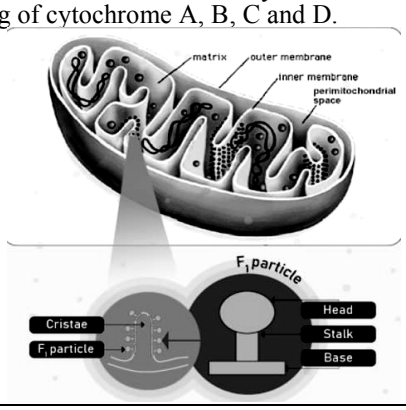
@apna_pdf

79. Cytochromes are found in :-

(a) Outer wall of mitochondria
(b) Cristae of mitochondria
(c) Lysosomes
(d) Matrix of mitochondria

AIPMT-2015

Ans. (b) : Cytochromes were initially described in 1884 by Macmunn as respiratory pigments. They are found in the **cristae of mitochondria**, cytochrome are a group of proteins involved in redox reaction. They contain Fe containing the heme group at its core. They are involved in the electron transport chain present in the Inner mitochondrial membrane or cristae. The electron transport chain contains two cytochrome complexes consisting of cytochrome A, B, C and D.



80. The size of chlorophyll molecule is

(a) head $15 \times 15 \overset{o}{A}$, tail $25 \overset{o}{A}$
(b) head $20 \times 20 \overset{o}{A}$, tail $25 \overset{o}{A}$
(c) head $15 \times 15 \overset{o}{A}$, tail $20 \overset{o}{A}$
(d) head $10 \times 12 \overset{o}{A}$, tail $25 \overset{o}{A}$

AIPMT-1989

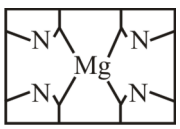
Ans. (c) : Term 'chlorophyll' is used by **Caventoy** consists of a flat or squire head 15 × 15 Å hydrophilic in nature made up of porphyrine ring of tetrapyrol, in which Mg lies in the center and a long tail about 20Å in length, hydrophilic in nature or lipophilic made up of phytol (C_{20} H_{39} OH).
Chlorophyll insoluble in water, green in colour absorb blue and red light of wavelength and reflected or transmit green light.

81. Chlorophyll-a is characterized by the side group

(a) Methyl (b) Aldehyde
(c) Phytol (d) Ketone

MGIMS Wardha-2011

Ans. (a) : Methyl group is an alkyl derived from methane (CH_4), consisting mono carbon atom bonded to these hydrogen atoms, which have chemical formula CH_3.



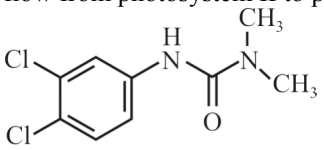
Structure of chlorophyll-a

82. DCMU

(a) inhibits PS-I
(b) inhibits PS-II
(c) destroy chloroplast
(d) inhibits oxidative phosphoryladon

Haryana PMT-2008 /JIPMER-2008

Ans. (b) : DCMU (Dichlorophenyl Dimethyl Urea) is a photosynthesis inhibitor that is very sensitive. If blocks photosystem II plastoquinone binding site, preventing electron flow from photosystem II to plastoquinone.



DCMU

83. Phycobilins absorb light of wavelength

(a) 670 – 700 nm (b) 610 – 650 nm
(c) 500 – 650 nm (d) 520 – 520 nm

BVP-2012

Ans. (c) : Phycobilins are photosynthetic pigments. It is water soluble, blue and red in colour without tail and Mg found in the phycobilisomes, they are also called accessory pigment. Phycobilins are only present in blue green algae & Red algae. So it absorb light of wavelength between 500 - 650 nm.

84. The chemical structure of chlorophyll a varies from chlorophyll b due to difference between

(a) CH_3 and C_2H_5
(b) CH_3 and HCH = CH_2
(c) CH_3 and CHO
(d) CHO and CH = CH_2

J&K CET-2009 / AMU-1996

Ans. (c) : Chlorophyll a and b are two primary types of chlorophyll molecules found in plants. Chlorophyll a has a Methyl group (CH_3) at the third position of the porphyrin ring, while chlorophyll b has an Aldehyde group (– CHO) at the same position. These altering in structure to contribute in the absorbing the different wavelength of light for broader range of energy for photosynthesis.

85. Which fractions of the visible spectrum of solar radiations are primarily absorbed by carotenoids of the higher plants?

(a) Blue and green (b) Green and red
(c) Red and violet (d) Violet and blue

Haryana PMT-2011
AFMC -2011
AIPMT-2003

Ans. (d) : The chloroplasts include a group of yellow-orange pigments known as carotenoids, which mostly absorb blue-green and violet light. As a result, the rate of photosynthesis varies with light wavelength. Carotenoids like-β-corotens, lycopene, and cryptoxanthin etc.

86. Which pigment responsible for photomorphogenetic response ?

(a) Phytochrome (b) Chlorophyll-a
(c) Chlorophyll-b (d) Xanthophyll

Punjab MET-1999

@apna_pdf

Ans. (a) : Phytochrome is the pigment responsible for photoperiodism. Phytochrome controls seed germination, initiation of flower and the start of blooming by detecting the presence or absence of light. It is a chromoprotein with a chromophore, a part that detects light, and it has two states: P600 (Pr) and P730 (Pfr).

87. The form of pigment which inhibits germination is

(a) P_{760} (b) P_{730}
(c) P_{650} (d) All of these

BCECE-2007
BHU PMT-2003, 2001

Ans. (b) : The pigment phytochrome behaves the following way:
red wavelengths (650 nm) and far- red wavelengths (730 nm) stimulate and prevent seed germination, respectively.

$$\text{Germination} \leftarrow P_{730} \underset{(650\,nm)\,red\,\lambda}{\overset{far\,red\,\lambda\,(730\,nm)}{\rightleftharpoons}} \rightarrow \text{No germination}$$

88. Chlorophyll molecules are green in colour because they. :

(a) transmit green light
(b) transform green light
(c) reflect green light
(d) absorb green light

Karnataka CET-2002

Ans. (c) : Chlorophyll molecules are green in colour because they do not absorb green light but only reflected.
Chlorophyll absorb blue and red light wavelength from visible spectrum.
Chlorophyll change light energy into chemical energy.
Maximum photosynthesis in white light.
Minimum photosynthesis in green light.

89. Which one of the following does not play any role in photosynthesis?

(a) Phycocyanin (b) Xanthophylls
(c) Phycoerythrin (d) Anthocyanin

DUMET-2010

Ans. (d) : Anthocyanins are colored, water-soluble pigments. Anthocyanins responsible for the colors, red, purple and blue in fruits and vegetables. Phycocyanin, phycoerythrin and Xanthophylls are photosynthetic pigment. There are reserve in different group of plants.

90. The trapping centre of light energy in photosystem-I is:

(a) P – 660 (b) P – 700
(c) P – 680 (d) P – 630

HP CET-2011

Ans. (b) : The trapping centre of light energy in photosystem-I is P-700. It receives electrons from photosystem-II by plastocynine. Thus, in the two photosystems, plastocyanin works as a plug between both photoactors.

91. A small protein attached to the outer surface of the inner membrane and which acts as a mobile carrier for transfer of electrons between complex III and IV is

(a) cytochrome d (b) cytochrome c
(c) cytochrome b (d) cytochrome a

J&K CET-2014

Ans. (b) : Cytochromes are iron-containing pigment found in all green cells in which aerobic respiration is taking place. Cytochrome is a small protein found attached to the outer surface of inner mitochondrial membrane. In the ETS chain, cyt-c transfer one electron from the third complex, cytochrome B, to the complex IV cyt-c.

92. Match the following.

(p) Chlorophyll a	**-**	**(i) Yellow**
(q) Chlorophyll b	**-**	**(ii) Bright or blue green**
(r) Xanthophyll	**-**	**(iii) Yellow – yellow orange**
(s) Carotenoids	**-**	**(iv) Yellow green**

(a) (p) - (2), (q) - (4), (r) - (1), (s) - (3)
(b) (p) - (3), (q) - (4), (r) - (2), (s) - (1)
(c) (p) - (4), (q) - (3), (r) - (2), (s) - (1)
(d) (p) - (4), (q) - (2), (r) - (1), (s) - (3)
(e) (p) - (4), (q) - (1), (r) - (3), (s) - (2)

Kerala PMT-2015

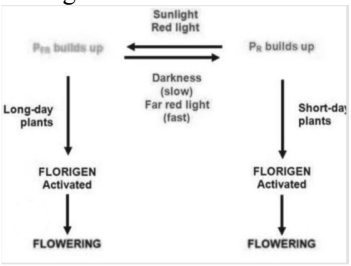
Ans. (a) : (p) Chlorophyll a – Bright or blue green
(q) Chlorophyll b – Yellow green
(r) Xanthophyll – Yellow
(s) Carotenoids – Yellow -yellow orange

93. Phytochrome becomes active in:

(a) green light (b) blue light
(c) red light (d) none of these

VMMC-2002

Ans. (c) : Phytochromes is activated by red light, & Pfr is activated by far-red light, so phytochromes become active in red light.

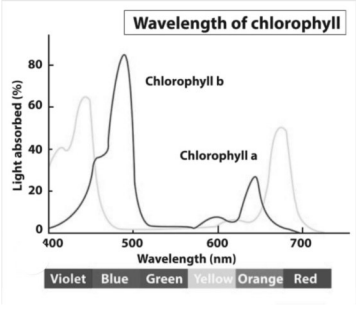


94. Maximum absorption of light occurs in the region of:

(a) 400-700 nm (b) 700-900 nm
(c) 1000-1200 nm (d) 1500 - 2000 nm

JIPMER-2003 / VMMC-2002 /Haryana PMT-2000

Ans. (a) : White light, as it come to us from sun, is composed of waves of different lengths, ranging from longer waves of red light through relatively longer waves and successively shorter waves to violet light, so the visible light wavelength is between 400 and 700nm.



@apna_pdf

95. The photosynthetic pigments viz, erythrolable, chlorolable and cyanolable respectively are :

(a) green, red, blue (b) red, blue, green
(c) red, green, blue (d) blue, green, red

JIPMER-2001

Ans. (c) : There are different kinds of cones, each of which can recognize a specific wavelength of light and give us the ability to see color.

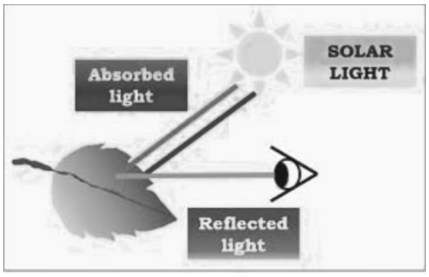
Erythrolabe :– It detects red colour
Chlorolabe :– It detects green colour
Cyanolabe :– It delects blue colour

96. Solarization is

(a) formation of chlorophyll
(b) destruction of chlorophyll
(c) utilization of sunlight
(d) effects of solar light

BHU PMT (Mains)-2008
BHU PMT (Screening)-2005

Ans. (b) : Basically solarization is destruction of chlorophyll. Inhibition of photosynthesis under very high light intensities is known as solarization, and it is mostly caused by the photooxidation of certain molecules like chlorophyll. Chlorophyll is damaged by solarization.



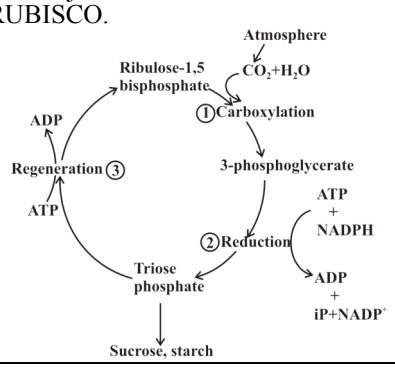
D. Light Reaction

97. Which of the following is the first compound that accepts carbon dioxide during dark phase of photosynthesis?

(a) NADP (b) RuBP
(c) Ferridoxin (d) Cytochrome

Uttarakhand PMT-2008 / J&K CET-2008
BHU PMT-2004 / BVP-2007
Rajasthan PMT-2007 / Manipal-2008

Ans. (b) : In the first step of the **calvin cycle** 6 molecules of CO_2 from the atomsphere bind with the 6 molecule of the RuBP chemical, which has 5 carbons. With the aid of an enzyme known as RuBP, CO_2 molecules are joined to RuBP with the help of an enzyme RUBISCO.



98. Identify the incorrect statements among the following

I. When only PS I is functional, cyclic flow of electrons is not possible
II. The breakdown of the gradient provides enough to make the enzyme synthesis
III. The NADP reductase enzyme is located of the thylakoid membrane
IV. Proton gradient increases due to PC and Cyt f.

(a) I, II, III (b) I, III, IV
(c) II, III, IV (d) I, II, IV

TS EAMCET-10.05.2023, Shift-II

Ans. (b) : The NADP reductase enzyme is located on the outerside of the thylokoid membrane. It is bind with thylokoids at the day time but free in stroma at the night (dark) time.

99. Cyclic photophosphorylation results in the formation of ————

(a) ATP and NADPH (b) NADPH
(c) ATP, NADPH, O_2 (d) ATP

AP EAMCET-12.07.2022 Shift-II

Ans. (d) : Cyclic photophosphorylation occurs in PSI, reaction center P_{700} absorb the light in the form of photon excited high energy electron and ejected from ground state of the molecule moves uphill and accepted by primary electron acceptor (PEP) i.e.- FRS or Fe-S or Fd.

Cyclic photophosphorylation results is the synthesis of ATP with an electron transport system that is activated by photosystems I. It occurs in the stromal lamella. In this process the system converts ADP to ATP for immediate energy for the cells.

100. Identify the substrate level phosphorylation reactions among the following

(A) Triose bis phosphate to triose phosphate
(B) Phosphoglycerate to phosphoenol pyruvate
(C) Succinyl CoA to succinic acid
(D) Malic acid to OAA

Options:

(a) A, B (b) B, C
(c) A, C (d) B, D

TS EAMCET-09.08.2021 Shift-I

Ans. (c) : Substrate-level phosphorylation is a metabolic process that involves the direct transfer of a phosphate group from a substrate to ADP or GDP, producing ATP or GTP as a byproduct. It converting a higher energy product into a lower energy product.

Succinyl-CoA is acted upon by enzyme succinyl-CoA synthetase to from succinate during the kreb's cycle. The reaction releases sufficient energy to form ATP (in plants) or GTP (in animals) by substrate- level phosphorylation. GTP can form ATP through a coupled reaction.

Succinyl CoA + GDP/ADP +

$$H_3PO_4 \underset{\text{synthetase}}{\overset{\text{SuccinylCoA}}{\rightleftharpoons}} \text{succinate} + CoA + GTP/ATP$$

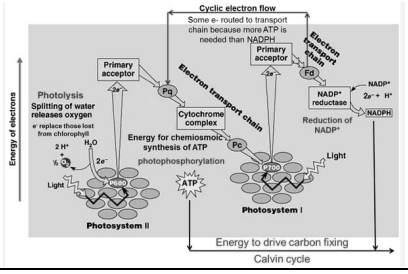
101. During non-cyclic photophosphorylation, when electrons are lost from the reaction centre at PS II, what is the source which replaces these electrons?

(a) Light (b) Oxygen
(c) Water (d) Carbon dioxide

NEET-2020 Phase-II

@apna_pdf

Ans. (c) : During non-cyclic photophosphorylation, electrons expelled by the excited PS-II photocentre do not return to it. Therefore, it requires an external electron donor and that purpose is served by water. H_2O undergo photolysis, and the electrons thus released are picked up by PS-II (P_{680}) and handed to PS-I (P_{700}). The non cyclic flow of electron is called – Z- scheme.



102. The deficiency of which of these elements interrupts photolysis of water during photosynthesis?

(a) Mn and C*l* (b) Zn and Cu
(c) Ca and K (d) N and P

Karnataka CET-2020

Ans. (a) : Mn (Manganese) and C1 (Chlorine) deficits may prevent water from being photolyzed during photosynthesis. Photolysis is the term used to describe the splitting of water molecules in the presence of light.

103. Dark reaction

(a) in light
(b) in dark
(c) requires product of light reaction
(d) All of the above

JIPMER-2019

Ans. (c) : Plants make glucose in the dark reaction by combining carbon dioxide with ATP and NADPH from the light reaction. It happens in the chloroplast's stroma. Since dark reactions don't need light, they don't necessarily happen at night. It just needs light reaction byproducts like ATP and NADPH.

104. Which of the following is not a product of light reaction of photosynthesis?

(a) ATP (b) NADH
(c) Oxygen (d) NADPH

NEET-2018

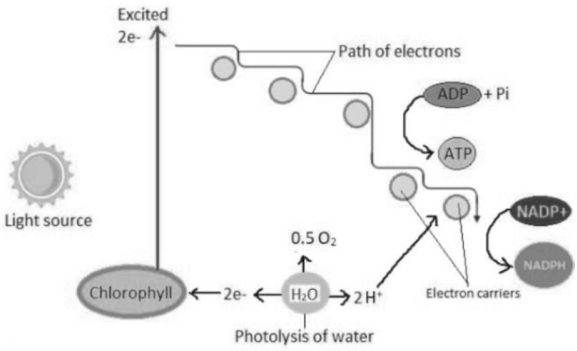
Ans. (b) : During the light reaction process many products are formed i.e., ATP, NADPH, and oxygen, while NADH is formed during respiration. The ATP and NADPH from light-dependent reaction are used to make sugar in the calvin cycle.
In another form of light reaction called cyclic photophosphorylation, electrons follow circular path, producing only ATP.
Note: Some time student may confused between NADH and NADPH, so NADH is mainly involved in catabolic process while NADPH is involved in anabolic process.
NADH is involved in respiration, whereas NADPH is involved in synthesis of carbohydrates.

105. The products of light reaction during photosynthesis include

(a) ATP and NADPH (b) O_2 and $NADP^+$
(c) O_2 and H_2O (d) $NADP^+$ and H_2O

KVPY (SA)-05.11.2017

Ans. (a) : The products of light reaction during photosynthesis include ATP and NADPH. The by product of light reaction in photosynthesis are ATP (adenosine triphosphate) and NADPH (nicotinamide adenine dinucleotide phosphate) these energy rich molecule are essential for the subsequent dark reaction (Calvin cycle) in production glucose and other carbohydrates.



Non-cyclic Photophosphorylation

106.

In this process which of the following play important role?

(a) Chlorophyll (b) Light energy
(c) Ca^{++}, Mn^{++}, Cl^- (d) All of the above

GUJCET-2015

Ans. (d) : Water undergoes photolysis, which is a crucial step in the light response of photosynthesis. As a by product, water generates H^+ ions, which decrease CO_2 to make glucose and O_2. Chlorophyll and light energy, as well as the presence of the ions Ca^{2+}, Mn^{2+}, and Cl^-, are necessary for photolysis to occur.

107. Which one of the following statements about the events of noncyclic photophosphorylation is NOT correct ?

(a) ATP and NADPH are not produced.
(b) Only one photosystem participates
(c) O_2 is released.
(d) Photolysis of water takes place.

Karnataka CET-2010

Ans. (b) : In non-cyclic photophosphorylation, electron derived from the photolysis of water are arise to higher energy level in PS-I and PS-II and pass along the electron transport chain carrier molecule to NADP reductase. This enzyme transfers electron to NADP to make $NADPH_2$, which provide reducing power for the light-dependent reaction of photosynthesis.

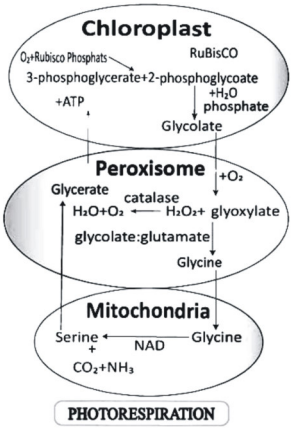
108. The organelles, those take part in photorespiration are

(a) chloroplast and mitochondria
(b) chloroplast, mitochondria and peroxisome
(c) mitochondria and peroxisome
(d) mitochondria only

JIPMER-2012
UP CPMT-2005

@apna_pdf

Ans. (b) : The organelles, those take part in photorespiration are chloroplast, mitochondria and peroxisome.



109. The microelement, which is an integral part of the electron carrier which transfers electrons for cyt-b-f complex to PS-I is a component of

(a) Nitrate reductase
(b) Cytochrome-'C'-oxidase
(c) IAA oxidase
(d) Dinitrogenase

AP EAMCET-2013

Ans. (b) :

- **Cytochrome-'C'oxidase**-Cytochrome C- Oxidase (CCO) is a respiratory energy- transducing enzyme. It catalyzes electron transfer from cytochrome to molecular oxygen, conserving the released energy as a charge and proton gradient across the membrane in which it is located.
- **Nitrate reductase**: Nitrate reductase is molybdous enzymes that reduce nitrate to nitrite. This reaction is critical for the production of protein in most crop plants, as nitrate is the dominant source of nitrogen in fertilized soils.
- **IAA oxidase**: IAA is the main auxin in plants, regulating, growth and developmental processes such as cell division and elongation. Tissue differentiation, apical dominance, and response to fight gravity and pathogens.
- **Dinitrogenase** : Nitrogenases are enzymes that are produced by certain bacteria, such as cyanobacteria and rhizobacteria. These enzymes are responsible for the reduction of nitrogen to ammonia. Dinitrogenase reductase transfers electrons from and electron donor to dinitrogenase, which can catalyze the reduction of nitrogen to ammonium. Because nitrogen fixation is an energy-demanding process, it is tightly regulated in response to several environmental factors.

110. The synthesis of one molecule of glucose during Calvin cycle requires

(a) 12 molecules of ATP and 18 molecules of $NADPH_2$
(b) 6 molecules of ATP and 12 molecules of $NADPH_2$
(c) 18 molecules of ATP and 12 molecules of $NADPH_2$
(d) 12 molecules each of ATP and $NADPH_2$

Karnataka CET-2006

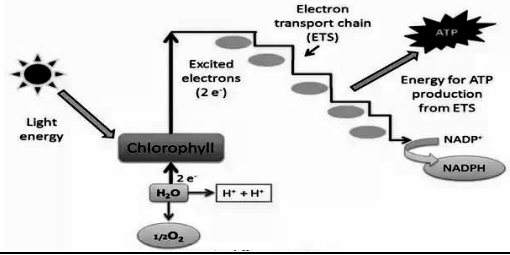
Ans. (c) : The synthesis of one molecule of glucose during Calvin cycle requires 18 molecules of ATP and 12 molecules of $NADPH_2$.

111. In Photosynthesis energy from light reaction to dark reaction is transferred in the form of : -

(a) ADP (b) ATP
(c) RUDP (d) Chlorophyll

AIPMT-2002

Ans. (b) : The energy currency is ATP. Assimilatory power is the ability of plants to produce food in the form of carbohydrates from the reduction of CO_2 during photosynthesis in the form of ATP and NADPH.



112. Two different species cannot live for long duration in the same niche or habitat. This law is

(a) Allen's law
(b) Gause's law
(c) Competitive exclusion principal
(d) Weiseman's theory

AIPMT-2002

Ans. (c) : Competitive exclusion principal stats that two species completing for the same limited resources in the same ecological nicks cannot coexist indefinitely.
One species will eventually out compete and displace the other, leading to the exclusion of the less adapted species. This principle helps explain patterns of species distribution and abundance in ecosystems.

113. Dark reactions of photosynthesis occur in

(a) granal thylakoid membranes
(b) stromal lamella membranes
(c) stroma outside photosynthetic lamellae
(d) periplastidial space.

AIPMT-1991

Ans. (c) : Dark reaction also called 'Blackman reaction' discovered by 'F.F Blackman'. Dark reaction is a series of reactions that include CO_2 fixation, reducing the resultant molecule to make glucose and regenerating the carbon-fixing substrate. It occurs in stroma of chloroplast, outside of photosynthetic lamellae. It occurs in absence of light. CO_2 reduced to form the carbohydrate which is stored in the form of starch. It is the fixation of CO_2 or Assimilation of CO_2.

114. Ferredoxin is a constituent of

(a) PS I (b) PS II
(c) Hill reaction (d) P_{680}

AIPMT-1991

Ans. (a) : Ferredoxin (Fd) is a soluble protein which act as an electron carrier. It is an iron-sulphur containing protein present on the stromal side of the thylakoid membrane. It is a component of PSI.
PSI absorbs both wave length of light above 680 nm and below 680 nm. The reaction center of the photo system is P_{700} and carotenoids. Its occurs on outer surface of thylakoid membrane.

@apna_pdf

115. Quantum yield of photosynthesis is :
(a) 33% (b) 9%
(c) 12% (d) 8%

Haryana PMT-2004
Manipal-2003

Ans. (c) : The quantum yield of photosynthesis (ϕ) is a definitive measure of the energetic efficiency of photoautotrophy. The rate or yield of photosynthesis is measured by the number of oxygen molecules produced per quantum of light absorbed. This is called quantum yield. Hence the quantum yield is 12% in C_3 plants.
Number of quanta of light required for evolution of one molecule of O_2, 8 quanta are required

$$= \frac{1}{8} = \cdot 125 = 12.5$$

116. During light reaction of photosynthesis which of the following phenomenon is observed during cyclic phosphorylation as well as non-cyclic phosphorylation:
(a) release of O_2
(b) formation of ATP
(c) formation of NADPH
(d) involvement of PS-I and PS-II

DUMET-2001

Ans. (b) : In cyclic phosphorylation, electrons released from P700 cyclically return to P700. ATP is synthesized during electron flow. The formation of ATP during the oxygen-releasing process of photosynthesis is called non-cyclic photophosphorylation.

117. Dark reaction in photosynthesis is called so because
(a) It does not depend on light energy
(b) It can occur in dark also
(c) It cannot occur during day light
(d) It occurs more rapidly at night

CMC Ludhiana-2014

Ans. (a) : The dark reaction also called as Blackman's reaction. It occurs in stroma of chloroplast where all enzymes necessary for CO_2 reduction and the synthesis of sugar & starch are located. It does not require the light.

118. Hill reaction was demonstrated
(a) in the absence of water
(b) in the absence of carbon dioxide
(c) in the presence of carbon dioxide
(d) in the absence of a suitable electron acceptor.

AMU-1996

Ans. (b) : Light reaction discovered by 'Robert Hill' therefore called 'Hill reaction' which is light dependent phase.
Hill demonstrated photolysis of water by isolated chloroplasts in the presence of light and suitable electron acceptor and showed the production of O_2 even if CO_2 was absent. Hence, Hill reaction was demonstrated in the absence of CO_2.

119. The radiation energy of light is converted to chemical energy and stored as
(a) AMP (b) ADP
(c) ATP (d) APP

Manipal-2010

Ans. (c) : Photosynthesis is the process of utilizing light or solar energy into chemical energy. Sunlight is absorbed by chlorophyll of leaves. ATP molecules are formed when light energy is transformed into chemical energy. The light dependent reaction is a photochemical reaction taking place in the thylakoid membranes of chloroplasts, where light energy is transformed into adenosine triphosphate (ATP).

120. Which of the following is synthesized in the dark-reaction of photosynthesis?
(a) $NADPH_2$ (b) ATP
(c) Oxygen (d) PGA

AMU-2002

Ans. (d) : Photosynthesis occurs in two phase: the light reaction and dark reaction. The formation of PGA occurs in the dark reaction of photosynthesis. It is a 3-carbon compound, which is the first stable product of the calvin cycle. Light reaction occurs in grana thylakoids. Dark reaction occurs in the stroma of chloroplasts. Light reaction is the initial stage of photosynthesis which traps light energy to produce ATP and NADPH.

121. The first step in dark reaction of photosynthesis is
(a) formation of ATP
(b) ionisation of water
(c) attachment of CO_2 to a pentose sugar
(d) excitement of electron of chlorophyll by a photon of light.

MGIMS Wardha-2004
UP CPMT-2004

Ans. (c) : We know that the first step in the dark reaction of photosynthesis is attachment of carbon dioxide to a pentose sugar. The CO_2 taken in by the plant combines a 5-carbon compound known as ribulose 1, 5 bi-phosphate with two molecules of 3-phosphoglycerate. This step is catalyzed by the enzyme ribulose biphosphate carboxylase.

122. In photosynthesis what occurs in PS-II
(a) It takes longer wavelength of light and e^- from H_2O
(b) It takes shorter wavelength of light and e^- from H_2O
(c) It takes longer wavelength of light and e^- from NADP
(d) It takes shorter wavelength of light and e^- NADP

BHU PMT-2003
JIPMER-2005

Ans. (b) : Pigments of PS-II reaction center, chlorophyll P_{680} absorb maximum 680 nm wavelength light, electrons are released from this system, and thus chlorophyll molecules get oxidised. Four electrons are extracted from two molecules of water with the release of O_2 and $4H^+$ into thylakoid lumen .

$$2H_2O \xrightarrow{Mn^{2+}} 4H^+ + 4e^- + O_2$$

123. A sleep movement is a nastic response that occurs daily in response to:
(a) dark (b) light
(c) both (a) and (b) (d) none of these

VMMC-2006

@apna_pdf

Ans. (c) : The term "nastic response" refers to the daily response of the body to a stimulus such as light, temperature, pH, or other factors. Nastic movements refers to the non-directional movements of plants that occur due to turgor changes.

124. PS-I and PS-II were discovered by

(a) Robert Emerson (b) Blackman
(c) Robert Mayer (d) Arnon

Haryana PMT-2007

Ans. (a) : The photosystem I and photosystem II was discovered by 'Robert Emerson' and 'William Arnold' in the 1950 by using green algae (chlamydononas).
'Blackman' suggested that photosynthesis is a two-step process. 'Arnon' discovered and named photosynthetic phosphorylation.

125. Autoradiography technique was used to

(a) trace the path of carbon in photosynthesis
(b) establish that the oxygen evolved during photosynthesis is by photolysis of water molecule
(c) study photorespiration in certain plants
(d) find out the absorption maximum of chlorophyll pigments

VMMC-2005
AMU-2004

Ans. (a) : In California, USA, Calvin, Benson, and other researchers discovered to calvin cycle. They gave radioactive C-14 in isotope, CO_2 on the experiment of chlorella. The half-life of radioactive carbon, C-14, is 5568 years. Consequently, with its aid, the route of fixation during photosynthesis can be identified and found carbon dioxide uptake, carbon fixation, reduction etc. Hence, autoradiography technique was used to trace the path of carbon in photosynthesis.

E. Transport of Electron

126. _____element is a component of Ferridoxin

(a) Zinc (b) Iron
(c) Magnesium (d) Copper

AP EAMCET-11.07.2022 Shift-II

Ans. (b) : Iron is a essential component of Ferredoxin. Ferredoxin is a group of iron-sulfur proteins that mediate electron transfer in a wide variety of metabolic reactions. Ferredoxins are the proteins that function primarily in photosynthesis.

127. Assertion (A) : Electrons released from photo system are used by electron transport chain during photophospherylation.
Reason (R) : Movement of electrons from pheophytin to PSI reaction centre is an oxidation reduction reaction.
The correct option among the following is :

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A) is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-II

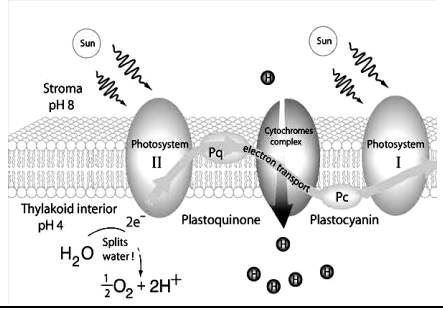
Ans. (a) : Photophosphorylation is the conversion of ADP to ATP using the energy of sunlight through the activation of PSII. An electron transport chain consist of a series of redox reaction that sequentially proceed to transfer electrons from a high-energy molecule (the donor) to a lower-energy molecule (the acceptor).

128. In light reaction, plastoquinone facilitates the transfer of electrons from

(a) $Cytb_6f$ complex to PS-I
(b) PS-I to $NADP^+$/ PS-I से $NADP^+$
(c) PS-I to ATP synthase
(d) PS-II to $Cytb_6f$ complex

NEET-2020 Phase-I

Ans. (d) : Plastoquinone (PQ) helps transfer electrons from photosystemII (PS-II) to the cytochrome b_6f complex in the light reaction of photosynthesis . This process involves the reduction of PQ and the subsequent movement of electron through the cytochrome b_6f complex, creating a proton gradient that drives ATP synthesis through ATP synthase. This electron transfer helps in power the generation of energy rich molecules like ATP and NADPH, which are vital for the process of photosynthesis.



129. Match the items given in Column I with those in Column II and select the correct option given below :

	Column-I		Column-II
(A)	Eutrophication	(i)	UV-B radiation
(B)	Sanitary landfill	(ii)	Deforestation
(C)	Snow blindness	(iii)	Nutrient enrichmen
(D)	Jhum cultivation	(iv)	Waste disposal

	(A)	(B)	(C)	(D)
(a)	ii	i	iii	iv
(b)	i	iii	iv	ii
(c)	i	ii	iv	iii
(d)	iii	iv	i	ii

NEET-2018

Ans. (d) :

Eutrophication	—	Nutrient enrichment
Sanitary landfill	—	Waste disposal
Snow blindness	—	UV-B radiation
Jhum cultivation	—	Deforestation

- **Eutrophication** is nutrient enrichment.
- **Sanitary land fill** is method of solid waste disposal in which waste material buried in pits.
- **Snow blindness** caused by UV-B radiation.
- **Jhum cultivation** mainly practiced in north east state of India in which land is cultivated temporarily and then abundant so it can be revert to its natural regulation.

@apna_pdf

130. Populations are said to be sympatric when------.

(a) Two populations are physically isolated by natural barriers.
(b) Two populations live together and freely interbreed to produce sterile offspring.
(c) Two populations share the same environment but cannot interbreed.
(d) Two populations are isolated but occasionally come together to interbreed.

Karnataka CET-2010

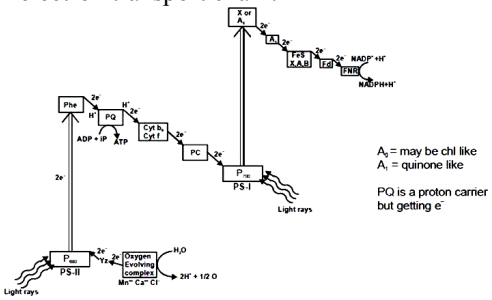
Ans. (c) : Populations are said to be sympatric when two populations share the same environment but cannot interbreed. Sympatric speciation is a phenomenon in which an ancestral population evolves to form separate species in the same habitat. Over time these populations will form new species which means that the two populations will not be able to interbreed and there is no gene flow between the populations.

131. Electrons from excited chlorophyll molecule of photosystem II are accepted first by:

(a) Quinone (b) Ferredoxin
(c) Cytochrome-b (d) Cytochrome-f

AIPMT-2008

Ans. (a) : Quinone is the first compound to take electrons from an energized photosystem II chlorophyll molecule. Ferredoxin serves as an electron transfer agent in biological redox processes. .
Cytochrome-b and cytochrome-f both play a important role in electron transport chain.



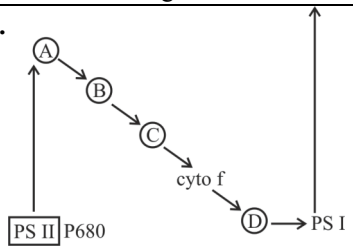
132. Both photosynthesis and respiration require

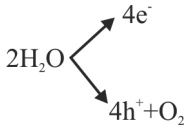
(a) Mitochondria (b) Sunlight
(c) Chloroplasts (d) Cytochromes

Karnataka CET-2006

Ans. (d) : Cytochromes are essential for respiration and photosynthesis. It was described by Charles Alexander Macmunn as respiratory pigment in 1884. Electron transfer occurs during both respiration and photosynthesis across several electron carriers ensconced in the inner mitochondrial membrane and thylakoid membrane, respectively. Iron-containing proteins called cytochromes produce ATP through the transfer of electrons.

133.



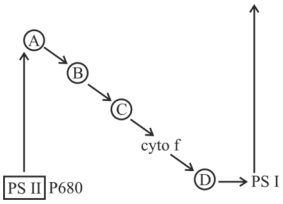


In the above schematic diagram, which is plastocyanin?

(a) A (b) B
(c) C (d) D

Karnataka CET-2007

Ans. (d) :



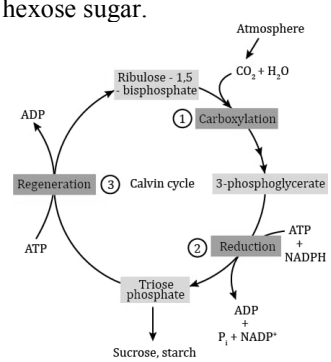
In the given schematic diagram, D is representing plastocyanin.
Hence the correct answer is option 'd'.

134. For the synthesis of one glucose molecule the calvin cycle operates for:

(a) 2 times (b) 4 times
(c) 6 times (d) 8 times

AIPMT-2000

Ans. (c) : The calvin cycle involves the fixation of carbon dioxide. The calvin cycle has three steps, including carbon fixation, reduction, and regeneration. One carbon dioxide molecule is fixed by one calvin cycle turn. One glucose molecule requires the production of six carbon atoms. Consequently, the calvin cycle must complete six rotations to create one molecule of hexose sugar.



135. Which is wrong for cytochrome P–450

(a) It contains Fe
(b) It concern with oxidation
(c) It is a pigment
(d) It is a coloured cell

AIPMT-1998

Ans. (d) : Iron-containing hemoproteins called cytochromes, are crucial to heme groups that are primarily in charge of producing ATP through electron transport,. Therefore, it is inappropriate for cytochrome P-450 is a colored cell.

136. Which of the following biomolecules is common to respiration-,mediated breakdown of fats, carbohydrates and proteins?

(a) Glucose-6-phosphate

@apna_pdf

(b) Fructose 1,6 bisphosphate
(c) Pyruvic acid
(d) Acetyl CO-A

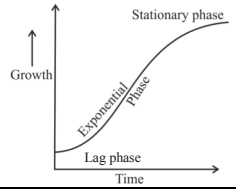
NEET-2016 Phase-II

Ans. (d) : Acetyl CO-A is the common metabolite that arise from respiratory breakdown of carbohydrates, lipid and proteins. Fructose-6-phosphate and glucose 6 phosphate does not arise from fats and proteins. Pyruvic acid may or may not arise from fats and proteins.

137. Typical growth curve in plants is:-
(a) Linear (b) Stair-steps shaped
(c) Parabolic (d) Sigmoid

AIPMT-2015

Ans. (d) : Typical growth curve in plants is sigmoid.
• Sigmoid growth curve is shown below–



138. In the electron transport chain, in terminal oxidation, the cytochrome, which donates electrons to O_2 is
(a) Cytochrome-b (b) Cytochrome-c
(c) Cytochrome-a_3 (d) Cytochrome-a

MGIMS Wardha-2009

Ans. (c) : Cytochrome – a_3 is responsible for transferring the electrons to molecular oxygen and it is participate in the reduction of O_2 to form water, This cytochrome is a part of complex IV (also known as cytochrome c oxidase), the last complex in the electron transport chain.

139. Cytochrome oxidase is a/an
(a) exoenzyme (b) endoenzyme
(c) proenzyme (d) coenzyme

Haryana PMT-2008

Ans. (b) : Cytochrome oxidase is an integral membrane protein located in the inner mitochondrial membrane and it's classified as endoenzymes. It also play an important role in the electron transport chain, facilitating the transfer of electron to molecular oxygen (O_2) as part of the terminal step, resulting in the production of water.

140. Last electron acceptor in respiration is:
(a) CO_2 (b) O_2
(c) H_2 (d) NADH

Rajasthan PMT-2006

Ans. (b) : Oxygen is terminal electron acceptor. The process is called respiration, specifically aerobic respiration. When we breath oxygen, it diffuses into the mitochondria of cell, where it is used as the final acceptor of electrons from electron transport chain. It finally leads to the formation of water and the production of ATP.

141. Cu is present in
(a) plasmalemma (b) plastoquinone
(c) plastocyanin (d) ferridoxin

UP CPMT-2003

Ans. (c) Copper (Cu) is present in plastocyanin, a protein found in the thylakoid membrane of chloroplasts. Plastocyanin act as an electron carrier in photosynthesis, shuttling electron between the cytochrome complex and photosystem I.

142. Photosynthetic evolution of oxygen requires
(a) Coenzyme (b) Fe-enzyme
(c) Mn-enzyme (d) Zn-enzyme

CG PMT-2009

Ans. (c) : Manganese is required for the photosynthetic evolution of oxygen. Mn plays a vital role in the oxygen-evolving complex of photosynthesis; four atoms are required to split water.

143. The final electron acceptor in pseudocyclic electron transport in chloroplast is
(a) $NADP^+$ (b) Ferredoxin
(c) oxygen (d) NAD^+

CG PMT-2009

Ans. (a) : The non-cyclic electron pathway has distinct steps that the electrons pass through. Water is first photolyzed, and two electrons from this process travel through the electron transport molecules of the cytochrome complex and photosystem I. Which then send it to the NADP, and it serves as the last electron acceptor.

F. Chemosmotic Hypothesis

144. The Chemiosmotic coupling Hypothesis of oxidative phosphorylation proposes that Adenosine Tri-Phosphate (ATP) is formed because
(a) A proton gradient forms across the inner membrane
(b) There is a change in the permeability of the inner mitochondrial membrane toward Adenosine Di-Phosphate (ADP)
(c) High energy bonds are formed in mitochondrial proteins
(d) ADP is pumped out of the matrix into the intermembrane space

AIIMS-2016 / AIPMT-2008

Ans. (a) : Electron transporters found in the **inner mitochondrial membrane** aid in the oxidative phosphorylation process inside mitochondria. In addition to creating a chemical gradient, the mitochondrial electron transport system also creates an electrochemical gradient when protons are released into the peri-mitochondrial region.

145. Assertion (A) True xerophytes store water in the form of mucilage which helps to withstand prolonged period of drought.
Reason (R) Vascular and mechanical tissues are well developed in true xerophytes.
The correct answer is
(a) Both (A) and (R) are true and (R) is the correct explanation of (A).
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A).
(c) Only (A) is true, but (R) is not true
(d) (A) is not true but (R) is true

AP EAMCET-2009

@apna_pdf

Ans. (d)) : Plants that have evolved to exist in dry condition called xerophytes. They have well-developed vascular and mechanical tissues to take full advantage of conditions of water stress are common adaptation to minimize the rate of transpiration.

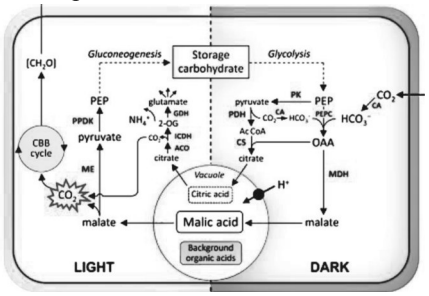
They have a thick, waxy cuticle that prevents evaporation. Sunken stomata retain wet air to slow the rate of evaporation. Hairs on the inner surface of folded leaves with stomata help trap moist air and decrease transpiration.

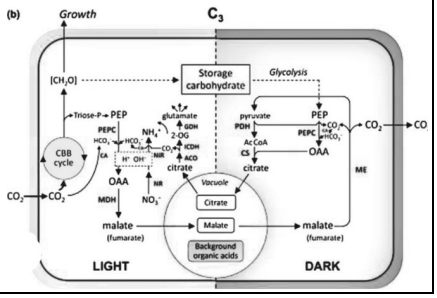
146. In CAM plants, CO_2 acceptor is

(a) RuBP (b) PEP
(c) OAA (d) PGA

BHU PMT (Screening)-2007

Ans. (b) : In CAM plants, CO_2 acceptor is PEP CAM plants are also known as Crassulacean Acid Metabolism. Phosphoenol pyruvic acid (PEP) is the CO_2 acceptor in CAM plants at night, whereas ribulose bisphosphate is the acceptor during the day. Oxalo acetic acid (OAA) is the first stable product in the case of CAM plants.



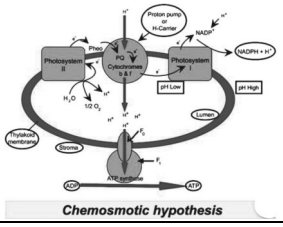


147. Chemiosmotic mechanism of ATP production in aerobic respiration was given by:

(a) Krebs (b) Calvin
(c) Hatch and Slack (d) Peter Mitchell

AFMC-2004

Ans. (d) : According to Peter Mitchell's "chemiosmotic hypothesis," ATP can be produced by utilizing an electrochemical gradient of protons across a membrane.



G. C_3 and C_4 Pathway

148. What will be the number of Calvin cycles to generate one molecule of hexose?

(a) 8 (b) 9
(c) 4 (d) 6

MHT CET-06.10.2020 Shift-I / Haryana PMT-2010
AFMC-2007 / AIPMT-1996

Ans. (d) : Calvin cycle occurs in all photosynthetic plant it does not matter whether they have C_3 or C_4 path ways. There are 6 atoms of carbon required for the synthesis of one glucose molecule, Hence, to produce one molecule of hexose sugar, 6 turns of Calvin cycle are required.

149. Which one of the following contain agranal Chloroplast ?

(a) C_3 plants (b) Succulants
(c) C_4 plants (d) Hydrophytes

BVP-2012 / BCECE-2011
MGIMS Wardha-2007 / Haryana PMT-1999

Ans. (c) : The C_4 plants contain agranal chloroplasts. Bundle sheath cell of C_4 plants contain larger chloroplasts in size and arranged centripetally and also contain starch granule but lack grana. This is the reason there chloroplasts are agranal as they lack grana where as is mesophyll cells there are smaller chloroplasts with well developed grana.

150. Calvin cycle occurs in :

(a) cytoplasm (b) chloroplasts
(c) mitochondria (d) glyoxysomes

Tripura JEE-2017 / BCECE-2003
BVP-2002 / Rajasthan PMT-1997

Ans. (b) : The conversion of carbon dioxide into glucose takes place through a light dependent reaction, also called the Calvin cycle. It is performed in the stroma of the chloroplast.

Calvin cycle occurs in both C_3 plant and C_4 plant. In C_3 plant it occurs in mesophyll cell but in C_4 – plant takes place in bundle sheath cell.

151. The reaction commonly involved in calvin cycle and acrobic respiration
I. Phophorylation
II. Condensation
III. Carboxylation
IV. Dephosphorylation

(a) I, II, III (b) I, III, IV
(c) I, II, IV (d) II, III, IV

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : The reaction commonly involved in aerobic respiration and calvin cycle are phosphorylation, condensation, dephosphorylation.

- Calvin cycle discovered by M. Kalvin and A. VENSON discoverd the path of corbon.
- M. KALVIN and A VENSON used this cycle in experiment chlorella algae.

152. In the photosynthesis of C_4 plants the first 4 carbon compound is formed by the following reaction

(a) Decarboxylation of pyruvic acid
(b) Carboxylation of PEP
(c) Oxidation of malic acid
(d) Oxidative decarboxylation of malic acid

TS EAMCET 10.05.2023 Shift-I

@apna_pdf

Ans. (b) : In the photosynthesis of C_4 plants, the first 4 carbon compound is formed by the carboxylation of PEP (Phosphoenolpyruvate). PEP carboxylase is an enzyme that attaches a carbon dioxide molecule to PEP, forming oxaloacetate, a 4 carbon compound. Oxaloacetate then transported to bundle sheath cells, where it is decarboxylated to release CO_2 and calvin cycle.

153. To reduce 1 CO_2 in C_3 Cycle assimilatory power needed is

(a) 2 ATP + 3 $NADPH+H^+$
(b) 6 ATP + 2 $NADPH+H^+$
(c) 5 ATP + 2 $NADPH+H^+$
(d) 3 ATP + 2 $NADPH+H^+$

TS EAMCET 10.05.2023 Shift-I

Ans. (d) : The assimilatory power needed to reduce 1 CO_2 in the C_3 cycle is 3 ATP and 2 $NADPH_2$. This is because the calvin cycle requires ATP to power the reactions and NADPH to provide the electrons needed to reduce the CO_2 molecules.

154. Primary CO_2 acceptor in C_4 plants

(a) Phosphoenol pyruvic acid
(b) Ribulose 1,5 bis phosphate carboxylase
(c) Oxalo acetic acid
(d) Phospho glyceric acid.

AP EAPCET-23.05.2023, Shift-II

Ans. (a) : Phosphoenolpyruvic acid (PEP) is the primary CO_2 acceptor in C_4 plants.
In C_4 plants, the first step of carbon fixation is the carboxylation of PEP by the enzyme PEP carboxylase. This reaction produces 4 carbon containing substance oxaloacetic acid.

- Ribulose 1,5-bisphusphate carboxylase (RUBP) is the primary CO_2 acceptor in C_3 plants.
- Phospho Glyceric Acid (PGA) is a product of the calvin cycle.

155. Assertion (A) : C_4 plant loses only half of the water compared to C_3 plant for the same amount of CO_2 fixed,
Reason (R) : C_4 photosynthetic system is evolved for maximizing the availability of CO_2 while minimizing water loss

(a) Both A and R are correct, R is the correct explanation for A.
(b) Both A and R are correct, but R is not the correct explanation for A.
(c) A is correct but R is incorrect.
(d) A is incorrect but R is correct.

AP EAPCET-22.05.2023, Shift-II

Ans. (a) : C_4 plants loses only half of the water compared to C_3 plants for the same amount of CO_2 fixed. In C_3 plants, CO_2 is fixed directly into Rubisco, an enzyme that is also responsible for fixing O_2.
C_4 plants have evolved a way to avoid photorespiration by fixing CO_2 into a 4-carbon compound called oxaloacetate in the mesophyll cells of their leaves.

156. Given below are two statements :
Statement I : RuBisCO is the most abundant enzyme in the world.
Statement II : Photorespiration does not occur in C_4 plants
In the light of the above statements, choose the most appropriate answer from the options given below:

(a) Both statement I and Statement II are correct
(b) Both Statement I and Statement II are incorrect
(c) Statement I is correct but Statement II is incorrect
(d) Statement I is incorrect but Statement II is correct

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : RuBisCO or ribulose 1,5 bisphosphate carboxylase/oxygenase is universally occurring enzyme of all photosynthetic plant except few photosynthetic bacteria.

- According to Ellis (1979) it is the most abundant protein on earth.
- Respiration that is initiated in chloroplasts and occurs in light only is called photorespiration. It occurs in Calvin cycle during plant metabolism. In this process RuBisCO is responsible for fixing of CO_2 reacts with oxygen rather than CO_2.

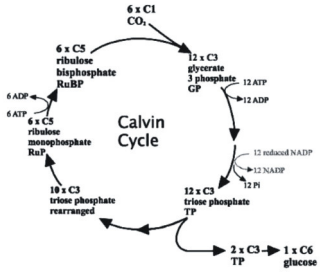
157. How many ATP and $NADPH_2$ are required for the synthesis of one molecule of Glucose during Calvin cycle?

(a) 18 ATP and 16 $NADPH_2$
(b) 12 ATP and 12 $NADPH_2$
(c) 18 ATP and 12 $NADPH_2$
(d) 12 ATP and 16 $NADPH_2$

NEET (UG) 07.05.2023

Ans. (c) : Calvin cycle is a series of biochemical redox reactions that takes place in the stroma of chloroplast in photosynthetic organisms.
Calvin cycle was discovered in 1950 by Melvin Calvin James Bassham and Andrew Benson at the university of california by using radioisotope carbon - 14

- Calvin cycle is also known as the C_3 cycle. It is a chemical reactions where the carbon from the carbon cycle is fixed into sugars. It occurs in the chloroplant of the plant cell.
- Calvin cycle operate 6 time for fix one molecule of glucose.
- For one turn ATP used = 3 molecules NADPH used = 2 molecule thus for 6 cycles = 10 ATP molecules and 12 NADPH molecules used.



158. What is the role of large bundle sheath cells found around the vascular bundles in C_4 plants?

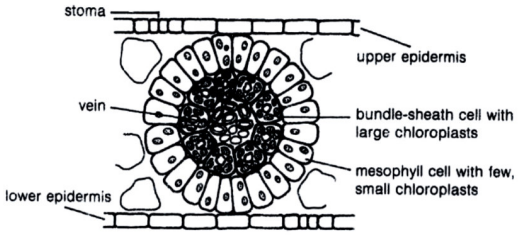
(a) To protect the vascular tissue from high light intensity

@apna_pdf

(b) To provide the site for photorespiratory pathway
(c) To increase the number of chloroplast for the operation of Calvin cycle
(d) To enable the plant to tolerate high temperature

NEET-2022

Ans. (c) : In C_4 plants, the bundle sheath cells play a particularly unique role in the photosynthetic fixation of CO_2, where they create a specialized compartment that allows CO_2 to be concentrated around RuBisCO, and also to increase the number of chloroplast for the operation of Calvin cycle.



159. Given below are two statements

Statement I : The primary CO_2 acceptor in C_4 plants is phosphoenolpyruvate and is found in the mesophyll cells.

Statement II : Mesophyll cells of C_4 plants lack RuBisCo enzyme. In the light of the above statements, choose the correct answer from the options given below:

(a) Statement I is incorrect but Statement II is correct
(b) Both Statement I and Statement II are correct
(c) Both Statement I and Statement II are incorrect
(d) Statement I is correct but Statement II is incorrect

NEET-2022

Ans. (b) : The primary CO_2 acceptor is a 3-Carbon molecule, Phosphoenol Pyruvate (PEP) and is present in the mesophyll cells.

• Mesophyll cells of C_4 plants lack RuBisCO enzymes. In C_4 plants, RuBisCO enzyme is found in the bundle sheath cell.

So, the both statement I and statement II correct.

160. When one CO_2 molecule is fixed as one molecule of triose phosphate, which of the following photochemically made, high energy chemical intermediates are used in the reduction phase?

(a) 1 ATP + 1 NADPH (b) 1 ATP + 2 NADPH
(c) 2 ATP + 1 NADPH (d) 2 ATP + 2 NADPH

NEET (Re-Exam)-04.09.2022

Ans. (d) : For fixing one molecule of CO_2 in the Calvin cycle 3 ATP and 2 NADPH are required.

The Calvin cycle comprises three main steps :

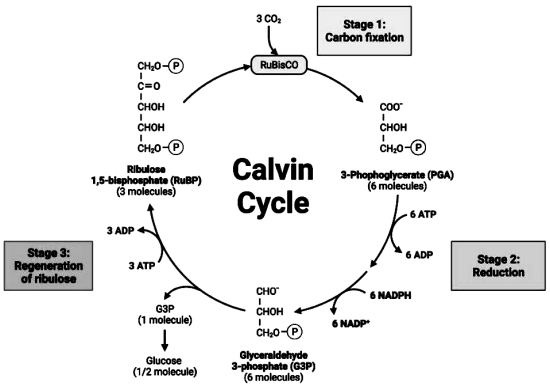
Carbon Fixation - In this step, a CO_2 molecule binds with Ribulose -1, 5-biphosphate (RuBP), which is an acceptor molecule, the binding results in the formation of a six carbon compound that eventually splits to form two molecule of 3 carbon compound each known as 3-phosphoglyceric acid (3 PGA).

Reduction-In this step, one molecule of 3-PGA is converted into Glyceraldehyde-3-phosphate (G-3-P).

This reaction is facilited by 1-ATP and 1-NADPH.

So, when two molecule 3-PGA are converted into 2-molecule of Glyceraldehyde-3-phosphate (G-3-P), 2-ATP and 2-NADPH are utilized.

Regeneration:-It is complex process that requires ATP. In this stage some Glyceraldehyde-3 phosphate molecules are used to produce glucose, while others are recycled to regenerate the RuBP acceptor.



161. Identify the differences between C_3 and C_4 plants among the following characters

(A) Photorespiration rate
(B) Activity of RuBisCO
(C) Type of light reactions
(D) CO_2 primary acceptor from atmosphere
(E) Anatomy of the leaf

Options:

(a) A, B, C (b) B, C, D
(c) C, D, E (d) A, D, E

TS EAMCET-09.08.2021 Shift-I

Ans. (d) :

	C_3 plant (calvin cycle)	C_4 plants (Hatch and slack cycle)
Photorespiration rate	High	Absent
CO_2 primary acceptor from atmosphere	RuBP	PEP carboxylase
Anatomy of leaf	Do not show any special anatomy	Leaves show kranz anatomy
Example	95% of shrubs, trees and plants as wheat, cotton, tobacco, oats etc.	Only 5% of plant on earth are C_4 plants as maize, corn, sugarcane, etc.

162. The first stable product of CO_2 fixation in sorghum is

(a) Phosphoglyceric acid
(b) Pyruvic acid
(c) Oxaloacetic acid
(d) Succinic acid

NEET-2021

@apna_pdf

Ans. (c) : The first stable product of CO_2 fixation in sorghum is **oxaloacetic acid** (4 carbon compound).

- First stable product in C_3-Cycle (calvin cycle) is 3-**phosphoglyceric acid.** PGA is a 3 carbon compound, hence, these plants are called C_3 plants.
- **Pyruvic acid** is the end product of glycolysis and acts as a substrate and a co-factor.
- **Succinic acid** is an intermediate product in krebs cycle or citric acid cycle.

163. Match the following lists:

List-I	List-II
(A) Sun light is essential to the plant process that purifies air fouled by breathing animals	**I. Melvin Calvin**
(B) Bacteria were used to detect the sites of O_2 evolution	**II. Sachs**
(C) Evidence for the production of glucose	**III. Priestley**
(D) Role of air in the growth of green plants	**IV. Ingenhousz**
	V. Engelmann
	VI. Neil

The correct match is:

	A	B	C	D
(a)	IV	I	VI	II
(b)	V	II	IV	III
(c)	IV	II	V	III
(d)	IV	V	II	III

TS EAMCET-10.08.2021 Shift-I

Ans. (d) : Joseph Priestley – Performed a series of experiments that revealed the essential role of air in the growth of green plants.
Julius Von Sachs – Provided evidence for the production of glucose when plants grow.
T.W. Engelmann – The bacteria were used to detect the sites of oxygen (O_2) evolation.
Jan Ingenhousz – Showed that sunlight is essential to the plant process that purifies the air fouled by burning candles or breathing animals.

164. Select the mismatched pair?

(a) F.W. Went – Auxin
(b) Buchner – Zymase
(c) H. G. Khorana – C_4 pathway
(d) Frankel Conrat – RNA

AP EAMCET-03.09.2021 Shift-I

Ans. (c) : C_4 pathway was discovered by M.D. Hatch and C.R. Slack in 1966. So, that this pathway is known as Hatch and slack pathway.
H.G Khorana is associated with genetic research and DNA synthesis. He was also awarded Nobel Prize for his work on the genetic code and the synthesis of oligonucleotides.

165. Which one of the following is NOT an example of C_4 plant?

(a) Sugarcane (b) Gram
(c) Amaranthus (d) Maize

MHT CET 5.10.2020 Shift-I

Ans. (b) : Hatch and Slack gave a new pathway of CO_2 fixation. This take place mostly in monocot plants like sugarcane, Maize and rarely in dicot (Amaranthus). Gram is a C_3 plant.

166. Which of the following statements is incorrect?

(a) RuBisCO action requires ATP and NADPH
(b) RuBisCO is a bifunctional enzyme
(c) In C_4 plants, the site of RuBisCO activity is mesophyll cell.
(d) The substrate molecule for RuBisCO activity is a 5-carbon compound

NEET-2020 Phase-II

Ans. (c) : In C_3 plants, RuBisCO occurs in mesophyll cells, where as in C_4 plants RuBisCO is present in bundle sheath cells. RuBisCO plays a vital role in CO_2 fixation during the calvin cycle.
RuBisCO break down 6-carbon compound into two molecule of 3 carbon compound, and the energy in ATP and NADPH is used to convert molecules into Glyceraldehyde 3 phosphate. The substrate for RuBisCO is ribulose-1,5-biphosphate (5 carbon compound).

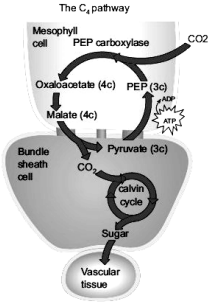
167. In Hatch and Slack pathway, the primary CO_2 acceptor is

(a) Rubisco
(b) Oxaloacetic acid
(c) Phosphoglyceric acid
(d) Phosphoenol pyruvate

NEET (Odisha)-2019

Ans. (d) : The C_4 pathway initiates with a molecule called **phosphoenol pyruvate (PEP),** which is a 3-carbon molecule and acts as the primary CO_2 acceptor in the mesophyll cells of C_4 plants.

- In the Hatch and Slack pathway, phosphoenol pyruvate is the primary CO_2 acceptor and is seen in the mesophyll cells. The carboxylation takes place with the help of an enzyme called **PEP carboxylase**. They yield a 4 – C molecule called **Oxaloacetic acid (OAA)**.



168. Which of the following is not a C_4 plant

(a) Maize (b) Tribulus
(c) Amaranthus (d) Wheat

SRM JEEE-2019

Ans. (d) : C_4 plants- Including maize, sugarcane and sorghum avoid photorespiration by using another enzyme called PEP during the first step of carbon fixation. This step takes place in the mesophyll cells that are located close to the stomata where CO_2 and O_2 enter the plant. Beans, rice, wheat, potatoes, most temperate crops and all woody trees is not a C_4 plant.

169. An example of C4 plant is

(a) Coconut (b) Mango
(c) Rice (d) Sugarcane

SRM JEEE-2019

@apna_pdf

Ans. (d) : C4 plant is one that enters the Calvin cycle by converting carbon dioxide into four-carbon sugar molecules. These plants produce a lot of energy and are highly effective in hot, dry environments. Examples of C4 plants include sugarcane, corn, sorghum, millet etc.

170. In the maize plant, CO_2 fixation occurs in both mesophyll and bundle sheath cells. The enzymes involved in these cells for the process respectively are,

(a) RuBisCO and PEP Kinase
(b) PEP Kinase and Pepsin
(c) RuBisCO and PEP Carboxylase
(d) PEP Carboxylase and RuBisCO

Karnataka CET-2018

Ans. (d) : In the Maize plant, CO_2 fixation occurs in both mesophyll and bundle sheath cells. C_4 cycle, PEP carboxylase fixed the carbon dioxide in mesophyll cells, and RuBisCO synthesised the sugars in bundle sheath cells.

171. With reference to factors affecting the rate of photosynthesis, which of the following statements is not correct?

(a) Light saturation for CO_2 fixation occurs at 10% of full sunlight
(b) Increasing atmospheric CO_2 concentration up to 0.05% can enhance CO_2 fixation rate
(c) C_3 plants responds to higher temperatures with enhanced photosynthesis while C_4 plants have much lower temperature optimum
(d) Tomato is a greenhouse crop which can be grown in CO_2 enriched atmosphere for higher yield

NEET-2017

Ans. (c) : At high temperature and light oxygen has a higher affinity for the enzyme RuBisCO. Oxygen bind to RuBisCO instead of carbon dioxide, thus reduces C_3 - plant photosynthetic efficiency and water use efficiency. Thus, in environments with high temperature and light, C_4 plants shows initial carbon fixation in mesophyll cells where PEP, Combines with carbon dioxide to form OAA. Which is further processed significantly improving the plants photosynthetic and water use efficiency. As a result in high light and temperature environments, C_4 plants tend to be more productive than C_3 plants.

172. Study the following lists:

	List-I		List-II
A.	**Hatch and Slack**	**1.**	**Electron microscope**
B.	**Theophrastus**	**2.**	**Citric acid cycle**
C.	**Knoll and Ruska**	**3.**	**Micrographia**
D.	**Robert Hooke**	**4.**	**C_4 pathway**
		5.	**Historia Plantarum**

The correct match is:

	A	B	C	D
(a)	4	5	1	3
(b)	4	5	1	2
(c)	2	4	5	3
(d)	2	3	4	1

AP EAMCET-2005

Ans. (a) :

List-I	List-II
A. Hatch and Slack	1. C_4 pathway
B. Theophrastus	2. Historia Plantarum
C. Knoll and Ruska	3. Electron Microscope
D. Robert Hooke	4. Micrographia

173. If bundle sheath cells of the C_4 plants are infected by an organism, which utilize CO_2 efficiently then which process will be affected very first?

(a) PGAL → RuBP
(b) PGAL+PGA → Glucose
(c) PGA → PGAL
(d) RuBP → PGA

GUJCET-2014

Ans. (d) : The chloroplast and the enzymes needed for the Calvin cycle are found in the bundle sheath cells of C_4 plants. The enzyme RuBisCO combines RuBP (ribulose bisphosphate) with CO_2 to produce PGA (3-Phosphoglycerate), which is the first reaction in the Calvin cycle.

174. How many molecules of ATP and NADPH are require in formation of two molecules of glucose? How many Calvin cycles are required?

(a) 36 ATP, 24 NADPH, 12 Calvin cycles
(b) 18 ATP, 12 NADPH, 6 Calvin cycles
(c) 36 ATP, 24 NADPH, 6 Calvin cycles
(d) 24 ATP, 36 NADPH, 12 Calvin cycles

GUJCET-2015

Ans. (a): Six Calvin cycles are required for the synthesis of one glucose molecule, and these cycles use upto a total of 18 ATP and 12 NADPH.
12 NADPH.
Consequently, 36 ATP, 24 NADPH, and 12 turns of the Calvin cycle are required for the production of 2 glucose molecules.

175. Identify the incorrect statement with respect to Calvin cycle.

(a) The first stable intermediate compound formed is phosphoglycerate.
(b) 18 molecules of ATP are synthesised during carbon fixation.
(c) NADPH + H+ produced in light reaction is used to reduce diphosphoglycerate.
(d) The carboxylation of RuBP is catalysed by RuBisCO.

Karnataka CET-2009

Ans. (b) : Calvin pathway occurs in all photosynthetic plants. Calvin cycles can be described under 3 stages.
(i) Carboxylation
(ii) Reduction
(iii) Regeneration
First stable product of Calvin cycle is 3- phosphoglycer ate.

In	out
6 CO_2	one glucose
18 ATP	18 ADP
12 NADPH	12 NADP.

Hence, no ATP is produced in Calvin cycle.

@apna_pdf

176. Chloroplasts without grana are known to occur in

(a) Bundle sheath cells of C_3 plants.
(b) Mesophyll cells C_4 plants.
(c) Bundle sheath cells of C_4 plants.
(d) Mesophyll cells of all plants.

Karnataka CET-2006

Ans. (c) : Chloroplasts without grana are known to occur in bundle sheath cells of C_4 plants. Bundle sheath cells are a layer of cells in plant leaves, and stems, that forms a sheath surrounding vascular bundles. In C_4 plants the bundle sheath cells contains chloroplasts and are sites of Calvin cycles. Sugarcane, maize are example of C_4 plant.

177. A plant in your garden avoids photo respiratory losses, has improved water use efficiency, shows high rates of photosynthesis at high temperatures and has improved efficiency of nitrogen utilization. In which of the following physiological groups would you assign this plant

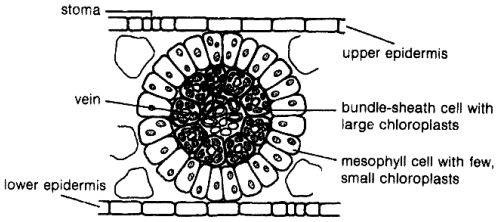
(a) Nitrogen fixer (b) C_3
(c) C_4 (d) CAM

NEET-2016 Phase-I

Ans. (c) : This plant protects your garden photorespiratory losses, improves water use efficiency, shows higher rates of photosynthesis at the high temperatures and has improve nitrogen efficiency of nitrogen utilization is a C_4 plant. Due to the kranz anatomy of its leaves, C_4 plants are unique. They are able to withstand higher temperatures, respond to intense light, lack a wasteful process termed photorespiration, and have better nitrogen consumption efficiency.

The majority of plants with the C_4 pathway have been adapted to dry tropical climates and are referred to as C_4 plants.

eg:- Sugarcane



- **Nitrogen fixation** – It is a biological process in which the nitrogen gas is convert into usable form for plant $\left(NH_3, NO_2^-, NO_3^-\right)$

  eg:- Rhizobium etc.
- **CAM Plant** (Crassulacean acid metabolism) In CAM plant stomata open at night. Which allows CO_2 to diffuse into leaf to be combined with PEP (Phosphoenolpyruvate) & from malate.

  eg:- Opuntia
- **C_3 Plant -** The majority of plant & crop are C3 plants. The first carbon compound produced during photosynthesis contains three carbon atoms [3-phosphogyceric acid (PGA)].

  eg:- Wheat, Oats, Rye.

178. Which of the following characteristics out of I, II and III are exhibited by C_4 plants?

I. Kranz anatomy.
II. The product of photosynthesis is oxalo acetic acid.
III. Both PEP carboxylase and ribulose-bis phosphate carboxylase act as carboxylating enzyme.

Choose the correct option:

(a) I and II, but not III (b) II and III but not I
(c) I and III, but not II (d) All of these

JIPMER-2015

Ans. (d) : C_4 plants have an alternative CO_2 fixation pathway called the Hatch and Slack cycle where OAA is the first stable product. The leaf of these plants has kranz anatomy where the vascular bundles are surrounded by the bundle sheath. Here, two carboxylation reactions take place, first by PEP carboxylase in the mesophyll chloroplast and second by RuBisCO in the bundle sheath chloroplast.

179. If 'X' molecules of ATP are utilised to produce one molecule of glucose during photosynthesis of a C_3-plant and 'Y' molecules of ATP are formed through substrate level phosphorylation during the breakdown of one molecule of glucose in aerobic respiration, then the ratio of 'X' and 'Y' is

(a) 3 : 1 (b) 5 : 2
(c) 1 : 1 (d) 2 : 3

AP EAMCET-2010

Ans. (a) : In the photosynthesis of C_3 plants, one molecule of glucose is produced using 6ATP molecules, and 2ATP molecules is produced during the aerobic respiration process when one molecule of glucose is broken down. Hence the ratio of x and y is 3:1.

180. Which technique has helped in investigation of Calvin cycle?

(a) X-ray crystallography
(b) X-ray technique
(c) Radioactive isotope technique
(d) None of the above

AP EAMCET-2011
AIPMT-1991

Ans. (c): In 1954-55, Calvin traced the pathway of carbon fixation by using radioactive isotope method by using C^{14} and gave the calvin cycle.
Calvin and his co-workers were able to formulate the complete metabolic path of carbon assimilation in the form of cycle which is called as Calvin cycle.

181. C_4 pathway for CO_2 fixation was proposed by

(a) Benson and associates
(b) Arnon and associates
(c) Rouhani and associates
(d) Hatch and associates

UP CPMT-2006

Ans. (d) : Hatch and Slack cycle is the name given to the C_4 cycle, which was originally studied in detail by M.D. Hatch and C.R. Slack in 1966. Oxaloacetic acid is the cycle's first stable carbon product.

@apna_pdf

182. The process which makes major difference between C_3 and C_4 plants is
(a) glycolysis (b) calvin cycle
(c) photorespiration (d) respiration

NEET-2016 Phase-II

Ans. (c) : The process which makes major difference between C_3 and C_4 plants is photorespiration.
Photorespiration is the light dependent process of oxygenation of Ribulose Biphosphate and release of carbon dioxide by the photosynthetic organ of a plant. It occurs in chloroplast. The peroxisome and mitochondria are required for completing the process.
• This process creates an important difference between C_3 and C_4 plants as it is absent in C_4 plants.

183. Stomata of CAM plants: -
(a) Are always open
(b) Open during the day and close at night
(c) Open during the night and close during day
(d) Never open

AIPMT-2003

Ans. (c): During the night when temperature lowers down and atmosphere become misty, stomata of CAM plant open and during the day time, when the water stress is high and the rate of transpiration is at its peak the stomata of CAM plants closed.
• Most of the plants stomata open during day time but in CAM open during night time. This type of plants are found in dry environment.

184. In Hatch and Slack pathway
(a) Chloroplast are of same type
(b) Occurs in Kranz anatomy where mesophyll have small chloroplast whereas bundle sheath have granal chloroplast
(c) Occurs in Kranz anatomy when mesophyll have small chloroplast where as bundle sheath have larger, agranal chloroplast
(d) Kranz anatomy where mesophyll cell are diffused

Haryana PMT-2005 / JIPMER-2005
BHU PMT-2003

Ans. (c) : Hatch and Slack pathway occurs in Kranz anatomy where mesophyll have small chloroplasts whereas bundle sheath have larger agranal chloroplast. Kranz anatomy is a specialized structure in C_4 plants where the mesophyll cells are clustered around the bundle-sheath cell in a ring-like fashion.

185. The net requirement of assimilatory power for the formation of 6 hexose molecules in maize plant is
(a) 72 ATP, 48 NADPH
(b) 90 ATP, 60 NADPH
(c) 108 ATP, 72 NADPH
(d) 180 ATP, 72 NADPH

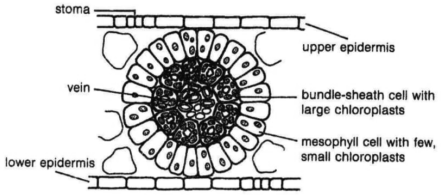
AP EAMCET-2008

Ans. (d) : The net requirement of assimilatory power for the formation of 6 hexose molecules in maize plant is 180 ATP, 72 NADPH.
The C_4 plants respond to higher rate of photosynthesis maize belongs to the group of the C_4 plants. These plants require 30 molecule of ATP and 12 molecule of NADPH for the formation of one molecule of glucose. So, for 6 molecules of glucose to be formed 180 molecules of ATP and 72 molecules of NADPH are required.

186. In Kranz anatomy, the bundle sheath cell have:
(a) Thin walls many intercellular space and large
(b) Thick walls, no intercellular spaces and large number of chloroplasts
(c) Thin walls, no intercellular spaces and several chloroplasts
(d) Thick walls, many intercellular space and few chloroplasts

AIIMS-2015

Ans. (b) : Kranz anatomy is a special type of anatomy found in the leaves of C_4 plants (Sugarcane). Mesophyll cells are clustered around the bundle sheath cells in a ring-like fashion.
The bundle sheath cells with thick walls and no intercellular spaces between them, prevents the entry of O_2 and escape of CO_2. It has a large number of chloroplasts.
It provides a perfect site for CO_2 to be concentrated within the plants, around the RuBisCO.
It helps in preventing photorespiration.



Kranz anatomy

187. The sugarcane plant has
(a) Dumb-bell shaped guard cells
(b) Kpentamerous flowers
(c) Reticulate venation
(d) Capcular fruits.

AIIMS-2004

Ans. (a) : The sugarcane plant has dumb-bell shaped guard cells. It is a characteristic feature of monocot plants.

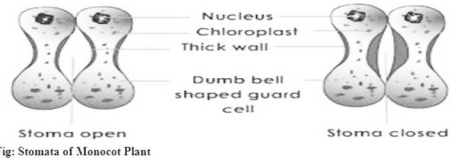


Fig: Stomata of Monocot Plant

188. Which one is a C_4 - plant?
(a) Papaya (b) Pea
(c) Potato (d) Maize/corn

AIPMT-1993

Ans. (d) : A Maize/corn C_4 plant that utilizes the C_4 fixation pathway. This pathway is when the CO_2 is first bound to phosphoenol pyruvate in the mesophyll cell. Example of C_4 plants are sugar cane, maize/corn etc. C_4 plants are well adapted to habitats with high day time temperature, intense sunlight, low water condition.

189. In C_4 plants, Calvin cycle operates in
(a) stroma of bundle sheath chloroplasts
(b) grana of bundle sheath chloroplasts
(c) grana of mesophyll chloroplasts
(d) stroma of mesophyll chloroplasts

AIPMT-1989

Ans. (a) : Unlike the light reactions, which take place in the thylakoid, the reactions of the Calvin cycle take place in the stroma (the inner space of chloroplasts).

@apna_pdf

190. C_4 plants can absorb CO_2 from
(a) Its much low concentration
(b) Its much high concentration
(c) Carbonates
(d) Bicarbonates

CMC Vellore-2007

Ans. (a) : The enzyme PEP carboxylase present in C_4 plants is very sensitive to CO_2 that is why C_4 plant can absorb CO_2 even from its much low concentration. An increase in the concentration of CO_2 increase the rate of photosynthesis.

191. C_4-plants show an advantage over C_3-plants when the weather is
(a) dry (b) cold and dry
(c) hot and dry (d) hot and wet

BVP-2013

Ans. (c) : C_4 is a plant commonly found in hot and dry climates.
C_4 plants grow better than C_3 plants under hot, dry condition when plants must close their stomata to conserve water.
- In these plants CO_2 is captured in special mesophyll cells by the first phosphoenol pyruvate to form oxaloacetate.
- The rate of photosynthesis per unit of nitrogen is generally high than that of C_3 plant. C_4 plants are more efficient than C_3 plant due to high rate of photo synthesis and reduced rate of photorespiration.

192. The C_4 plants are different from the C_3 plants with reference to the :
(a) types of pigments involved in photosynthesis
(b) the number of NADPH that are consumed in preparing sugar
(c) types of end product of photosynthesis
(d) the substance that accepts CO_2 in carbon assimilation and first stable product

BCECE-2003

Ans. (d) : The C_4 plant are different from the C_3 plants with reference to the substance that accepts CO_2 in carbon assimilation and first stable product. In C_3 plants the first product is a 3-C compound is 3 phosphoglyceric acid while in C_4 plants, a 4-C compound is oxaloacetic acid a first stable compound.
• The substrate which accepts CO_2 in C_3 plant is a 5-C compound RuBP and in C_4 plant it is PEP, a 3-C compound.

193. Chloroplast dimorphism is a characteristic feature of
(a) plants with Calvin cycle (b) C_4– plants
(c) all plants (d) only in algae

WB JEE-2010

Ans. (b) : Chloroplast dimorphism is a characteristic feature of C_4 plants. Dimorphic chloroplasts are the chloroplasts which are concentrated into two types of cells having different size and structure. The dimorphic chloroplast is present in C_4 plants because of the presence of special leaf anatomy called kranz anatomy.
It is a characteristic feature of C_4 plants, e.g. sugarcane, Amaranthus and maize etc.

194. C_3 – plants have (1) calvin cycle (2) kranz type of anatomy (3) photorespiration (4) No photorespiration
(a) 1,2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2011

Ans. (d) : C_3 plants are defined as the plants that use the C_3 pathway in the dark reaction of photosynthesis. There is no indication of kranz anatomy by the leaves of these plants. The plants that undergo the Calvin cycle for carbon fixation are known as C_3 plants.
* C_3 plants do not have the anatomic structure nor the abundance of PEP carboxylase to avoid photorespiration like C_4 plants.
Hence, C_3 plants have photorespiration. The RuBP binds with O_2 instead of being converted into 2 PGA molecules to form one phosphoglycerate and phosphoglycolate molecule in a pathway called Photorespiration.

195. The loss of water in C_4- plants compared to C_3-plants for the same amount of CO_2 fixed is
(a) half (b) one-third
(c) one-fourth (d) double

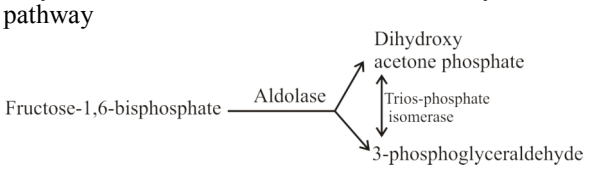
AMU-2010

Ans. (a) : C_4 plants are twice as efficient as C_3 plants in terms of fixing carbon (making sugar). However, a C_4 plants loses only half as much water as a C_3 plants for the same amount of CO_2 fixed. C_4 plant like maize and sorghum loses half as much water as a C_3 plant for the same amount of (CO_2) fixed. The C_4 plants have adapted themselves to continue with the process of photosynthesis even with the stomata closed.

196. Two enzymes common to EMP pathway and C_3 cycle are
(a) Aldolase and triose phosphate isomerase
(b) Aldolase and enolase
(c) Cytochrome oxidase and enolase
(d) Phosphoglyceromutase and triose phosphate isomerase.

AMU-1998

Ans. (a) : Aldolase and triose phosphate isomerase both enzymes are common to EMP & C_3 cycle. EMP pathway



in C_3 cycle
3-phosphoglyceraldehyde $\underset{\text{isomerase}}{\overset{\text{Triose-phosphate}}{\rightleftharpoons}}$ dihydroxyacetone phosphate + 3 phosphoglyceraldehyde $\xrightarrow{\text{Aldolase}}$ fructose-1-6-diphosphate.

197. To form one molecule of glyceraldehydes phosphate in Calvin cycle :
(a) 9ATP and 36 NADPH are required
(b) 6ATP and 6 NADPH are required
(c) 3ATP and 3 NADPH are required
(d) 9 ATP and 6 NADPH are required

Haryana PMT-2005

@apna_pdf

Ans. (d) : For fixation of six CO_2 molecules during Calvin cycle of photosynthesis, 18 molecules of ATP and 12 molecules of $NADPH_2$ are required.

- One molecule of glyceraldehyde 3 phosphate is formed by fixation of $3CO_2$ molecules.

For a 3 carbon molecule to be synthesized, 3 turns of the calvin cycle are required, with the entry of a molecule of CO_2 at each turn.

Each turn of Calvin cycle consumes 3 ATP & 2 NADPH molecule So- 3×3 ATP = 9 ATP

3×2 NADPH = 6 NADPH

198. 3-phosphoglyceric acid (PGA) as the first CO_2 fixation product in algal photosynthesis was discovered by

(a) Joseph Priestley (b) Jan Ingenhousz
(c) T.W. Engelmann (d) Julius von Sachs
(e) Melvin Calvin

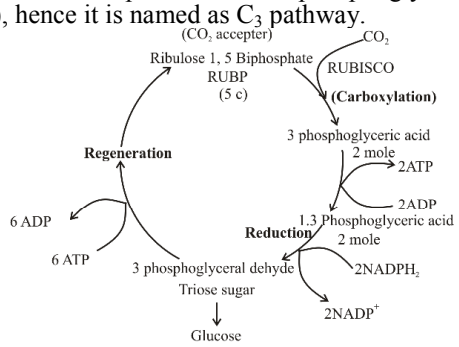
Kerala PMT-2015

Ans. (e) : PGA or 3-phosphoglyceric acid as first CO_2 fixation product in algal photosynthesis was discovered by Melvin Calvin.

He used radioactive ^{14}C in algal photosynthetic studies.

Carbon atoms from CO_2 are fixed and used to make 3-carbon sugars in the calvin cycle. This cycle is powered up, and subject to, ATP and NADPH from the light response, which occur in the thylakoid film. The response of the calvin cycle happen in the stroma (the inner space of chloroplasts).

The first stable product was 3-phosphoglyceric acid (PGA), hence it is named as C_3 pathway.



CALVIN CYCLE

H. Known about ATP and NADPH

199. Three hexoses are produced as net gain in calvin cycle by the assimilatory power generated in noncyclic photophosphorylation with 36 water molecules. The ratio of O_2 released to that of ATP generated is

(a) 3 : 1 (b) 3 : 2
(c) 1 : 1 (d) 4 : 1

TS EAMCET-10.05.2023, Shift-II

Ans. (c) : In noncyclic photophosphorylation, 2 ATP molecules are produced for every water molecule that is split. So, 36 water molecule will produce 72 ATP molecule. For every 2 water molecules that are split, 1 oxygen molecule is produced. So, 36 water molecules will produce 18 oxygen molecules. So, the ratio of O_2 and ATP is 1:1.

200. NADP is converted into $NADPH_2$ in____

(a) Photosystem-II
(b) Calvin cycle
(c) Non-cycle photophosphorylation
(d) Photosystem-I

AP EAMCET-11.07.2022 Shift-II

Ans. (c) : NADP is converted into $NADPH_2$ in non-cyclic photophosphorylation. Non-cyclic photophosphorylation involved both PS-I and PS-II. Flow of electrons is unidirectional. Here electrons are not cycled back and are used the reduction of NADP to $NADPH_2$.

$NADP^+ + 2H + 2e^- \rightarrow NADPH + H^+$

201. How many ATP molecules are generated when one molecule of reduced coenzyme $NADH_2$ is reoxidised during respiratory chain ?

(a) Two (b) Four
(c) One (d) Three

MHT CET-07.10.2020 Shift-I

Ans. (d) : The $NADH_2$ and the $FADH_2$ are produced during the cycles of respiration. These molecules are produced during the glycolysis and the krebs cycle. These molecules are oxidized in the process of electrons transport system (ETS). These products are oxidized and the protons are used for creating a gradient which is used in the synthesis of ATP. $NADH_2$ transfers the electrons to the complex I to complex II. By this process move number of protons which are pumped by ATP synthase. SO, the more protons will result in production of 3 ATPs.

202. Adenosine triphosphate was discovered by

(a) Jack Lipman (b) A Bloor
(c) Karl Lohmann (d) Emil Fisher

JIPMER-2016
Karnataka CET-2004

Ans. (c) : Adenosine Triphosphate (ATP) was discovered by Karl Lohmann in 1929 from the muscles. These are source of energy of the cell produced by the mitochondria.

From the perspective of bio-chemistry, ATP is classified as a nucleoside triphosphate which indicates that it consists of 3 components of nitrogenous base (Adenine), ribose sugar and triphosphate. chemical formula – $C_{10}H_{16}N_5O_{13}P_3$

203. In which one of the following reactions, substrate level phosphorylation does not occur?

(a) 1, 3 bisphosphoglyceric acid → 3-phosphoglyceric acid
(b) Glucose-6-phosphate → Fructose -6-phosphate
(c) Succinyl Co-A→ Succinic acid
(d) Phosphoenol pyruvic acid → Pyruvic acid

AP EAMCET-2005

Ans. (b) : In biological system, this reaction is vital for the cellular storage and transfer of free energy using energy carrier molecules. Phosphorylation is the process of adding a phosphate group of adenosine diphosphate (ADP) to form the adenosine triphosphate (ATP) by the enzyme kinase.

There are total 3 reactions in respiration where substrate level phosphorylation occurs – 2 in glycolysis and one in kreb's cycle.

@apna_pdf

In glycolysis-

- Phosphoenol pyruvic acid + AMP + P ~ P → Pyruvic Acid + ATP + H_3PO_4.
- 1, 3–biphosphoglyceric acid + ADP → 3 – phosphoglyceric acid + ATP.
- No phosphate group is added in glucose 5 – phosphate → 3 phosphoglyceric acid.

In kreb's cycle-

- Succinyl – CoA + H_2O + GDP/ADP → Succinate +CoA + GTP/ATP.

Hence, the (b) one is right answer.

204. The 4-carbon compound formed during RuBP regeneration reactions of calvin cycle is:

(a) sedaheptulose phosphate
(b) xylulose phosphate
(c) erythrose phosphate
(d) glyceraldehyde phosphate

AP EAMCET-2000

Ans. (c) : Erythrose phosphate is a four carbon atom sugar produced during the regeneration of RuBP or ribulose 1, 5 bisphosphate from phosphoglyceraldehyde.

Phosphoglyceraldehyde $\xrightarrow{\text{Aldolase}}$ fructose 1,6 diphosphoate $\xrightarrow{\text{Phosphatase}}$ fructose 6 phosphate $\xrightarrow{\text{Trans ketolase}}$ Erythrose 4, phosphate.

205. Process in which the phosphate group of a compound is removed and directly added to ADP is:

(a) substrate level phosphorylation
(b) photophosphorylation
(c) oxidative phosphorylation
(d) none of these

HP CET-2013 / VMMC-2003

Ans. (a) : Substrate level phosphorylation is a reaction in which the phosphate group of a chemical compound is removed & directly added to ADP.

206. In Photosynthesis $NADPH_2$ is formed but in respiration if forms during

(a) HMP (b) ETS
(c) Krebs cycle (d) None of these

BCECE-2008

Ans. (a) : $NADPH_2$ is formed during light reaction of photosynthesis & also formed during hexose monophosphate shunt of glucose oxidation.

The HMP consists of 2 irreversible oxidative reactions and a series of reversible sugar-phosphate conversion. No ATP is consumed or produced directly.

207. How many ATP molecules will be generated in a plant system during complete oxidation of 40 moles of glucose?

(a) 190 (b) 380 (c) 1520 (d) 3040

WB JEE-2012

Ans. (c) : During the complete oxidation of one molecule of glucose, 38 ATP molecules are produced. So, 40 molecules of glucose will produced.

$40 \times 38 = 1520$ ATP molecules.

208. How many ATP molecules are obtained from fermentation of 1 molecule of glucose?

(a) 2 (b) 4 (c) 3 (d) 5

WB JEE-2009 / J&K CET-2011

Ans. (a) : During alcoholic fermentation of glucose molecule, it is oxidized to pyruvic acid by glycolysis. The pyruvic acid is decarboxylated to form acetaldehyde and CO_2. The acetaldehyde is then reduced to ethanol. The process of glycolysis results in the net production of 2 molecules of ATP.

Fermentation is a biochemical process that gets energy from carbohydrates and does not require oxygen.

$C_6H_{12}O_6 \rightarrow 2C_2H_5OH + 2CO_2 + 2ATP$ (energy)

209. The number of NADPH molecules that are used during the conversion of carbon dioxide into one molecules of glucose

(a) 4 (b) 1
(c) 12 (d) 6

VMMC-2013

Ans. (c) : Formation of 1 molecule of glucose requires 6 turns of calvin cycle. It is called C_3 cycle because the first stable compound formed a 3-carbon molecule PGA

In	Out
Six CO_2	One glucose
18 ATP	18 ADP
12 NADPH	12 NADP

210. Energy equivalent of a NADH in which of the following numbers of ATP molecules?

(a) 2 (b) 3
(c) 38 (d) 36

J&K CET-2012 / AFMC-2004 / Karnataka CET-2000

Ans. (b) : Each NADH molecule the oretically yield 3 ATP molecules during chemiosmosis. In some tissues, NADH requires more energy to cross the mitochondrial membrane & some of its potential is lost.

NADH(Nicotinamide adenine dinucleotide) is a coenzyme central to metabolism. It consist of two nucleotide joined through their phosphate group.

211. The role of the oxidative pentose phosphate pathway is to generate reducing potential in the form of

(a) NADPH only (b) NADH only
(c) FADH only (d) FADH and NADH

AMU-1998

Ans. (a) : The role of the oxidative pentose phosphate pathway is to generate reducing potential in the form of NADPH only**.** Pentose phosphate pathway is an oxidative phosphate pathway of cellular respiration in which glucose 6 phosphate acts as the substrate. After its complete oxidation through HMP, 12 $NADPH^+$, H^+ & $6CO_2$ are formed. Pentose phosphate pathway also known as hexose monosphosphate shunt (HMP).

In this pathway, no ATP is directly produced from oxidation of glucose-6-phosphate.

212. Chemiosmotic theory of ATP synthesis, in the chloroplast and mitochondria, is based on:

(a) proton gradient
(b) membrane potential
(c) accumulation of K ions
(d) accumulation of Na ions

WB JEE-2006 / Kerala PMT-2013

Ans. (a) : Chemiosmotic theory of ATP synthesis, in the chloroplast and mitochondria, is based on proton gradient. The chemiosmotic theory explains how ATP is generated in the mitochondria via the ETC. ETC is an oxidative phosphorylation reaction taking place in the inner membrane of the mitochondria. ATP is generated utilizing the electronchemical gradient generated due to the accumulation of protons in the thylakoid lumen of chloroplast.

@apna_pdf

I. Photorespiration

213. Photorespiration is favoured by
(a) high temperature and low O_2
(b) high humidity and temperature
(c) high O_2 and low CO_2
(d) high CO_2 and low O_2

JIPMER-2003 / AIPMT-1996
Rajasthan PMT-1999,2004,2006
AIPMT-1996 / Punjab MET-2006

Ans. (c) : Photorespiration is favored by high oxygen and low CO_2 conditions. Photorespiration is light induced oxidation of photosynthetic intermediates with the help of oxygen.
Due to this condition, RuBisCO behaves as carboxylase and it enters the calvin or C_3 cycle. It occurs when the CO_2 level inside a leaf become low or high O_2 concentration, high intensity and high temp.

214. The substrate for photorespiration is
(a) phosphoglyceric acid (b) glycolate
(c) serine (d) glycine

Uttarakhand-2005 / MGIMS Wardha-2003
JIPMER-1997 / AIPMT-1989

Ans. (b) : The substrate of photorespiration is a 2-carbon compound glycolic acid (glycolate). The atomospheric O_2 react with RuBP and form phosphoglycolate and phosphoglycerate. Phosphoglycerate converted into glycolate which is act as substrate for photorespiration.

215. The compounds produced when RuBP reacts with O_2 are
(a) 3 - phosphoglyceric acid.
(b) G-3-P and DHAP
(c) Phosphoglycerate and Phosphoglycolate
(d) Phosphoglycolate and Glyceraldehyde - 3.P

AP EAPCET-23.05.2023, Shift-II

Ans. (c) :
- [(RuBP reacts with oxygen (O_2) instead of carbon dioxide (CO_2) during the process of photosynthesis, a phenomenon called photorespiration occurs.)]
- Then it forms a six-carbon compound called 2-carboxy-3-keto-arabinitol 1,5-bisphosphate. This compound is unstable and quickly breaks down into three-carbon compounds-phosphoglycerate and phosphoglycolate.
- Phosphoglycerate is a precursor to the calvin cycle, which is the main pathway for photosynthesis.
- Phosphoglycolate is a wasteful product that is reduced back into the calvin cycle.

216. Assertion (A) :Photorespiration is a wasteful process
Reason (R) : There is no synthesis of sugars, ATP or NADPH, instead ATP is utilized and CO_2 is released in photorespiration
(a) Both A and R are correct R is the correct explanation of A
(b) Both A and R are correct, but R is not the correct explanation of A
(c) A is correct but R is incorrect
(d) A is incorrect but R is correct

AP EAPCET-23.05.2023, Shift-I

Ans. (a) : Photorespiration is a process that occurs in plant when oxygen is present in high concentration. It is a wasteful process because it does not produce any sugars or ATP, and it actually consumes ATP. The wasteful nature of photorespiration has been puzzle to scientists for long time. While the exact reason is not confirmed but some hypothesis suggest that photorespiration help as a protective mechanism, preventing damage caused by excess oxygen in certain conditions. Another idea suggest that it regulate the temperature of plant.

217. Choose the correct statements.
(A) Photorespiration is synthesis or neither sugar nor ATP rather release of O_2
(B) CAM metabolism is an alternative to C_3 and C_4 pathways of CO_2 fixation in plants in dry and hot climates
(C) Bundle sheath cells are having large number of chloroplasts, thick walls with no intercellular space
(D) After World War II photosynthetic studies were exemplary
(a) A, B, C (b) B, C, D
(c) A, C, D (d) A, B, D

TS EAMCET-09.08.2021 Shift-II

Ans. (b) : Photorespiratoin is a wasteful pathway that occurs when RuBisCO acts on O_2 rather than CO_2 and does not produce ATP or NADPH.
C_4 plants are adapted to dry hot tropical region. In C_4 plants photorespiration does not occur so C_4 pathways is more efficient than the C_3 pathway. In the leaves of C_4 plants, special type of anatomy is present in which bundle sheath cells are having large number of chloroplasts, thick wall with no inter cellular space, called kranz anatomy.

218. Three major ways in which different cells handle pyruvic acid are as follows, except —
(a) Lactic acid fermentation
(b) Photorespiration
(c) Aerobic respiration
(d) Alcoholic fermentation

AP EAMCET-03.09.2021 Shift-I

Ans. (b) : There are 3 major ways in which different cells handle pyruvic acid produced by glycolysis, there are, anaerobic respiration including lactic acid fermentation, alcoholic fermentation & aerobic respiration.

Lactic acid fermentation-

$$\text{Pyruvic acid} + NADH \rightarrow \text{Lactic acid} + NAD^+$$

Aerobic respiration (in glycolysis)

$$\text{Glucose} \rightarrow \text{Pyruvic acid} + 2ATP$$

Alcoholic fermentation-

$$C_6H_{12}O_6 \rightarrow 2\,C_2H_5OH + 2CO_2$$

$$\text{Glucose} \rightarrow 2\ \text{pyruvate} \rightarrow 2\ \text{acetaldehyde} \rightarrow 2\text{ethanol}$$

Photorespiration-

$$\underset{5C}{\text{Ribulose 1,5-biphosphate}} + O_2 \xrightarrow[\text{oxygenase}]{\text{RuBP}} \underset{3C}{\text{PGA}} + \underset{2C}{\text{Phosphoglycolate}}$$

219. Photorespiration RuBisCO binds with O_2 to form
(i) Phosphoglycerate
(ii) Phosphoglycolate
(iii) Glyceraldehyde-3-Phosphate

@apna_pdf

(iv) Phosphoenol pyruvate

The correct combination is :

(a) (i) and (ii) (b) (ii) and (iii)
(c) (iii) and (iv) (d) (i) and (iv)

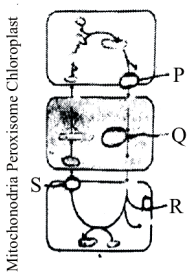
TS EAMCET-02.05.2018 Shift-II

Ans. (a) : RuBisCO can bind to either carbondioxide or oxygen depending on environmental condition. Binding to carbondioxide and initiation of the calvinc cycles is favoured at low temperatures and at a high carbon dioxide-to-oxygen ratio in RuBisCO, an oxygen molecule can bind comfortable in the site designed to bind to carbon dioxide.

The RuBP binds with O_2 to form one molecule of PGA (3c compound) and phosphoglycolate (2c compound) in the pathway of photorespiration.

$$\underset{5C}{\text{Ribulose 1,5-biphosphate}} + O_2 \xrightarrow[\text{oxygenase}]{\text{RuBP}} \underset{3C}{\text{PGA}} + \underset{2C}{\text{Phosphoglycolate}}$$

220. In the given figure, what are the substances labelled as P, Q, R and S?



(a) P-PGA, Q-Glyoxylate, R-NH_3, S-Serine
(b) P-Glycolate, Q-Glyoxylate, R- NH_3, S-Serine
(c) P-Glycolate, Q-Glycerate, R- CO_2, S-Serine
(d) P-RuBP, Q-Glycerate, R-CO_2, S-Serine

GUJCET-2017

Ans. (b): In the given diagram, it represents C_2 cycle or photorespiration. The process has following steps:-

- Oxygen bind with RuBP oxygenase and forms phosphoglycolate in chlroplast which gets converted to glycolate and is transported to peroxisome.
- In peroxisomes it forms glyoxylate and then glycine. Glycine then enters the mitochondria, and looses NH_4 and CO_2 and forms serine.
- The photo respiratory cycle with glycolate – glyoxylate CO_2 – serine are involved in this photorespiratory cycle.
- Photorospiration occurs in chloroplast, peroxisome and mitochondria. It is wasteful process there is no formation of any product.

221. Photorespiration is also known as -------- pathway

(a) C_2 (b) C_3
(c) C_4 (d) Carbon reduction

SRM JEEE -2017

Ans. (a) : Photorespiration (also known as the oxidative photosynthetic carbon cycle or C_2 cycle) refers to a process in plant metabolism where the enzyme RuBisCO oxygenates RuBP wasting some of the energy produced by photosynthesis. C_3 cycle is also known as calvin cycle. C_4 cycle is also known as Hatch and slack cycle. Carbon reduction cycle is known as C_3 cycle.

222. Which of the option is correct for photorespiration?

(a) In Chloroplast, glycerate forms glycine
(b) In Peroxisome, glycerate forms phosphoglycolate
(c) In Mitochondrion, glycine forms serine
(d) In Bundle sheath, serine forms glycine

GUJCET-2014

Ans. (c) : The phosphoglycolate which is formed in the chloroplast is transferred to the peroxisome in the form of glycolate. The glycolate in peroxisome is converted to glycine through some intermediates and then transferred to the mitochondria. In the mitochondria 2 molecules of glycine form a molecule of serine, CO_2 and NH_3 and serine is transferred to peroxisome.

In chloroplast→

Glycerate→ 3 phosphoglycerate +2 phosphoglycolate.

In peroxisome → Glycolate oxidase → H_2O_2+ glyoxalate →Glycine.

223. The correct sequence of cell organelles during photorespiration is:

(a) Chloroplast-mitochondria-peroxisome
(b) Chloroplast-vacuole-peroxisome
(c) Chloroplast-Golgibodies-mitochondria
(d) Chloroplast-Rough endoplasmic reticulum-Dictyosomes

AIPMT (Screening)-2012

Ans. (a) : The correct sequence of cell organelles during photorespiration is-

Chloroplast → Mitochondria → Peroxisome.

Photorespiration is a process which takes place in C_3 plants. It is a wasteful pathway in which ATP produced by photosynthesis is used in oxygenation reaction. It is occurs in C_3- plant not C_4 plant. Photorespiration occurs when O_2 does bind to RuBisCO hence CO_2 fixation is decreases.

224. One set of a plant was grown at 12 hours day and 12 hours night period cycles and it flowered while in the other set night phase was interrupted by flash of light and it did not produce flower. Under which one of the following categories will you place this plant ?

(a) Darkness neutral (b) Day neutral
(c) Short day (d) Long day

JCECE-2009 / AIPMT-2004

Ans. (c) : Plants basically reply to their surroundings in another way primarily based on special intervals of the day and temperature or so they normally concepts. When the dark period is interrupted by the flash of light, the plant could not produce flowers because the dark period could not reach the critical requirement. It shows that the plant needs a long dark period than the light period. So it is a short day plant.

- Short day plant flowers only when day length is less than about 12 hours.

225. During oxidative phosphorylation, the net gain of ATP is

(a) 40 (b) 38
(c) 34 (d) 30

CMC Ludhiana-2012

Ans. (c) : 34 molecule of ATP are obtained as a result of oxidative phosphorylation (30 through NADH and 4 through $FADH_2$) .

@apna_pdf

Glycolysis yields 6 ATP, 6 ATP from link reaction and from krebs cycle 22 ATP are generated through oxidative phosphorylation.

Source	Carbon flow	Number of NADH or $FADH_2$	Number of ATP molecules by substrate level phosphorylation	Net ATP molecules made by oxidative phosphorylation	Maximum yield of ATP
Glycolysis	Glucose (6C)→ 2 Pyruvate	2 NADH	2 ATP	6 or 4 ATP from 2 NADH	8 or 6
Pyruvate decarboxylation	2 Pyruvate (3C) → 2 acetyl (2C)+ 2 CO_2	2 NADH		6 ATP from 2 NADH	6
Krebs cycle	2 acetyl (2C)→ 4 CO_2	6 NADH 2 $FADH_2$	2 ATP	18 ATP from 6 NADH and 4 ATP from 2 $FADH_2$	24
Total	Glucose (6C)→ 6 CO_2	10 NADH 2 $FADH_2$	4 ATP	34 ATP	36 or 38 ATP

226. The first reaction in photorespiration

(a) phosphorylation (b) decarboxylation
(c) oxygenation (d) carboxylation

VMMC-2002 / UP CPMT-2001 / AP EAMCET-1998

Ans. (c) : Photorespiration is the uptake of O_2 instead of CO_2 in presence of light by green plants. The first reaction in photorespiration is oxygenation. In this step, RuBP is converted into one molecule of 3 PGA and one molecule of 2 phasphoglycolate. This reaction is catalysed by enzyme RuBisCO.

$$\underset{5C}{\text{Ribulose 1,5-biphosphate}} + O_2 \xrightarrow[\text{oxygenase}]{\text{RuBP}} \underset{3C}{\text{PGA}} + \underset{2C}{\text{Phosphoglycolate}}$$

J. FactorAffecting Photosynthesis

227. Match the following

List–I (Cycle/fixation name)		List–II (Product formed)	
A.	**First stable product of TCA cycle**	**i.**	**Ammonia**
B.	**First stable product of C_3 cycle**	**ii.**	**3 PGA**
C.	**First stable product of C_4 cycle**	**iii.**	**OAA**
D.	**Product of nitrogen fixation**	**iv.**	**Citric acid**

(a) A – ii, B – iii, C – I, D - iv
(b) A – iii, B – ii, C – iv, D - i
(c) A – iv, B – ii, C – iii, D - i
(d) A – I, B – iv, C – ii, D - iii

TS EAMCET-11.05.2023, Shift-I

Ans. (c) :

A.	First stable product of TCA cycle	iv.	Citric acid
B.	First stable product of C_3 cycle	ii.	3 PGA
C.	First stable product of C_4 cycle	iii.	OAA (Oxalo Acetic Acid)
D.	Product of nitrogen fixation	i.	Ammonia

- TCA cycle-also known as the kreb's cycle is a series of chemical reaction that produce energy for the cell. The first stable product of the TCA cycle is citric acid.
- C_3 cycle also called as calvin cycle is the process that plants use sunlight to convert CO_2 into glucose. The first stable product of the C_3 cycle is phosphoglycerate.
- C_4 cycle is a variation of the C_3 cycle that is used by some plants to more efficiently fix CO_2. The first stable product of the C_4 cycle is OAA.
- Nitrogen fixation is the process by which nitrogen gas is converted into Ammonia. Ammonia is a form of nitrogen that can be used by plants and other organisms.

228. The saturation point of CO_2 in C_4 plants is:

(a) 390 µl/L (b) 450 µl/L
(c) 460 µl/L (d) 360 µl/L

AIIMS-27.05.2018 Shift-I

Ans. (d) : At high temperatures C_4 plants are more efficient. This is because their saturation point is low compared to C_3 plants. C_4 plants have higher optimum temperature for photosynthesis than C_3 plants due to the carbon-dioxide concentrating system. Plants take sunlight in the morning and carbon dioxide at night and make their food at that particular time. The optimum carbon dioxide concentration or saturation point is low compared to C_3 plants in C_4 plants. It is 360 µl/L.
C_3 response to increased CO_2 concentration and saturation is only beyond 450 µl/L.
460 µl/L is atmospheric saturation of CO_2 is around 0.39%

229. Photosynthesis cannot continue for long if during light reaction, only cyclic-photophosphorylation takes place. This is because

(a) There is unidirectional cyclic movement of the electrons
(b) There is no evolution of O_2
(c) Only ATP is formed $NADPH^+ + H^+$ is not formed
(d) Photosystem I stops getting excited of a wavelength of light beyond 680 nm

Karnataka CET-2008

Ans. (c) : Assimilatory power (ATP and $NADPH_2$) are produced during light reaction of photosynthesis. As only cyclic photophosphorylation takes place, only ATP is formed because NADP reductase enzyme is absent in the storma lamellae, so in the cyclic photophosphorylation NADPH & O_2 does not forms. And photosynthesis cannot continue for long. In the absence of $NADPH_2$, the dark reaction of photosynthesis does not takes place.

230. Plants adapted to low light intensity have :

(a) Higher rate of CO_2 fixation than the sun plants
(b) More extended root system
(c) Leaves modified to spines
(d) Larger photosynthetic unit size than the sun plants

Manipal-2007/AIPMT-2004/MGIMS Wardha-2015

Ans. (d) : At lower light levels, chloroplasts have larger proteinaceous photosynthetic unit (PSU) to increase the probability that a photon will strike the chlorophyll antenna. So, plants adapted to low light intensity don't have larger photosynthetic unit size than the sun plants. Shade tolerant plants have lower photosynthetic rates and hence, lower growth rate.
Plants adopted to low light intensity have a higher rate of CO_2 fixation than the sun plants.

@apna_pdf

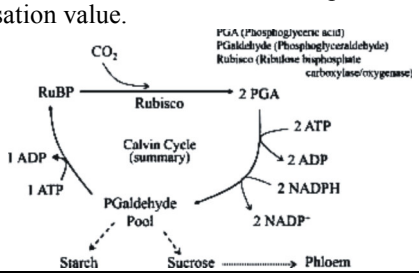
231. Photosynthesis in C_4 plant is relatively less limited by atmospheric CO_2 levels because

(a) there is effective pumping of CO_2 into bundle sheath cells
(b) RuBisCO in C_4 plants has higher affinity for CO_2
(c) six carbon acids are the primary initial CO_2 fixation products
(d) the primary fixation of CO_2 is mediated via PEP carboxylase.

AIIMS-2016

Ans. (d) : Plants such as sugarcane and sorghum fix atmospheric CO_2 in phosphoenol pyruvic acid to produce of oxaloacetic acid (C_4) in the presence of phosphoenol pyruvate corboxylase (PEP corboxylase). These plants are called C_4 plants.

- In C_4 plants the primary product of OAA is mediated by PEP carboxylase, so it is relatively less limited by atmospheric CO_2 levels because C_4 plants have low compensation value.



232. Which of the following set of elements are essential for the photosynthesis to occurs

(a) Cu, Co, Fe (b) Cu, Mo, Zn
(c) Mg, Co, Mn (d) Mg, Fe, Mn, Cu, Cl, P

AIIMS-2014

Ans. (d) : Magnesium (Mg)- It is a constituent of the ring structure of chlorophyll.

Iron (Fe)- It involved in the transfer of electrons like ferredoxin and cytochromes. It is reversibly oxidized from Fe^{2+} to Fe^{3+} during electron transfer.

Manganese (Mn)- The main function of Mn is in splitting of water to liberate O_2 during photosynthesis.

Copper (Cu)- It is essential for the overall metabolism in plants.

Chlorine (Cl)- It is essential for the water splitting reaction in photosynthesis a reaction that leads to O_2 evolution.

Phosphorus (P)- It is required for all phosporylation reactions.

233. At a temperature above 35ºC

(a) rate of photosynthesis will decline earlier than that of respiration
(b) rate of respiration will decline earlier than that of photosynthesis
(c) there is no fixed pattern
(d) both decline simultaneously

AIPMT-1992

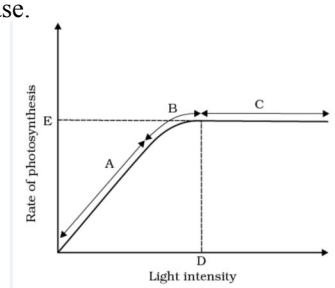
Ans. (a) : If the temperature is increased to more than 35°C there will be a decline in the rate of photosynthesis due to the denaturation of carbon fixing enzymes. The temperature optimum for photosynthesis of different plants also depends on the habitat that they are adapted to.

234. During monsoon, the rice crop of eastern states of India shows lesser yield due to limiting factor of

(a) CO_2 (b) light
(c) temperature (d) water

AIPMT-1991

Ans. (b) : During monsoon, the rice crop of the eastern states of India shows lesser yield due to limiting factor of light. Light quality, light intensity and duration of exposure to light act as factor that affect photosynthesis. During monsoon, the cloudy day condition reduce the light intensity for the plant due to which photosynthetic yield decrease.



235. What will happen if the supply of oxygen is decreased to an illuminated wheat plant?

(a) Its photosynthesis would decrease
(b) Its respiration process would stop
(c) All physiological process would stop
(d) Its photosynthesis would increase

AMU-2003

Ans. (d) : Wheat is a C_3 plant, where the rate of photosynthesis increases when the amount of oxygen decreases. C_3 carbon fixation is one of the metabolic pathway. This process converts CO_2 & RuBP into 3 phosphoglycerate.

236. Stomata of CAM plants

(a) Open during the night and close during the day
(b) Never open
(c) Are always open
(d) Open during the day and close at night

MGIMS Wardha-2010

Ans. (a) : CAM plants open their stomata at night decreasing water loss & increasing water use efficiency as well as drought tolerance.

237. A decrease in photosynthetic rate with increased availability of oxygen is called:

(a) Warburg effect-
(b) Richmond Lang effect
(c) Blackmans law of limiting factors
(d) Emerson enhancement effect

Karnataka CET-2003

Ans. (a) : An increase in O_2 concentration result in decrease in photosynthetic rate is effect is called Warburg effect.

238. If oxygen content is reduced to 1% the rate to respiration becomes

(a) optimum (b) minimum
(c) maximum (d) None of these

CG PMT-2007

Ans. (b) : If the rate of respiration is higher or directly depends on the concentration of available oxygen. Increase in O_2 concentration increases the rate of respiration.

@apna_pdf

14 RESPIRATION IN PLANTS

A. Plants Breathing and Cellular Respiration

1. Match the following :

List–I (Compound oxidized)		List–II (Compound formed)	
A.	Succinic acid	I.	Acetyl COA
B.	α- keto glutaric acid	II.	Succinyl COA
C.	Iso citric acid	III.	Oxalosuccinic acid
D.	Pyruvic acid	IV.	Fumaric acid

(a) A – I, B – III, C – IV, D - II
(b) A – I, B – II, C – III, D - IV
(c) A – III, B – II, C – I, D - IV
(d) A – IV, B – II, C – III, D - I

TS EAMCET-11.05.2023, Shift-I

Ans. (d) : D one is the correct combination–

A.	Succinic acid	IV.	Fumaric acid
B.	α-keto glutaric acid	II.	Succinyl COA
C.	Iso citric acid	III.	Oxalosuccinic acid
D.	Pyruvic acid	I.	Acetyl COA

2. The ascending order of molecules of the following compounds released during the oxidation of two molecules of pyretic acid $FADH_2$, CO_2, $NADH_2$

(a) 1, 3, 4 (b) 2, 6, 8
(c) 1, 6, 8 (d) 2, 4, 6

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : During the oxidation of two molecules of pyruvic acid, 2 molecules of $FADH_2$, 6 molecules of CO_2 and 8 molecules of $NADH_2$ are released .

- The ascending order of molecules of the following compounds released during the oxidation of two molecules of pyruvic acid is–
- 2 molecules of $FADH_2$
- 6 molecules of CO_2
- 8 molecules of $NADH_2$

3. Assertion (A) : The pathway from glucose to lactic acid occur in 10 metabolic steps. Organisms will trap this energy and store in the form of chemical molecules.
Reason (R) : Glucose is the only substrate for the production of energy.
The correct option among the following is:

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)
(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)
(c) (A)is true but (R) is false
(d) (A) is false but (R) is true

TS EAMCET-10.08.2021 Shift-I

Ans. (c) : The pathway from Glucose to lactic acid occur in 10 metabolic step. Glycolysis is the metabolic pathway that converts glucose ($C_6H_{12}O_6$) into pyruvic acid, (CH_3CO COOH). The free energy released in this process is used to form the high-energy molecules ATP and reduced NAD, Glucose is the not only substrate for the production of energy. Protein and fat are also able for the production of energy.

4. Match the location of the cell given in Column I with its function in Column II.

Column I	Column II
1. Mitochondrial matrix	p. Kreb's cycle
2. Cytoplasm	q. ETC
3. F_0 and F_1	r. Glycolysis
4. Inner mitochondrial membrane	s. ATP synthesis

(a) 1 - p, 2 - r, 3 - s, 4 - q
(b) 1 - q, 2 - s, 3 - q, 4 - r
(c) 1 - r, 2 - q, 3 - p, 4 - s
(d) 1 - s, 2 - p, 3 - r, 4 - q

Karnataka CET-2021

Ans. (a) : Krebs's cycle occurs in matrix of mitochondria as it enzymes are present in matrix except succinic dehydrogenase, which is found attached to inner mitochondrial membrane.

- Glycolysis occurs in the cytoplasm and involves partial oxidation of glucose into two molecules of pyruvic acid through a series of enzyme mediated reactions.
- $F_0 - F_1$ particles an oxysomes are spherical or knob like structures present in the inner membrane of the mitochondria. F_1 head piece contains the site for ATP synthesis from ADP and phosphate. F_o forms the channel through which protons across the inner membrane.
- Electron transport chain (ETC) occurs in the inner mitochondrial membrame.

5. Choose the correct statements regarding entry of substrates into respiratory pathway.

(A) The amino acids will be formed by protease activity on proteins.
(B) Carbohydrates will be converted into glucose for entry.
(C) Amino acids will enter as pyruvate or acetyl COA.
(D) Fatty acids will be entered as PGAL.
Options:

(a) B, C only (b) A, C only
(c) C, D only (d) B, D only

TS EAMCET-28.09.2020 Shift-I

@apna_pdf

Ans. (a) : The correct statement about entry of substrates into respiratory pathway are

Respiratory substrates	Converted into a substrate to enter in respiration	Respiratory pathway in which they enter
Carbohydrates like source fructose	Glucose	Glycolysis
Fatty acids (from fats)	Acetyl CoA	Krebs cycle
Glycerol (from fats)	Phosphoglyce-raldehyde	Glycolysis
Amino acids (from proteins)	Acetyl CoA, Pyurvic acid	Krebs cycle

6. Match the following:

a.	**Pyruvic acid**	**i.**	**End products in respiration**
b.	**Acetyle Co-A**	**ii.**	**End products in an aerobic respiration**
c.	**$C_2H_5OH + H_2O$**	**iii.**	**Connecting link between glycolysis and Krebs**
d.	**$CO_2+H_2O+ATP+\Delta$**	**iv.**	**End product in Glycolysis**

(a) (a – ii), (b – i), (c – iii), (d – iv)
(b) (a – i), (b – ii), (c – iii), (d – iv)
(c) (a – iv), (b – iii), (c – ii), (d – i)
(d) (a – iv), (b – iii), (c – i), (d – ii)

AP EAMCET-24.09.2020 Shift-I

Ans. (c) : Pyruvic acid – End product in Glycolysis
Acetyl CoA – Connecting link between glycolysis and krebs
$C_2H_5OH+H_2O$ – End products in an aerobic respiration.
$CO_2 + H_2O + ATP + \Delta$ - End products in respiration

7. Which of the following statements regarding mitochondria is incorrect?
(a) Enzymes of electron transport are embedded in outer membrane.
(b) Inner membrane is convoluted with infoldings.
(c) Mitochondrial matrix contains single circular DNA molecule and ribosomes.
(d) Outer membrane is permeable to monomers of carbohydrates, fats and proteins.

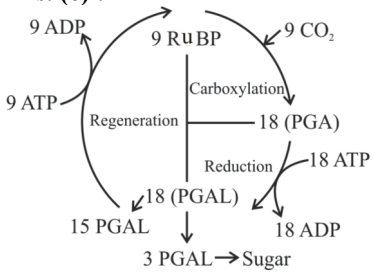
NEET-2019

Ans. (a) : The enzymes of the electron transfer chain are embedded in the inner membrane of the mitochondria.
The inner membrane is convoluted with infolding to increase its surface area. The outer membrane is permeable to monomers of carbohydrates, fats, and proteins for transport into the mitochondria through protein channels called porins.

8. If 18 PGAL are formed during dark reaction, how many Calvin cycles and ATPs are required respectively?
(a) 9 Calvin cycle, 24 ATP
(b) 8 Calvin cycle, 18 ATP
(c) 9 Calvin cycle, 27 ATP
(d) 6 Calvin cycle, 36 ATP

GUJCET-2018

Ans. (c) :



In a Calvin cycle (Dark Reaction) –
for 1 CO_2 molecule →2 PGAL + 3 ATP required
2 PGAL formed in 1 Calvin cycle
18 PGAL formed in $\frac{18}{2} = 9$ Calvin cycle
In 1 Calvin cycle → 3 ATP form
So, in 9 Calvin cycle 3 × 9 = 27 ATP form
Thus, 9 Calvin cycle, and 27 ATP are required for formation of 18 PGAL during dark reaction.

9. The number of ATP molecules produced during aerobic and anaerobic respiration are……and …… respectively.
(a) 2 and 38 (b) 0 and 2
(c) 38 and 0 (d) 38 and 2

HP CET-2018

Ans. (d) : The number of ATP molecules produced during aerobic and anaerobic respiration are 38 and 2 respectively.

10. Which one of the following is true about respiration in green plants? Respiration takes place____.
(a) Only when stomata are open
(b) Only when photosynthesis stops
(c) Only when photosynthesis is in progress
(d) Throughout life

MHT CET-2018

Ans. (d) : Plants breathe throughout its life span both during the day and night. However it is prominent at night.

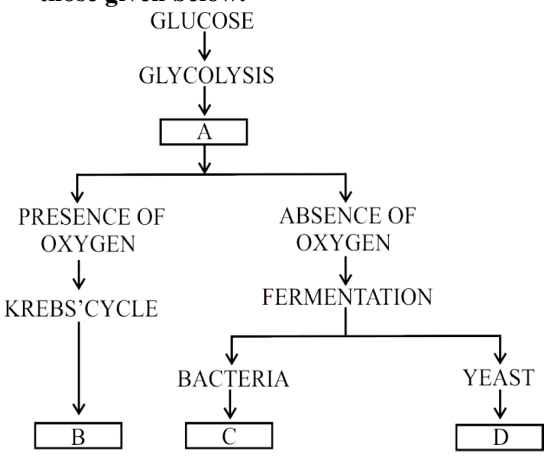
11. The overall goal of glycolysis, Krebs cycle and the electron transport system is the formation of:-
(a) Nucleic acids
(b) ATP in small stepwise units
(c) ATP in one large oxidation reaction
(d) Sugars

AIPMT-2007

Ans. (b) : Respiration is an energy liberating, enzymatically controlled multistep catabolic reaction. In this process step wise break down of organic substances (hexose sugar) takes place inside the living cell.
3 major process occur in aerobic respiration- glycolysis, kreb's cycle and electron transport chain.
The substrate is completely broken down to form CO_2 and water and a large amount of energy is released stepwise in the form of ATP.
Hence, the overall goal of glycolysis, Krebs cycle and the electron transport system is the formation of ATP in small stepwise units.

@apna_pdf

12. The following is a simplified scheme showing the fate of glucose during aerobic and anaerobic respiration. Identify the end products that are formed at stages indicated as A, B, C and D. Identify the correct option from those given below.



(a) A = Carbondioxide and water,
B = Pyruvic acid,
C = Ethyl alcohol and Carbondioxide,
D = Lactic acid,

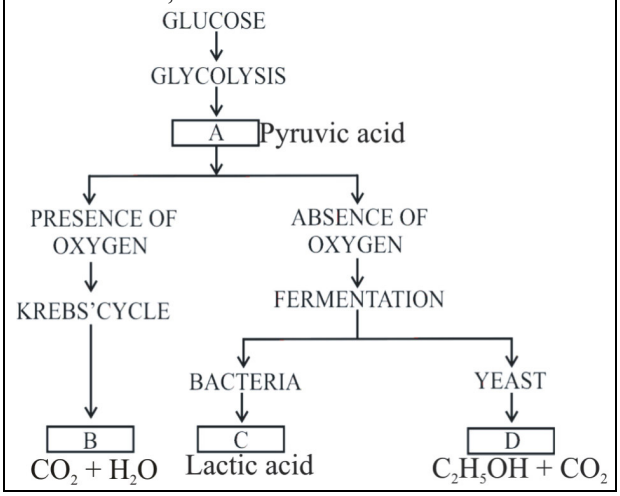
(b) A = Pyruvic acid,
B = Carbondioxide and water,
C = Lactic acid,
D = Ethyl alcohol and Carbondioxide,

(c) A = Pyruvic acid,
B = Carbon dioxide and water,
C = Ethyl alcohol and Carbon dioxide,
D = Lactic acid,

(d) A = Pyruvic acid,
B = Ethyl alcohol and Carbondioxide,
C = Lactic acid,
D = Carbondioxide and water,

Karnataka CET-2006

Ans. (b) : A = Pyruvic acid, B = Carbon dioxide and water, C = Lactic acid, D = Ethyl alcohol and Carbondioxide,



13. Match the following column I and II for organismic respiration.

column-I		column-II	
A.	Respiration in bacteria	1.	Mitochondria
B.	Respiration in cyanobacteria	2.	Cytoplasmic membrane
C.	Respiration in eukaryotic cell	3.	Mesosomes

Codes:

	A	B	C
(a)	2	3	1
(b)	3	2	1
(c)	1	3	2
(d)	3	1	2

JIPMER-2015

Ans. (b) : Respiration in bacteria → Mesosomes
In bacteria plasma membrane folds to form a cell organelles called mesosome which is similar to mitochondria in function.

Respiration in Cyanobacteria → Cytoplasmic membrane
Respiration in cyanobacteria occurs with the help of cytoplasmic membrane which is made of lipid and protein.

Respiration in eukaryotic cell → Mitochondria
In eukaryotic cell mitochondria (power house of cell) perform the process of respiration.

14. Oxidation of palmitic acid yield :

(a) 129 ATP (b) 132 ATP
(c) 36 ATP (d) 76 ATP

AIPMT-1998

Ans. (a) : Palmitic acid = $C_{16}H_{32}O_2$
$2n = 16$
$n = 8$
that means after the oxidation of palmitic acid 8 Acetyl CoA form,
Number of NADH & $FADH_2$ form = n – 1
= 8 – 1
= 7
Hence there will be 7NADH & 7$FADH_2$ form,
1 NADH = 3 ATP
7 NADH = 7 × 3 = 21 ATP
1 $FADH_2$ = 2 ATP
7 $FADH_2$ = 7 × 2 = 14 ATP
In TCA cycle, 1 Acetyl CoA produce = 12 ATP
So, in TCA cycle, 8 Acetyl CoA form = 12 × 8 = 96 ATP.
From NADH = 21 ATP
From $FADH_2$ = 14 ATP
From TCA cycle = 96 ATP
131 ATP
During the process of oxidation ,
In the first step 2 ATP molecule utilized,
Remaining ATP molecule = 131 – 2 = 129 ATP.
Thus, through the oxidation of one molecule of palmitic acid number of ATP molecule release = 129 ATP

@apna_pdf

15. Which of the following respiratory substrate requires the highest number of O_2 molecules for its complete oxidation?

(a) Tripalmitin (b) Triolein
(c) Tartaric acid (d) Oleic acid

AP EAMCET-2009

Ans. (b) : Triolein – Triolein is a respiratory substrates which requires highest number of ATP molecule for its complete oxidation. It is a symmetrical triglyceride which is derived from 3 units of unsaturated fattyacid chain linked with a molecule of glycerol.

- **Tripalmitin–**Triglycerides such as tripalmitin, trilaurin, tricaprin and trimyristin are used for constructing the internal lipid core.
- **Tartaric acid–**Tartaric acid is often used as an acidulant in grape and lime-flavored beverages, gelatin desserts, jams, jellies , and hard sour confectionary.
- **Oleic acid –** Oleic acid is a type of fatty acid. Oils with oleic acid are used to replace saturated fats in the diet.

16. Four respiratory enzymes are given below. Arrange them in increasing order of the carbon number of the substrates on which they act

(i) Enolase
(ii) Aconitase
(iii) Fumarase
(iv) Alcohol dehydrogenase
The correct order is:

(a) (ii), (iv), (iii), (i) (b) (iv), (i), (ii), (iii)
(c) (i), (iv), (iii), (ii) (d) (iv), (i), (iii), (ii)

AP EAMCET-2009

Ans. (d) :

Respiratory Enzyme	Substrate	Number of Carbon in substrate
Enolase	2 phosphoglyceric acid	3 C
Aconitase	Citric acid	6 C
Fumarase	Fumaric acid	4 C
Alcohol dehydrogenase	Acetaldehyde	2 C

Thus, increasing order of enzyme based on the carbon number of the substrates on which they act is
(iv), (i), (iii), (ii).

17. Step of respiration are controlled by:

(a) Substrates (b) Enzymes
(c) Hormone (d) Bile juice

UPCPMT-2002

Ans. (b) : Step of respiration are controlled by enzymes. In the process of cellular respiration, Glucose is converted into CO_2 & H_2O
This process takes place in 3 steps -
(i) Glycolysis
(ii) Citric acid cycle
(iii) Oxidative phosphorylation

Enzymes–Enzyme transfers the electron from one molecule to another during the respiration.

Ex–In glycolysis (EMP pathway) dehydrogenase removes the hydrogen ion and electrons from intermediate of cell cycle & passed to NAD forming NADH.

Hormone – Hormones are chemical substances that act like messenger molecule in the body.

Bile Juice – Bile is a fluid that is made and released by the liver and stored in the gallbladder. Bile helps indigestion. It breaks down fat into fatty acid.

Substrate – In a context of enzymes, a substrate is the molecule that an enzyme act upon to speed up a reaction.

18. Net gain of ATP in prokaryotes from a molecule of glucose when oxidized is:

(a) 40 (b) 38
(c) 36 (d) 34

UP CPMT-2002

Ans. (b) : In prokaryotes when a single molecule of glucose is oxidized, total 38 molecules of ATP are obtained.

- 2 ATP molecules obtained from glycolysis.
- 2 ATP molecules obtained from kreb's cycle.
- 34 ATP molecules obtained from electron transport system.

Thus, 38 ATP molecules are obtained by oxidation of single glucose molecule.

19. Salt respiration is:

(a) secretion of salt through respiratory channels
(b) decrease in respiration during salt absorption
(c) active increase in respiration during mineral absorption
(d) linking of ion movement with respiratory chain

J&K CET-2002

Ans. (c) : Salt Respiration :- It is the increase in the rate of respiration of a plant or tissue when it is transferred from water to a salt solution.
Saline water contains Na^+ & Cl^- ions. These ions move from lower concentration to higher concentration (against the concentration gradient). In this way salt respiration requires more energy. Hence, Salt respiration is active increase in respiration during mineral absorption.

20. Through which process, phospho-glyceraldehyde is converted into biphosphoglyceric acid?

(a) Phosphorylation and oxidation.
(b) Dephosphorylation and dehydrogenation.
(c) Carboxylation and hydration.
(d) Decarboxylation and hydrogenation.

GUJCET-2008

Ans. (a) : Phosphorylation and oxidation cellular respiration is the process of obtaining chemical energy from the breakdown of organic molecules that we consume through food.
The C-C bonds in the complex molecule undergo oxidation that breaks the bond between them and release lots of energy which the cell traps in the form of ATPs (phosphorylation). Hence, through Phosphorylation and oxidation process, phospho-glyceraldehyde is converted into biphosphoglyceric acid.

21. Cristae help in:

(a) respiration (b) photosynthesis
(c) transpiration (d) guttation

BHU PMT (Mains)-2010

@apna_pdf

Ans. (a) : Mitochondria is a double membrane bound cell organelles.
(i) outer membrane
(ii) inner membrane
The inner membrane folds inside and increase the surface area by forming finger like projection called cristae, which help in respiration. Cristae have 2 faces
(i) Towards matrix side – N face
(ii) Cytosolic side – P face
ATP synthases is an enzyme complex found in inner membrane of mitochondria.

22. Consider the following statements with respect to respiration.
a. Glycolysis occurs in the cytoplasm of the cell
b. Aerobic respiration takes place within the mitochondria
c. Electron transport system present in the outer mitochondrial membrane
d. $C_{51}H_{98}O_6$ is the chemical formula of Tripalmitin – a fatty acid
e. Respiratory quotient

$$= \frac{\text{Volume of } O_2 \text{ evolved}}{\text{Volume of } CO_2 \text{consumed}}$$

Of the above statements
(a) a, b and d alone are correct
(b) b, c and d alone are correct
(c) c, d and e alone are correct
(d) b, d and e alone are correct
(e) a, c and e alone are correct

Kerala PMT-2012

Ans. (a) : Electron transport system is present in the inner membrane of mitochondria.
• The electron transport chain is a series of complexes made up of proteins and organic molecules in the inner membrane of the mitochondria. The electron are transported from NADH + H^+ and $FADH_2$ to molecular oxygen through the complexes of the ETC.
• Tripalmitin ($C_{51}H_{98}O_6$) - is triglyceride derived from palmitic acid, a common fatty acid.
• Respiratory quotient (R. Q) – R.Q is the ratio of volume of carbon dioxide liberated in respiration to the volume of oxygen consumed in it over specific period of time by a unit tissue, called organ or organisms.

$$R.Q = \frac{\text{Volume of } CO_2 \text{ liberated}}{\text{Volume of } O_2 \text{consumed}}$$

23. When malic acid is the respiratory substrate
(a) the amount of carbon dioxide released is more than the oxygen consumed
(b) the amount of carbon dioxide released is less than the oxygen consumed
(c) the amount of carbon dioxide released is equal to oxygen consumed
(d) carbon dioxide is not released

Uttarakhand PMT-2010

Ans. (a) : When malic acid is respiratory substrate: Then the value of R.Q is more than 1 (more than unit.)

$$\underset{\text{Malic acid}}{2C_4H_6O_5} + 3O_2 \longrightarrow 4CO_2 + 3H_2O$$

$$\therefore R.Q = \frac{4}{3} = 1.33 \ (> 1)$$

Hence, the amount of carbon dioxide released is 1.33 times more than the oxygen consumed when malic acid is a respiratory substrate.

24. Pick the reactions separately from the following where a water molecule is removed and reduction of NAD^+ does not occur in the reactions of respiration
(I) Succinic acid → Fumaric acid
(II) Malic acid → Oxaloacetic acid
(III) 2 phosphoglycerate → Phasphoenol pyruvic acid
(IV) Pyruvic acid → Acetyl Co-A
Correct answer is:
(a) I, IV (b) I, II
(c) II, III (d) I, III

AP EAMCET-2016

Ans. (d) :
Succinic acid → Fumaric acid
FAD → $FADH_2$
In Krebs cycle when succinic acid converts to fumaric acid, reduction of FAD occur instead of NAD^+.
2Phosphoglycerate → Phosphoenol pyruvic acid + $2H_2O$
In the process of glycolysis when phosphoglycerate converts to phosphoenol pyruvic acid, 2 water molecules are released.

25. Select the wrong statement :
(a) When tripalmitin is used as a substrate in respiration, the R.Q. is 0.7
(b) The intermediate compound which links glycolysis with Kreb's cycle is malic acid
(c) One glucose molecule yields a net gain of 36 ATP molecules during aerobic respiration
(d) One glucose molecule yield a net gain of 2 ATP molecules during fermentation
(e) The scheme of glycolysis was given by Embden, Meyerhof and Parnas

Kerala PMT-2011

Ans. (b) : Pyruvic acid formed during glycolysis undergoes oxidative decarboxylation to form acetyl CoA. This 2-carbon acetyl CoA acts as a conneting link between glycolysis and kreb cycle.
• Acetyl CoA acts as substrate enters in krebs cycle and the acceptor molecule is oxaloacetate a four carbon compound.
Hence, the intermediate compound which links glycolysis with Kreb's cycle is malic acid is incorrect statement.

26. Cyanide resistant respiration is characteristic of:
(a) viruses (b) bacteria
(c) plants (d) animals

CG PMT-2011 / BHU PMT(Mains)-2006
DUMET-2002

@apna_pdf

Ans. (c) : Cyanide resistant respiration is characteristic of plants.

- During aerobic respiration is the flow of electron in usual mitochondrial electron transport chain is blocked by the presence of cyanides which inhibit the activity of cytochrome oxidize. This type of activity is known as cyanide sensitive respiration.
- Plant mitochondria, however, differ from the animal mitochondria in having an alternate oxidize system pathway through which terminal oxidation of reduced coenzyme continues even in the presence of cyanides. This type of respiration is known as cyanide resistant (or cyanide insensitive) respiration.

27. Which of the following two enzymes catalyzes the release of CO_2 from the substrate?

(I) ∝- Ketoglutaric dehydrogenase
(II) Pyruvate dehydrogenase
(II) Succinic thiokinase
(IV) Enolase

(a) (I), (IV) (b) (II), (III)
(c) (I), (II) (d) (III), (IV)

TS EAMCET-15.05.2016

Ans. (c) : In Krebs cycle, α- ketoglutarate (5C) undergoes oxidative decarboxylation to form succinyl CoA (4c). The reaction is catalyzed by α - ketoglutarate dehydrogenase enzyme complex. One molecule of CO_2 is released and NAD^+ is converted to NADH.

- Pyruvate dehydrogenase enzyme complex converts pyruvic acid into acetyl CoA. This reaction is an oxidative decarboxylation reaction in which one molecules of CO_2 is released and one molecule of reduced NADH is formed.

$2Pyruvate + 2NAD^+ + 2CoA \xrightarrow[Mg^{2+}]{\text{Pyruvate dehydrogenase}} 2acetyl\ CoA + NADH + H^+ + CO_2$

28. Complete oxidation of a molecule of glucose yield :

(a) 15 ATP molecules (b) 36 ATP molecules
(c) 2 ATP molecules (d) 8 ATP molecules

BVP-2006

Ans. (b) : Glycolysis is a sequence of 10 chain reactions catalyzed enzymes. 38 molecules of ATP are formed in oxidation of 1 mol of glucose in aerobic conditions but 2 molecules of ATP are used in during glycolysis , so the net gain is of 36 molecules of ATP. The free energy released in this process in used to produce the high energy molecules ATP and NADPH.

B. Know about Glycolysis

29. Which of the following connect glycolysis to Krebs cycle?

(a) Acetyl Co-A
(b) Ribozyme
(c) Cytochrome oxidase
(d) N-acetyl glucosamine

HP CET-2011 / CMC Vellore-2010
CG PMT-2009, 2007 / Uttarakhand PMT-2007
BCECE-2007, 2006 / UP CPMT-2003, 2001
Rajasthan PMT-1996

Ans. (a) : Acetyl Co-A connect glycolysis to krebs cycle. During glycolysis pyruvic acid is formed by partial oxidation of glucose in the cytoplasm. Pyruvic acid gets transported to the mitochondria, where it undergoes oxidative decarboxylation to form acetyl Co-A. The Acetyl Co-A enters in the kreb cycle.

30. Match List I with List II :

	List I		List II
A.	Oxidative decarboxylation	I.	Citrate synthase
B.	Glycolysis	II.	Pyravate dehydrogenase
C.	Oxidative phosphorylation	III.	Electron transport system
D.	Tricarboxylie acid cycle	IV.	EMP pathway

Choose the correct answer from the options given below :

(a) A-II, B-IV, C-III, D-I
(b) A-III, B-IV, C-II, D-I
(c) A-II, B-IV, C-I, D-III
(d) A-III, B-I, C-II, D-IV

NEET (UG) 07.05.2023

Ans. (a) : Glycolysis is a metabolic pathway in which glucose converts into pyruvic acid.
glycolysis is also called as EMP pathway.(Embden, Meyerhof. and Paranus.)

- Oxidative phosphorylation is an oxidation response where the carboxyl molecule is eliminated as CO_2
- TCA cycle is also known as Krebs cycle or citric cycle it begin with the formation of citric and which contains three carboxylic group (COOH).

31. Given below are two statements : One is labelled as Assertion A and the other is labelled as Reason R :

Assertion A : ATP is used at two steps in glycolysis.

Reason R : First ATP is used in converting glucose into glucose-6-phosphate and second ATP is used in conversion of fructose-6-phosphate into fructose-1-6-diphosphate.

In the light of the above statements, choose the correct answer from the options given below :

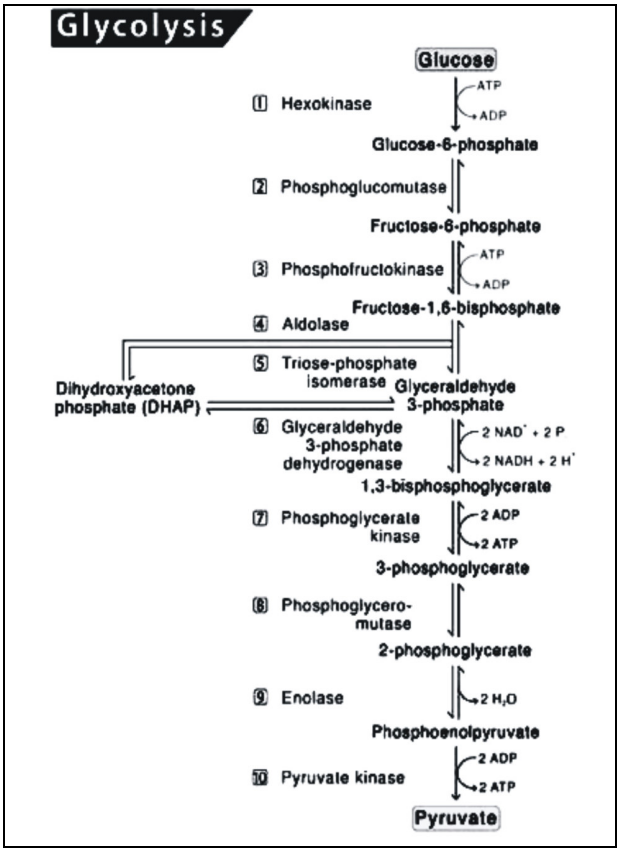
(a) A is false but R is true.
(b) Both A and R are true and R is the Correct explanation of A.
(c) Both A and R are true but R is NOT the correct explanation of A.
(d) A is true but R is false.

NEET (UG) 07.05.2023

Ans. (b) : Glycolysis is the process in which glucose is broken down to produce energy. It produce, two molecule of pyruvic acid, ATP, NADH and water.

- Glycolysis operate in the cytoplasm of cell and does not require oxygen. It occur in both aerobic and anaerobic organisms.
- In first step and third step ATP is used.
- The end products of the reaction include 2 pyruvate 2 ATP and 2 NADH molecules.

@apna_pdf



32. What is the ratio of total ATP molecules formed to net ATP molecules in oxidation of a glucose molecule through glycolytic pathway?

(a) 2:1 (b) 1:2
(c) 3:1 (d) 1:3

TS EAMCET-31.07.2022 Shift-I

Ans. (a) : In glycolysis, two molecules of ATP are consumed during double phosphorylation of glucose to form fructose- 1, 6 diphosphate, while four molecules of ATP are formed by substrate level phosphorylation. Hence, there is a net gain of 2 ATP.

$$\text{Ratio} = \frac{4\ \text{ATP}(\text{proceed during glycolysis})}{2\ \text{ATP}(\text{net gain ATP})}$$

Ratio = 2 : 1

33. Identify the biomolecule common to respiration involving fat, carbohydrate and protein.

(a) Pyruvic acid
(b) Glucose-6-phosphate
(c) Citric acid
(d) Acetyl CoA

TS EAMCET-09.08.2021 Shift-I

Ans. (d) : Acetyl CoA is common intermediated for all the biomolecules to be broken down in the respiratory pathway. Carbohydrates are first converted into glucose. Glucose is converted to pyruvate, which is then decarboxylated to acetyl CoA to enter the TCA cycle.
Fats are broken down into fatty acids and glycerol. Fatty acids are converted into acetyl CoA. Proteins are broken down into amino acids, which are then deaminated and enter as Krebs cycle intermediates, pyruvate or acetyl CoA.

34. Total how many ATP molecules are formed by substrate level phosphorylation in glycolysis?

(a) 8 ATP (b) 4 ATP
(c) 36 ATP (d) 2 ATP

MHT CET-08.10.2020 Shift-I

Ans. (b) : In the substrate level phosporylation per 1 glucose of molecule in glycolysis there are 4 ATP generated. Keep in mind that 2 ATP were used at the begining of pathway.

35. If mitochondria is absent in mature RBC what will be the source of energy:

(a) TCA (b) ETS
(c) Link reaction (d) Glycolysis

AIIMS-25.05.2019 Shift-II

Ans. (d) : In the blood, 3 types of blood corpuscles are found-RBC, WBC, Platelets
In mature mammalian RBC mitochondria absent so kreb cycle does not function.
Through the process of glycolysis RBC metabolize glucose which produces lactate, which is then released from cell provide 2 ATP from each glucose molecules.

36. From among the following, identify the substrate required for the only oxidative reaction that occurs in the process of glycolysis

(a) 3–phosphoglyceric acid
(b) Glyceraldehyde 3–phosphate
(c) Fructose–6–phosphate
(d) Glucose–6–phosphate

TS EAMCET-02/05/2018 Shift-II
AP EAMCET-2007

Ans. (b) : In glycolysis, the oxidative reaction refers to the conversion of glyceraldehyde–3–phosphate to 1,3–bisphosphoglycerate. This is the step where NAD^+ is reduced to form NADH, which is an important electron carrier.
The correct substrate for this oxidative reaction is Glyceraldehyde 3–phosphate.

37. Which is correct link reaction

(a) Pyruvic acid + NAD^+ + Co-A $\xrightarrow[Mg^{++}]{\text{Pyruvate dehydrogenase}}$ Acetyl Co-A + $NADH.H^+ + CO_2$

(b) Pyruvic acid + FAD^+ + Co-A $\xrightarrow[Mg^{++}]{\text{Pyruvate dehydrogenase}}$ Acetyl Co-A + $NADPH.H^+ + CO^2$

(c) Pyruvic acid + NAD^+ + Co-A $\xrightarrow[Mg^{++}]{\text{Pyruvate dehydrogenase}}$ Acetyl Co-A $NADPH.H^+ + CO_2$

(d) Pyruvic acid + NAD^+ + Co-A $\xrightarrow[Mg^{++}]{\text{Pyruvate dehydrogenase}}$ Acetyl Co-A + $NADH.H^+$

AIIMS-27.05.2018 Shift-II

Ans. (a) : The process of glycolysis takes places in cytosol. It is a catabolic process. The end product of this process is pyruvate. Pyruvate enters in mitochondrial matrix that undergoes oxidative decarboxylation by a complex set of reactions catalyzed by pyruvic dehydrogenase.

@apna_pdf

The reactions catalyzed by pyruvic dehydrogenase need the participation of several coenzymes, including NAD^+ and coenzyme A.

$$\text{Pyruvic adic} + NAD^+ + \text{Co - A} \xrightarrow[Mg^{++}]{\text{Pyruvate dehydrogenase}} \text{Acetyl Co - A} + NADH.H^+ + CO_2$$

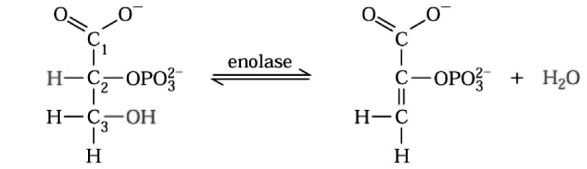
The acetyl Co-A formed in the above reaction enters the krebs cycle.

38. In which of the following reactions of glycolysis, a molecule of water is removed from the substrate?

(a) Glucose → Glucose-6-phosphate
(b) Fructose-6-phosphate → Fructose-1,6 bisphosphate
(c) 2-phosphoglycerate → Phosphoenol pyruvate
(d) Phosphoenol pyruvate → pyruvate

AIIMS-2017

Ans. (c) : In the 9th step of glycolysis, enolase enzyme catalyzes the conversion of 2-phosphoglycerate into phosphoenolpyruvate. This enzyme removes water from 2- Phosphoglycerate and results in the production of phosphoenolpyruvate.



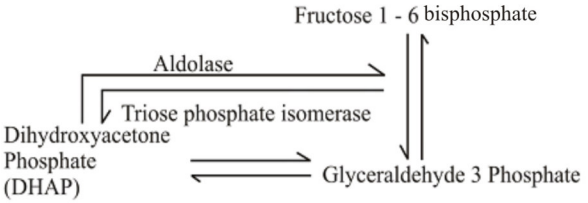
2-Phosphoglycerate (2PG) **Phosphoenolpyruvate (PEP)**

39. During glycolysis the compounds PGAL and DHAP are formed from fructose 1, 6 diphosphate by____

(a) Cleavage (b) Isomerisation
(c) Phosphorylation (d) Condensation

MHT CET-2017

Ans. (a) : This is a type of cleavage reaction, which means breaking a larger molecule into smaller molecules.



Fructose 1, 6 bisphosphate undergoes cleavage to provide glyceraldehydes 3- phosphate (PGAL) and dihydroxyacetone phosphate (DHAP) in a reversible reaction catalyzed by fructose, 1,6-biphosphate aldolase.

40. Number of oxygen molecules utilized in glycolysis is____

(a) 0 (b) 2
(c) 4 (d) 6

MHT CET-2017

Ans. (a) : In the process of respiration (both aerobic and anaerobic), glycolysis is a common process. In the anaerobic respiration there is no need of single molecule of oxygen. It takes places in cytoplasm of cell.

41. The outcome of Calvin cycle include:

(a) 6 CO_2, 18 ATP, 12 NADPH
(b) One glucose, 18 ATP, 12 NADPH
(c) 6 CO_2, 18 ADP, 12 NADP
(d) One glucose, 18 ADP, 12 NADP

Karnataka CET-2017

Ans. (d) : Calvin cycle perform a very important role in the process of photosynthesis.
It is also known as light independent reaction or biosynthetic phase or dark reaction etc.
Calvin cycle occurs in 3 stages –
Carboxylation, reduction, regeneration
One CO_2 molecule fixes in one round of calvin cycle.
The outcome of calvin cycle include 1 molecule of Glucose, 18 ADP & 12 NADP.

42. Excess CO_2 suppress cell growth and productivity by?

(a) Inhibiting respiration
(b) Changing osmolarity of medium
(c) Altering PH of the medium
(d) Both a and c

SRM JEEE -2017

Ans. (d) : Excess CO_2 suppress cell growth and productivity by-
(1) Altering intracellular p^H by diffusing across cell membrane and,
(2) Inhibiting respiration etc.

43. Common enzyme in glycolysis and pentose phosphate pathway is

(a) hexokinase (b) aconitase
(c) fumarase (d) dehydrogenase

UP CPMT-2011

Ans. (d): The enzyme which is found in glycolysis and Pentose phosphate pathway is known as Dehydrogenase.

In pentose phosphate pathway –

Glucose 6 Phosphate —(Dehydrogenation (at Ist Carbon))→ NADPH
NADPH —(Oxidative Phosphorylation)→ Production of ATP

In Glycolysis –

Glyceraldehyde 3 Phosphate —(Glyceraldehyde 3-Phosphate dehydrogenase)→ 1,3- bisphosphoglycerate

44. Identify the correct combinations of the following

	Substrate	Enzyme	Product
I.	Phosphoenol pyruvate	PEP Carboxylase	C_4 acid
II.	Malate	Malic enzyme	C_4 acid
III.	RuBP	Ribulose 5-phosphate kinase	C_3 acid
IV.	Pyruvate	Pyruvate dikinase	C_3 acid

@apna_pdf

The correct combination is:

(a) III and IV (b) I and II
(c) II and III (d) I and IV

AP EAMCET-2007

Ans. (d) : I and IV

	Substrate	Enzyme	Product
I.	Phosphoenol pyruvate	PEP Carboxylase	C_4 acid
II.	Malate	Malate Dehydrogenase	C_4 acid
III.	RuBP	RuBisCo	C_3 acid
IV.	Pyruvate	Pyruvate dikinase	C_3 acid

- PEP Carboxylase-phosphoenolpyruvate carboxylase
- RuBisCo- Ribulose - 1,5 -bisphosphate corboxylase / oxygenase.

Note-

- Malate dehydrogenase is an enzyme that reversibly catalyzes the oxidation of malate to oxaloacetate using the reduction of NAD^+ to NADH.

45. Net gain of ATP during glycolysis are:

(a) 2 (b) 4
(c) 8 (d) 10

GUJCET-2008 / Haryana PMT-2007 / UP CPMT-2006

Ans. (c): Net gain of ATP during glycolysis is 8

In aerobic & anaerobic both respiration, Glycolysis is the first stage of breakdown of glucose in the cell.

In the process of glycolysis, number of ATP molecules used = 2 ATP

Number of ATP molecules generated in glycolysis = 4 ATP.

In the process of glycolysis 2 NADH also form = $2 \times 3 = 6$ ATP

Total ATP molcecule produced = 6 + 4 = 10 ATP

2 ATP molecule utilized earlier

Remaining ATP molecule = 10 – 2 = 8 ATP

46. Which of the following is concerned with CO_2 fixation ?

(a) Krebs cycle (b) Calvin cycle
(c) Ornithine cycle (d) Glycolysis

UP CPMT-2003

Ans. (b) : The calvin cycle is process that happens in plants, algae and some bacteria. It takes CO_2 from the air and fixed it into sugars like glucose. This process occurs in three stages : Carbon fixation, reduction and regeneration of starting molecules.

47. Oxidation of pyruvate to CO_2 and H_2O occur through

(a) citric acid cycle (b) tricarboxylic acid
(c) Krebs cycle (d) All of these

AMU-2008

Ans. (d) : Oxidation of pyruvate to CO_2 and H_2O occurs through the citric acid cycle, which is also known as the tricarboxylic acid cycle or the kreb's cycle. These are different names for the same series of reactions that break down acetyl-CoA derived from carbohydrates, fats and proteins into carbon dioxide, water and energy. The citric acid cycle produces two molecules of CO_2, one molecules of ATP, three molecules of NADH, and are molecule of $FADH_2$ for each molecule of acetyl-CoA that enters the cycle.

48. Glycolysis term has originated from Greek words:

(a) glycose and lysis (b) glycos and lysis
(c) glyco and lysis (d) glucose and lysis

AMU-2012

Ans. (b) : The term glycolysis originates from Greek words Glycos for sugar & lysis for splitting. Glycolysis occurs in both aerobic & anaerobic respiration.

49. Which of the following is formed from phosphorylation?

(a) Fructose 1, 6-bisphosphate
(b) Phosphoglyceric acid
(c) PEP
(d) Pyruvic acid

JCECE-2015

Ans. (a) : Fructose 1,6-bisphosphate is further phosphorylated by means of ATP in the presence of enzyme phosphofructokinase and Mg^{2+}, the product is fructose 1,6-diphosphate or bisphosphate. So the correct answer is fructose 1, 6-biphosphate.

50. Which of the following enzymes is responsible for formation of glucose from glucose-6-phosphate ?

(a) Kinase (b) Aldolase
(c) Dehydrogenase (d) Phosphatase

BHU-PMT (Screening)-2008

Ans. (a) : Glucose is phosphorylated to glucose 6-Phosphate by ATP (Adenosine tri Phosphate) in the presence of enzyme thiokinase or glucokinase and magnesium ($Mg2^+$),

51. Which group of the following scientists discovered the EMP pathway of glycolysis:

(a) Embden, Meyerhof and Parnas
(b) Emerson, Hoffman and Peterson
(c) Embden, Morrison and Pitcher
(d) Avery, Mcleon and McCarthy

BVP-2002

Ans. (a) : Glycolysis is also known as the Embden - Meyerhof - Parnas (EMP) pathway, which was discovered by - Gustav Embden, Otto Meyerhof and J. Parnas in 1930. Glycolysis is a metabolic pathway that is oxygen-independent.

52. In glycolysis, during oxidation electrons are removed by -

(a) Glyceraldehyde-3-phosphate
(b) NAD^+
(c) Molecular oxygen
(d) ATP

AIPMT-2004

Ans. (b) : During glycolysis, NAD (nicotinamide adenine dinucleotide) removes electrons from 1,3 diphospho-glyceric acid using diphosphoglyceral dehyde dehydrogenase

- NAD^+ changes to NADH and this is either utilized as such in anaerobic respiration or in the presence of oxygen.
- NAD^+ is coenzyme central to metabolism found in all living cell. NAD^+ is called a dinucleotide because it consists of two nucleotide.
- Some NAD^+ is converted into the coenzyme nicotinamide adenine dinucleotide phosphate.

@apna_pdf

53. Which one of the following reactions is an example of oxidative decarboxylation?
(a) Conversion of succinate to fumerate.
(b) Conversion of fumerate to malate.
(c) Conversion of pyruvate to acetyl CoA.
(d) Conversion of citrate to isocitrate.

Karnataka CET-2011

Ans. (c) : The pyruvic acid formed during glycolysis enters the mitochondria where oxidative decarboxylation takes place and acetyl CoA– is formed from pyruvate.
This reaction is catalysed by the pyruvic acid dehydrogenase complex and occurs in the presence of NAD^+ and coenzyme - A

Pyruvic acid + NAD^+ + Co-A $\xrightarrow[Mg^{++}]{\text{Pyruvate dehydrogenase}}$ Acetyl Co-A + $NADH + H^+ + CO_2$

54. $2NADH(H^+)$ produced during anaerobic glycolysis yield:
(a) 6 ATP molecules (b) 4 ATP molecules
(c) 8 ATP molecules (d) none of the above

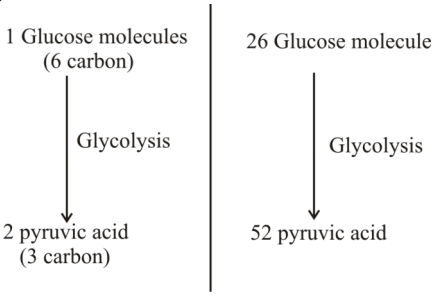
Punjab MET-2007

Ans. (d) : Anaerobic respiration on fermentation is a metabolic process that converts sugar to acid and gases or alcohol. This process takes place when the electron transport chain is unavailable due to lack of a final electron receptor. As the electron transport chain is inactive, NADH (H^+) cannot donate their electron to the ETC to generate ATP. Instead the NADH(H^+) are used in the oxidation of pyruvate formed during anaerobic glycolysis into ethanol and CO_2.
Therefore, as NADH(H^+) is not involved in generation of ATP during anaerobic respiration.

55. How many glucose molecules are required for the formation of 52 pyruvic acid molecules at the end of glycolysis?
(a) 52 (b) 46
(c) 32 (d) 26

MHT CET-2016

Ans. (d) :



56. Which process does the following equation represent?
$C_6H_{12}O_6 + 2NAD + 2ADP + 2Pi \rightarrow 2CH_3–CO–COOH + 2NADH_2 + 2ATP$
(a) Complete glycolysis
(b) Complete aerobic respiration
(c) Complete anaerobic respiration
(d) Complete fermentation

MHT CET-2015

Ans. (a) : Glycolysis is the process in which glucose is split to form energy. It produces two molecules of pyruvate, ATP, NADH and water. The process takes place into the cytoplasm and it does not require oxygen.
$C_6H_{12}O_6 + 2NAD + 2ADP + 2Pi \rightarrow 2CH_3COCOOH + 2NADH_2 + 2ATP$

57. Acetylation of Pyruvate takes place in the____
(a) Perimitochondrial space
(b) Mitochondrial matrix
(c) Cristae
(d) F_1 particles

MHT CET-2014

Ans. (a) : In the process of respiration between glycolysis and kreb cycle linker step is conversion of pyruvate to acetyl Co-A. When pyruvate enter in mitochondria, acetylation starts to take place in perimitochondrial space (space between inner and outer mitochondrial space), before the pyruvate enters the mitochondrial matrix for further processing in the citric acid cycle.

58. Which is the first compound which is common for both glucose & fructose in glycolysis?
(a) Fructose-6-phosphate
(b) Glucose-6-phosphate
(c) Fructose-1, 6-bisphosphate
(d) Fructose-1-phosphate

BCECE-2015

Ans. (a) : Glycolysis is the first process in the process of respiration. It is a multistep reaction. Glucose and fructose both are functional isomers & undergo glycolysis when they required.
Fructose 6-Phosphate is found common to both glucose and fructose in glycolysis.

59. Which enzyme fixes CO_2 in Calvin cycle ?
(a) RuBP carboxylase (b) PEP carboxylase
(c) Carbonic anhydrase (d) Hexokinase

A Punjab MET-2011

Ans. (a) : The enzyme that fixes CO_2 in the Calvin cycle is called Rubisco or RuBP carboxylase. It catalyzes the incorporation of CO_2 into a molecule called RuBP, initiating the process of carbon fixation in photosynthesis.

C. The Fermentation

60. Anaerobic respiration after glycolysis is called:
(a) restoration (b) fermentation
(c) multiplication (d) fragmentation

BCECE-2010 / MGIMS Wardha-2008
Uttarakhand PMT-2007 / WB JEE-2006

Ans. (b) : Aerobic and anaerobic both respiration includes the process of glycolysis.
In anaerobic respiration the generation of 2 ATP occur in the process of glycolysis. Anaerobic process after the glycolysis is called as fermentation.

61. The end product of fermentation are:
(a) CO_2 and O_2 (b) CO_2 and C_2H_5OH
(c) O_2 and C_2H_5OH (d) CO_2 and CH_3CHO

BVP-2012 / VMMC-2002
Haryana-2000, 2001 / AIPMT-1997

@apna_pdf

Ans. (b) : The end product of fermentation are C_2H_5OH & CO_2. The chemical equation for alcoholic fermentation is $C_6H_{12}O_6 \rightarrow 2C_2H_5OH + 2CO_2$.
It is anaerobic process (There is no supply of O_2).
There are two types of fermentation & their end products are different.

Fermentation	End product
Lactic acid fermentation	lactate
Alcohol fermentation	ethyl alcohol and CO_2.

62. Idenitfy the correct statement about fermentation.
(a) Glucose breakdown completely
(b) Net gain of energy is 2 ATP and 1 $NADH_2$
(c) O_2 is required
(d) An anaerobic reaction

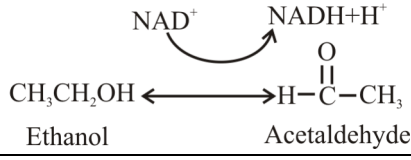
AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Fermentation is a metabolic process that does not require oxygen. In fermentation, glucose is broken down to pyruvate, but the pyruvate is not completely oxidised to carbon dioxide and water. The net gain of energy in fermentation is 2ATP molecules, and it involves the production of ethanol or lactic acid.
Fermentation does not use oxygen; thus it is "anaerobic" reaction.

63. Find out in which of the following enzymatic reactions, NADH is converted to NAD:
(A) Acetaldehyde → Ethanol
(B) Glyceraldehyde 3 – Phosphate → 3 – phosphoglyceric acid
(C) Pyruvic acid → lactic acid
(D) Oxalosuccinic acid → α-ketoglutaric acid
(E) α-ketoglutaric acid → succinyl CoA
(a) B, C (b) D, E
(c) A, B (d) A, C

TS EAMCET-09.08.2021 Shift-II

Ans. (d) : The reduction of acetaldehyde to ethanol is an oxidation reduction reaction that occurs in the presence of alcohol dehydrogenase. In this reaction NAD is formed from $NADH+H^+$.
• Under anaerobic condition , pyruvic acid is converted to lactate in lactate fermentation by using the enzyme lactate dehydrogenase (LDH). In this reaction NAD is formed from $NADH+H^+$.



64. Fermentation differs with aerobic respiration except one in the following?
(a) Partial breakdown of glucose
(b) Net gain is 2 ATP
(c) NADH oxidation is slow
(d) Glucose degraded into CO_2 & H_2O

AP EAPCET-07.09.2021 Shift-I

Ans. (d) : Difference between aerobic respiration and fermentation–
• Fermentation accounts for only a partial breakdown of glucose, whereas in aerobic respiration it is entirely degraded to CO_2 and H_2O.
• In fermentation, there is a net gain of only two molecules of ATP for each molecule of glucose degraded to pyruvic acid whereas many more molecules of ATP are generated under aerobic conditions.
• NADH is oxidized to NAD^+ rather slowly in fermentation however the reaction is very vigorous in case of aerobic respiration.

65. Select a suitable name for this process :
$C_6H_{12}O_6 + 2ADP + 2Pi \rightarrow 2C_2H_5OH + 2ATP + 2CO_2 \uparrow$
(a) Alcoholic fermentation
(b) Photorespiration
(c) Lactate fermentation
(d) Aerobic respiration

Karnataka CET-2012

Ans. (a) :

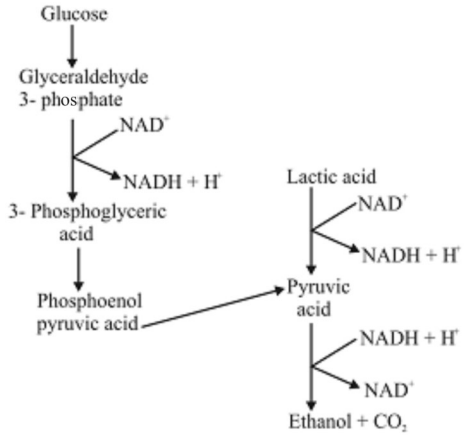
$$\underset{\text{Glucose}}{C_6H_{12}O_{6(aq)}} \xrightarrow{\text{yeast}} 2\underset{\text{Ethanol}}{CH_3CH_2OH_{(aq)}} + 2\underset{\text{carbondioxide}}{CO_{2(9)}} \uparrow$$

• Alcoholic fermentation is also referred to as ethanol fermentation, is a biological process by which sugar is converted into alcohol and carbon dioxide. Yeasts are responsibile for this process and oxygen is not necessary, which means that alcoholic fermentation is an anaerobic process. This type of fermentation is used to make bread, wine, and biofuels to generate energy.

66. The energy-releasing process in which the substrate is oxidized without an external electron acceptor is called:
(a) aerobic respiration (b) glycolysis
(c) fermentation (d) photorespiration

AIPMT-2010, 2008

Ans. (c) : During fermentation, the respiratory substrate is partially oxidized without on external electron acceptor. During aerobic respiration, oxygen acts as an external electron acceptor. Glycolysis is the common step in both aerobic and anaerobic respiration (fermentation.)



67. Continuous addition of sugars in 'fed batch' fermentation is done to:
(a) degrade sewage (b) produce methane
(c) obtain antibiotics (d) purify enzymes

AIPMT (Screening)-2011

Ans. (d) : Purify enzymes.
This is due to the fact that sugars facilitate the metabolism of most of the microorganisms and provide the substrate for respiration and also as a source of energy.

@apna_pdf

68. Ethanol is commercially produced through a particular special of:
(a) Aspergillus (b) Saccharomyces
(c) Clostridium (d) Trichoderma

AIPMT (Screening)-2011

Ans. (b) : Ethanol is generally created through a particular species of yeast Saccharomyces. It is one of the most essential characteristics` of ethanol producing yeast that is ethanol tolerance. It is a common renewable biofuel.

69. The most common substrate used in distilleries for the production of ethanol is:
(a) Molasses (b) Corn meal
(c) Soyabean (d) Ground gram

AIPMT (Screening)-2011

Ans. (a) : The most common substrate used in distilleries for the production of ethanol is molasses. This process of fermentation occurs with the help of *Saccharomyces cerevisiae*, a particular species of yeast.

70. Formation of alcohol by yeast is:
(a) anaerobic process (b) extracellular
(c) microbial (d) All of the above

AMU-2011

Ans. (d) : Formation of alcohol by yeast is an anaerobic process, meaning it occurs in the absence of oxygen. It is also an extracellular process, as yeast cells release alcohol (ethanol) outside of their cell walls during fermentation. This process is indeed microbial, as it involves the activity of microorganisms like yeast.
Hence, all of the above options are correct regarding the formation of alcohol by yeast.

71. Rice wine is:
(a) Beer (b) Wine
(c) Cider (d) Sake

AIIMS-2011

Ans. (d) : Rice wine is a popular alcoholic beverage used for both drinking and cooking. It is known as sake. Rice wine is made by the fermentation of rice starch that is converted to sugars. It is also known as Japanese rice wine because it's originated from Japan.

72. Aerobic respiration produces more usable chemical energy than fermentation, because fermentation involves:
(a) Formation of lactic acid
(b) Complete oxidation of food
(c) Partial oxidation of food
(d) Evolution of CO_2 and alcohol

AIIMS-1995, 2014

Ans. (c) : In aerobic respiration complete oxidation of food occur while in anaerobic respiration partial oxidation of food occur.
Aerobic respiration are forms more usable chemical energy than fermentation.
Number of ATP after aerobic respiration = 38 ATP
Number of ATP form after anaerobic respiration = 2 ATP.

73. When yeast ferments glucose, the products obtained are:
(a) ethanol and CO_2 (b) methanol
(c) ethanol and water (d) water and CO_2

AIPMT-1994

Ans. (a) : At the time of fermentation, yeast cell convert cereal- and convert sugar into ethanol and CO_2. At the same time hundreds of secondary metabolites that influence the aroma and taste of beer are formed.

74. In lactic acid fermentation, the number of ATP formed by the oxidation of NADH is:
(a) eight (b) six
(c) three (d) nil

AMU-2014

Ans. (d) : Lactic acid fermentation occurs in lactic acid bacteria, such as fungi muscles of vertebrates. NADH formed during glycolysis is often used. ATP formation does not occur during regeneration of NAD^+. So, it does not produce ATP. Hence, in lactic acid fermentation, the number of ATP formed by the oxidation of NADH is nil.

75. Which of the following shows fermentation?
(a) Yeast (b) Gymnosperm
(c) Angiosperm (d) None of these

Rajasthan PMT-1999

Ans. (a) : Fermentation - It is a cellular respiration process that happens in absence of O_2 for example anaerobic respiration.
- It takes place in the cytoplasm.
- Lactic acid fermentation and alcoholic fermentation are the two types of anaerobic respiration.
- Alcoholic fermentation observed in fungi such as Yeast, Rhizopus and bacteria.
- Lactic acid fermentation is found in lactic acid bacteria such as lactobacillus, some fungi and muscles of vertebrates

76. Alcoholic fermentation takes place in the presence of:
(a) maltase (b) zymase
(c) amylase (d) invertase

Rajasthan PMT-2003

Ans. (b) : Alcoholic fermentation takes place in the presence of zymase. Zymase is an enzyme complex that changes the simple sugars into ethanol and carbon dioxide.

$$C_6H_{12}O_6 \xrightarrow[\text{Yeast}]{\text{Zymase}} 2C_2H_5OH + 2CO_2$$

77. Fermentation is represented by equation:
(a) $C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2 + 673$ kcal
(b) $C_6H_{12}O_6 \rightarrow 2C_2H_5OH + 2CO_2 + 21$kcal
(c) $6CO_2 + 12H_2O \rightarrow C_6H_{12}O_2 + 6O_2$
(d) $6CO_2 + 6H_2O \xrightarrow[\text{Chlorophyll}]{\text{Light}} C_6H_{12}O_6 + 6O_2$

CG PMT-2004

Ans. (b) : The process of fermentation occur during anaerobic respiration. In fermentation an organism like (yeast) converts carbohydrate into alcohol or acid. Yeast performs fermentation to obtain energy by converting sugar into alcohol. Lactic acid converts carbohydrates into lactic acid.

$$C_6H_{12}O_6 \longrightarrow 2C_2H_5OH + 2CO_2$$

@apna_pdf

D. Aerobic Respiration

78. How many molecules of $FADH_2$ are produced per every glucose molecule in aerobic respiration

(a) Four (b) Three
(c) One (d) Two

TS EAMCET-10.05.2023, Shift-II

Ans. (d) : During aerobic respiration, 2 molecules of $FADH_2$ are produced per every glucose molecules in the kreb's cycle. The kreb cycle is the second stage of aerobic respiration and it takes place in the mitochondria.

In the kreb's cycle, pyruvate molecules from glycolysis are oxidised to carbon dioxide and water.

This process releases energy, which is used to produced ATP and NADH. $FADH_2$ is a molecule that carries electrons from the kreb cycle to the electron transport chain. So, the total number of molecules of $FADH_2$ produced per every glucose molecule in aerobic respiration is 2.

79. The net ATP formed by substrate level phosphorylation, oxidation of NADH + H^+ and oxidation of $FADH_2$ during aerobic respiration of five glucose molecules are

(a) 10, 70, 10 (b) 20, 140, 20
(c) 20, 160, 10 (d) 10, 140, 10

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : During aerobic respiration of five glucose molecules are–

- Substrate-level phosphorylation produced 20 ATP
- Oxidation of NADH + H^+ produces 140 ATP.
- Oxidation of $FADH_2$ produces 20 ATP. In total, 180 ATP is formed through these process.

80. In which of the following reactions of TCA cycle of aerobic respiration NAD is reduced to NADH + H^+ ?

A. Oxidation of isocitric acid
B. Oxidation of α ketoglutaric acid
C. Osication of succinic acid
D. Oxidation of malic acid

(a) AB (b) AC
(c) BCD (d) ABD

TS EAMCET-11.05.2023, Shift-II

Ans. (d) : NAD is reduced to NADH + H^+ in the following reaction of TCA cycle–

- Oxidation of isocitric acid – Isocitric acid is oxidised to alpha – ketoglutaric acid during this process, NAD is reduced to NADH + H^+.
- Oxidation of α-keto glutaric acid is oxidized to succinyl – CoA. NAD is also reduced to NADH + H^+ during this reaction.
- In the oxidation of malice acid, NAD is to NADH + H^+ in the kreb cycles.

81. Consider the following statements regarding photosynthesis and respiration in plants and select the correct option.

I. RuBisCO has high affinity to oxygen in low CO_2 concentration.
II. The Calvin pathway occurs in the chloroplast of bundle sheath cells of C_4 plants.
III. Yeast poison themselves when the concentration of alcohol reaches 7%.
IV. Oxygen is a final hydrogen acceptor during aerobic respiration.

(a) Statements II & IV are correct, I is wrong.
(b) Statements I & II are correct, IV is wrong.
(c) Statements I & III are correct, II is wrong.
(d) Statements I & IV are correct, III is wrong.

Karnataka CET-2020

Ans. (d) : RuBisCO is the most abundant enzyme found on earth. Its full form is Ribulose – 1, 5- bisphosphate carboxylase oxygenase. It performs the process of carbon fixation in C_3 cycle. RuBisCO acts as an oxygenase in low CO_2 concentration.

82. In the mitochondrial matrix, pyruvate is first converted to acetyl CoA by a process called:

(a) substrate level phosphorylation
(b) dehydrogenation
(c) oxidative decarboxylation
(d) condensation

Tripura JEE-2019

Ans. (c) : In the mitochondrial matrix, pyruvate is the first converted to acetyl CoA by a process called oxidative decarboxylation.

Dehydrogenation is the process by which hydrogen is removed from an organic compound to form a new chemical

Condensation is the process by which water vapor in the air is changed into liquid water.

83. Which one of the following metabolic conversions requires oxygen?

(a) Glucose to pyruvate
(b) Glucose to CO_2 and ethanol
(c) Glucose to lactate
(d) Glucose to CO_2 and H_2O

KVPY SA-2019

Ans. (d) : Cellular respiration or respiration is the process by which cells breakdown glucose energy. CO_2 and H_2O are also released in the process. This can happen in the presence of oxygen it is known aerobic respiration.

- During glycolysis, glucose is converted into pyruvate
- Yeast converts glucose to ethanol and CO_2 by anaerobic fermentation

$$\text{Glucose} \xrightarrow{\text{Fermentation}} \text{Ethanol} + CO_2$$

The conversion of glucose to lactate is known as anaerobic glycolysis (it does not require O_2)

84. If Respiratory substrate like sucrose dipeptide protein and lipid are present in living cell, which substrate is utilized first?

(a) Sucrose (b) Lipid
(c) Protein (d) Dipeptide

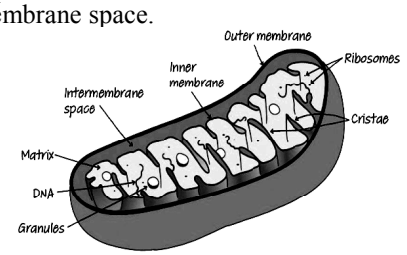
GUJCET-2018

Ans. (a): Sucrose:– The compound oxidized during the process of respiration are called as respiratory substrates. Respiratory substrates like sucrose, dipeptide, protein and lipid are present in living cell. Sucrose (carbohydrate) are utilized first, because it is primary respiratory substrate.

@apna_pdf

85. In mitochondria, protons accumulate in the
(a) Matrix (b) Outer membrane
(c) Inner membrane (d) Intermembrane space
AIPMT (Mains)-2011

Ans. (d) : During aerobic respiration, electrons move through the electron transport chain in mitochondria. As electron move, they loose energy, which is used to pump protons from the mitochondrial matrix to the intermembrane space.



86. Glycolate induces opening of stomata in : -
(a) Presence of oxygen (b) Low CO_2 conc.
(c) High CO_2 (d) CO_2 absent
AIPMT-2001

Ans. (b) : Zelitch (1963) suggested that glycolic acid is formed in the guard cells. This acid is formed under low concentration of CO_2.
- Glycolate produced gives rise to carbohydrates, under this condition osmotically active material is produced and ATP synthesis also takes place.
- ATP is formed during glyoxylate-glycolate shuttle.
- This ATP helps in the active pumping of water in the guard cells and stomata open. Stomata close when this process is reversed.

87. In photosynthesis $NADPH_2$ is formed but in respiration its forms during:
(a) HMP (b) ETS
(c) Krebs cycle (d) None of these
UP CPMT-2006

Ans. (a) : $NADP^+$ and NAD^+ are most important coenzymes in cellular metabolism. These both compound's contain derivatives of vitamin nicotinic acid, function as electron carriers.
$NADPH_2$ is formed during light reaction of photosynthesis and also formed during hexose monophosphate shunt (HMP shunt) of glucose oxidation.
$NADPH_2$ is formed during the aerobic respiration **i.e. kreb's cycle**.

88. Ganong's respiroscope is used to demonstrate……
(a) evolution of oxygen during photosynthesis.
(b) evolution of carbon dioxide during fermentation.
(c) production of carbon dioxide during aerobic respiration.
(d) production of heat during aerobic respiration.
Karnataka CET-2004

Ans. (c) : Ganong's respiroscope is used to demonstrate the production of carbon dioxide during aerobic respiration. The ganong's respiroscope experiment uses germinating seeds to study the evolution of CO_2 during the process of aerobic respiration. Germinating seeds absorb O_2 from the respiroscope and liberate CO_2.

89. Which one is product of aerobic respiration?
(a) Malic acid (b) Ethyl alcohol
(c) Lactic acid (d) Pyruvic acid
WB JEE-2009

Ans. (a) : The product of aerobic respiration is malic acid. It is formed during Krebs cycle.

$$\text{fumaric acid} \xrightarrow[\text{fumerase}]{H_2O} \text{malic acid}$$

In anaerobic respiration ethyl alcohol and lactic acid are formed.

90. In yeast during anaerobic respiration how many glucose molecules are required for production of 38 ATP?
(a) 1 (b) 2
(c) 19 (d) 38
Rajasthan PMT-2004

Ans. (c) : In yeast during anaerobic respiration, 19 glucoses molecules are required for production of 38 ATP. This is because each glucose molecule produce 2 ATP molecules in anaerobic respiration So, to produce 38 ATP we need 38/2 = 19 glucose molecule.

91. Number of water molecules produced per molecule of glucose during aerobic respiration is:
(a) 12 (b) 8
(c) 6 (d) 10
Haryana PMT-2002

Ans. (c) : Number of water molecules produced per molecule of glucose during aerobic respiration is 6.
$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O + 38$ ATP (energy).
The glucose reacts in the presence of six oxygen molecules giving 6 carbon dioxide molecules and six water molecules and energy is released in the form of ATP.

92. In the mesophyll cells of CAM plants, CO_2 fixation during day occur through:
(a) RuBP-oxygenase
(b) PEP-carboxylase
(c) RuBP-carboxylase
(d) Both RuBP carboxylase and PEP-carboxylase
Uttarakhand PMT-2006

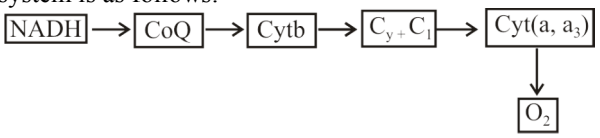
Ans. (c) : In the mesophyll cells of CAM plants, CO_2 fixation during day occur through RuBP-carboxylase.

93. During aerobic respiration the final electron acceptor is:
(a) Cyto b (b) $NADH_2$
(c) Water (d) Oxygen
MHT CET-2016
Punjab MET-2003

Ans. (d) : ATP is formed during the process of oxidative phosphorylation in the mitochondria which is a part of aerobic respiration.
• The electron transport chain plays an important role in this process. The electrons move through a series of electrons donars and carriers that lead to formation of a potential gradient. This gradient helps in ATP synthesis. During this process, O_2 is reduced by the hydrogen from NADH and it finally accepts the electrons of the chain.
Thus, it is the terminal electron acceptor that results in the formation of water molecules.

@apna_pdf

Therefore, during aerobic respiration the final electron acceptor is oxygen.
The sequence of compounds in the hydrogen transport system is as follows:



94. How much of the energy released during aerobic respiration is approximately conserved in the form of ATP?
(a) 20% (b) 40%
(c) 60% (d) 100%
MHT CET-2015

Ans. (b) : Energy gain in complete oxidation of one mole of glucose is:–

$$\text{Glycolysis} \longrightarrow 2ATP + 2NADH_2 = 8ATP$$
$$\downarrow \text{ETS}$$
$$6ATP$$
$$\text{Intermediate step} \longrightarrow 2NADH_2 \xrightarrow{\text{ETS}} 6ATP$$
$$\text{Krebs cycle} \longrightarrow NADH_2 + 2ATP = 24\ ATP$$
$$\text{ETS} \quad \text{ETS}$$
$$18\ ATP \quad 4\ ATP$$
$$\text{Total} = 38\ ATP$$
$$1\ ATP = 7.3\ kcal$$
$$38\ ATP = 38 \times 7.3 = 277.4\ kcal$$

Therefore, efficiency of aerobic respiration is

$$\frac{277.4}{673} \times 100 \approx 40\%$$

Hence, approx 40% of energy is released during aerobic respiration is conserved in the form of ATP.

95. The process by which there is inhibition of aerobic respiration by atmospheric O_2 is:
(a) pasteurs effect (b) calvins effect
(c) darwins effect (d) none of the above
DUMET-2004

Ans. (a) : Louis Pasteur observed that when yeast is exposed to aerobic conditions (in the presence of O_2), their glucose consumption and ethanol production drop, whereas in the presence of O_2 glucose consumption increases several fields. Reason for the decrease in consumption of glucose is that fermentation results in the production of 2 ATPs per glucose whereas aerobic respiration gives 32 ATPs per glucose. Hence, for the generation of same amount ATP to perform essential metabolic activities; more consumption of glucose is needed in anaerobic condition.

96. During aerobic respiration, acetyl Co-A is synthesized in:
(a) Cytosol
(b) Mitochondrial matrix
(c) Glyoxysomal matrix
(d) Perichondrial space
AMU-2014

Ans. (b) : During aerobic respiration, acetyl Co-A is synthesized in mitochondrial matrix. Acetylcoenzyme is formed by oxidative decarboxylation of pyruvate, the end product of glycolysis. Glycolysis takes place in cytosol of the cell but formation of acetyl Co-A occurs in mitochondrial matrix.

97. One mole glucose, on complete oxidation, yields energy:
(a) 686 cal (b) 68,600 cal
(c) 6,86,000 cal (d) 68,60,000 cal
CG PMT-2004

Ans. (c) On complete oxidation of 1 gram of glucose molecule provides 686000 cal of energy.
1 Kcal = 1000 calories
Therefore, 686 kcal = 686000cal

98. Which of the following stages of aerobic respiration takes place in the matrix of the mitochondria?
(i) Oxidative decarboxylation of pyruvic acid
(ii) Glycolysis
(iii) Krebs cycle
(iv) Oxidative phosphorylation
(a) I and II only (b) II and III only
(c) III and IV only (d) I and III only
(e) I and IV only
Kerala PMT-2013

Ans. (d) : Oxidative decarboxylation of pyruvic acid and Kreb's cycle take place in the matrix of the mitochondria.
Glycolysis occurs in cytosol of the cell.
Oxidative phosphorylation is the process of ATP synthesis by energy liberated during oxidation of reduced co-enzymes (NADH, $FADH_2$) produced in respiration. It occurs in inner mitochondrial membrane.

E. Krebs Cycle

99. Krebs cycle takes place in
(a) cytoplasm (b) chloroplast
(c) nucleus (d) mitochondria
Manipal-2012 / AMU-2009
AFMC-2002 /JIPMER-2001
Rajasthan PMT-2000

Ans. (d) : The Krebs cycle, also known as the citric acid cycle or tricarboxylic acid cycle, takes place in the mitochondria of eukaryotic cells. It is a crucial part of cellular respiration, where energy is generated by breaking down glucose and other molecules to produce ATP.

100. In Krebs's cycle, reaction representing substrate level phosphorylation is
(a) G3p → 1, 3 DPGA
(b) Succinyl CoA → Succinic acid
(c) Succinic acid → Fumaric acid
(d) α – ketoglutarate → Succinyl CoA
TS EAMCET 10.05.2023 Shift-I

Ans. (b) : Substrate level phosphorylation is a type of cellular respiration that occurs directly in the substrate, cutouts the need for an electron transport chain. In the case of kreb's cycle, the substrate is succinyl Co A. When succinyl Co A is converted to succinic acid, a high-energy phosphate group is transferred from succinyl Co-A to ADP, forming ATP.

@apna_pdf

101. How many times decarboxylation occurs during each TCA cycle?

(a) Once (b) Twice
(c) Thrice (d) Many

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Carboxyl group is removed from a compound along with the release of carbon dioxide is called decarboxylation.

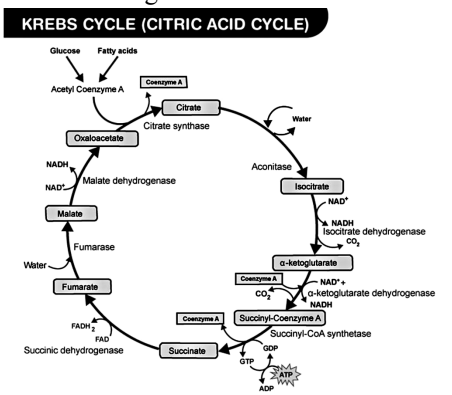
- In the Krebs cycle decarboxylation occurs in two step.
- First decarboxylation occurs when oxalosuccinic acid is converted in α-ketoglutaric acid.
- Second decarboxylation occurs when α-ketoglutaric acid is converted into succinyl CoA.

102. The 5-C compound formed during TCA cycle is:

(a) α-ketoglutaric acid (b) Oxalo succinic acid
(c) Succinic acid (d) Fumaric acid

NEET (Re-Exam)-04.09.2022

Ans. (a) : The only 5-carbon compound formed during TCA cycle is α-Ketoglutaric acid.



103. How many ATP molecules would be produced from complete aerobic breakdown of one molecule of acetyl Co-A?

(a) 38 (b) 15
(c) 36 (d) 12

MHT CET 5.10.2020 Shift-I

Ans. (d) : In the process of aerobic respiration-
1 glucose molecule forms 2 molecule of pyruvic acid.
Each pyruvic acid is converted to Acetyl CoA and enters in Krebs cycle
From one Acetyl CoA, following formation takes place
3 $NADH_2$ = 9ATP
1 $FADH_2$ = 2ATP
1GTP = 1ATP
Total = 12ATP
So, total 12ATP will be produced from complete aerobic breakdown of one molecule of acetyl CoA.

104. How many oxidation steps are involved in aerobic respiration during acetylation and Krebs cycle?

(a) Two (b) Four (c) Three (d) Five

MHT CET-07.10.2020 Shift-I

Ans. (b) : There are four oxidation steps are involved in aerobic respiration during acetylation and Krebs cycle. (A) Isocitrate to alpha-Ketoglutarate
(B) Alpha-ketoglutarate to succinyl Co-A
(C) Succinate to Fumarate
(D) Malate to oxaloacetate

105. In C_4 plants, C_3 cycle takes place in

(a) Mesophyll cells
(b) Bulliform cells
(c) Companion cells
(d) Bundle sheath cells

Karnataka CET-2020

Ans. (d) : In C_4 plants, C_3 cycle takes place in bundle sheath cells. C_3 and C_4 cycle is a type of dark reaction of photosynthesis. The cell present between the upper and lower epidermis are called the mesophyll cells. In C_4 plants the fixation of carbon happens in the mesophyll cells, where as the C_3 cycle or Calvin cycle occurs in the bundle sheath. In this way, the C_4 plants are able to reduce the water loss to the transpiration. Sugarcane, corn and sorghum are example of C_4 plants.

106. Identify the dehydration and oxidation reactions among the following:

i. oxaloacetic acid + Acetyl CoA→ Citric acid + Coenzyme A
ii. Fumaric acid +H_2O → Malic acid
iii. Citric acid → Cis-aconitic acid
iv. ISocitric acid + NAD^+→ oxalosuccinic acid + NADH
v. Malic acid +NAD^+→ Oxaloacetic acid +NADH

The correct combination is

(a) iii, iv, v (b) i, ii, iii, iv
(c) ii, iii, iv, v (d) ii, iii, v, i

TS EAMCET-09.05.2019 Shift-I

Ans. (a) : (III) Citric acid looses water molecule to yield cis-aconitic acid in the presence aconitase enzyme.

Citric acid $\xrightarrow{\text{Aconitase}}$ Cis-aconitic acid +H_2O

• Citric acid, cis-aconitic acid and isocitric acid contain three carboxylic acid groups.

(iv) Isocitric acid undergoes oxidation in the presence of dehydrogenase enzyme to produced succinic acid.

Isocitric acid + NAD^+ $\xrightarrow{\text{dehydrogenase}}$ Oxalosuccinic acid + NADH + H^+

(v) Malic acid undergoes oxidation in the presence of malic dehydrogenase to form OAA.

Malic aicd + NAD^+ $\xrightarrow[\text{dehydrogenase}]{\text{malic}}$ OAA + NADH + H^+.

107. In the following reaction, identify X and Y respectively :

Pyruvic acid + CoA + NAD^+ $\xrightarrow[X]{Mg^{2+}}$ Y + CO_2 + NADH + H^+

(a) Water, Acetyl CoA
(b) Acetyl CoA, Pyruvate dehydrogenase
(c) Pyruvate dehydrogenase, Acetyl CoA
(d) Pyruvate dehydrogenase, Oxalo-acetic acid

Karnataka CET-2018

Ans. (c) : The pyruvate dehydrogenase bring about decarboxylation of pyruvic acid to produce molecule of acetyl CoA which is further utilized in the Krebs cycle. The krebs cycle or TCA cycle (tricarboxylic acid cycle) or citric acid cycle is a series of enzyme catalysed reactions that occur in the mitochondrial matrix, where acetyl - CoA is oxidized to form carbon dioxide and coenzymes are reduced, which generate ATP in the electron transport chain.

@apna_pdf

108. Which statement is wrong for Krebs' cycle?

(a) There are three points in the cycle where NAD+ is reduced to NADH + H+

(b) There is one point in the cycle where FAD+ is reduced to FADH

(c) During conversion of succinyl CO-A to succinic acid, a molecule of GTP is synthesised

(d) The cycle starts with condensation of acetyl group (acetyl CO-A) with pyruvic acid to yield citric acid

NEET-2017

Ans. (d) : The kreb's cycle starts with condensation of acetyl CoA with oxaloacetic acid and water to provide citric acid. Each turn of the cycle forms three NADH molecules and one $FADH_2$ molecule. One GTP molecule is synthesised during conversion of succinyl CoA to succinic acid.

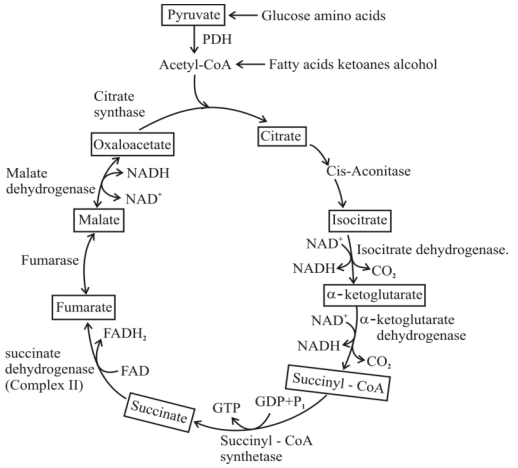


Fig :- Kreb's cycle

109. A competitive inhibitor of succinic dehydrogenase is :

(a) α-ketoglutarate (b) malate

(c) malonate (d) oxaloacetate

AIPMT-2008

Ans. (c) : An inhibitor is a type of chemical compound that supply enzyme activity. A competitive inhibitor shows structural similarity with the substrate and prevents the binding of the substrate to the enzyme.The competitive inhibitor of succinic dehydrogenase is malonate. It resembles the substrate succinate and binds to the active site of the enzyme, thereby inhibiting enzyme activity.

110. In Krebs' cycle GTP is formed by

(a) oxidative phosphorylation

(b) substrate level phosphorylation

(c) photophosphorylation

(d) decarboxylation

UP CPMT-2011

Ans. (b): GTP is formed by substrate – level phosphorylation is the Kreb cycle. Substrate level phosphorylation is a type of ATP synthesis that occurs directly form the energy released by chemical reaction. In the Kreb cycle, GTP is formed during the conversion of succinyl – Co-A to succinate. This reaction is catalyzed by the enzyme succinyl – CoA synthetase, and it requires the hydrolysis of GDP.

111. Which one is not correct about Krebs' cycle?

(a) It occurs in mitochondria.

(b) It starts with six carbon compound

(c) It is also called citric acid cycle.

(d) The intermediate compound which links glycolysis with Krebs' cycle is malic acid.

Karnataka CET-2007

Ans. (d) : The intermediate compound that links glycolysis with krebs cycle is acetyl-CoA, not malic acid. Acetyl-CoA is formed from the oxidative decarboxylation of pyruvate, which is the end product of glycosis. Acetyl-CoA then enters the Krebs cycle by combining with oxaloacetate to form citrate, a six carbon compound. Malic acid is one of the intermediates of the Krebs cycle.

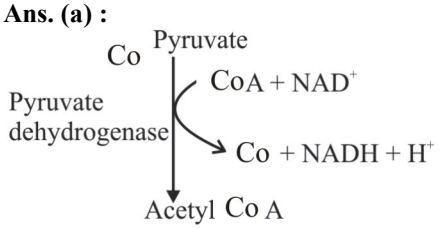
112. Biological oxidation in Krebs cycle involves:

(a) O_2 (b) N_2

(c) CO_2 (d) SO_2

WB JEE-2006

Ans. (a) :



There is no need of oxygen in Krebs cycle directly but it can only take place when oxygen is present because it depends on by products from the electron transport chain which needs oxygen.

113. Match the items in column I with column II.

Column -I	Column II
A. Grana	**Krebs cycle**
B. Stroma	**Light reaction**
C. Cytoplasm	**Dark reaction**
D. Matrix	**Glycolysis**

(a) A - 3 B - 2 C - 1 D - 4

(b) A- 1 B - 2 C - 3 D - 4

(c) A - 2 B - 3 C - 4 D - 1

(d) A - 4 B -1 C - 2 D - 3

VMMC-2011

Ans. (c) :

	Column-I	Column-II
A.	Grana	Light reaction
B.	Stroma	Dark reaction
C.	Cytoplasm	Glycolsis
D.	Matrix	Kreb's cycle

114. Citric acid cycle is the alternate name of which of the following?

(a) HMP shunt (b) Glycolysis

(c) TCA cycle (d) Calvin cycle

WB JEE-2009

Ans. (c) : Citric acid cycle is commonly known as Kreb's cycle or TCA (tricarboxylic Acid cycle)

• HMP shunt (Hexose monophosphate pathway) is also called pentose phosphate pathway

• Calvin cycle is also known as the C_3 cycle or light-independent or dark reaction of photosynthesis. Calvin

@apna_pdf

cycle is the process by which carbon fixation is done to form carbohydrates during photosynthesis.

• EMP pathway is the other name of glycolysis it is named after the 3 scientist Embden, Meyerhof and Parnas who gave the concept of glycolysis. It is the pathway of glucose catabolism.

115. Which of these is not a ketone body?
(a) Acetoacetic acid
(b) Acetone
(c) Succinic acid
(d) Betahydroxy butyric acid

UP CPMT-2004

Ans. (c) : Ketone bodies are produced by the liver and used peripherally as an energy source when glucose is not readily available.
Hence, succinic acid is not a ketone body

116. Which of the following is not an intermediate of Krebs cycle?
(a) Acetyl Co-A (b) Citric acid
(c) Succinic acid (d) Lactic acid

BCECE-2005

Ans. (d) : The intermediate of Kreb's cycle is citric acid, acetyl Co-A succinic acid. Lactic acid is not an intermediate of Krebs cycle. Lactic acid is formed in muscle cells and red blood cell (RBC).

• Lactic acid is fuel for cells during intense exercise.

117. The pyruvic acid formed during glycolysis is oxidized to CO_2 and H_2O in a cycle called:
(a) Calvin cycle (b) Nitrogen cycle
(c) Hill reaction (d) Krebs cycle

J&K CET-2008

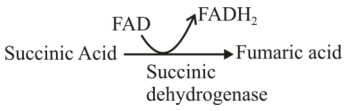
Ans. (d) : The Pyruvic acid formed during glycolysis is oxidized to CO_2 and H_2O in a cycle called Krebs cycle.

- Krebs cycle essentially involves the oxidation of acetyl CoA to CO_2 and H_2O
- Krebs cycle is the central metabolic pathway.
- The TCA cycle is the final common oxidative pathway for carbohydrates, fats and amino acid.
- Nitrogen cycle is a biochemical process through which nitrogen is converted in number of form, passing from the atmosphere to the soil to organism and back into the atmosphere.

118. FAD is electron acceptor in the citric acid cycle during the oxidation of:
(a) Malic acid to oxaloacetic acid
(b) Succinic acid to malic acid
(c) Citric acid to alpha-ketoglutaric acid
(d) Alpha-ketoglutaric acid to succinic acid
(e) Oxaloacetic acid to citric acid

Kerala PMT-2015
WB JEE 2009

Ans. (b) :

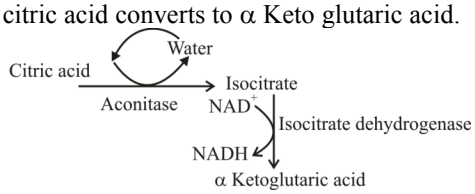


In the Krebs cycle at eighth step in which succinic acid converts in to fumaric acid in the presence of enzyme succinic dehydrogenase release energy and produce FADH that gives 2ATP.

119. In citric acid cycle, decarboxylation occurs when:
(a) citric acid converts to α-ketoglutaric acid
(b) succinic acid converts to malic acid
(c) malic acid converts to oxaloacetic acid
(d) oxaloacetic acid converts to citric acid

AMU-2010

Ans. (a) : In the citric acid cycle decarboxylation occur when citric acid converts to α Keto glutaric acid.



120. Which of the following is true for TCA cycle is eukaryotes?
(a) takes place in mitochondrion
(b) produces no ATP
(c) takes place in Golgi complex
(d) independent of electron transport chain

KVPY SB & SX-2012

Ans. (a) : TCA cycle or Krebs cycle takes place in the mitochondria in the cell. The number of ATP molecules produced in the Krebs cycle is 2ATP.

121. Total yield in one Krebs′ cycle
(a) $3FADH_2$, $2NADH_2$, 1ATP
(b) $2FADH_2$, $2NAD_2$, 2ATP
(c) $2NADH_2$, $1FADH_2$, 2ATP
(d) $3NADH_2$, $1FADH_2$, 1ATP

CG PMT-2006

Ans. (d) : Total yield in one kreb's cycle is 12 ATP
1 NADH + 1 NADH + 1 ATP + 1 $FADH_2$ + 1 NADH = 12 ATP
OR
3 $NADH_2$, 1 $FADH_2$, 1 ATP = 12 ATP

122. In which one of the following do the two names refer to one and the same thing?
(a) Krebs' cycle and Calvin cycle
(b) Tricarboxylic acid cycle and citric acid cycle
(c) Citric acid cycle and Calvin cycle
(d) Tricarboxylic acid cycle acid urea cycle

BHU PMT (Screening)-2011

Ans. (b) : Krebs cycle is also knows as citric acid cycle. It is the second phase of aerobic respiration and starts with the condensation of acetyl CoA with OAA forms citrate, the first tricarboxylic acid of krebs cycle.
Therefore, it is also called as citric acid cycle and tricarboxylic acid cycle.

123. Match the compounds given in Column I with the number of carbon atoms present in them which are listed under column II. Choose the answer which gives the correct combination of alphabets of the two columns.

Column-I	Column-II
(A) Oxaloacetate	1. 6-C compound
(B) Phosphoglycer-aldehyde	2. 5-C compound
(C) Isocitrate	3. 4-C compound
(D) α-Ketoglutarate	4. 3-C compound
	5. 2-C compound

@apna_pdf

(a) A-4 B-5 C-2 D-3
(b) A-3 B-4 C-1 D-2
(c) A-3 B-5 C-1 D-2
(d) A-2 B-4 C-1 D-5

VMMC-2015 / Manipal-2009

Ans. (b) :

	Column I	Column II
A	Oxaloacetate	4 Carbon compound
B	Phosphoglyceradehyde	3 Carbon compound
C	Isocitrate	6 Carbon compound
D	Alpha-ketoglutarate	5 Carbon compound

124. Respiratory quotient during early stages of germination of castor seed is:
(a) one (b) more than one
(c) zero (d) less than one

AP EAMCET-1997

Ans. (d) : Respiratory substrate is less than one in the case of germinating of castor seed. Fats generally have an R.Q value less than one it is because of more oxygen consumed than the number of CO_2 eliminated.
- Organic acid has respiratory quotient is more than one
– R.Q of carbohydrate is approximately one.
– R.Q is zero in succulent plants.

$$R.Q = \frac{\text{Volume of } CO_2 \text{ expelled}}{\text{Volume of } CO_2 \text{ consumed}}$$

125. Krebs cycle was discovered by Krebs in pigeon muscles in 1940. Which step is called gateway stem/link reaction/transition reaction in respiration?
(a) Glycolysis
(b) Formation of acetyl-CoA
(c) Citric acid formation
(d) ETS terminal oxidation

AFMC-2006

Ans. (b) : The gateway step , link reaction, or transition reaction is the step in respiration that links glycolysis to the Krebs cycle. This step is the formation of acetyl – CoA from pyruvate. Acetyl CoA is the substrate for the Krebs cycle and it is also the molecule that carries energy from glycolysis to the Krebs cycle.

126. Most of the biological energy is supplied by mitochondria through:
(a) Breaking of proteins
(b) Reduction of NADP
(c) Breaking of sugar
(d) Oxidizing TCA substrate

AMU - 2008 / VMMC-2008,2006

Ans. (d) : Most of the biological energy is supplied by mitochondria through oxidizing TCA substrate.
The entire process of Krebs cycles which is located in the inner membrane of mitochondria is known as mitochondrial matrix. Krebs cycle or TCA cycle is a catabolic oxidation of organic substrates which results in increase of CO_2 and H_2O.

127. One turn of Krebs' cycle for the oxidation of 1 mole of sucrose produce how many ATP molecules.
(a) 12 (b) 24
(c) 22 (d) 11

CG PMT-2011

Ans. (a) : One mole of sucrose/glucose form 12 ATP molecules
In sucrose, there will be in all turns of Krebs cycle instead of two as in case of glucose and, therefore total ATP production will be two times more than glucose that is 12 ATP.

128. The Nobel Prize for the discovery of TCA cycle and ATP biosynthesis was awarded to:
(a) Hans Krebs
(b) Lipman
(c) Krebs and Lipman jointly
(d) Vishniae and Ochoa

CG PMT-2011

Ans. (c) : The Nobel Prize for the discovery of TCA cycle and ATP biosynthesis was awarded to Krebs and Lipman jointly.

129. The reaction which is catalyzed by a protein that is not found in the matrix of mitochondria is:
(a) conversion of pyruvic acid to acetyl Coenzyme-A
(b) oxidative decarboxylation of α-ketoglutaric acid
(c) oxidation of succinic acid
(d) cleavage of succinyl Coenzyme-A

AP EAMCET-2008

Ans. (c) : The reaction which is catalyzed by a protein that is not found in the matrix of mitochondria is oxidation of succinic acid.

F. ETS and Oxidative Phosphorylation

130. Choose the incorrect statement with reference to the cyclic electron transport
(a) PSI alone is functional
(b) Occurs in stroma lamella.
(c) Membrane of stroma lamellae lack NADP reductase enzyme
(d) Occurs when wavelength below 680 nm are available for e^- excitation.

AP EAPCET-22.05.2023, Shift-I

Ans. (d) : Cyclic electron transport occurs when light with wavelength above 680 nm (primarily absorbed by PSI) is available for electron excitation. This process allows plants to generate ATP without producing NADPH, and it is important to balancing the energy needs of the cell and the production of reducing equivalents for biosynthests.
Hence, the (d) one is incorrect.

131. This event occurs during electron transport system and oxidative phosphorylation of mitochondria
(a) Succinic dehydrogenase transfers electrons to NADH dehydrogenase
(b) $FADH_2$ donates directly to Cytochrome c reductase
(c) Cytochrome c reductase donates electrons directly to ATP synthase for the synthesis of ATP
(d) Oxygen acts as the final hydrogen acceptor

AP EAPCET-23.05.2023, Shift-I

@apna_pdf

Ans. (d) : Oxygen is the final electron acceptor in the electron transport chain because it has the high-test oxidation potential. This means that it can accept electron with the highest amount of energy. When oxygen accepts electrons it combines with hydrogen ions to from water.

132. Which of the following statements are incorrect?

(a) Oxidation-reduction reactions produce proton gradient in respiration

(b) During aerobic respiration, role of oxygen is limited to the terminal stage

(c) In ETC (Electron Transport Chain), one molecule of NADH + H^+ gives rise to 2 ATP molecules, and one $FADH_2$ gives rise to 3 ATP molecules

(d) ATP is synthesized through complex V

NEET-2021

Ans. (c) : In ETC one NADH +H^+ produces 3 ATP while one $FADH_2$ produces 2 ATP molecules.

- During respiration, process of ATP synthesis that is established by oxidation-reduction reactions.
- A proton gradient is required for ATP synthesis that is established by oxidation-reduction reactions.
- ATP is synthesised via complex V.

133. Assertion (A) : When electrons move through the transport chain, protons are transported across the membrane.

Reason (R) : Because the primary acceptor of electron located towards the outside of the membrane, transfers its electrons to a H carrier (PQ).

The correct option among the following is Options:

(a) (A) is true, (R) is true and (R) is the correct explanation for (A)

(b) (A) is true, (R) is true but (R) is not the correct explanation for (A)

(c) (A) is true but (R) is false

(d) (A) is false but (R) is true

TS EAMCET-09.08.2021 Shift-I

Ans. (a) : When electrons move through the transport chain, protons are transported across the membrane because the primary acceptor of electron located towards the outside of the membrane transfers its electrons to a H carrier (PQ).

As electrons move through the photosystems, protons are transported across the membrane. This happens because the primary accepter of electrons which is located towards the outer side of the membrane transfers its electron not to an electron carrier but to an H carrier hence, this molecule removes a proton from the stoma while transporting an electron. When this molecule passes on its electron to the electron carrier on the inner side of the membrane, the proton is released into the inner side or the lumen side of the membrane.

134. Which of the following is/are the product (s) of cyclic photophosphorylation?

(a) Both NADPH and H^+ (b) NADPH

(c) ATP (d) Both ATP and NADPH

KVPY SB & SX-2019 / Kerala PMT-2015

Ans. (c) : Cyclic photophosphorylation is process that uses light energy to produce ATP. It does not produce NADPH.

- NADPH is formed during non-cyclic photophosphorylation by NADP and H^+ .

135. ATP formation occurs through which of the following :

(a) Photophosphorylation

(b) Oxidative phosphorylation

(c) Substrate level phosphorylation

(d) All of these

AIIMS-26.05.2019 Shift-I

Ans. (d) : • Substrate-level phosphorylation is an exergonic reaction in which a phosphoryl group from a substrate is transferred to adenosine diphosphate (ADP or GDP) to produce adenosine triphosphate (ATP or GTP).

• Oxidative phosphorylation is the process that takes place through electron transport chain and establish a proton gradient, followed by chemiosmosis that produce ATP.

• Photophosphorylation uses the radiant energy of the sun for the synthesis of ATP.

136. Oxidation of $NADH_2$ and $FADH_2$ takes place during ETS, which is associated with:

(a) matrix (b) Cytoplasm

(c) Stroma (d) Cristae

MHT CET-2019

Ans. (d) : Oxidation of $NADH_2$ and $FADH_2$ takes place during ETS, which is associated with cristae.

• The inner mitochondrial membrane contain group of electron and proton acceptors. Each of these groups are arranged in specific sequence that form electron transport chain on electron transport system (ETS).

137. Co-enzymes of Electron Transport Chain in mitochondria are____.

(a) Cytochromes,dehydrogenases, flavoproteins

(b) Cytochromes, catalases, peroxidases

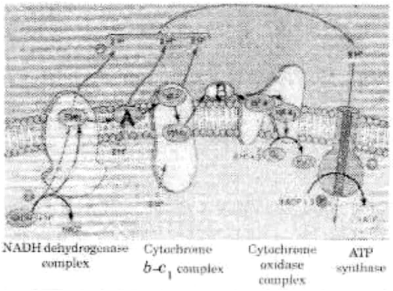
(c) Hyaluronidases, dehydrogenases, hydrolases

(d) Flavoproteins, anhydrases, phosphatases

MHT CET-2018

Ans. (a) : Co-enzymes of Electron Transport Chain in mitochondria are cytochromes,dehydrogenases, flavoproteins.

138. The following is a scheme showing the electron transport system. Identify the electron carrier molecules indicates as A and B Choose the correct option.



(a) A = Cytochrome C, B = Coenzyme Q

(b) A = Coenzyme Q, B = Cytochrome C

(c) A = FMN, B = Fe-S protein

(d) A = Fe-S protein B = FMN

Karnataka CET-2010

@apna_pdf

Ans. (b) : Electron transport system is a series of protein complex and other molecule in inner mitochondrial membrane that transfer electron from electron donor to electron acceptor. Coenzyme Q (shown by A) is a lipid–soluble benzoquinone that serves as an electron carrier and transfers the electrons to cytochrome bc_1 of complex III. Cytochrome C (shown by B) is a soluble protein that accepts an electron from complex III and donates them to the binuclear copper center of complex IV.

139. During which stage in the complete oxidation of glucose are the greatest number of ATP molecules formed from ADP?
(a) Conversion of pytuvic acid in acetyl Co-A
(b) Electron transport chain
(c) Glycolysis
(d) Krebs cycle

JIPMER-2007

Ans. (b) : The electron transport chain is a series of four protein complexes that couple redox reactions, creating an electrochemical gradient that forms ATP in a complete system named oxidative phosphorylation.
Hence, during this stage in the complete oxidation of glucose are the greatest number of ATP molecules formed from ADP.

140. The name of process of aerobic respiration, in which energy is provided in steps in electron transport chain, is:
(a) EMP-pathway
(b) decarboxylation
(c) photophosphorylation
(d) oxidative phosphorylation

WB JEE-2006

Ans. (d) : The name of process of aerobic respiration, in which energy is provided in steps in electron transport chain, is oxidative phosphorylation.

141. Phytochrome occurs in two forms. In which form it promotes the germination of seeds of some species ?
(a) P_{fr} forms (b) P_r forms
(c) Both (a) and (b) (d) None of these

UP CPMT-2004

Ans. (a) : The form of phytochrome that promotes germination is P_{fr} . P_{fr} is the active form of phytochrome , and it is produced when seeds are exposed to red light . P_{fr} then binds to proteins in the cell, which triggers a series of events that lead to germination.
• Phytochrome is a pigment. It is a protein that absorbs light in the red and far red region of the visible spectrum.

142. Photophosphorylation was discovered by:
(a) Hill (b) Arnon
(c) Jolly (d) Dixon

Punjab MET-1999

Ans. (b) : Photophosphorylation was discovered by Dr.Daniel Arnon and his colleagues. It is the process of utilizing light energy from photosynthesis to convert ADP to ATP. Arnon found this in vitro in isolated chloroplast by using P^{32}.

143. The ATP production in photosynthesis is called:
(a) phototropism (b) phosphorylation
(c) photooxidation (d) photophosphorylation

Uttarakhand PMT-2007

Ans. (d) : The ATP production in photosynthesis is called photophosphorylation. During the light reaction of photosynthesis, phosphorylation occurs, where in inorganic phosphate is added to ADP and results in the formation of ATP since this process utilizes light energy. It is known photophosphorylation.

144. In Electron Transport system (ETS), which of the following cytochrome reacts with oxygen?
(a) Cyt – a_3 (b) Cyt – *f*
(c) Cyt – b (d) Cyt – b_6

VMMC-2013

Ans. (a) : In electron transport system (ETS) chytochrome a_3 reacts with oxygen.
• Cyto a_3 also contains copper elements
• Cyto b_6 is the mitochondrial protein which functions as part of electron transport chain

145. Which of the following stains is used for determination of cytochrome oxidase activity in the cell?
(a) Eosin (b) Neutral red
(c) Janus green B (d) Methylene blue

Manipal-2011

Ans. (c) : Janus green B stains is used for determination of cytochrome oxidase activity in the cell. Janus green B is used in change in colour based on the presence of reduced cytochrome c oxidase indicating its activity.
• Janus green – B selectively stains mitochondria

146. Non-cyclic photophosphorylation results in the production of :
(a) ADP (b) ATP
(c) NADPH (d) ATP and NADPH

J&K CET-2012

Ans. (d) : Non-cyclic photophosphorylation results in the production of ATP and NADPH. Oxygen is produced as a waste product of photosynthesis.

147. Which of the following vitamins is used in electron transport system ?
(a) Calciferol (b) Thiamine
(c) Riboflavin (d) Ascorbic acid

AMU -2000

Ans. (c) : Riboflavin (vitamin-B2) is used in electron transport system. It plays an important role by acting as a component of the electron carriers in the form of flavin adenine dinucleotide (FAD) and flavin mononucleotide (FMN). These carriers help transport electrons during the process of generating energy from molecules.

148. Ferredoxin is found in:
(a) PS - I (b) PS - II
(c) Hill reaction (d) P_{680}

CG PMT-2006

Ans. (a) : Ferredoxin is found in PS - I
Reaction center of pigment system - II is P_{680} nm.
Reaction center of photo system - I (PS - I) is P_{700}.
Hill reaction is the portion of the light reaction in which electrons from water are transferred to an electron acceptor that reduce reducing the acceptor.

149. Inner mitochondrial membrane possesses enzyme:
(a) ATP - synthetase, succinate dehydrogenase and respiratory chain enzymes
(b) NADH - cytochrome reduclase and monomeric oxidase

@apna_pdf

(c) Malale and isocitrate dehydrogenases fumarate aconitase and citrate symheiaa
(d) Adenyrate kinase and nucleoside diphosphokinase

CMC Ludhiana-2007

Ans. (a) : The mitochondria is a double membrane cell organelle, that is also called as the power house of the cell. The inner membrane of the mitochondria is the site of the electron transport chain (aerobic respiration).
The inner membrane of the mitochondria membrane help in the synthesis of ATP molecule, succinate dehydrogenase is a part of respiratory complex – II that is responsible for the converting succinate to fumarate in the citric acid cycle or Kreb's cycle.
Thus, the inner membrane of mitochondria possesses enzyme ATP synthetase, succinate dehydrogenase and respiratory chain enzymes.

150. What is common in photosynthesis and respiration?
(a) Light energy (b) $NADPH_2$
(c) Cytochromes (d) $NADH_4$

CMC Ludhiana-2008

Ans. (c) : Cytochrome is common in photosynthesis and respiration.
It takes part in redox reaction and electron transport.
Redox reaction- It is an active protein that is known as cytochrome which contain Fe atom.

151. The carrier which transfer the electrons in electron transport system:
(a) Phytochrome (b) Cytochrome
(c) Quantasomes (d) Fucoxanthin

CMC Ludhiana-2008

Ans. (b) : The carrier which transfer the electrons in electron transport system is cytochrome. It transfers the electrons in electron transport system.
Phytochrome are blue - green, proteinaceous pigment, phytochrome pfr promotes germination of seeds.
Fucoxanthin is a xanthophylls with the chemical formula $C_{42}H_{58}O_6$. It is an accessory pigment in the chloroplast of brown seaweeds.

152. Which one of the following is complex V of the ETS of inner mitochondrial membrane?
(a) NADH dehydrogenase
(b) Cytochrome c oxidase
(c) Ubiquinone
(d) Succinate dehydrogenase
(e) ATP synthase

Kerala PMT-2009

Ans. (e) : Complex V is ATP synthase complex that comprise of head piece, stalk and a base piece. It is also called as F_o-F_1 or elementally particles.
- F_1 is a peripheral membrane protein complex that contains catalytic site for converting ADP and P_i to ATP. It is necessary for binding F_1 to the inner mitochondrial membrane.
- F_o is an integral membrane protein complex consisting of 3 different polypeptides, form the channel for flow of electrons to F_1.

153. The correct sequence of electron acceptor in ATP synthesis is:
(a) Cyt. b, c, a_3, a (b) Cyt. c, b, a, a_3
(c) Cyt. a, a, b, c (d) Cyt. b, c, a, a_3,

AIPMT-1997

Ans. (d) : The electron are transported from NAD^+ to Flavoprotein and then to cytochrome Q. From Cytochrome Q electron are transfer to Cyt b, Cyt c, Cyt a and Cyt a_3.

154. Phosphorylation in respiration is known as:
(a) Oxidative phosphorylation
(b) Photophosphorylation
(c) Reductive photophosphorylation
(d) Oxidative phosphorylation

MHT CET-2006

Ans. (a) : Phosphorylation in respiration is known as oxidative phosphorylation. It is the synthesis of energy rich ATP molecules with the help of energy liberated during oxidation of reduced co-enzymes (NADH, $FADH_2$) formed in respiration.

155. In the electron transport system present in the inner mitochondrial membrane, complexes I and IV are respectively:
(a) NADH dehydrogenase and $FADH_2$
(b) $FADH_2$ and NADH dehydrogenase
(c) NADH dehydrogenase and cytochrome oxidase complex
(d) NADH dehydrogenase and ATP synthase
(e) Cytochrome complex and NADH dehydrogenase

Kerala PMT-2011

Ans. (c) : Complex I of electron transport chain (ETS) is NADH dehydrogenase that oxidizes NADH formed in mitochondrial matrix at the time of citric acid cycle. Complex IV of ETS refers to cytochrome oxidase complex that contain cytochrome a and a_3 and two copper centre.

156. Match the following electron transport chain (ETC) inhibitors with their mode of action.

	Column - I		Column – II
A.	Dinitrophenol (2.4-DNP)	1.	Electro flow from cyt - a_3 to O_2
B.	Cyanide	2.	Direct electrons from Co-Q to O_2
C.	Antimycin -A	3.	Electron flow from NADH/ FADH a to Co-Q
D.	Rotenone	4.	Electron flow from Cyt-b to Cyt-c

Codes
(a) A-2 B-4 C-1 D-3 (b) A-2 B-1 C-4 D-3
(c) A-3 B-4 C-1 D-2 (d) A-4 B-3 C-2 D-1

MGIMS Wardha-2015

Ans. (a) :

	Column-I		Column–II
(A)	Dinitrophenol (2.4-DNP)	(2)	Direct electrons from Co-Q to O_2
(B)	Cyanide	(4)	Electron flow from Cyt-b to Cyt-c
(C)	Antimycin - A	(1)	Electro flow from cyt - a_3 to O_2
(D)	Rotenone	(1)	Electron flow from NADH/FADH a to Co-Q

@apna_pdf

G. The Respiratory Balance Sheet

157. Respiratory substrate fielding maximum number of ATP molecules is:
(a) ketogenic amino acid (b) glucose
(c) amylase (d) glycogen
CG PMT-2011

Ans. (b) : Respiratory substrate that give maximum number of ATP molecules is glucose.
One glucose molecules on aerobic respiration gives 36 ATP molecules.

158. Arrange the following compounds formed in respiration based on their C-atoms in ascending order
(I) Pyruvic acid (II) α-ketoglutaric acid
(III) Citric acid (IV) Malic acid
Identify correct answer:
(a) IV, I, II, III (b) I, IV, II, III
(c) I, II, IV, III (d) I, IV, III, II
AP EAMCET-2016

Ans. (b) : • Pyruvic acid is a 3-carbon compound with empirical formula $C_3H_4O_3$.
• α – ketoglutaric acid is 5-carbon compound with empirical formual $C_5H_6O_5$.
• Citric acid is a 6-carbon compound with empirical formula $C_6H_8O_7$.
• Malic acid is 4-carbon compound with empirical formula $C_4H_4O_4$
So, the ascending order of these molecules on the basis of a number of carbon atoms will be
Pyruvic acid < Malic acid < α-Ketoglutararic acid < Citric acid.

H. Amphibolic pathway

159. How many ATP molecules are synthesized in complete aerobic respiration of dipeptide molecule during Amphibolic pathway?
(a) 30 ATP (b) 60 ATP
(c) 15 ATP (d) 36 ATP
GUJCET-2017

Ans. (a) : Total 30 ATP molecules are synthesized in complete aerobic respiration of dipeptide molecule during amphibolic pathway.

160. During anaerobic respiration in yeast :
(a) H_2O and CO_2 are end products
(b) CO_2, ethanol and energy are end products
(c) CO_2, and H_2O are end products
(d) CO_2, acetic acid and energy are end products
Haryana PMT-2004

Ans. (b) : Anaerobic respiration occurs in the absence of oxygen and involves the partial oxidation of glucose molecules.
The number of ATP molecules obtained through anaerobic respiration is lower than aerobic respiration
In yeast, the end product of anaerobic respiration is ethyl alcohol, CO_2 and ATP.

161. The process of deriving glucose from fats and proteins is called:
(a) glycogenolysis (b) gluconeogenesis
(c) glycogenesis (d) glycolysis
CG PMT-2011

Ans. (b) : The process of obtaining glucose from fats and proteins is called gluconeogenesis.
Gluconeogenesis occurs in the liver cells and maintain blood glucose level during a fast.

162. Which of the two statements together supports that respiratory pathway is an 'amphibolic pathway' ?
(I) Fats breakdown to glycerol and fatty acids subsequently yields acetyle co-enzyme 'A'
(II) In respiration, C-C bonds of complex compounds breakdown through oxidation leading to release of energy
(III) Acetyl coenzyme 'A' from the respiratory pathway is withdrawn for the synthesis of fatty acids .
(IV) Proteins are degraded by protease to amino acids and enter the respiratory pathway.
(a) (I, II) (b) (I, IV)
(c) (II, IV) (d) (II, III)
TS EAMCET-2015

Ans. (d) : In respiration, glucose is first broken down into pyruvate in the cytoplasm and then giving out energy, this makes it a catabolic process.
• The intermediates formed during the breakdown of biomolecules, are utilized to synthesize biomolecules such as proteins, fatty acids, etc. This makes it an anabolic process.

I. Respiratory quotient

163. When the organic acid is oxidised in respiration, the value of R.Q. becomes:
(a) zero (b) one
(c) less than one (d) more than one
MGIMS Wardha-2013 / CG PMT-2005
Rajasthan PMT-1997, 1995

Ans. (d) : When an organic acid is oxidized the value of R.Q. in respiration becomes more than one because organic acid are rich in O_2 and need less O_2 for their oxidation. It is clear from the equation given below,

$$\underset{(\text{malic acid})}{C_4H_6O_5} + 3O_2 \rightarrow 4CO_2 + 3H_2O$$

$$\because \quad \text{R.Q.} = \frac{\text{Volume of } CO_2 \text{ evolved}}{\text{Volume of } O_2 \text{ taken}} = \frac{4}{3}$$

R.Q. = 1.3(More than one)

164. R.Q. is always less than one in:
(a) wheat (b) millets
(c) bean (d) castor
BHU PMT (Mains)-2009 / Haryana PMT-2005
BHU PMT-2003 / HP CET-2012 / VMMC-2004

Ans. (d) : R.Q is always less than one in castor.
Groundnut and castor seeds are fats storing seeds and the stored fats are mobilized during their seed germination.
Therefore, the RQ value is less than one for germinating groundnut and castor seed.
When fats are used in respiration, the R.Q. will be less than one.

@apna_pdf

165. In a germinating seed when protein is aerobically oxidized, the R.Q. value will be:

(a) More than one (b) Less than one
(c) One (d) Zero

BHU PMT (Screening)-2011 / Karnataka CET-2003 DUMET-2001 / AMU-2001 / AP EAMCET-2000

Ans. (b) : $R.Q = \frac{CO_2 \text{ eliminated}}{O_2 \text{ consumed}}$

Respiratory quotient of different compounds have different volumes such as R.Q of protein is around 0.8. Whenever the substrate is protein the R.Q value will be always less than one and in case of a germinating seed protein is aerobically oxidized, then respiratory quotient value will be less than 1.

166. Find out the correct match

	Set-I		Set-II
A.	Tidal Volume	i.	3000 – 3500 ml
B.	Insipratory Reserve Volume	ii.	1000 – 1100 ml
C.	Expiratory Reserve Volume	iii.	500 ml
D.	Inspiratory Capacity	iv.	2500 – 3500 ml

(a) A-iii, B-i, C-iv, D-i
(b) A-ii, B-iii, C-i, D-iv
(c) A-iii, B-iv, C-i, D-ii
(d) A-iii, B-iv, C-ii, D-i

AP EAPCET-23.05.2023, Shift-II

Ans. (d) : j

	Set-I		Set-II
A	Tidal volume	(iii)	500 ml
B	Insipratory Reserve volume	(iv)	2500–3500 ml
C	Expiratory Reserve volume	(ii)	1000 – 1100 ml
D	Inspiratory capacity	(iv)	3000 – 3500 ml

167. Considering following chemical equation, guess what could be the nature of respiratory substrate ?

$2(C_{51}H_{98}O_6)+145O_2 \rightarrow 102CO_2+98H_2O+Energy$

(a) Carbohydrate as well as protein
(b) Fat
(c) Protein
(d) Carbohydrate

MHT CET-06.10.2020 Shift-I

Ans.(b):

$2C_{51}H_{98}O_6+145O_2 \rightarrow 102CO_2+98H_2O+Energy$

$$R.Q = \frac{102CO_2}{145O_2} = 0.7$$

168. When tripalmitin is used as respiratory substrate in aerobic respiration, the process consumes 145 molecules of Oxygen and releases 102 molecules of CO_2, then RQ value would be:

(a) 0.7 (b) 1.0
(c) 0.5 (d) 1.4

Karnataka CET-2019

Ans. (a) : Tripalmitin is a fatty acids and for the fats respiratory quotient is always less than one as consumption of oxygen is more. If 145 molecules of O_2 is consumed and 102 molecules of CO_2 are evolved. The RQ value would be 0.7.

169. RQ of malic acid is:

(a) 1.9 (b) 1.49
(c) 1.33 (d) 1

JIPMER-2018

Ans. (c) : R.Q. of malic acid is 1.33

$$\underset{\text{(Malic acid)}}{C_4H_6O_5} + 3O_2 \rightarrow 4CO_2 + 3H_2O$$

$$R.Q = \frac{4 \text{ mol of } CO_2 \text{ produced}}{3 \text{ mol of } O_2 \text{ consumed}} = 1.33$$

170. Respiratory Quotient (RQ) is less than one when the substrate is :

(a) Protein (b) Carbohydrate
(c) Organic acid (d) None of these

VMMC-2011

Ans. (a) : Respiratory Quotient (RQ) is the ratio of the amount of CO_2 released to the amount of O_2 consumed.

$$R.Q = \frac{\text{amount of } CO_2 \text{ realsed}}{\text{amount of } O_2 \text{ consumed}}$$

When the respiratory substance is fat or protein then the RQ is usually less than one because the volume of carbon dioxide evolved and oxygen observed is not equal.

- Carbohydrate respiratory quotient is 1.
- When organic acid are as a respiratory substance their RQ is greater than one.

171. Respiratory quotient of carbohydrate is :

(a) unity (b) greater than unity
(c) less than unity (d) equal to five

CMC Ludhiana -2013 / BCECE-2005

Ans. (a) : Respiratory Quotient (RQ) is the ratio of volume of CO_2 produced to volume of O_2 consumed.

- RQ of carbohydrate is 1 (unity)

$$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O + ATP$$

$$RQ = \frac{6CO_2}{6O_2} = 1$$

When, carbohydrate are used as substarate and are completely oxidised, the RQ will be 1.

172. The RQ of $C_{39}H_{72}O_6$ is:

(a) 2.71 (b) 1.34
(c) 0.718 (d) 3.250

Manipal-2011

Ans. (c) : $R.Q. = \frac{\text{Volume of } CO_2 \text{ produced}}{\text{Volume of } O_2 \text{ consumed}}$

$$C_{39(Fat)}H_{72}O_6 + 54O_2 \rightarrow 39CO_2 + 36H_2O$$

$$RQ = \frac{39CO_2}{54O_2} = 0.72$$

173. Respiratory Quotient (R.Q.) is defined as :

(a) vol. of O_2/vol. of CO_2
(b) vol. of CO_2/vol. of O_2
(c) vol. of O_2/vol. of N_2
(d) vol. of N_2/vol. of CO_2

AMU-2005 / Uttarakhand PMT-2004 / Manipal-2004

@apna_pdf

Ans. (b) : Respiratory quotient (R.Q) is the ratio of the volume of CO_2 gives out and the volume of O_2 taken in respiration.

$$R.Q = \frac{\text{Volume of } CO_2}{\text{Volume of } O_2}$$

174. R.Q. of sprouting potato tubers will be:

(a) 1 (b) < 1
(c) >1 (d) 0

Karnataka CET-2002

Ans. (a) : R.Q. of sprouting potato tubers will be 1

175. Respiratory quotient of mixed diet is:

(a) 0.25 (b) 0.85
(c) 0.7 (d) 1.5

Haryana PMT-2002

Ans. (b) : The approximate respiratory quotient of a mixed diet is 0.8.
Some of the other factor that may affect the R.Q are energy balance, circulating insulin and insulin sensitivity.

176. RQ of succulents is:

(a) 1 (b) 4
(c) 0 (d) ∞

CG PMT-2006

Ans. (c) : In succulent plants, at night stomata are open and CO_2 is fixed into organic acid therefore, at night there is no net CO_2 evolved.
Hence, value of R.Q. is zero.

177. The respiratory quotient during cellular respiration would depend on:

(a) the nature of enzymes involved
(b) the nature of the substrate
(c) the amount of carbon dioxide released
(d) the amount of oxygen utilized

Karnataka CET-2009
Manipal-2009
JIPMER-2014

Ans. (b) : The respiratory quotient during cellular respiration would depend on the nature of the substrate.

178. More CO_2 is evolved than the volume of oxygen consumed when the respiratory substrate is:

(a) fat (b) sucrose
(c) glucose (d) organic acid

Haryana PMT-2003

Ans. (d) : More CO_2 is evolved than the volume of oxygen consumed when the respiratory substrate is organic acid. The organic acid consume less oxygen due to its adequate presence and give R.Q. more than one.

$$2(COOH)_6 + O_2 \rightarrow 4CO_2 + 2H_2O$$

$$RQ = \frac{4CO_2}{1O_2} = 4 \text{ is for oxalic acid.}$$

179. Respiratory quotient of oxalic acid is:

(a) 1.5 (b) 1.0
(c) 4 (d) 0.7

BVP-2013

Ans. (c) : The organic acid (oxalic acid) consume less oxygen due to its adequate presence and gives R.Q. more than one.

$$2(COOH)_6 + O_2 \rightarrow 4CO_2 + 2H_2O$$

$$RQ = \frac{4CO_2}{1O_2} = 4$$

So, the R.Q. of oxalic acid is 4

180. RQ value of 4 may be expected for the complete oxidation of which one of the following?

(a) Glucose (b) Malic acid
(c) Oxalic acid (d) Tartaric acid

Kerala PMT-2009
Punjab MET-2007

Ans. (c) : The oxalic acid consume less oxygen and release more carbon dioxide, so that R.Q is more than one.

$$2C_2H_2O_4 + O_2 \rightarrow 4CO_2 + 2H_2O$$

$$R.Q = \frac{CO_2}{O_2} = \frac{4}{1} = 4$$

- When carbohydrates are the respiratory substrate:–
  The value of R.Q. = 1.0
- When organic acid are respiratory substrate:
  Then value of R.Q. is < 1 (more than 1.)
- When lipid or fats and proteins are respiratory substrate, R.Q. Value will be less than one . It is because lipids are poor in O_2 for their oxidation.

181. Which one has the lowest respiratory quotient?

(a) Glucose (b) Tripalmitin
(c) Oxalic acid (d) Malic acid

BCECE-2015

Ans. (b) : Respiratory quotient is the ratio of the volume of CO_2 released and O_2 consumed in respiration.

- The respiratory quotient (RQ) depends upon the type of respiratory substrate used during respiration.

It is less than 1 for fat. If tripalmitin is the respiratory substrate the ratio would be about 0.7 2

$$\underset{\text{(Tripalmitin)}}{(C_{51}H_{98}O_6)} + 145O_2 \rightarrow 10CO_2 + 98H_2O \text{ Energy}$$

- R.Q. value is greater than unity (1) as in organic acid O_2 consumption is less than CO_2 release more.

182. The Respiratory Quotient (RQ) of glucose is:

(a) 0.5 (b) 0.7
(c) 1.0 (d) 1.5

WB JEE-2014

Ans. (c) : R.Q. is defined as ratio of volume of CO_2 released to O_2 consumed in respiration.

$$RQ = \frac{\text{Vol. of } CO_2}{\text{Vol. of } O_2}$$

When carbohydrates (glucose) are the respiratory substrate:–
Then value of R.Q. = 1 (unity)

$$C_6H_{12}O_6 + 6O_2 \rightarrow 6CO_2 + 6H_2O + E$$

$$RQ = \frac{6}{6} = 1$$

@apna_pdf

15 PLANT GROWTH AND DEVELOPMENT

A. Plants Growth

1. The deteriorative processes in plants, that naturally terminate their functional life, are collectively called

(a) wilting (b) abscission
(c) plasmolysis (d) senescence

UP CPMT-2009 / Rajasthan PMT-2009 / BVP-2006 AMU-2005 / Manipal-2004 / Uttarakhand PMT-2004

Ans. (d) : The deteriorative process in plants, that naturally terminate their functional life, collectively called senescence. Senescence as an active development cellular process in the growth and functioning of a flowering plants, is indicated in leaf as abscission.

Wilting- When plant-roots are unable to supply sufficient moisture to the stems and leaves, then plant wilt condition.

Abscission- It is the shedding of various parts of an organism.

Plasmolysis –Plasmolysis is defined as the process of contraction or shrinkage of the protoplasm of a plant cell and is caused due to the loss of water in the cell.

2. Humus is essential for plant growth because

(a) it is rich in nutrients and increases the water holding capacity of soil
(b) it increases aeration of soil
(c) it increases porosity of soil
(d) All of above

HP CET-2011 / BCECE-2006 / VMMC-2005 AMU-2004 / BVP-2003

Ans. (d) : Humus is essential for plant growth because it is rich in nutrients and increases the water holding capacity of soil , increases aeration of soil and increases porosity of soil also.

3. The maximum growth rate occurs in

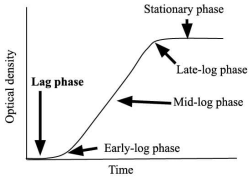
(a) stationary phase (b) senescent phase
(c) lag phase (d) exponential phase

CMC Ludhiana-2012, 2009 / JCECE-2009 Manipal-2007 / CG PMT-2006 / AIPMT-2004

Ans. (d) : The maximum growth rate occurs in exponential phase. It is characterized by rapid growth in population of tree.

In microbial growth curve, lag initial phase is characterized by cellular activity but not growth.

- Exponential or log phase is the time when cells are dividing by binary fission and doubling in number after each generation time.
- In stationary phase, the growth curve begins to destine as the available nutrients become depleted and waste products start to accumulate.
- The terminal irreversible stage of ageing is called senescence this is the last phase of life span that ultimately leads to death.



4. Which of the following statements is not correct?

(a) Plant growth is generally determinate.
(b) Plant growth is measurable.
(c) Phase of cell elongation of plant cells is characterized by increased vacuolation.
(d) Cells in the meristematic phase of growth exhibit abundant plasmodesmatal connections.

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (a) : Plant growth is indeterminate i.e. plants retain the capacity for unlimited growth throughout their life.

- The growth of reproductive organs is limited which is called determinate growth.

5. Growth can be measured by:

(a) Auxanometer (b) Horizontal microscope
(c) Crescograph (d) All of these

SRM JEEE -2019, 2017 UPCPMT-2002

Ans. (d) : Auxanometer – It is used to measure the growth in length of a plant organ.

Horizontal microscope – A horizontal microscope which slides vertical scale is used for measurement of plant growth.

Crescograph – It is a device that is used to measure the growth of plants.

6. Assertion (A) : Measurement and comparison of the total plant growth per unit time is not absolute growth rate.

Reason (R) : The growth of given system per unit time as percentage of initial size is called the relative growth rate

What of the following is true?

(a) Both (A) and (R) are true and (R) is the correct explanation of (A)
(b) Both (A) and (R) are true, but (R) is not the correct explanation of (A)

@apna_pdf

(c) (A) is true, but (R) is false
(d) (A) is false, but (R) is true

TS EAMCET-02.05.2018 Shift-II

Ans. (d) : Increase in total growth of two organs or organisms is measured and comparison of total growth per unit time is called absolute growth rate.
Relative growth rate a measurement of the production of a plant defined as the increase in dry mass per unit of plant. The growth of the given system per unit time expressed on a common basis per unit initial parameter is called relative growth rate.
Hence, (A) is false but (R) is true.

7. Two seeds are germinated, A in light and B in dark. Which grows taller in initial stage?
(a) A > B (b) B > A
(c) A = B (d) No growth in either case

CG PMT-2011

Ans. (a) : When two seeds germinated in different situation, A in light and B in dark then, it is clear that A grows taller in initial stage, because of the auxin is more active in light.
Auxin is a plant hormone which induce cell division, elongation and differentiation, apical dominance, root and stem tropism and in embryonic development.

8. Excess amount of CO_2
(a) retards growth
(b) accelerates growth
(c) affects growth shortly
(d) does not effect growth

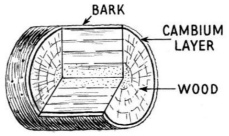
CG PMT-2011

Ans. (a) : Excess amount of CO_2 retards growth. The concentration of CO_2 in the atmosphere today hovers around 410 parts per million. Maximum CO_2 level cause plants to thickness their leaves that could worsen climate change effects. Due to excess of CO_2 trees that grow quickly die younger.

9. The growth in diameter of stem is due to :
(a) cambium (b) xylem
(c) Phloem (d) shoot apex

Rajasthan PMT-2000

Ans. (a) : The growth in diameter of stem is due to cambium. Growth of plants depends on two of growth namely primary growth and secondary growth. Primary growth means increase in length of stem and root and secondary growth means increase in thickness.
Xylem- It acts as main water conducting tissue. It provides mineral and nutrition to plant parts.
Phloem- It works as a main food conducting tissue. It also provides mineral and nutrition to plant parts.
Shoot apex:- It is the apical part of the stem.



'Cambium'

10. The maximum growth of plants occurs during?
(a) summer (b) winter
(c) autumn (d) spring

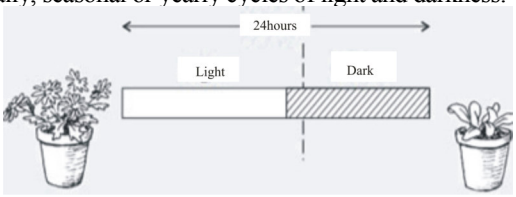
Rajasthan PMT-2000

Ans. (d) : The maximum growth of plants occurs during springseason. In this season the temperature starts increasing and moisture level also increased. We know that plant growth depends upon water, light, warmth and soil or compost. So, spring season is beneficial for all condition.

11. A physiological response to the duration of light and darkness is a
(a) daily phase cycle (b) circadian rhythm
(c) biological clock (d) photoperiodism

AMU-2001

Ans. (d) : A physiological response to the duration of light and darkness is a photoperiodism. It is the ability of plants and animals to measure environmental day length. Photoperiodism response of organism to change of duration in daily, seasonal or yearly cycles of light and darkness.



12. Phototropic curvature in Avena coleoptile is the result of uneven distribution of
(a) auxin (b) starch
(c) gibberellins (d) phytochrome

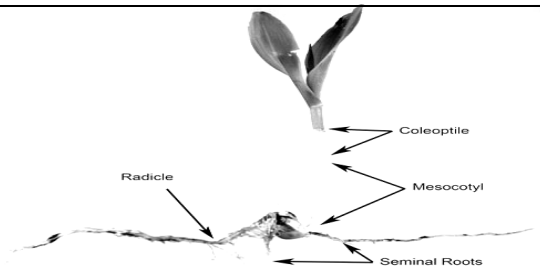
MGIMS Wardha-2013

Ans. (a) : Phototropic curvature in Avena coleoptile is the result of uneven distribution of auxin. Auxin is a plant hormone which is responsible for cell multiplication and photoactive movement so, Auxin can effect phototropic curvature.
Gibberllins- It is a group of plant hormones that collect elongation of the stem, flowering and germination.
Phytochrome- It is used to detect light. It is sensitive to light in the red and far-red region of the visible spectrum.
Starch:- Starch is the major reserve food material found inside the plants.

13. Which part of embryo comes out first during seed germination?
(a) Radicle (b) Plumule
(c) Hypocotyl (d) Epicotyl

BVP-2010, 2014

Ans. (a) : Radicle part of embryo comes out first during seed germination. Embryo is a miniature version of the plants.



Plumule- It helps in developing the shoot system, which includes the stem, leaves, flowers and fruits.
Hypocotyl- It is a part of plant seeding that lies between the radicle and the cotyledons.
Epicotyl–It is a region of the stem of embryo plant found beneath the stalk of leaves directly above the root.

14. Maximum amount of growth in root occurs
(a) In the absence of light
(b) At its apex
(c) Behind the apex
(d) In the presence of soil

BCECE-2011

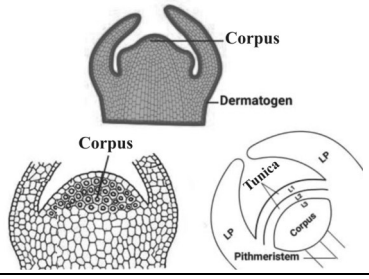
@apna_pdf

Ans. (c) : Maximum amount of growth in root occurs behind the apex. Apex part of root is made up of protective tissue.

15. Tunica corpus theory is used for
(a) shoot apex (b) root apex
(c) leaf apex (d) both [a] and [b]

Uttarakhand PMT-2007

Ans. (a) : Tunica corpus theory is used for shoot apex. This theory is given by Schmidt in 1924. According to the theory, the apical region of the shoot system is categorized. Tunica is the outer covering made up of small cells. Corpus is the inner mass of the cells forming the inner core.



16. In germinating seeds, fatty acids are degraded exclusively in the
(a) proplastids (b) glyoxysomes
(c) peroxisomes (d) mitochondria

BHU PMT (Screening)-2010

Ans. (b) : In germinating seeds, fatty acids are degraded exclusively in the glyoxysomes. Glyoxysomes are small spherical vesicles enclosed by a single unit membrane. Glyoxysomes happen only in fat-rich plant cells, where they take part in β-oxidation of fats and perform the glyoxylate cycle.
Proplastids- They are a pigment. They contain double membrane-bound organelle.
Peroxisomes- They are small in size and their membrane is enclosed that contain enzyme involve in different metabolic reaction.
Mitochondria – Mitochondria are membrane bound cell organelles that generate most of the chemical energy needed to power the cell's biochemical reaction.

17. Senescence as an active developmental cellular process in the growth and functioning of a flowering plants, is indicated in
(a) vessels and tracheid differentiation
(b) leaf abscission
(c) annual plants
(d) floral parts

Rajasthan PMT-2010

Ans. (b) : Senescence as an active development cellular process in the growth and functioning of a flowering plants, is indicated in leaf abscission. Senescence is a metabolic process, therefore it requires energy. It is not simply the ending of growth. Leaves, for example, move the product of photosynthesis- and their own structural substances out of leaf tissue into stem and root tissue during senescence and before their vascular connections are served at abscissions.

18. At which stage the enzymatic actions start in plant?
(a) Germination
(b) At the time of photosynthesis
(c) At the time of flower establishment
(d) At the time of fertilization

AMU-2011

Ans. (a) : At germination stage the enzymatic actions starts in plant. Any enzymatic action that participates in purging DNA of damaged elements and returns it to its canonical form.

19. Plant response to environment is mainly through
(a) induction of dormancy
(b) abscission of parts
(c) synthesis of pigments
(d) growth

CG PMT-2007

Ans. (d) : Plant response to environment is mainly through growth. The response of an organism, usually, a plant, to an environmental stimulus is called a tropism. Some plant stimuli include light, gravity, water, movement of the sun, and touch. The naming of the tropism is associated with the stimulus.

20. Growth is an irreversible process seen at all organizational levels. It consists of
(a) organ growth (b) subcellular growth
(c) cell growth (d) All of the above

CG PMT-2007

Ans. (d) : Growth is an irreversible process seen at all organizational level. It consists of organ growth, subcellular growth and cell growth. It occurs by a rise in cell size or number. In animal, growth rate is observed upto a certain period of time.
Whereas plants show continuous growth throughout the lifetime. Growth is the most fundamental characteristic of living organism and various metabolic process that happen at the value of energy.

21. Substances synthesized during growth are
(a) protoplasmic (b) apoplasmic
(c) both (a) and (b) (d) nucleic acid

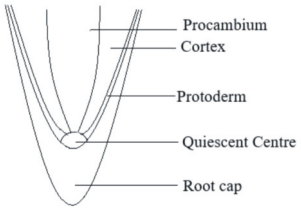
CG PMT-2007

Ans. (c) : Substances synthesized during growth are protoplasmic and apoplasmic. Protoplasmic is a living part of a cell that is covered by a plasma membrane. Protoplasm is mixture of small molecules such as ions, amino acid etc. Apoplasmic are non-living material. They are formed by the cell which become component of tissues.

22. Quiescent center occurs in
(a) at the tip of root apex
(b) at shoot apex
(c) just below the tip of root apex
(d) just below the tip of shoot apex

VMMC-2014

Ans. (a) : Quiescent center occurs at the tip of root apex. It is basically found in the root behind a region of meristematic activity and cell. Quiescent acts a strong resistance towards ionising radiation.



23. Plant growth is:
(a) limited (b) unlimited
(c) diffused (d) irretic

Uttarakhand-2005

@apna_pdf

Ans. (b) : Plant growth is unlimited. Plant growth can be understand as the increasing of plant mass or volume without formation (with formation) of new structures such as cells, tissues or cell organelles. Primary growth in the plant is a result of rapidly dividing cell.

24. A few normal seedlings of tomato were kept in a dark room. After a few days they were found to have become white-coloured like albinos. Which of the following terms will you use to describe them?

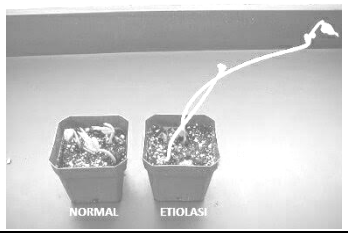
(a) Mutated (b) Embolised
(c) Etiolated (d) Defoliated

AIPMT-2014

Ans. (c) : Etiolation involved prolonged growth in the absence of light.

Etiolation is a process in which flowering plants are grown in the partial or complete absence of light. Etiolation is mainly characterised by the long and weak stem and smaller, sparse pale yellow colour (chlorosis) leaves due to longer internodes. Etiolation is performed by phytohormones such as auxin, gibberellins

Hence, the tomato seedlings when kept in the darkroom were found to become white coloured like albinos.



25. Which one increases in the absence of light?

(a) Uptake of minerals
(b) Uptake of water
(c) Elongation of internodes
(d) Ascent of sap

AIPMT-1989

Ans. (c) : In general intense light retards growth in plants. High light intensities induce dwarfening of the plant. In the absence of light stem becomes excessive long due to 'etiolation'. This causes cells of internodes to get enlarged.

26. If the shoot apex of any young plant growing in a pot, is cut off, which of the following events are more feasible to occur?

(a) the remaining upper leaves will increase in area
(b) the axillary buds in the remaining upper leaves will grow faster
(c) Regeneration of apical bud will occur
(d) The plant dies

AP EAMCET-1998

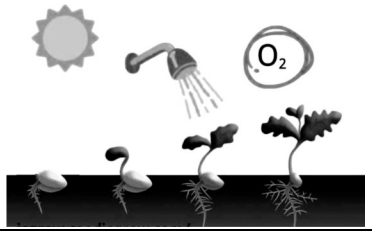
Ans. (b) : When we cut the shoot apex the axillary buds are developed and grow more rapidly. This method is used to obtain tall and bushy plants. Removal of shoot apex is called as topping and growing of axillary buds called is suckering.

27. Necessary conditions for seed germination is

(a) light and O_2
(b) light and high temperature
(c) vernalization and scarification
(d) water and O_2

UP CPMT-2005

Ans. (d) : Water, oxygen, and proper temperature are essential conditions for seed germination. Some seeds require proper light also. Some germinate better in full light while other requires darkness to germinate. When a seed is exposed to the proper conditions, water and oxygen are taken in through the seed coat.



28. Opening of floral buds into flowers, is a type of:

(a) Autonomic movement of growth
(b) Autonomic movement of locomotion
(c) Autonomic movement of variation
(d) Paratonic movement of growth

AIPMT-2007

Ans. (a) : Opening of floral buds into flowers, is a type of autonomic movement of growth.

Movement may be of two types, movement of locomotion and movement of curvature.

- Opening of floral buds into flowers is such a type of growth movement.
- Movement of curvature is movement of individual parts in relation to other parts.
- Curvature movement may be growth movement and turgor movements.
- Growth movements are caused by differential growth in different part of an organ.
- Inner surface or upper surface of floral leaves expand towards outer side due to more cell growths. This makes the flower to open.

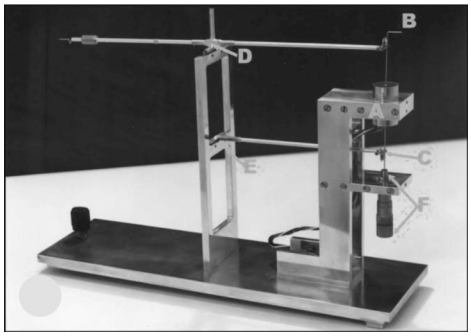
29. Crescograph was invented by :

(a) F.W.Went (b) C.V. Raman
(c) J.C. Bose (d) Charles Darwin

BHU PMT-2001

Ans. (c) : India's greatest scientist sir Jagadish Chandr **Crescograph –** It is a device that is used to measure the growth of plants.

a Bose designed crescograph. It is a plant growth measurement instrument.



Crescograph

@apna_pdf

30. Auxetic growth is increase in
(a) cell volume only
(b) cell number only
(c) fatty tissue
(d) intercellular material

BVP-2010

Ans. (a) : Three type of growth are present in multicellular animal
1. Auxetic growth - Increase in cell volume only not in number
2. Multiplication growth – Increase in number not a volume
3. Accretionary growth – Growth due to mitotic division of some special type of cell occurring in specific location.

31. Rapid and dramatic increase in shoot length is called
(a) Triple response growth
(b) Bolting
(c) Scarification
(d) Night break effect

J&K CET-2007

Ans. (b) : Bolting is called rapid and dramatic increase in shoot length. It is seen in flowering plant during long day condition. It can artificially be induced by application of gibberellic acid. It requires either long day or cold treatment.

32. A tree grows at the rate of 0.5m per year. What will be the height of the board fixed at 1.5 m above the base five years ago?
(a) 4.0 m (b) 3.5 m
(c) 1.5 m (d) 4.5 m

J&K CET-2004

Ans. (c) : According to this question
The rate growth of plant is 0.5 m per year
after 5 year, the plant growth will be
$0.5 \times 5 = 2.5 + 1.5\ m = 4\ m$
After 5 years, the height of the board will be the new height of the board minus the initial height of the plant with the board that is, 2.5 m–1.5 m = 1.5m
Therefore the board was fixed at 1.5 m.

B. Phase of Growth and Development

33. Choose the incorrect pair among the following
(a) Biosphere reserve – Indo Burma region
(b) Aravalli Hills – Rajasthan and Gujarat.
(c) Koringa sanctuary – Uttarakhand
(d) Biodiversity hotspot – Himalayan region
(a) B, C (b) A, C
(c) A, D (d) B, D

AP EAPCET-22.05.2023, Shift-II

Ans. (b) : Biosphere reserve are designated areas that conserve biodiversity and promotes sustainable development. They are located in different parts of the world, including the Indo–Burma region. However, the Nanda Devi Biosphere reserve is located in the Himalyas, not in the indo – Burma region.
• Koringa sanctvary – Andhra Pradesh, the koriga Bird sanctuary is protected area in the state of Andhra Pradesh. It is home to a variety of bird species, including the endangered white necked stork.

34. Differentiation is change of tissues from_____
(a) Meristematic to permanent
(b) Simple to complex
(c) Complex to simple
(d) Permanent to meristematic

SRM JEEE-2019

Ans. (a) : Differentiation is change of tissue from meristematic to permanent. A cluster of cells, performing similar functions are known as tissues. In plants, tissues are classified broadly into two groups on the basis of cell division capacity, namely – Meristematic and Permanent tissue. Meristematic tissues in plants consist of a mass of undifferentiated cells whose main function is to participate in plant growth.

35. Which one increases in the absence of light?
(a) uptake of minerals
(b) uptake of water
(c) elongation of internodes
(d) ascent of sap.

SRM JEEE-2018

Ans. (c) : The elongation of internodes is seen to occur in absence of light but uptake of minerals, uptake of water and ascent of sap all this process are related to photosynthesis which occur in the presence of light.

36. Etiolation in plants is caused when
(a) they are grown in dark
(b) they have mineral deficiency
(c) they are grown in intense light
(d) they are grown in blue light

DUMET-2009

Ans. (a) : Etiolation is a process which is characterized by long, weak stems, smaller leaves due to longer internodes and a pale yellow colour. It is caused when the plants grow in dark without or little light.

37. Which pigment involves in photoperiodic change in plants?
(a) Phytochrome (b) Cytochrome
(c) Chlorophyll (d) Anthocyanin

Rajasthan PMT-2009

Ans. (a) : Phytochrome pigment involve in photoperiodic change in plants. It is a pigment that present in green plants and is mainly responsible for photomorphogenic changes and development.
Cytochrome- It is a iron containing heamoproteins. They are electron carriers and they involved in the generation of ATP via electron transport.
Anthocyanin- It is mainly in the form of red to blue flavonoid pigments that are majorly represented in plants.
Chlorophyll – Chlorophyll is a pigment that gives plants their green colour, and it helps plants create their own food through photosynthesis.

38. The morphogenetic property of cytokinin was first experimentally proved by:
(a) Hannig (b) Guha and Maheshwari
(c) Skoog and Miller (d) Went

AP EAMCET-1999

Ans. (c) : The morphogenetic property of cytokinin was first experimentally proved by 'Skoog and Miller'. Cytokinins control aspects of almost all plant growth and development process. They are a class of plant hormones that promote cell division in plant roots.

@apna_pdf

39. Who proposed the histogen theory

(a) Nageli (b) Schmidt
(c) Strasburger (d) Hanstein

Rajasthan PMT-1996

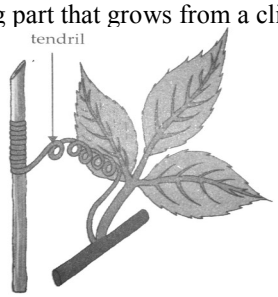
Ans. (d) : The 'Histogen Theory' proposed by 'Hanstein' (1870) and supported by Strasburger (1868). This theory explain three principal tissue of root i.e. vascular cylinder, cortex and epidermis originate different groups of initial, cells or histogen in apical meristem-plerome, problem and dermatogens respectively.

40. Movement of tendrils in response to touch is known as

(a) nyctinastism (b) thigmotropism
(c) seismonastism (d) haptonastism

UP CPMT-2010

Ans. (b) : Movement of tendrils in response to touch is known as thigmotropism. Thigmotropism are movement that happen due to contact with foreign body. Tendrils are a long part that grows from a climbing plant.



Nyctinastism- In plant, it refers to the nastic movement of leaves or petals of higher plants in response to darkness.

Seismonastism- It refers to the movement which is shown by plants on receiving stimulus.

Haptonastism – Haptonasty is a type of growth independent movement observed in Mimosa. In this type of movement, the leaflets fold, and the petioles droop in response to touch.

41. When a plant has different types of leaves, the condition is known as:

(a) heterophylly (b) anisophylly
(c) myremecophylly (d) none of the above

HP CET-2011

Ans. (a) : When a plant has different types of leaves, the condition is known as heterophylly. Heterophylly refers to the different shapes of leaves present at different stages of life or in different environmental conditions in a single plant.

Anisophylly- It means that a plant has two or more shapes and sizes leaves.

Myremecophyly- When ant takes its shelter on some trees such as mango, Litchi, Jamun etc, then this condition is related to myremecophily.

42. The correct sequence of cellular growth stages is

(a) division → differentiation → elongation
(b) differentiation → division → elongation
(c) division → elongation → differentiation
(d) elongation → differentiation → division

MGIMS Wardha-2014

Ans. (c) : According to the given option, the correct sequence of cellular growth stages is as follows.
division → elongation → differentiation
Hence, correct answer is option (c).

43. Grafting involved the formation of a young plant :

(a) with the root of scion and shoot of stalk
(b) with the root of stalk and shoot of scion
(c) by stem cutting
(d) by layering

JIPMER-1999

Ans. (b) : Grafting involved the formation of a young plant with the root of stalk and shoot of scion. Grafting or graftage is a horticultural technique where by tissues of plants are joined so as to continue their growth together.

44. When food supply is poor, the rate of growth is

(a) fast (b) slow
(c) intermediate (d) nil

CG PMT-2007

Ans. (b) : When food supply is poor, the rate of growth is slow. Lag phase is a process that explain the event of growth rate.
Lag phase is the slower phase where cell division is slow. It is also called as period of initial adjustment.

45. The response of plants to light was first of all discovered by:

(a) Lamarck (b) Darwin
(c) Thimann (d) Went

Haryana PMT-1999

Ans. (b) : The response of plants to light was first of all discovered by 'Darwin'.
The response of plants to light is caused due to a chemical process that is called auxin. Auxin was first discovered for its ability to promote growth in plants. This theory was published in 1880, in a book **'The Power of Plant Movement'**.

46. In a longitudinal section of a root, starting from the tip upward, the four zones occur in the following order :-

(a) Root cap, cell division, cell maturation, cell enlargement
(b) Cell division, cell enlargement, cell maturation, root cap
(c) Cell division, cell maturation, cell enlargement, root cap
(d) Root cap, cell division, cell enlargement, cell maturation

AIPMT-2004

Ans. (d) : The root system of a plant develops from the hypocotyls of the embryo of a seed.

- In a longitudinal section of a root, starting from the tip upward, the four zones occur in the following order.
- Root cap → Zone of cell division → Zone of cell enlargement → Zone of cell maturation.

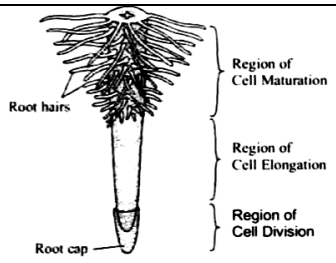
(i) Root cap zone - The apex of each root is covered by a cushion of thin walled cells known as root cap.

(ii) Region of cell division - It lies just behind the root cap it is the main growing region of the root where active cell divisions take place.

(iii) Region of elongation - The region of elongation is responsible for growth in length of the root.

(iv) region of maturation - Epidermal cells of this region give out small, thin, cylindrical unicellular outgrowths, known as root hairs. These are the main absorbing organs of the root.

@apna_pdf



Regions of the root

47. Klinostat is employed in the study of
(a) osmosis (b) growth movements
(c) photosynthesis (d) respiration

AIPMT-1993

Ans. (b) : Klinostat is employed in the study of growth movements. A Klinostat is a device which uses rotation to negate the effect of gravitational pull on plant growth and development.

48. Gibberellic acid induces flowering
(a) in short day plants under long day conditions
(b) in day-neutral plants under dark conditions
(c) in some gymnospermic plants only
(d) in long day plants under short day conditions

AIPMT-1997

Ans. (d) : Gibberellic acid induces flowering in long day plants under short day conditions.Gibberellic acid, a plant hormone stimulating plant growth and development, is a tetracyclic diterpenoid compound.

49. The movement of auxin is largely
(a) centripetal (b) basipetal
(c) acropetal (d) both (a) and (c)

AIPMT-1994

Ans. (b) : Auxin is a growth promoting phytohormone. It moves mainly from the apical to the basal end (basipetally). This type of unidirectional transport is termed polar transport. Auxin is the only plant growth hormone known to be transported polarly.

50. If the growing plant is decapitated, then
(a) Its growth stops
(b) leaves become yellow and fall down
(c) axillary buds are inactivated
(d) axillary buds are activated

AIPMT-1994

Ans. (d) : If the growing plant is decapitated, then axillary buds are activated.

51. Senescence as an active developmental cellular process in the growth and functioning of a flowering plant, is indicated in:
(a) Annual plants
(b) Floral parts
(c) Vessels and tracheid differentiation
(d) Leaf abscission

AIPMT-2008

Ans. (d) : Senescence can be defined as the sum of deteriorative processes which naturally terminate the functional life of an organism. It can occur in a plant or may be limited to a particular plant organ such as leaf and flower or cells such as phloem and xylem. Abscission is natural shedding of leaves, foliage branches, fruits, floral parts etc. According to Leopold (1967) abscission is a senescence phenomenon.
- Abscission is a cell separation process by which plants can shed organs such as fruits, leaves, or flowers. The process takes place in specific locations termed abscission zones.

52. The process in which mature differentiated cells to meristematic activity to form callus is called
(a) Cyto differentiation (b) Redifferentiation
(c) Dedifferentiation (d) Differentiation

Karnataka CET-2007

Ans. (c) : The process in which mature differentiated cell reverse to meristematic activity to form callus is called 'Dedifferentiation'. Dedifferentiation is a phenomenon of reversion of differentiated cell or nuclei to non differentiated.

53. The timing of seasonal activities of plants in relation to change in environment condition is termed as
(a) dendrochronology (b) biological clock
(c) lapse rate (d) phenology

DUMET-2010

Ans. (d) : The timing of seasonal activities plant in relation to change in environmental condition is termed as phenology. It means in summer, fruit ripen. In autumn, leaves change colour and fall in winter, plant rest. It is the study of periodic plant and animal life cycles.
Dendrochronology is the science that deals with the dating and study of the annual growth increments or tree ring in woody trees or shrubs.

54. The branch of science dealing with senescence is called
(a) Serology (b) Genealogy
(c) Gerontology (d) Cosmology

AMU-2002

Ans. (c) : Gerontology:- It is define as the science that deals with ageing. It includes the social, cultural, cognitive and physiological and biological aspects with respect to ageing.
Serology - Serology is the scientific study of serum and other body fluid.
Genealogy - The study of family, origins and history.
Cosmology - Studies how the history of the universe lead to the star, galaxies and other features.

C. Plants growth regulators

55. Identify the Plant Growth Regulators that inhibit apical dominance, delay senescence, promote root hair formation and play an important role in seed development and maturation respectively are
(a) Auxins, Abscisic acid, Ethylene and Cytokinins
(b) Cytokinins, Gibberlic Acid, Ethylene and Absisic acid
(c) Cytokinins, Gibberlic Acid, Auxins, Absisic acid
(d) Auxins, Ethylene, Cytokinins, Gibberelic acid

TS EAMCET-11.05.2023, Shift-II

Ans. (b) : Cytokinins, Gibberlic Acid, Ethylene and Abs sic acid are the plant growth regulators respectively that inhibit apical dominance, delay senescence, promote root hair formation and play an important role in seed development and maturation.

@apna_pdf

56. Which of the following is not a secondary metabolite?

(a) Anthocyanin (b) Lecithin
(c) Curcumin (d) Morphine

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Secondary metabolites are produced by certain micro-organism. It's not essential for the growth and reproduction of organisms from which they are not formed. "Secondary metabolites are the chemical compounds that do not participate in plant metabolism".

- Lecithin is not a secondary metabolites because it is a phospholipid. They are found in cell membrane.
- Anthocyanin, curcumin and morphine are the secondary metabolites.

57. Match List-I with List-II.

	List-I		List-II
(A)	**Terpenoides**	**(i)**	**Codeine**
(B)	**Lectins**	**(ii)**	**Diterpenes**
(C)	**Alkaloids**	**(iii)**	**Ricin**
(D)	**Toxins**	**(iv)**	**Concanavalin A**

Choose the correct answer from the options given below:

(a) (A)-(ii), (B)-(iii), (C)-(i), (D) -(iv)
(b) (A)-(ii), (B)-(iv), (C)-(i), (D) -(iii)
(c) (A)-(ii), (B)-(iv), (C)-(iii), (D) -(i)
(d) (A)-(ii), (B)-(i), (C)-(iv), (D) -(iii)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (b) : Usually option (b) is the correct answer because diterpenes belong to the category of terpenoides, concanavalin is a Lectin. Codein is an alkaloid and Ricin is a toxin.

(A) Terpenoids → Diterpenes
(B) Lectins → Concanavalin-A
(C) Alakloids → Codein
(D) Toxins → Ricin

58. For chemical defence against herbivores, Calotropis has

(a) toxic ricin (b) distasteful quinine
(c) cardiac glycosides (d) strychnine

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (c) : These are the glycosides naturally obtained from certain plants and contain active principles which act specifically on the failing heart and make them normal. That's why, they are called cardiac glycosides.

- They increase force of myocardial contraction, but not heart rate.
- Ricin preventing the cells from making the proteins they need.
- Quinine is used to treat malaria caused by plasmodium falciparum.
- Strychnine prevents chemical that controls nerve signals to the muscles.

59. Identify the derivative of carotenoids

(a) Gibberellic acid (b) Indole butyric acid
(c) Indole-3-acetic acid (d) Abscisic acid

AP EAMCET-12.07.2022 Shift-II
AIPMT-2009

Ans. (d) : Abscisic acid is a derivative of carotenoid.

- Abscisic acid (ABA) is a plant hormone that is also as abscisin II or dormin.
- Carotenoids are the source of abscisic acid.
- Carotenoids are essential pigments in photosynthetic organs along with chlorophylls and acts as anti-oxidants, photo protector, precursors of plant hormones in non - photosynthetic organs of plants and colour attractants.

60. The gaseous plant growth regulator is used in plants to :

(a) kill dicotyledonous weeds in the fields
(b) speed up the malting process
(c) promote root growth and root hair formation to increase the absorption surface
(d) help overcome apical dominance

NEET-2022

Ans. (c) : The gaseous plant growth regulator is used in plants to promote root growth and root hair formation to increase the absorption surface.

Gaseous plant growth regulator is ethylene which helps in root growth and root hair absorption and therefore increases the surface area for absorption. Ethylene promotes water absorption by increasing the root's absorption surface.

61. Production of Cucumber has increased manifold in recent years. Application of which of the following phytohormones has resulted in this increased yield as the hormone is known to produce female flowers in the plants :

(a) Cytokinin (b) ABA
(c) Gibberellin (d) Ethylene

NEET-2022

Ans. (d) : Ethylene- Ethylene is a simple gaseous PGR (Plant growth regulator). The hormone finds its use in increasing the yield of cucumber plants by increasing the female flower formation. So the correct answer is Ethylene (C_2H_4).

Cytokinin- Cytokinins are plant hormones that promote cell division or cytokinesis in plant roots and shoots.

Gibberllins- Gibberllins are plant hormones that regulate development processes including stem elongation germination dormancy flowering flower development and leaf and fruit senescence.

ABA- Abscisic acid increases resistance of plants to cold and other types of stresses like drought and water logging etc. It is therefore also known as **stress hormone**.

62. Which of the following statements are false regarding ethephon?

(A) A source of ethylene.
(B) It is slowly absorbed and transported within the plant to release ethylene rapidly.
(C) It causes reduced abscission in flowers and fruits of cotton.
(D) Supresses the internode elongation in deep water rice plants.

(a) A, B, C only (b) B,C, D only
(c) A, C, D only (d) A, B, D only

TS EAMCET-30.07.2022 Shift-II

Ans. (b) : Ethephon is a plant growth regulator used to promote fruit ripening, abscission, flower induction and other responses. $C_2H_6ClO_3P$ is the formula of ethephon. Ethephon is an herbicide, has advantages in controlling the invasive species of *Ipomea cairica.*

- Ethephon in an aqueous solution is readily absorbed and transported within the plant and release ethylene slowly.

@apna_pdf

63. Match the following?

Column – I	Column - II	Column - III
(a) Francis Darwin	(i) Coconut milk	(p) Auxin
(b) F.W. Went	(ii) Rice seedling	(q)Phototropism
(c) E.Kurosawa	(iii) Coleoptiles of canary grass	(r) Kinetin
(d) F. Skoog	(iv) Oats seedlings	(s) Gibberellic acid

(a) (a – iii – q), (b – iv – p), (c – ii – s), (d – i – r)
(b) (a – iv – p), (b – iii – r), (c – i – q), (d – ii – s)
(c) (a – ii – s), (b – i – q), (c – iii – p), (d – iv – r)
(d) (a – i – r), (b – ii – s), (c – iv – p), (d – iii – q)

AP EAMCET-03.09.2021 Shift-I

Ans. (a) : Charles Darwin & his son studies photo-tropism studying coleoptile of canary grass & oats.

- Went first discovered auxin at coleoptiles tip.
- Skoog and miller discovered Kinetin in coconut milk.
- Kurosawa discovered gibberellic acid from fujikuroi fungus found in rice.

64. Match the following concerning the activity function and the phytohormone involved.

A.	**Fruit ripener**	**i.**	**Abscisic acid**
B.	**Herbicide**	**ii.**	**GA_3**
C.	**Bolting agent**	**iii.**	**2, 4-D**
D.	**Stress hormone**	**iv.**	**Ethephon**

Select the correct option from following

(a) (A)-(iv), (B)-(ii), (C)-(i), (D)-(iii)
(b) (A)-(ii), (B)-(iii), (C)-(iv), (D)-(i)
(c) (A)-(iii), (B)-(iv), (C)-(ii), (D)-(i)
(d) (A)-(iv), (B)-(iii), (C)-(ii), (D)-(i)

NEET-2020 Phase-II

Ans. (d)		
(A)	Fruit ripener	Ethephon
(B)	Herbicide	2, 4-D
(C)	Bolting agent	GA_3
(D)	Stress hormone	Abscisic acid

65. Match the following plant hormones given in the List-I with their main corresponding physiological effects, presented in the List-II

	List-I		List-II
A	**Auxin**	**i**	**Cell division**
B	**Gibberellins**	**ii**	**Fruit ripening**
C	**Ethylene**	**iii**	**Bolting in cabbage**
D	**Abscisic acid**	**iv**	**Apical dominance**
		v	**Seed dormancy**

The correct match is:

	(A)	(B)	(C)	(D)
(a)	i	iv	ii	iii
(b)	iv	iii	ii	v
(c)	iii	iv	v	ii
(d)	iv	v	iii	i

TS EAMCET-09.05.2019 Shift-I

Ans.(b):	
List - I	**List-II**
(A) Auxin	Apical dominance
(B) Gibberellins	Bolting in cabbage
(C) Ethylene	Fruit ripening
(D) Abscisic acid	Seed dormancy

66. It takes very long time for pineapple plants to produce flowers. Which combination of hormones can be applied to artificially induce flowering in pineapple plants throughout the year to increase yield?

(a) Gibberellin and Cytokinin
(b) Gibberellin and Abscisic acid
(c) Cytokinin and Abscisic acid
(d) Auxin and Ethylene

NEET-2019

Ans. (d) : Auxin and Ethylene combination of hormones can be applied to artificially induce flowering in pineapple plants throughout the year to increase yield.
Auxin -: Auxin promotes pineapple flowering.
Ethylene -: Ethylene is a gaseous plant hormone. It also helps in synchronization of flowering and fruit set up in pineapple.
Hence, the (d) one is the right answer.

67. Zeatin isolated from

(a) Rice (b) Wheat
(c) Agro-bacterium (d) Maize

SRM JEEE-2019

Ans. (d) : The first natural cytokinin was obtained from unripe maize grains of kernels by Letham 1964. It is known as Zeatin (6 – hydroxy 3 – methyl 2 – butenyl amino – purine). It also occurs in coconut milk. Zeatin is a plant hormone derived from the purine base called adenine. Zeatin belong to the family growth hormone called cytokinins.

68. Functions not induced by Cytokinins

i. Production of leaves
ii. Production of chloroplasts
iii. Nutrient mobilization
iv. Leaf senescence
v. Xylem differentiation
vi Synthesis of carotenoids

Options

(a) i, ii, iii (b) iv, v, vi
(c) ii, iv, v (d) iii, iv, vi

AP EAMCET-25.04.2018 Shift-II

Ans. (b) : Cytokinins functions induced by production of leaves, production of chloroplasts, nutrient mobilization. Leaf senescence has the important function of recycling nutrients, mostly nitrogen to growing and storage organs of the plant.

69. In a garden, the gardner cut the apical bud of Lawsonia (Mehandi) because _____

(a) The length should be limited in Lawsonia
(b) Due to the cutting of apical bud the effect of auxins decreases and lateral bud grows and forms dense appearance that is why it can give a definite shape
(c) Other apical bud grows quickly due to cut of apical bud
(d) Due to the cutting of apical bud effect of ethylene decreases and plant growth rapidly

GUJCET-2017

@apna_pdf

Ans. (b) : In a garden, the gardner cut the apical bud of Lawsonia (Mehandi) because of due to the cutting of apical bud the effect of auxins decreases and lateral bud grows and forms dense appearance that is why it can give a definite shape.

70. Artificial application of auxins like IAA, IBA and NAA to unpollinated pistils can form

(a) Fruits with much flash (b) Larger fruits
(c) Sweet fruits (d) Seedless fruits

BVP-2010
MGIMS Wardha-2009

Ans. (d) : Artificial application of auxins like IAA, IBA and NAA to unpollinated pistils can form seedless fruits. Auxin is a plant hormone that is produced in the stem tip that help cell elongation. Auxins also promote flowering and prevent dropping of fruits and leaves at early stage.

71. ABA closes stomata but which hormone encourages them to open?

(a) GA (b) Auxin
(c) Cytokinin (d) Ethylene

BHU PMT (Screening)-2011

Ans. (c) : ABA closes stomata but cytokinin hormone encourages them to open. Cytokinin also help in plants growth and cytokinesis in different parts of the plant. This hormone controls the opening of stomata. It also has a major role in plant pathogenesis by including disease resistance to certain pathogens.

72. Compare the statements A and B
Statement A: Auxins promote apical dominance by suppressing the activity of lateral buds.
Statement B: In moriculture, periodic pruning of shoot tips is done to make mulberry plants bushy.
Select the correct description.

(a) Both the statements A and B are correct and A is the reason for B
(b) Statement A is correct and B is wrong
(c) Statement A is wrong and B is correct
(d) Both the statements A and B are correct and A is not the reason for B

Manipal-2009

Ans. (a) : According to the given statements A and B are correct and A is the reason for B. Hence, it is clear that option (a) is a correct answer.
Here assertion describes a function of auxins, pruning of mulberry shoots reducing the effect of apical dominance and promotes lateral growth.

73. Match the following column I with column II.

	Column - I		Column - II
A.	Abscisic acid (ABA)	1.	Malt yield in barley grains.
B.	Cytokinin	2.	Excised radish cotyledon expansion test.
C.	Gibberellin	3.	Avena coleoptiles curuatuse test.
D.	Auxin	4.	Horizontal stem growth induction.
E.	Ethylene	5.	Rice seeding growth inhibition test.

(a) A-1 B-2 C-3 D-4 E-5
(b) A-5 B-1 C-2 D-3 E-4
(c) A-5 B-2 C-1 D-3 E-4
(d) A-2 B-1 C-4 D-3 E-5

VMMC-2015

Ans. (c) : According to the given column I and column II data, the correct answer is option (c).

Hormone	Function
Abscisic acid (ABA)	Rice seeding growth inhibition test
Cytokinin	Excised radish cotyledon expansion test
Gibberellin	Malt yield in barley grains
Auxin	Avena coleoptiles curuatuse test
Ethylene	Horizontal stem growth induction

74. During a tissue culture process the student added a chemical X to the set up. After a few days, new green shoots are observed to be appearing on the callus. What was added in the form of X to this set up ?

(a) Auxin (b) Cytokinin
(c) Gibberellins (d) Terpenes

VMMC-2015

Ans. (b) : During a tissues culture process the student added a chemical X to the set up. After a few days, new green shoots are observed to be appearing on the callus. For this set up was added cytokinin. Cytokinins are involved in performing cell division in plant roots and shoot system.

75. Mitosis can be inhibited by

(a) auxin (b) colchicine
(c) cyclins (d) insulin

VMMC-2015

Ans. (b) : Mitosis can be inhibited by colchicine. It is commonly known as *Autumn crocus*. Colchicine prevents cell from forming spindles during mitosis, inhibiting chromosomal segregation during anaphase. It induces multiple sets of chromosomes.
It is also used in cancer therapy to suppress cell division.

76. One of the commonly used plant growth hormone in tea plantations is

(a) ABA (b) Zeatin
(c) IAA (d) Ethylene

Rajasthan PMT-2011

Ans. (c) : One of the commonly used plant growth hormone in tea plantations is IAA. IAA is a type of auxin present in the plant. Indole-3 acetic acid is the synthetic plant hormones which is important in tea plantation.

77. Gibberellin was obtained form :

(a) Gibberella fujikuroi (b) Aspergillus
(c) Yeast (d) none of the above

Rajasthan PMT-2000

Ans. (a) : In 1926 Japanese scientist Eiichi Kurosawa identified that foolish seedling disease was caused by the fungus Gibberella fujikuroi. It induces flowering in long day plants. This process is normally dependent on exposure to long days or low temperature. It controls major parts of plant, growth such as flower development, germination, and flowering time. It is a group of plant hormones responsible for plant growth.

@apna_pdf

78. How does pruning help in making the hedge dense?
(a) It induces the differentiation of new shoots from the rootstock
(b) It frees auxiliary buds from apical dominance
(c) The apical shoot grows faster after pruning
(d) It releases wound hormones

CMC Ludhiana-2009

Ans. (b) : Pruning is the process of cutting shoot tips to promote the lateral growth of branches.
- When pruning frees auxiliary buds from apical dominance it helps in making the hedge dense. Pruning is essential for maintaining attractive and healthy trees and shrubs.
- Apical dominance is the phenomenon by which presence of apical buds does not allow the nearby lateral buds to grow. Apical buds produce high concentration of hormone auxin which inhibits the growth of lateral buds. When the apical buds are removed by pruning, the lateral buds sprout . This produces dense bushy growth.

79. 6-(4-hydroxy-3 methyl-trans-2-butenyl amine) purine is also called as
(a) Methyl jasmonate (b) Zeatin
(c) Brassinolide (d) Triacontanol

AMU-2015

Ans. (b) : 6-(4-hydroxy-3 methyl-trans-2-butenylamine) purine is also called as zeatin. It is a type of cytokinin. Cytokinin promotes cell division in plant, roots, and shoots.
Brassinolide - It is a plant steroid hormones that are essential for plant growth.
Triacontanol-It is an endogenous plant growth regulator which facilitates numerous plant metabolic activities leading to better growth and development.
Methyl jasmonate – Methyl jasmonate and its free-acid jasmonic acid, collectively referred to as jasmonates, are important cellular regulators involved in diverse developmental processes, such as seed germination, root growth, fertility, fruit ripening, and senescence.

80. Primary precursor of IAA is:
(a) phenylalanine (b) tryptophan
(c) Cycas (d) Pteris

BHU PMT-2003

Ans. (b) : Primary precursor of IAA(Indole -3- acetate or Auxin) is tryptophan.The precursor of auxin is tryptophan and Zn.
Cycas- It is only the living genus identified in the cycadaceae. Cycas is a gymnosperm mainly found in the eastern and south eastern Asian region.
Pteris - They are native to tropical and subtropical regions. They are terrestrial genus that inhabits shady and moist forest.
Phenylalanine – It is an essential amino acid. It is found in high-protein foods. It may improve memory and learning ability. It may enhance mood and alertness.

81. The term cytokinin was coined by:
(a) Letham (b) Mendel
(c) De Vries (d) None of these

Rajasthan PMT-1996

Ans. (a) : The term cytokinin was coined by Letham.Cytokinins are present in all plant tissues. They are abundant in the root tip, shoot apex, and immature seeds.

82. Highest concentration of auxin is found in
(a) root and shoot tips (b) leaves and fruits
(c) mid stem portion (d) none of the above

UP CPMT-2003

Ans. (a) : Highest concentration of auxin is found in root and shoot tips. Auxin was first isolated from human urine. They are generally produced by growing apices of stem and roots. Auxin also induce parthenocarpy, e.g. in tomatoes. Auxin also controles xylem differentiation and help in cell division.

83. Compare the statement A and B.
Statement: A Ethylene is a gas which acts as growth regulator of plants.
Statement: B It is the most simple plant hormone.
(a) Both the statements A and B are correct and B is the correct explanation of A.
(b) Both the statements A and B are correct and B is not correct explanation of A.
(c) Statement A is correct and B is wrong
(d) Statement A is wrong and B is correct

Manipal-2011

Ans. (b) : Ethylene is a gaseous plant hormone that controls many activities in plants. Ethylene is a most simple plant hormone which is synthesized in the ripening fruits and tissues undergoing senescence.
According to the given statements A and B both are correct but B is not correct explanation of A. Hence it is clear that correct answer is option (B).

84. Mobilization of stored food in germinating seed is triggered by
(a) ABA (b) GA
(c) cytokinin (d) ethylene

AFMC -2009

Ans. (b) : Mobilization of stored food in germinating seed is triggered by GA or Gibberellins. Gibberellins or gibberellic acids promote the process of germination because they hydrolyze and mobilize the food store in the endosperm by releasing the enzymes from the aleurone layer.
- ABA plays an important role in seed development, maturation and dormancy.
- Ethylene induces fruits ripening, breaks seed dormancy.

Cytokinin hormone helps in promoting the cells growth, development, differentiation, affecting apical dominance and delay in leaf senescence.

85. The scientist, who performed some experiments with oat coleoptiles for the presence of a substance which could diffuse into agar blocks is
(a) Ganong (b) Went
(c) Boysen-Jensen (d) Fujikura

J&K CET-2009

Ans. (b) : The scientist who performed some experiments with oat coleoptiles for the presence of a substance (i.e. for auxin) which could diffuse into agar blocks is Went.

86. Which of the following movements in plants is related to the changes in the auxin level?
(a) Movement of shoot towards the source of light
(b) Nyctinasty
(c) Movement of sunflower towards sun
(d) All of the above

J&K CET-2009

@apna_pdf

Ans. (a) : The movements in plants is related to the movement of shoots towards of light due to changes in the auxin level. Sun is an important source of digit for all the organism in the world. If a plant moves in response to sunlight during daytime then, it is called heliotropism. Phototropism is the general response of a plant towards light.
Nyctinasty- If a plant grows in response to darkness that phenomenon is called nyctinastic plants.

87. Length of grapes stalks increases due to
(a) auxin (b) cytokinins
(c) gibberellins (d) ethylene
J&K CET-2014

Ans. (c) : Length of grapes stalks increases due to gibberellins. Gibberellins are responsible for elongation of stem leaf expansion, bolting, enzyme formation etc. Their ability to cause increase in length of axis is used to make stalk of grapes to grow larger and as certain better yield.

88. Select the correctly matched pair
(a) C. Darwin and S.F. Darwin - Gibberellic acid
(b) F.W. Went - Auxin
(c) E.Kurosawa - Ethylene
(d) Skoog and Miller - Abscisis acid
(e) Cousins - Cytokinin
Kerala PMT-2015

Ans. (b) : C. Darwin and S.F. Darwin first studied the effect of light on the bending of coleoptiles of canary grass and oats. This phenomena is called phototropism.
- F.W. Went discovered the first plant hormone auxin in the tip of oat coleoptiles.
- Cousins demonstrated that remature ripening of bananas.
- E. Kurosawa extracted gibberellins from the fungus Gibberella fujikuroi and reported that it caused extreme elongation of rice stems.
- Skoog and Miller are identified with the study of morphogenesis of callus or mass of tissue into roots and shoots.

Hence, it is clear from the above explanation that option (b) is correct answer.

89. Internodal elongation is associated with
(a) auxin (b) cytokinin
(c) gibberellin (d) ABA
J&K CET-2012

Ans. (c) : Internodal elongation is associated with gibberellin. This properties is used in agriculture to the yield from sugarcane. It changes take place in the cells of internodal region increasing its length 3 to 4 times the original.

90. Which of the following growth hormones is associated with stomatal movements?
(a) Auxin (b) Gibberellin
(c) ABA (d) Cytokinin
J&K CET-2012

Ans. (c) : ABA growth hormones is associated with stomatal movements. Application of exogenous ABA to leaves of normal plants causes closing of stomata within few minute. Stomata are tiny pores present on the surface of the leaves. Massive amount of gaseous exchanges take place in the leaves through these pores for the purpose of photosynthesis. But it is important to note here that the exchange of gases occurs across the surface of stems, roots, and leaves as well.

91. Which one of the following pairs, is not correctly matched?
(a) Abscisic acid - Stomatal closure
(b) Gibberellic acid - Leaf fall
(c) Cytokinin - Cell division
(d) IAA - Cell wall elongation
Rajasthan PMT-2010

Ans. (b) : Correct functions of the questions option is as follows.
(a) Abscisic acid → Stomatal closure
(b) Gibberellic acid → Plant growth
(c) Cytokinin → Cell division
(d) IAA → Cell wall elongation
Hence, it is clear from above explanation that option (b) is not correctly matched.

92. The most essential precursor of ethylene is
(a) adenine (b) thiocarbamate
(c) zearin (d) methionine
AMU-2011

Ans. (d) : The most essential precursor of ethylene is methionine for the plants to grow and reproduce they need sun, water minerals and other nutrients. Plant also relay an certain organic compounds to signal and monitor their growth. Ethylene is a plant hormone that is found in gaseous form in nature. It is primarily found in all dividing cells.

93. Seedless watermelons are obtained by
(a) triploidy (b) gibberellin application
(c) haploidy (d) vegetative propagation
AMU-2011

Ans. (a) : Seedless watermelons are produced on triploid plants (3 sets of chromosome). Which come from the cross of diploid (2 sets) and tetraploid (4 sets) plants.

94. Which one of the following plant function is not controlled by auxins?
(a) Apical dominance (b) Phototropism
(c) Growth (d) Photosynthesis
AMU-2010

Ans. (d) : Apical dominance, phototropism and growth are plant function that is controlled by auxins but photosynthesis is not controlled by auxins. Photosynthesis is a light dependent anabolic process which is not dependent on auxin hormone.

95. Polyploidy can be induced by the application of
(a) auxin (b) kinetin
(c) colchicine (d) ethylene
Uttarakhand PMT-2009

Ans. (c) : Polyploidy can be induced by the application of colchicine. An organism having more than two sets of chromosomes is called polyploid. It is especially common in plants. Polyploidy is the presence of three or more chromosome set in an organism.
Colchicine chemical is used for induction of polyploidy.

96. Although the seeds are rich in auxin glucosyl esters, still they do not exhibit any physiological change like growth. The reason is:
(a) they are prime examples of bound auxins
(b) they are example of bound auxins that are inactive until IAA is released by enzymolysis
(c) that they are examples of free auxins
(d) none of the above
VMMC-2006

@apna_pdf

Ans. (b) : Although the seeds are rich in auxin glucosyl esters, still they do not exhibit any physiological change like growth. The reason is that they are example of bound auxins that are inactive untill IAA is released by enzymolysis. Hence, option (b) is correct.

97. The phytochemical quercetin is found in which of the following ?

(a) grapes (b) apples
(c) guava (d) lemon

VMMC-2006

Ans. (b) : The phytochemical quercetin is found in apples. Apples are a widely consumed, rich source of phytochemical, and epidemiological studies have linked the consumption of apples with reduced risk of some cancers, cardiovascular disease asthma and diabetes.

98. Match the phytohormones given in Column-I with their functions given in Column-II. Choose the answer with correct combination of alphabets.

	Column - I (Phytohormones)		Column - II(Functions)
A	Auxins	p.	breaking seed dormancy
B	Gibberellines	q.	inducting fruit ripening
C	Cytokinins	r.	formation of abscission layer
D	Ethylene	s.	root initiation
		t.	chloroplast development and chlorophyll synthesis

(a) A = p, B = r, C = q, D = s
(b) A = r, B = s, C = p, U = t
(c) A = s, B = p, C = t, D = q
(d) A = s, B = t, C = r, D = q

Karnataka CET-2003

Ans. (c) : According to the question, the correct combination is option (c)

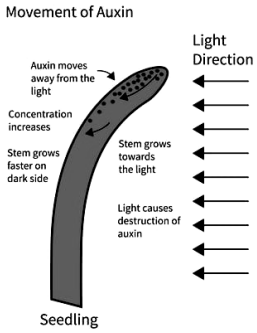
Phytohormones	Function
Auxins	Root initiation
Gibberellines	Breaking seed dormancy
Cytokinins	Chloroplast development and chlorophyll synthesis
Ethylene	Inducting fruit ripening

99. What causes a green plant exposed to the light on only one side, to bend toward the source of light as it grows ?

(a) Green plants seek light because they are phototropic
(b) Light stimulates plant cells on the lighted side to grow faster
(c) Auxin accumulates on the shaded side, stimulating greater cell elongation there.
(d) Green plants need light to perform photosynthesis

AIPMT-2015

Ans. (c) : Auxin accumulates on the shaded side, stimulating greater cell elongation there. Green plants need light to perform photosynthesis. Green plant seek light because they are phototropic. One important light response in plants is phototropism, which involves growth toward or away from-a light source. Positive phototropism is growth towards a light source, negative phototropism is growth away from light.



100. Identify the pair of physiological effects of two phytohormones which are synthesized from different amino acids.

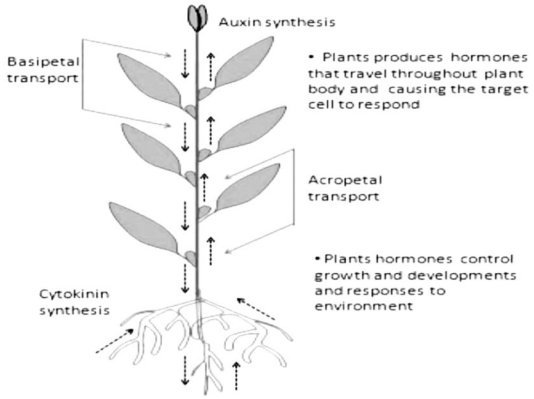
i. Formation of perennating buds in Lemna.
ii. Simultaneous flowering in pineapple.
iii. Bolting in cabbage
iv. Apical dominance in Polyalthia.

The correct pair is

(a) ii, iv (b) i, iv
(c) ii, iii (d) i, ii

AP EAMCET-2008

Ans. (b) : Auxin is synthesised in shoot apices, leaf primordia etc from amino acid tryptophan and cause an apical dominance. NAA and 2, 4-D (both auxins) are employed for inducing flowering in litchi and pineapple. Buds develop when cytokinins are in excess.



101. Through their effect on plant growth regulators, what do the temperature and light control in the plants

(a) Closure of stomata (b) Fruit elongation
(c) Apical dominance (d) Flowering

AIPMT (Mains)-2012

@apna_pdf

Ans. (d) : Plants are controlled by the temperature and light falling on them for the process of flowering.

Light and temperature may affect flowering in plants in various ways.

- The effects of photoperiods or daily duration of light hours (and dark period) on flowering is called photoperiodism eg. In short day plant these plant flower when the days are shorter. They need less than the critical duration eg. Soyabean, tobacco etc.

In long day plant, plants flower when the days are long. they require more than the critical duration.

eg. Spinach, Raddish, Hibiscus. etc.

102. A chemical believed to be involved in flowering is

(a) gibberellin (b) kinetin
(c) florigen (d) IBA

AIPMT-1991

Ans. (c) : Chailakhyan (1936), a Russian investigator who researched on Photoperiodism proposed the term florigen. According to him 'florigen complex, the true flowering hormone.

103. Cut or excised leaves remain green for long if induced to root or dipped in

(a) gibberellins (b) cytokinins
(c) auxins (d) ethylene

AIPMT-1988

Ans. (b) : Cut or excised leaves remain green for long if induced to root or dipped in cytokinin.

• Cytokinin help cell in retaining chlorophyll for longer time. Cytokinins delay the senescence (ageing) of leaves and other organs

104. Bananas can be prevented from over-ripening by

(a) maintaining them at room temperature
(b) refrigeration
(c) dipping in ascorbic acid solution
(d) storing in a freezer

AIPMT-1992

Ans. (c) : Bananas can be prevented from over-ripening by dipping in ascorbic acid solution.

105. Dwarfness can be controlled by treating the plant with

(a) Cytokinin (b) Gibberellic acid
(c) Auxin (d) Anti-gibberellin

AIPMT-2000, 1992

Ans. (b) : Dwarfness can be controlled by treating the plants with gibberellic acid. It has been proven that dwarf plants have lower level of GA, which causes the dwarfism. Thus the external supply causes rapid elongation of internodes.

106. Perishable vegetables can be maintained fresh for a longer period by spraying on them with a solution of:

(a) ABA (b) Cytokinin
(c) Ethephon (d) Phenyl mercuric acetate

Karnataka CET-2012

Ans. (b) : Cytokinin :- Cytokinins are plant growth hormones. They are amino derived. These hormones promotes cell division in plant. Cytokinins play important roles in fruit development, especially in cell division.

Hence, perishable vegetables are sprayed with a solution of cytokinin to keep them fresh for a longer time and increases their shelf life.

107. Which one of the following synthetic growth regulators is used to promote synchronized flowering in pineapple ?

(a) Phenylmercuric Acetate
(b) Benzyl Aminopurine
(c) 2-chloroethylphosphonic acid
(d) Indolebutyric acid

Karnataka CET-2010

Ans. (c) : 2–chloroethyl phosphonic acid also known as 'Ethepon' is used for ripening of fruit as it release ethylene.

The 2-Chloroethyl phosphoric acid is a compound which is used for the plant growth and helps in the ripening of the fruit quickly. It is widely used to initiate the reproductive development of the pineapple, these are sprayed on the mature pineapple that is green pineapple, they are then converted to ethylene that has low toxic levels and thus, flowering is promoted.

108. Which one of the following plant hormone was isolated from human urine?

(a) Synthetic auxin 2, 4-D,
(b) Gibberellins
(c) Heteroauxin indole acetic acid
(d) IBA

UP CPMT-2014

Ans. (c): The most important phytohormones "Auxin" (indole -3- acetic acid) was first isolated by Kogl and Haegan Smith (1934) in human urine.

109. Which one combination of plant growth regulators are used for feminising effect in cucurbits?

(a) Auxins > Ethylene > Cytokinins
(b) Gibberellins > Auxins > Cytokinins
(c) Ethylene > Gibberellins > Auxin
(d) Auxin + Gibberellins = 1

UP CPMT-2014

Ans. (a): Auxins, Ethylene and Cytokinins phytohormone are used for sex expression inducing formation of more female flower in place of male flower in cucurbits. Auxins is more effective to induce feminizing effect in cucurbits.

110. The chemical nature of gibberellins is that they are

(a) Acidic (b) Alkaline
(c) Proteinaceous (d) Amines

Karnataka CET-2006

Ans. (a) : Chemical nature of gibberellins are acidic. Gibberellins are plant growth regulators that facilitate cell elongation, help the plants to grow taller. Gibberellin was discovered by E. Kurosawa in 1926 while investigating foolish seeding (balance) disease. It was caused by a fungus Gibberella fujikuroi.

111. The carbon ratio of lutein, abscisic acid and GA_{27} is

(a) 6 : 3 : 4 (b) 5 : 3 : 4
(c) 8 : 3 : 4 (d) 4 : 3 : 5

AP EAMCET-2010

Ans. (c) : The number of carbon atom in lutein = 40
The number of carbon atom in abscisic acid = 15
The number of carbon atom in GA_{27}= 20
The carbon ratio of lutein, Abscisic acid and GA_{27} is 8 : 3: 4

@apna_pdf

112. Green potatoes are toxic due to
(a) Phytoalexins (b) Solanine
(c) Triazine (d) Hormones
BHU PMT (Screening)-2009

Ans. (b) : Potato some time becomes green which may indicate high levels of a potentially toxic compound which is called solanine which is exposed after the vegetable is exposed in the light solanine is also present in the sprout, root and leaves of a potato. The substance is a neutering if a person eats solanine. It causes headaches, diarrhoea, stomach cramp and nausea.

113. An example of mitogen is
(a) cytokinin (b) glucose
(c) glycerol (d) fructose
AMU-2015

Ans. (a) : An example of mitogen is cytokinin. Any agent that stimulates cell division is called mitogen.
Mitogens are non- specific stimulants of immune cells.Mitogens are signals that act from outside the cell to induce mitosis and cell division.

114. Which of the following is an anti auxin used in picking cotton balls ?
(a) TIBA (2, 3, 5-triiodobenzoic acid)
(b) PCIP (P-chlorophenoxy isobutyric acid)
(c) PAA (Phenyl Acetic acid)
(d) 2, 4-dichloro phenoxy acetic acid
CMC Ludhiana-2015

Ans. (a) : TIBA (2, 3, 5 Triiodobenzoic acid) is an anti auxin that used picking cotton balls. It is used as a plant growth regulator and controller.

115. Sprouting of potato can be prevented in storage by
(a) maleic hydrazide (b) gibberellins
(c) indole acetic acid (d) cytokinins
WB JEE-2007

Ans. (a) : Maleic hydrazide is also generally known as Fazor. It is a plant growth regulator (sprout inhibitor) that inhibit the division of cell but not stopped the growth of cell. It is used to control sprouting of potato and onions.

D. The photoperiodism

116. The plant respond to photo-periods due to the presence of:
(a) phytochromes (b) stomata
(c) enzymes (d) phytohormones
WB JEE-2006 / VMMC-2003
Karnataka CET-2001 / Haryana PMT-2001

Ans. (a) : The plant respond to photo-periods due to the presence of phytochromes. It is universally present in green plants and is mainly responsible for photomorphogenetic changes and developmental process in them.

117. The production of the flowers in response to light hours in a day is
(a) Photoperiodism (b) Photatropism
(c) Phototaxis (d) Photokinesis
AP EAPCET-23.05.2023, Shift-I

Ans. (a) : The production of flowers in response to light hours in a day is called photoperiodirm. Photoperiodism is an important adaptation that helps plants to flower at the right time of year. This ensures that the plants are able to reproduce when conditions are most favorable.

118. The site of perception of light in plants during photoperiodism is
(a) Leaf (b) Shoot apex
(c) Stem (d) Axillary bud
NEET-2021

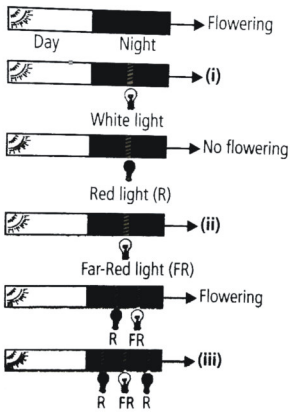
Ans. (a) : Photoperiodism refers to the responses related to the lengths of dark and light periods the site of perception of photoperiod is leaves. The hormone florigen, which are responsible for flowering, induces flowering as it migrates from leaves to shoot apical on induction of required photoperiods.

119. What is the site of perception of photoperiod necessary for induction of flowering in plants?
(a) Pulvinus (b) Shoot apex
(c) Leaves (d) Lateral buds
NEET-2019

Ans. (c) : The site of perception of photoperiod necessary for induction of flowering in plants is the leaves.

120. Flash of light in dark inhibits flowering in
(a) SDP (b) LDP
(c) LSDP (d) DNP
MGIMS Wardha-2009

Ans. (a) : Flash of light in dark inhibits flowering in SDP. Flash of light in dark occurs in those plants that begin flowering when day are shorter. SDP refers to short day plants. These plants need a big day duration that lasts between 7 to 8 hours and they need continuous dark periods that range between 16 to 17 hours.
LDP- It refers to the long day plants. These plants occur when days are longer, this latter is completely opposite from SDP.
LSDP- It is known as long-short day plants. These plants consumes very less amount of sulphur.
DNP : – Day neutral plants (DNP) do not depend upon the amount of darkness or daylight hours. Examples of day neutral plants are sunflower, cucumber, tomato.



121. Exposure to light inhibits the process of germination in the seeds of following plant:
(a) Allium (b) Lactuca
(c) Capsella (d) Tobacco
AP EAMCET-2002

Ans. (a) : Exposure to light inhibits the process of germination in the seeds of Allium plant. Plants are classified into two categories depending on their responses to light for germination. Those plants that require light to germinate have been named positive photoblastic. The process of development of new plant that originates from the embryo present in the seed is called germination.

@apna_pdf

122. Direction (A): Each of the question below consist of two statements an Assertion (A) and a Reason (R). Mark of the appropriate response as under : (A). A farmer does not prefer to grow tobacco plant under long day conditions. (R). Tobacco is a short days plant.

(a) If both A and R are correct and the R is a correct explanation of A.
(b) If both A and R are correct but R is not a correct explanation of A.
(c) A is true but R is false.
(d) Both A and R are false.

Haryana PMT-2003

Ans. (a) : Tobacco is an example of short days plants. Short day plants are those plant that start flowering when the length of the day is below to its critical length. To flower, they need a longer time of darkness and little time of light. Hence, it is clear that A and R are correct and R is a correct explanation of A.

123. Which of the following induces flowering in long day plants?

(a) Gibberellins (b) Cytokinin
(c) Auxins (d) Ethylene

Uttarakhand PMT-2008 BVP-2007

Ans. (a) : Gibberellins induces flowering in long day plants. It is acidic in nature. It promotes maleness in Cannabis.

Ethylene- Ethylene is a hormone that gives rise to fruits, flowers and seeds in plants.

Auxins- It is the phytohormone responsible for the growth of the roots and promotes apical dominance.

Cytokinin:– Cytokinins are a group of plant growth regulators which are primarily involved in performing cell division in plant roots, shoot system.

124. Beta vulgaris is a

(a) Short day plant (b) Long day plant
(c) Day neutral plant (d) Intermediate plant

J&K CET-2007

Ans. (b) : Beta vulgaris is a long day plant. It is a species of flowering plant in the subfamily Betoideae of the family Amaranthaceae. Economically it is the most important crop of the large order.

125. Genetic dwarfness can be overcome by treating with

(a) Cytokinin (b) Auxins
(c) Gibberellins (d) Ethylene

HP CET-2012

Ans. (c) : Genetic dwarfness can be overcome by treating with Gibberellins. It is a plant growth regulator. They help in seed germination to overcome dormancy of buds, and for delaying senescence.

126. Which hormone causes stunted growth in pea?

(a) Gibberellic acid (b) Auxin
(c) Cytokinin (d) Ethylene

HP CET-2012 / VMMC-2004

Ans. (d) : Ethylene hormone causes stunted growth in pea. It prevents elongation of stem and roots in longitudinal direction however the inhibition of growth in length is associated with radial enlargement of the tissue. It also causes suppression of bud growth and causes apical dominance.

127. Short day plant is

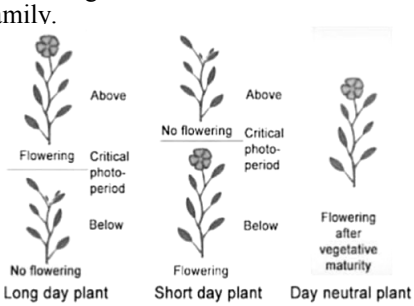
(a) Xanthium (b) Pisum
(c) Cucumis (d) Avena

Manipal-2010 / Haryana PMT-2007

Ans. (a) : Short day plant is Xanthium. It is a genus of flowering plants in the tribe Heliantheae.

Cucumis- It is a genus of twining, tendril-bearing plants in the family Cucurbitaceae which includes the cucumber, muskmelons, etc.

Avena- It is a genus of Eurasian and African plants in grass family.

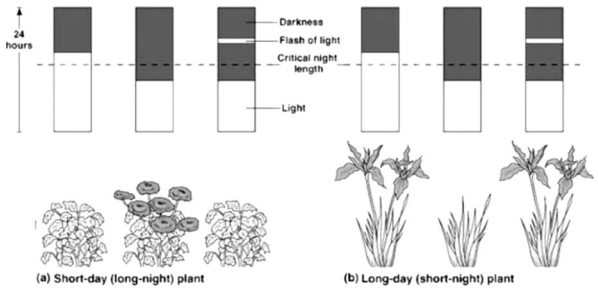


128. Which of the given is a long day plant?

(a) Glycine max (b) Spinach
(c) Chrysanthemum (d) Tobacco

Manipal-2012 / AFMC-2010

Ans. (b) : Spinach is a long day plant. Long day plants grow when the daylight is more than their required photoperiods which is seen in summers. These plants needs more light as compared to short day plants and they usually flower when the temperature becomes warmer.

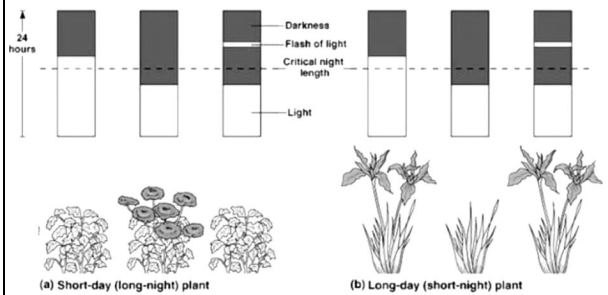


129. Which of the following is long day plant (LDP)

(a) Sugarcane
(b) Guldaudi
(c) Tobacco and Soybean
(d) Wheat and Raddish

Haryana PMT-2008 / Rajasthan PMT-2000

Ans. (d) : Wheat and raddish is long day plant. They grow when the daylight is more than their required photoperiods which is seen in summers.



@apna_pdf

130. When flowering is regulated by length of day and night, it is called
(a) photoperiodism (b) phototropism
(c) nyctinasty (d) seismonasty
(e) None of these

CMC Vellore-2010

Ans. (a) : When flowering is regulated by length of day and night, it is called photoperiodism. Photoperiodism is the physiological reaction of organism to the length of day or night. It occurs in plants and animals. Photoperiodism can also be defined as the developmental responses of plants to the relative lengths of light and dark periods.

131. Which of the following is a day neutral plant ?
(a) Helianthus annuus
(b) Euphorbia pulcherrima
(c) Avena sativa
(d) Beta vulgaris
(e) None of the above

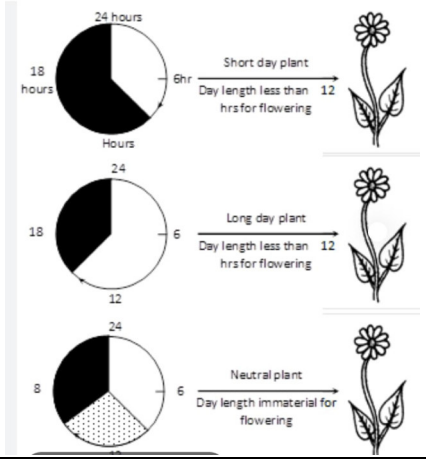
CMC Vellore-2010
AMU-2009
Punjab MET-2003

Ans. (a) : Helianthus annuus is a day neutral plant. It is commonly grown as a crop for its edible oily seeds. Apart from cooking oil production, it is also used as livestock forage as bird's food.
Avena sativa- It is high in iron, zinc and manganese. It improves brain health, insomnia, stress, and physical and sexual performance.
Beta vulgaris- It is an edible plant of the Amaranthaceae family.

132. One set of a plant was grown at 12 hours day and 12 hours night period cycles and it flowered, while in the other set night phase was interrupted by flash of light and it did not produce flower. Under which one of the following categories will you place this plant?
(a) Long day (b) Darkness neutral
(c) Day neutral (d) Short day

CMC Ludhiana-2009
AFMC-2008
Manipal-2007

Ans. (d) : One set of a plant was grown at 12 hours day and 12 hours night period cycles and it flowered, while in the other set night phase was interrupted by flash of light and it did not produce flower. Such type of flower will be placed in short day plant categories.



133. What type of plants will flower when short photoperiods are followed by long photoperiods?
(a) Long-short day plants
(b) Short-long day plants
(c) Intermediate plants
(d) None of the above

AMU-2002

Ans. (b) : Short-long day plants will flower when short photoperiods are followed by long photoperiods. They require the periodic exposure of light less than the critical period to induce flowering. They usually flower during the seasons when the days are of short duration, such as during the summer or fall.

134. A long day plant flowers only if exposed to a light period
(a) more than its critical day length
(b) less than its critical day length
(c) equal to its critical day length
(d) slightly less than its critical day length

AMU-2001

Ans. (a) : A long day plant flowers only if exposed to a light period more than its critical day length. They usually flower during the seasons when the days are of long duration, such as during the early summer and late spring.

135. Rajaji National Park is situated in
(a) Tamil Nadu (b) Uttarakhand
(c) Asom (d) Karnataka

AMU-2015

Ans. (b) : Rajaji National Park is situated in Uttarakhand. It's wildlife includes Elephant, Tiger, Panther etc. It was established in 1983. It is named after C Rajagopalachari.

136. The flowers of Oxalis open during the day and close at night. Such type of movement is
(a) photonasty (b) nyctinasty
(c) phototropic (d) seismonastic

Manipal-2012

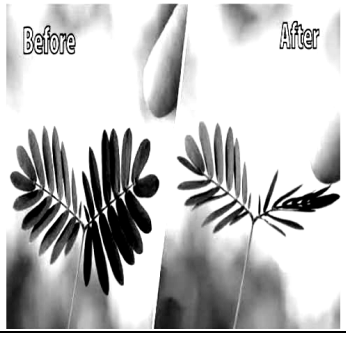
Ans. (a) : The flowers of Oxalis open during the day and close at night, such type of movement is known as photonasty. Oxalis triangular is commonly called false shamrock. Photonasty is the response of plants to the availability of light.

137. A sleep movement in plants is a nastic response, that occurs daily in response to :
(a) dark (b) light
(c) water (d) both a and b

Uttarakhand PMT-2004
Manipal-2004

Ans. (d) : A sleep movement in plants is a nastic response, that occurs daily in response to dark and light. In this case, plant close up their leaves and petals in response to the onset of darkness because it is a rather fast response. It does not involve differential growth but changes in cellular turgor. Nastic movement is the movement of a plant part in response to an external stimulus in which the direction of reaction is not dictated by the stimulus direction.
Thigmonasty
Movement of a part of plants in response to touch eg. Mimosa pudica, folds leaves and droops when touched. It is also known as Seismonasty

@apna_pdf



138. Which of the following control flowering in long day plants and sex expression in certain species?
(a) Auxin (b) Cytokinin
(c) Gibberellin (d) Ethylene

BHU PMT-2001

Ans. (c) : The Gibberellins control flowering in long day plants and sex expression in certain species Gibberella. It forms the basis of molecules such as vitamins A and E.

139. An example of short day plant is
(a) Wheat (b) Maize
(c) Chrysanthemum (d) Radish

J&K CET-2008

Ans. (c) : An example of short day plant is Chrysanthemum. They are native to East Asia and northeastern Europe. They are most popular fall garden flowers.

140. Which of the process Cholodny-Went theory is concerned with?
(a) Photomorphogenesis (b) Photoperiodism
(c) Phototropism (d) Photorespiration

J&K CET-2008

Ans. (c) : Phototropism process is concerned with Cholodny- Went theory. Phototropism of stem and roots are due to differential hormonal effect. Phytochromes detect light. They are sensitive to light of red and far-red wavelengths. It is used to control flowering times depending on the length of the day and night.

141. Opening and closing of flowers represent a kind of :
(a) nastic movement
(b) tropic movement
(c) mutation
(d) autonomic movement

HP CET-2011

Ans. (a) : Opening and closing of flowers represent a kind of nastic movement. The movement of a plant part in response to an external stimulus in which the direction of response is not determined by the direction of stimulus is known as a nastic movement.

142. In IUCN Red List (2004) documents, the extinction 784 species includes
(a) 335 vertebrates, 360 invertebrates and 89 plants
(b) 337 vertebrates, 362 invertebrates and 88 plants
(c) 338 vertebrates, 359 invertebrates and 87 plants
(d) 340 vertebrates, 357 invertebrates and 87 plants

J&K CET-2014

Ans. (c) : In IUCN Red List (2004) documents, the extinction 784 species includes 338 vertebrates, 359 invertebrates and 87 plants.
IUCN is the global authority on the status of the natural world and the measures needed to safeguard it. It is also known as Red Data Book.

143. Which of the following statements regarding photoperiodism is false?
(a) The response of plants to periods of light/day is termed photoperiodism
(b) The shoot apices cannot perceive photoperiods
(c) In day neutral plants there is no corelation between exposure to light duration and induction of flowering response
(d) Shoot apices modify themselves into flowering apices prior to flowering
(e) The site of perception of the light/dark duration is the flower

Kerala PMT-2015

Ans. (e) : Photoperiodism is a process that plant use to determine when to flower, there are some statements regarding photoperiodism.
(a) The response of plants to periods of light/day is termed photoperiodism.
(b) The shoot apices cannot perceive photoperiods
(c) In day neutral plants there is no corelation between exposure to light duration and induction of flowering response
(d) Shoot apices modify themselves into flowering apices prior to flowering
Hence, it is clear from above explanation that option (e) is false regarding to the question.

144. Importance of day length in flowering of plants was first shown in
(a) Lemna (b) tobacco
(c) cotton (d) Petunia

BHU PMT (Screening)-2010

Ans. (b) : Importance of day length in flowering of plants was first shown in tobacco. The reaction of the length of day and night on the flowering of the plants is known as photoperiodism. Photoperiodism was first studiesd by Garner and Allard (1920).
• They observed that "Maryland Mammoth" variety of tobacco could be made to flower in summer by reducing the light hours with artificial darkening.

145. Which one is a short day plant?
(a) Brassica campestris
(b) Raphamnus sativus
(c) Glycinemax
(d) Papaver somniferum

MGIMS Wardha-2008

Ans. (c) : Glycinemax is a short day plant. Short day plants are those plants that start flowering when the days are lower than their crucial day length. They compel a long interval of dusk and a short period of light to flower.

146. Plants flower in response to a certain ratio of light to dark in a day, which reflects seasonal changes. This response is known as:
(a) verbalization (b) photoperiodism
(c) photorespiration (d) photosynthesis

VMMC-2006

@apna_pdf

Ans. (b) : Plants flower in response to a certain ratio of light to dark in a day, which reflects seasonal changes. This response is known as photoperiodism. It is the physiological reaction of organism to the length of night or a dark period. It happens in plants and animals. They are classified under their group. According to the photoperiods-
(i) Short day plants
(ii) Long day plants
(iii) Day neutral plants

147. Pigment involved in the perception of the photo periodic stimulus is :
(a) cytochrome (b) phytochrome
(c) chlorophyll (d) carotenoids

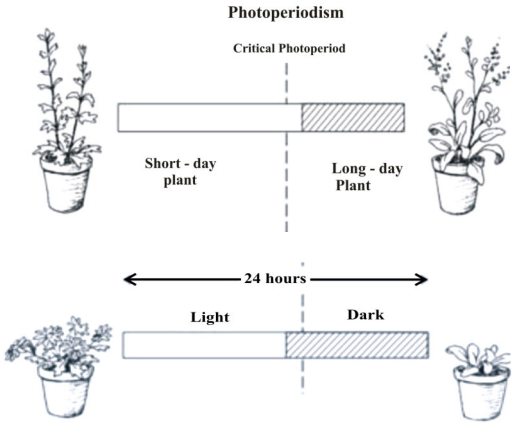
Rajasthan PMT-1998

Ans. (b) : Pigment involved in the perception of the photoperiodic stimulus is phytochrome. It is universally present in green flowering plants. It is mainly responsible for photomorphogenetic changes and development process in them.

148. The photoperiodic cycles of 6 hours of dark period and 18 hours of light period induce flower formation in:
(a) Xanthium (b) Tobacco
(c) Soybean (d) Beta

Uttarakhand PMT-2010
AP EAMCET-2003

Ans. (d) : The photoperiodic cycles of 6 hours of dark period and 18 hours of light period induce flower formation in Beta vulgaris plant.



149. Assertion (A) : Lettuce seeds are positively photoblastic.
Reason (R) : Gibberellin application effectively works as a substitute in darkness for germination.
The correct answer is:
(a) Both A and R are true and R is the correct explanation of A
(b) Both A and R are true but R is not the correct explanation of A
(c) A is true but R is false
(d) A is false but R is true

AP EAMCET-2004

Ans. (b) : Lettuce seeds are positively photoblastic. Gibberellin application effectively works as a substitute in darkness for germination.
Both A and R are true but R is not the correct explanation of A.

150. In photoactive plants, during daytime the following ionic flux of guard cell is directly involves the expenditure of energy
(a) outward movement of malate
(b) inward movement of K^+
(c) outward movement of protons
(d) inward movement Cl^-

Manipal-2015

Ans. (c) : In photoactive plants, during daytime the outward movement of protons ionic flux of guard cell is directly involves the expenditure of energy. Here ions goes in and out of the guard cells during stomatal closure and opening.

151. The effect of daily light period on flowering is called :
(a) photorespiration (b) phototropism
(c) photo-oxidation (d) photoperiodism

JIPMER-2001

Ans. (d) : The effect of daily light period on flowering is called photoperiodism. The length of day and night is known as photoperiod. Some plants need to be exposed to sunlight for a particular duration of time to induce flowering. The plants which require more exposure to light are called long day plants. Those plants which require less exposure to light is called short day plants.

152. Identify the plant in which 'night break' is inhibitory to floral induction:
(a) spinach (b) Xanthium
(c) beet (d) Hyoscyamus

AP EAMCET-2001

Ans. (b) : 'Night break' is inhibitory, to floral induction in Xanthium plant. Night break is a phenomenon seen in plants that are used to study the photoperiodic control of growth and flowering. Xanthium is a dicotyledon belonging to the Asteraceae family in the Angiospermae.

153. Stomata open during day because the guard cells have
(a) outer walls thin (b) kidney shape
(c) chlorophyll (d) large nuclei

CG PMT-2006

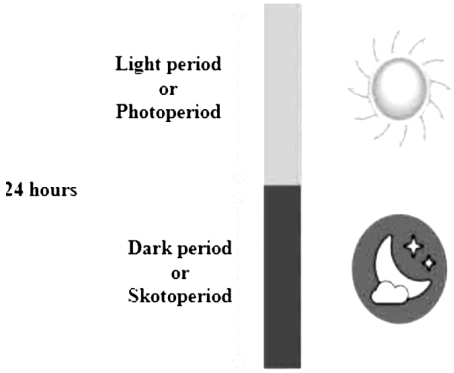
Ans. (c) : Stomata open during day because the guard cells have chlorophyll. Guard cells surround the stomata and helps in the opening and closing of the stomata. The stomata open due to swelling of guard cells and vice versa.

154. *Nicotiana sylvestris* flowers only during long days and *N. tabacum* flowers only during short days. If raised in the laboratory under different photoperiods, they can be induced to flower at the same time and can be cross-fertilized to produce self-fertile offspring. What is the best reason for considering *N. sylvestris* and *N. tabacum* to be separate species: -
(a) They cannot interbreed in nature
(b) They are reproductively distinct
(c) They are physiologically distinct
(d) They are morphologically distinct

AIPMT-2003

@apna_pdf

Ans. (a) : *Nicotina sylvestris* (long day plant) and *Nicotiana tabacum* (short day plant) have different photoperiods. Photoperiods are specific for each species. In nature, these plants cannot interbreed and thus make them cross breed.

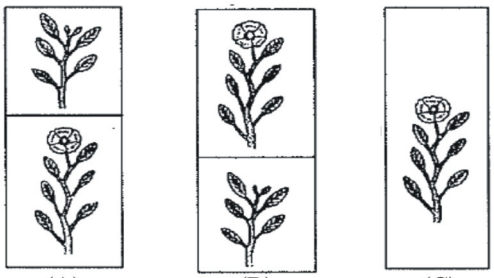


155. Refer the given figures on photoperiodism and select the correct option.

	A	B	C
(a)	No correlation between light period and flowering	Long light-exposure period	Short light-exposure period
(b)	Long light-exposure period	No correlation between and flowering	Short light-exposure period
(c)	Short light-exposure period	Long light-exposure period	No correlation between light period and flowering
(d)	No correlation between light period and flowering	Short light-exposure period	Long light-exposure period

AIIMS-2010

Ans. (c) :



(A) Short light exposure period. (B) Long light exposure period (C) No correlation between light period and flowering

(A) Short day plant requires longer duration of darkness and has less critical photoperiod.
(B) Long day plant requires shorter duration of darkness and has longer critical photoperiod.
(C) Day neutral plant which do not depend on the length of the photoperiod. They flower regardless of photoperiod.

156. Nicotiana sylvestris flowers only during long days and N. tabacum flowers only during short days. If raised in the laboratory under different photoperiods, they can be induced to flower at the same time and can be cross-fertilized to produce self-fertile offspring. What is the best reason for considering N. sylvestris and N. tabacum to be separate species?

(a) they cannot interbreed in nature
(b) they are reproductively distinct
(c) they are physiologically distinct
(d) they are morphologically distinct

AIIMS-2008

Ans. (a) : ***Nicotiana sylvestris*** and ***Nicotiana tabacum*** have different photoperiods. Photoperiods are specific for each species. In nature, these plants cannot interbreed and thus have to provide altered photoperiods and thus make them cross breed. These two species cannot reproduce freely. They are reproductively distinct.

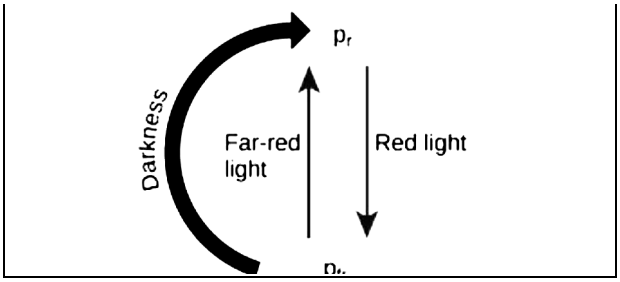
157. The biological clock measures the length at each night by the:

(a) Relative amount of red absorbing and far-red absorbing phytochrome present at dawn
(b) Amount of far-red absorbing phytochrome at dusk
(c) Relative amount of red absorbing and far-red absorbing phytochrome at mid day
(d) Rate at which are kind of phytochrome is converted to the other

AIIMS-2015

Ans. (a) : The biological clock measures the length at each night by the relative amount of red absorbing and far-red absorbing phytochrome present.
Photoreceptors and biological clocks are universal mechanisms for sensing and responding to the light environment.
Exposure to red light converts the chromo protein to the functionally active form, while darkness converts the chromospheres to the inactive form.

@apna_pdf



158. If a tree flowers thrice in a year (Oct, Jan and July) in Northern India. It is said to be
(a) photo and thermo-insensitive
(b) photo and thermo-sensitive
(c) photosensitive but thermo-insensitive
(d) theromosensitive but photo-insensitive

AIPMT-1997

Ans. (a) : If a tree flowers thrice in a year (October, January and July) in Northern India. It is said to be photo and thermo insensitive.

159. If a plant produces flowers when exposed only to alternating periods of 5 hours light and 3 hours dark in a 24 – hour cycle, then the plant should be a _____.
(a) Short day plant (b) Long day plant
(c) Short-long day plant (d) Day neutral plant

Karnataka CET-2014

Ans. (b) : If a plant produces flowers when exposed only to alternating periods of 5 hours light and 3 hours dark in a 24 – hour cycle, then the plant should be a long day plant.

160. Cytochrome is : -
(a) Metallo flavoprotein
(b) Fe containing porphyrin pigment
(c) Glycoprotein
(d) Lipid

AIPMT-2001

Ans. (b) : Cytochrome is iron containing hemeprotein. They contain iron porphyrin or copper porphyrin as prosthetic groups. Cytochrome accept and release an electron in electron transport chain.

161. Proteinaceous pigment which control the activities concerned with light : -
(a) Phytochrome (b) Chlorophyll
(c) Anthocyanin (d) Carotenoids

AIPMT-2001

Ans. (a) : Proteinaceous pigment which control the activities concerned with light is phytochrome. Phytochrome is a plant pigment that can detect the presence or absence of light and is involved in regulating many processes that are linked to day length (Photoperiod), such as seed germination and initiation of flowering.

162. What is true for photolithotrops : -
(a) Obtain energy from radiations and hydrogen from organic compounds
(b) Obtain energy from radiations and hydrogen from inorganic compounds
(c) Obtain energy from organic compounds
(d) Obtain energy from inorganic compounds

AIPMT-2001

Ans. (b) : Photolithotrops are those plants that obtain energy from radiation and hydrogen from inorganic compounds.
In other words, photolithotrops manufacture their own organic nutrients from inorganic material.

E. Plant hormones

163. Abscission of flowers and leaves is caused by
(a) ABA (b) Ethylene
(c) GA (d) Auxin

TS EAMCET 10.05.2023 Shift-I

Ans. (b) : The abscission, or the process of shedding flowers and leaves is primarily caused by plant hormone called ethylene. Ethylene is responsible for triggering the separation of these plants parts from the main stem. This natural process alloces plant to shed older or damage leases and flowers malting way for new growth.

164. Select the correct combination

	Role	Positive	Negative
I	Apical dominance	Auxin	Cytokinin
II	Seed germination	Ethylene	ABA
III	Seed dormancy	ABA	Ethylene
IV	Senescence	ABA	Gibberellin

(a) I and II (b) I, II and III
(c) III and IV (d) I, II, III and IV

TS EAMCET 10.05.2023 Shift-I

Ans. (d) : Apical dominance is regulated by the auxin. Auxin hormone has positive effect on apical dominance. Cytokinin is the hormone that promotes growth of lateral buds and also has negative effect on apical dominance.
- Ethylene is an important component of the gaseous environment, and regulates numerous plant developmental processes including seed germination and seedling establishment. ABA is inhibited the seed germination. ABA promotes seed dormancy.
- ABA plays a well characterized role in promoting seed and bud dormancy. Ethelene can break the dormancy of the seed and buds.
- Various plant hormones have been shown to be involved in regulating plant senescenece. For example Abscisic acid (ABA), ethylene and salicylic acid. Gibberellins slow down fruit ripening and senescence. It inhibit the nodule senescence.

Hence, (d) one is a correct answer.

165. Identify correct statements
(A) 2, 4-D used to kill dicotyledonous weeds
(B) Auxins promote flowering in Pine apple
(C) Ethyle reduces the respiration rate during ripening of fruits
(D) ABA – Initiate flowering in mango
(a) A and B are correct (b) B and C are correct
(c) C and D are correct (d) D only correct

TS EAMCET-11.05.2023, Shift-I

Ans. (a) : 2, 4 – D is a synthetic auxin that is used to kill dicotyledonous weeds. It is the hormone that promotes the growth of shoots and inhibits the growth of roots.
- Auxin promotes flowering in pineapple. Auxins are plants hormones that play a role in various process cell division and elongation. They also play a role in apical dominance, which is the tendency of apical bud to suppress the growth of lateral buds. In pineapples, auxins are applied to the growing point to induce flowering.

@apna_pdf

166. Choose the correct combinations from the following

A. Induce sprouting of Potato tubers – Ethylene
B. Kill the dicot weeds – Cytokinin
C. Increase in Stalk length of grapes – Gibberellins
D. Induce apical dominance – Auxins

(a) A C D (b) B D C
(c) B C D (d) A B C

AP EAPCET-22.05.2023, Shift-II

Ans. (a) : Gibberelins are the plant hormones that induced sprouting of potato tubers. They do this by stimulating cell division and elongation in the buds, as well as the synthesis of enzymes that are need for growth.

- Gibberellins promote elongation of stems and stalks, which can lead to increased stalk length in grapes.
- Auxins are plant hormones responsible for controlling the growth of plants. They inhibit the growth of lateral buds, promoting apical dominance where the main stem goows stronger.

167. Match List-I with List-II

	List-I		List-II
(A)	**Auxin**	**(i)**	**Promotes female flower formation in cucumber**
(B)	**Gibberellin**	**(ii)**	**Overcoming apical dominance**
(C)	**Cytokinin**	**(iii)**	**Increase in the length of grape stalks**
(D)	**Ethylene**	**(iv)**	**Promotes flowering in pineapple**

Choose the correct answer from the options given below:

(a) (A)-(i), (B)-(iii), (C)-(iv), (D)-(ii)
(b) (A)-(iii), (B)-(ii), (C)-(i), (D)-(iv)
(c) (A)-(ii), (B)-(i), (C)-(iv), (D)-(iii)
(d) (A)-(iv), (B)-(iii), (C)-(ii), (D)-(i)

RE-NEET (UG)-06.06.2023 (Manipur)

Ans. (d) : Plant hormones are naturally occurring organic substances which control morphological, physiological and biochemical responses at very low concentration.

- Cytokinin modifies apical dominance and promotes lateral bud growth.
- Gibberellin causes extension of stem due to cell elongation and not by cell division.
- Ethylene promotes formation of female flowers in cucumbers.
- Auxins promotes flowering in pineapple.

168. Spraying of which of the following phytohormone on juvenile conifers helps in hastening the maturity period, that leads to early seed production?

(a) Abscisic Acid
(b) Indole-3-butyric Gibberellic Acid
(c) Gibberellic Acid
(d) Zeatin

NEET (UG) 07.05.2023

Ans. (c) : Gibberellins are plant growth regulators that facilitate cell elongation and help the plant to grow taller.

- Gibberellines was first isolate by Teijiro yabuta sumuki form fungal strains provided by kurosawa from *Gibberella fujikori.*
- Yabuta named the isolate Gibberellin.
- Gibberellin is useful in early seed production in conifers.

169. Which hormone promotes internode/petiole elongation in deep water rice?

(a) 2, 4-D (b) GA_3
(c) Kinetin (d) Ethylene

NEET (UG) 07.05.2023

Ans. (d) : Ethylene is regarded as a multifunctional phytohormone that regulates both growth and senescence.

- It is a gaseous hormone.
- Ethylene promotes internode or petiole elongation in deep water rice plants.
- Ethylene is a natural product of metabolism in plants. It enhance the respiration rate during the ripening of fruits.

170. Name of a gaseous plant hormone is

(a) IAA (b) gibberellin
(c) ethylene (d) abscisic acid

Tripura JEE-2022
WB JEE-2009

Ans. (c) : The name of a gaseous plant hormone is ethylene. It belongs to a group of plant growth regulators that are commonly used to accelerate fruit ripening and enhance the number of blooms and fruits produced. It causes changes in texture, softness, color and other process in fruits by triggering a series of events.

171. Identify the correct combinations from the following:

A	**Terpenes**	**–**	**hastens malting process**	**–**	**2,4 D**
B	**Carotenoid derivatives**	**–**	**Stimulates the closure of stomata**	**–**	**ABA**
C	**Indole compounds**	**–**	**Increases the inter nodal length**	**–**	**IBA**
D	**A modified form of a purine**	**–**	**helps nutrient mobilization**	**–**	**Kinetin**

(a) A, B only (b) B, D only
(c) C, D only (d) B, C only

TS EAMCET-31.07.2022 Shift-II

Ans. (b) :
Terpenes - Terpenes are a large, diverse class of organic hydrocarbon compound produced by various plant, they play important role in plant defense against herbivore disease resistances.
Abscisic acid is a plant hormone that is use in many seed and but dormancy, and the control of organ size and stomata closure ABA is carotenoid derivatives
IBA – (Indole 3-butyric acid) it is a plant hormone in the auxin family. It regulate the root apical meristem size and lateral root development.
Kinetin - It is a modified form of adenine not a purine.
Kinetin used in a cell division on plant and is similar to kinin.

@apna_pdf

172. Zn is essentially for _____

(a) Synthesis of fat
(b) Synthesis of auxins
(c) Synthesis of proteins
(d) Oxidation of carbohydrates

AP EAMCET-25.09.2020 Shift-II

Ans. (b) : Zn is essentially for synthesis of auxins. Zinc also serves in the control of plant growth through its indirect action on auxins. Zn affects the manufacturing of auxins and gibberellins at the same time supports the action that plant growth is influenced by a variety of growth components.

173. Match the Column-I and Column-II:

Column-I	Column-II
(i) Auxin	(A) Adenine derivatives
(ii) Gibberellin	(B) Carotenoid derivatives
(iii) Cytokinin	(C) Terpins
(iv) ABA	(D) Indole compounds

(a) i–B, ii–A, iii–D, iv–C
(b) i–D, ii–B, iii–A, iv–C
(c) i–B, ii–A, iii–C, iv–D
(d) i–D, ii–C, iii–A, iv–B

AIIMS-27.05.2018 Shift-I

Ans. (d) :
(i) Auxin → Indole compounds
(ii) Gibberellin → Terpins
(iii) Cytokinin → Adenine derivatives
(iv) ABA → Carotenoid derivatives

174. Which of the following statement is wrong about auxin?

(a) 2,4–D prevents the growth of dicot weeds
(b) 2,4–D prevents the growth of monocot weeds
(c) It promotes parthenoncarpy
(d) IAA is natural auxin

AIIMS-27.05.2018 Shift-I

Ans. (b) : Phytohormones are growth promoters of auxins. Indole acetic acid (IAA) is an auxin of a natural plant. Artificial auxins used as weedicides are 2,4,-D and 2,4,5-T. Also, naphthalene acetic acid (NAA) is a commonly used an artificial auxin in agriculture.

- 2,4- dichlorophenoxy acetic acid is synthetic auxin. It is widely used to remove broad leaved weeds or dicotyledonous weeds in cereal crops. It is also used to prepare weed-free lawns by gardeners.
- Auxin is applied to the indole-3- acetic acid (IAA) and to other natural and synthetic compounds having certain growth regulating properties. It also helps to initiate rooting in stem cuttings.

175. Cytokinin involves:

(a) Kinetin, zeatin, BAP (b) GA_3, IBA, Kinetin
(c) Zeatin, GA_3, BAP (d) IAA, Zeatin, Kinetin

AIIMS-26.05.2018 Shift-I

Ans. (a) : Cytokinins are of two types:-

- **Adenine-type cytokinins,** which are represented by kinetin, zeatin and 6- benzylaminopurine (BAP).
- **Phenylurea-type cytokinins,** which are represented by diphenylurea and thidiazuron (TDZ).
- GA_3 is another phytohormone, gibberellins. IBA and IAA are forms of auxin.

176. Which among the following belong to Auxin?

(a) IAA, IBA, CK (b) GA_3, 2,4-D, IAA
(c) IAA, IBA, NAA (d) 2,4-D, IAA, ABA

AIIMS-26.05.2018 Shift-II

Ans. (c) : Auxin is naturally occurring plant growth hormone it is produced at the tip of growing shoot and roots and promotes cell elongation.

- **IAA**- Indole -3-acetic acid is universal natural auxin.
- **IBA**- Indole-3- butyric acid with auxin like activity it is both naturally occurring and synthetically prepared.
- **NAA**- Napthalene acetic acid is a synthetic auxin.

177. Which of the following is wrong about ethylene

(a) Inhibit growth of root
(b) Ripening of fruits
(c) Elongation of stem in paddy
(d) Promote senescence of leaves and flowers

AIIMS-26.05.2018 Shift-II

Ans. (a) : Ethylene promotes senescence and abscission of plant organs, especially of leaves and flowers.

- It stimulates fruit ripening.
- It enhances the respiration rate during the ripening of the fruits.
- Ethylene is a phytohormone that regulates both growth and senescence.
- Ethylene promotes the elongation of the stem in paddy.
- Ethylene increases the speed of leaf and flower senescence.
- Ethylene inhibits lateral buds and causes apical dominance.

178. Pollen grains can be stored for several years in liquid nitrogen having a temperature of

(a) –120°C (b) –80°C
(c) –160°C (d) –196°C

NEET-2018

Ans. (d) : Pollen grains are stored in liquid nitrogen and the temperature of liquid nitrogen is – 196ºC.

- The pollen grain stored for several years, and later used in plant breeding techniques.
- Cryopreservation is the process of presenting and storing cells, tissue, organ or any outer biological material from any potential damage by maintaining the material at very low temperature.

Nitrogen maintain the energy efficiency and providing an environmental friendly approach.

179. Regulation to restrict the movement of diseased plant material from one place to another are called :

(a) plant regulations (b) plant quarantine
(c) plant protection (d) crop rotation

Manipal-2003

Ans. (b) : Regulation to restrict the movement of diseased plant material from one place to another are called plant quarantine. The purpose and intent of this act is to prevent the introduction of insect, fungus, or other pest which is destructive to crops. The National Plant Quarantine Station is at Rangpuri, New Delhi etc.

@apna_pdf

180. Which of the following movements in plants is not related to change in auxin level ?
(a) Nyctinastic leaf movement
(b) Movement of root towards soil
(c) Movement of sunflower, tracking the direction of sun
(d) Movement of shoot towards light

Haryana PMT-2004
Manipal-2003

Ans. (a) : Nyctinastic leaf movement in plants is not related to change in auxin level. It is a movement of leaves of many species from nearly horizontal leaves during the day and nearly vertical at night. These movements are controlled by biological clock, while the other conditions bending of shoot towards soil and movement of sunflower head tracking the sun are the condition related to auxins.

181. Gibberellins cause :
(a) shortening of genetically tall plants
(b) elongation of genetically dwarf plants
(c) promotion of rooting
(d) yellowing of young leaves

BVP-2005
Haryana PMT-2004
Manipal-2003

Ans. (b) : Gibberellins cause elongation of genetically dwarf plants. They are phytohormones which bring about cell elongation of mainly the stem. Gibberellins are formed by the young leaves of buds, root tips, developing seeds and promotes their growth and development. Genetically dwarf plants grow to normal size on the application of gibberellins. So gibberellins cause elongation of dwarf plants.

182. The micro element required for the synthesis of IAA is represented in its ionic form as a cofactor in this enzyme:
(a) Catalase (b) PEP carboxykinase
(c) Carbonic anhydrase (d) Nitrogenase

AP EAMCET-2002

Ans. (c) : The micro element required for the synthesis of IAA is represented in its ionic form as a cofactor in carbonic anhydrase. It catalyses the hydration of carbon dioxide into bicarbonate ions and protons. Zinc metal acts as a co-factor for this enzyme. Zinc is also the microelement required for the synthesis of indole acetic acid (IAA). IAA present in its ionic state as Zn^{2+}.

183. Removal of apical (terminal) bud of a flowering plant (or pruning of a flowering plant) leads to
(a) formation of new apical buds
(b) formation of adventitious roots on the cut side
(c) early flowering (or stopping of floral growth)
(d) promotion of lateral branches

Haryana PMT-2010

Ans. (d) : Removal of apical (terminal) bud of a flowering plant (or pruning of a flowering plant) leads to promotion of lateral branches. The apical bud when present does not allow the growth of auxiliary or vegetative buds this phenomenon is known as apical dominance. It is widely used in tea plantation and hedge making.

184. Coconut milk (coconut water) is widely used in tissue culture because it contains
(a) auxins (b) ethylene
(c) cytokinin (d) gibberellins

Haryana PMT-2010
AFMC-2007

Ans. (c) : Coconut milk (coconut water) is widely used in tissue culture because it contains cytokinin. It taste sweet and nutty. It contains easily digested carbohydrates in the form of sugar and electrolytes. It has fewer calories less sodium and more potassium than sports drink. Coconut water is most beneficial for adults and kids.

185. The reason for apical dominance is:
(a) ethylene (b) auxin
(c) cytokinin (d) gibberellins

Haryana PMT-2006

Ans. (b) : The reason for apical dominance is auxin. It occurs when the apical buds dominate and inhibit the growth of the lateral auxiliary buds. This result in the plant becoming long and leggy. This phenomenon is caused by auxin which is released from the shoot tip.

186. Thigmotropism occur due to the :
(a) light (b) contact
(c) temperature (d) pressure

Haryana PMT-2006

Ans. (b) : Thigmotropism occur due to the contact. It is one example of tropism, which is the response of a plant to environmental stimuli by growing towards or away from them.
Phototropism:- The action of a plant turning towards or away from light.

187. Which plant hormone promotes seed, bud dormancy and causes stomatal closure?
(a) IAA (b) Abscisic acid
(c) GAI (d) Cytokinin

Haryana PMT-2006

Ans. (b) : Abscisic acid hormone promotes seed, bud dormancy and causes stomatal closure. It is a growth inhibitor that retards or suppresses growth and metabolism. It is also known as stress hormone. Abscisic acid stimulates the closures of the stomata in the epidermis and increases the tolerance of plants to various kinds of stresses.

188. Multiple shoots are produced in meristem culture because the culture medium contains
(a) cytokinin for overcoming apical dominance
(b) auxin for proliferation of meristem
(c) auxin for overcoming apical dominance
(d) GA_3 for proliferation of meristem

CMC Vellore-2007

Ans. (a) : Multiple shoots are produced in meristem culture because the culture medium contains cytokinin overcoming apical dominance. Cytokinin represents a second messenger for auxin signaling in regulating bud activity. The plant hormones auxin and cytokinin are critical for plant regeneration in tissue culture with cytokinin playing on instrumental role in shoot organogenesis. Meristem is a type of tissue that are capable of cell division. Cells in the meristem can develop into all other tissue and organs that occur in plants.

@apna_pdf

189. A good example of an auxin type herbicide is:

(a) IAA (b) NAA
(c) 2, 4-D (d) IBA

AP EAMCET-1997

Ans. (c) : A good example of an auxin type herbicide is 2, 4-D. Auxin like indole-3-acetic acid (IAA) and indole 3- butyric acid (IBA) are isolated from plants. 2, 4-D is known to be the one among the oldest and also most generally available herbicides and commercially available since 1945, and 2, 4-D are synthetic auxins.

190. Morphogenesis is controlled by an interaction between

(a) auxins and gibberellins
(b) auxins and cytokinins
(c) gibberellins and cytokinins
(d) None of the above

CG PMT-2011

Ans. (b) : Morphogenesis is controlled by an interaction between auxin and cytokinin. It plays an important role in the growth and differentiation of cultured cells and tissue. Morphe means to shape and genesis means creation. So morphogensis is a process that causes an organism to develop its shape. In plants it happens during cell division, cell extension and cell separation.

191. First natural cytokinin was discovered by

(a) Skoog and Miller (b) Letham
(c) Benson and Calvin (d) Thimann and Went

BVP-2012

Ans. (a) : First natural cytokinin was discovered by Skoog and Miller. The first cytokinin discovered was an adenine derivative named kinetin which was isolated as a DNA degradation product.

192. Which of the following type of phytohormones, resemble the nucleic acids in some structural aspects:

(a) cytokinin (b) auxins
(c) gibberellins (d) abscisic acid

AP EAMCET-2000

Ans. (a) : Cytokinin phytohormones, resemble the nucleic acids in some structural aspects. Cytokinin also helps in promoting cell division and increase the production of crops. It plays a major role in plant photogenesis by inducing resistance against certain disease causing bacteria. Cytokinin are chemically derivatives of adenine i.e. purine.

193. Synchronous flowering in pine apple can be achieved by the application of:

(a) kinetin (b) 2, 4,D
(c) abscisic acid (d) NAA

AP EAMCET-2000

Ans. (d) : Synchronous flowering in pineapple can be achieved by the application of NAA. It is an organic compound that is soluble in organic solvent and is a colorless solid. It does not occur naturally and its toxic to plants at higher concentrations, like all auxins. It is also used for the vegetative propagation of plants from stem and leaf cutting. It is used for tissue culture of plants.

194. Study the following lists.

List - I	List - II
A. Zacharias Janssen	1. Sexual reproduction
B. Camerarius	2. Conduction of water
C. Stephen Hales	3. Compound mircoscope
D. Knoll and Ruska	4. Crystallisation of urease
	5. Electron microscope

(a) A-5 B-2 C-4 D-3
(b) A-3 B-1 C-2 D-5
(c) A-2 B-4 C-1 D-3
(d) A-5 B-2 C-3 D-1

Manipal-2010

Ans. (b) :
A- Zacharias Janssen → Compound microscope
B- Camerarius → Sexual reproduction
C- Stephen Hales → Conduction of water
D- Knoll and Ruska → Electron microscope

195. The following statements are given about plant growth hormones.

I. Kinetin is a degradative substance from DNA molecule
II. ABA is present, in all the plants
III. Low ratio of cytokinins to auxins favours root formation only
IV. ABA is synthesised catabolically through mevalonate pathway.

The correct combination is

(a) I and II (b) II and III
(c) I and III (d) III and IV

Manipal-2010

Ans. (c) : The following statements are given about plant growth hormones are- I. Kinetin is a degradative substance from DNA molecule.
III. Low ratio of cytokinins to auxins favours root formation only.

196. Function of ABA is

(a) apical dominance (b) growth inhibition
(c) cell division (d) seed germination

AFMC-2010

Ans. (b) : Function of ABA is growth inhibition.
• It induces dormancy in bud, tubers and many seeds.
• It prevent the water loss during drought condition by closing the stomata.

197. 6-furfuryl amino purine, 2, 4-dichloro phenoxy acetic acid and indole 3-acetic acid are

(a) kinetin, synthetic auxin and natural auxin
(b) natural auxin, gibberellin and kinetin
(c) synthetic auxin, kinetin and natural auxin
(d) gibberellin, natural auxin and kinetin

CMC Ludhiana-2010

Ans. (a) : 6-furfuryl amino purine, 2, 4-dichloro phenoxy acetic acid and indole 3-acetic acid are kinetin, synthetic auxin and natural auxin. It is a synthetic auxin hormone which acts as weedicide. It is the most common naturally found auxin hormone in plants.

@apna_pdf

198. Which of the following is not an influence of auxins?
(a) Apical dominance (b) Parthenocarpy
(c) Tropic movements (d) Bolting
CMC Ludhiana-2008

Ans. (d) : Bolting is not an influence of auxins. We know that auxin is a plant growth promoter has many functions. They promote apical dominance. Auxin helps to promote flowering. It can also be used as a weedicide. Auxin helps in differentiation of xylem and helps in cell division.

199. Auxin was first named by
(a) C Darwin (b) FW Went
(c) Alexopoulos (d) KV Thimann
MGIMS Wardha-2013

Ans. (b) : Auxin was first named by F.W. Went.
• Auxin is a plant hormone produced in the stem tip that promotes cell elongation it moves to the darker side of the plant.
• Auxin diffused out from the tip of oat coleoptiles in the gelatin block.

200. Genetic dwarfism can be overcome by
(a) gibberellin (b) ethylene
(c) auxin (d) ABA
JIPMER-2013

Ans. (a) : Genetic dwarfism can be overcome by gibberellin. When it is used on a dwarf plant the length of the internode increases. This increase results in the plant growing taller.

201. Which of the following is not an auxin?
(a) IAA (b) IBA
(c) Zeatin (d) NAA
JIPMER-2013

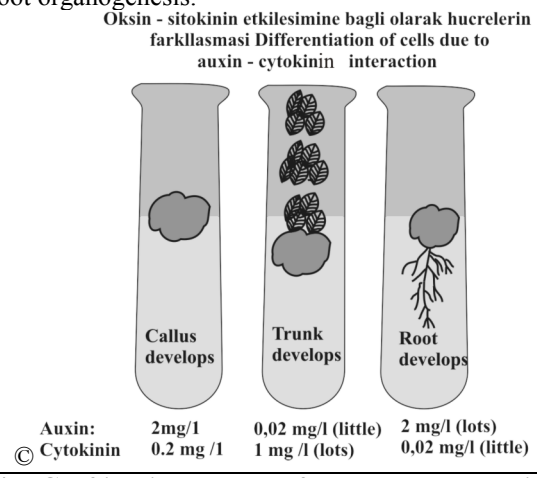
Ans. (c) : Zeatin is not an auxin.
• IAA is an auxin from a natural plant.
• NAA is commonly used artificial auxin in agriculture.
• IBA is most used synthetic auxins in plant propagation.

202. Plant hormones are:
(a) Growth regulators (b) Growth promoters
(c) Growth inhibitors (d) All of these
Manipal-2004
Uttarakhand PMT-2003

Ans. (d) : Plant hormones are growth regulator, growth promoters and growth inhibitors for their survival and growth plants require a lot of natural aid like water, oxygen. Sunlight and various minerals and nutrients. All these are externals factors that help in the development of plants. Plants hormones help in regulating the growth of plants. Hormones play a very important role in a plant's body and facilitate processes like vernalisation, dormancy ect.

203. Hormone used in tissue culture for better growth is : (1) auxin (2) gibberellin (3) cytokinin (4) vernalin
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct
BHU PMT (Mains)-2005

Ans. (d) : Hormone used in tissue culture for better growth is auxin and cytokinin. The phytohormone auxin and cytokinin are critical for plant regeneration in tissue culture, with cytokinin playing an instrumental role in shoot organogenesis.



204. Grafting is employed for a better and quicker yield of varieties of : (1) apple (2) mango (3) citrus (4) tea
(a) 1, 2 and 3 are correct
(b) 1 and 2 are correct
(c) 2 and 4 are correct
(d) 1 and 3 are correct
BHU PMT (Mains)-2005

Ans. (a) : Grafting is a type of vegetative propagation in plants. It is employed for a better and quicker yield of good varieties of plants that take years to produce fruits some common plants that can be grown by grafting include apple, mango and citrus.
• Grafting is especially successful in dicotyledonous plant, where the stem has a cambium layer.

205. The non-auxin herbicide which is used to kill broad leaved plants in grass lawns is :
(a) diquat (b) dinitrophenol
(c) dalapon (d) dicamba
BHU PMT (Mains)-2005

Ans. (c) : The non-auxin herbicide which is used to kill broad leaved plants in grass lawn is dalapon. Herbicides are chemical compounds that are used for the destruction of plant pests. These compounds are toxic to weeds only. They do not affect the growth of plants. Dalapon is an example of non-auxin herbicide that acts as a growth regulator of particular perennial and annual grasss.

206. Which of the following is correct?
(a) 99% of existed species are extinct
(b) 25% of existed species are extinct
(c) 40% of existed species are extinct
(d) 30% of existed species are extinct
Uttarakhand PMT-2004

Ans. (a) : 99% of existed species are extinct. Around 99% of all species which amounts to over 5 billion. Extinction and endangerment rates are higher than normal and with nonsensical habitat destruction those numbers will only continue to grow.

207. Phytochrome occurs in two forms. In which form it promotes the germination of seeds of some species?
(a) P_{fr} forms (b) P_r forms
(c) Both forms (d) None of these
MGIMS Wardha-2004

@apna_pdf

Ans. (a) : Phytochrome occurs in two forms P_{fr} form promotes the germination of seed of same species. It exists in two interconvertible forms, the red light - absorbing form (P_r) and the far- red light - absorbing form (P_{fr}). Phytochrome plays a crucial role in seed germination, stem elongation, leaf expansion and flowering time.

208. A ripe mango, kept with unripe mangoes causes their ripening. This is due to the release of a gaseous plant hormone

(a) Auxin (b) Cytokinin
(c) Gibberellin (d) Ethylene

KVPY SB & SX-2012

Ans. (d) : A ripe mango, kept with unripe mangoes causes their ripening. This is due to the release of a gaseous plant ethylene hormone.

Gibberellin:- Gibberellin are endogenous plant growth regulators, having tetracyclic, diterpenoid compounds.

209. One of the preventive methods of fruit drop is by spraying

(a) Auxin (b) Ethylene gas
(c) Gibberellins (d) Cytokinin

CG PMT-2007

Ans. (a) : One of the preventive methods of fruit drop is by spraying auxin.

210. Substances, which originate at the tip of stem, root and control the growth of different organs are

(a) Enzymes (b) Hormones
(c) Vitamins (d) Food substances

CG PMT-2007

Ans. (b) : The substances that are produced at the root tip of the stem and control the development of various organs are hormones. Plant hormones are chemical compounds presents in very low concentration in plants. They are produced in almost all parts of the plant and are transmitted to various parts of the plant. Hormones play an important role in the process like seed germination, phototropism etc.

211. Climacteric fruit shows:

(a) High respiration rate at ripening
(b) Sudden change in taste
(c) Sudden change in colour & shape
(d) None of the above

Uttarakhand-2005

Ans. (a) : Climacteric fruit shows high respiration rate at time of ripening. They have special characteristics that help them ripe even after harvesting is due to the large amount of ethylene produced in them along with high respiratory activity. They do not require remaining on the tree for their ripening. Citrus groups are the examples of the non-climacteric fruits and ripe without ethylene.

212. A phytohormone which increases the production of starch hydrolyzing enzymes during the germination of maize seeds, is employed of the following:

(a) Increasing the vase-life period of flowers
(b) Induction of seedless fruits in grapes
(c) Acceleration of ripening of banana fruits
(d) Eradication of dicot weeds

AP EAMCET-2003

Ans. (b) : A phytohormone that increases the production of starch hydrolyzing enzymes during the germination of maize seeds is employed of induction of seedless fruits in grapes. It is also responsible for the production of seedless fruit in grapes and tomatoes. Gibberellins is responsible for that mechanism or process. Hence, it is clear that option (b) is correct answer.

213. The phytohormone which increases the concentration of potassium in guard cells is also responsible for the induction of:

(a) Apical dominance
(b) Triple response growth
(c) Cell division
(d) Abscission

AP EAMCET-2004

Ans. (c) : Phytohormone which increase the concentration potassium in guard cells is also responsible for the induction of cell division. Plant hormones are chemical substances that regulate various aspects of plant growth and development.

Phytohormone are produced in one region and carried to the site of action through diffusion, xylem vessels, plant hormones are required in very small concentration to bring their action. Such as auxin is a growth promoting hormone that promotes cell division, cell differentiation, and apical dominance.

214. Pruning of plants promotes branching because the axillary buds get sensitized to :

(a) Ethylene (b) Gibberellin
(c) Cytokinin (d) Indole acetic acid

Haryana PMT-2004

Ans. (c) : Pruning of plants promotes branching because the auxiliary buds get sensitized to cytokinin. They are a class of plant growth substance that promote cell division. They are involved primarily in cell growth and leaf senescence.

Directions: In the following question more than one of the answers given may be correct. Select the correct answer and mark it according to the code:

215. Which of the following statement is correct ?

(1) The causal organism for foolish seedling disease is the source of gibberellin
(2) Abscisic acid is a growth promoter
(3) The ratio of auxin to cytokinin control cell differentiation
(4) Bolting of cabbage can be induced by treatment with IAA

(a) 1, 2 and 3 are correct (b) 1 and 2 are correct
(c) 2 and 4 are correct (d) 1 and 3 are correct

BHU PMT (Mains)-2008

Ans. (d) : Gibberellin is responsible for the foolish seedling disease of rice.

- Abscisic acid is a growth inhibiting hormone. It inhibits or suppresses the growth of plants.
- If cytokinins and auxin are present in equal amount, the cell divide but fail to differentiate. Thus they control cell differentiation.
- Cabbage bolting can be induced by gibberellins.

216. 'Richmond Lang effect' deals with:

(a) Parthenocarpic fruit formation by auxins
(b) Foolish seedling disease by gibberellins
(c) Delay in senescence by cytokinins
(d) Closure of stomata by abscisic acid

AP EAMCET-2001

@apna_pdf

Ans. (c) : The Richmond Lang effect deals with delay in senescence by cytokinins. They have a special effects on cytokinesis. It is synthesized in areas of rapid cell division. It helps to produce new leaves, chloroplast in leaves, shoot growth etc. They are phytohormones that can inhibit plant senescence by promoting cell division.

217. The presence of auxins in a solution could be tested by

(a) Avena sativa stem tip test
(b) Carbon tetrachloride test
(c) Iodine test
(d) Defoliation test

CG PMT-2006

Ans. (a) : The presence of auxins in a solution could be tested by Avena sativa stem tip test. Tips were placed on agar-block for some hours. This ensured the diffusion of auxins from the tips to the agar layer. Auxin is a class of plant growth regulators that are either indole derivatives or acetic acid derivatives. Thus, from the step tip test the presence of auxins in the solution can be detected.

218. Bakanae disease in rice plants is caused by

(a) NAA (b) 2, 4-D
(c) GA (d) IAA

VMMC-2011

Ans. (c) : Bakanae disease in rice plants is caused by gibberellic acid (GA). The appearance of symptoms of the disease in rice seedlings was reported when gibberellins were treated with sterile filtrates of the fungus. The active substances was later identified as gibberellic acid.

219. In callus culture, roots can be induced by supply of

(a) Auxin (b) Cytokinin
(c) Gibberellins (d) Ethylene

VMMC-2011

Ans. (a) : In callus culture, roots can be induced by supply of auxin. This culture is a tissue culture technique in which a complete plant grows from a single cell or tissue. The cell is kept in a medium rich in nutrients.

220. The alkaloid used for induction of polyploidy, is

(a) Auxin (b) Kinetin
(c) Ethylene (d) Colchicines

VMMC-2011

Ans. (d) : The alkaloid used for induction of polyploidy, is colchicines. Alkaloid is one of the secondary metobolites that contain one nitrogen atom. They have diverse physiological effects on organisms, some of the alkaloids induced are morphines, quinine, nicotine, strychnine, and ephedrine. Colchicine is alkaloids four in *Colchicum autumnale* plants that involve in the induction of polyploidy in plants.

221. One hormone hastens maturity period in juvenile conifers, a second hormone controls xylem differentiation, while the third hormone increases the tolerance of plants to various stresses. They are respectively

(a) Gibberellin, Auxin, Ethylene
(b) Auxin, Gibberellin, Cytokinin
(c) Gibberellin, Auxin, ABA
(d) Auxin, Gibberellin, ABA

AIIMS-2016

Ans. (c) : Spraying juvenile conifers with gibberellins hastens their maturity period, thus leading to early seed production.

- **Auxin** is a plant hormone produced in the stem tip that promotes cell elongation by controlling xylem differentiation.
- The plant hormone **ABA** is the major role player in mediating the adaptation of the plant to stress.

222. ABA is involved in

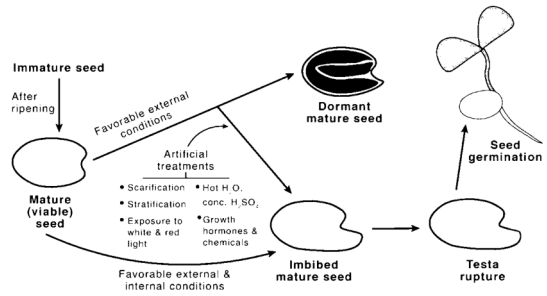
(a) Shoot elongation (b) Increased cell division
(c) Dormancy clock (d) Root elongation

AIIMS-2014

Ans. (c) ABA also helps in preventing the loss of dormancy of seed.

- Seed germination is inhibited by ABA which is antagonist to gibberellin.
- ABA also helps in the inhibition of the division of cells in the vascular cambium.
- The plant genes for ABA biosynthesis and sequence of the pathway have been explained.
- ABA plays a central role in induction and maintenance of seed dormancy and also inhibits the transition from embryonic to germination growth.

Seed Dormancy



223. Leaf fall occurs in tree when there is an increase in the concentration of ……..

(a) Auxins (b) Abscisic acid
(c) Cytokinins (d) Gibberellins

Karnataka CET-2005

Ans. (b) : The increases in the concentration of abscisic acid is responsible for leaf fall. Abscisic acid is a plant growth inhibitor hormone. The low amount of auxin hormone in a plant, results of in the falling of the leaves of the plant.

224. Which part would be most suitable for raising virus-free plants for micropropagation?

(a) Meristem (b) Node
(c) Bark (d) Vascular tissue

AIPMT (Screening)-2012

Ans. (a) : When plant breeders regenerate virus infected plants they often collect the meristem (specially apical meristem) from the infected plant and cultivate it in appropriate media to develop virus-free plantlets.

Meristem is localized group of cells which are actively dividing and undifferentiated but ultimately give rise to permanent tissue. Although plant is infected with a virus yet the meristem is free of virus.

High concentration of auxin and cytokinin hormone high frequency of cell multiplication and small size of plasmodesmata prevent the movement of the virus from one cell to another cell.

@apna_pdf

225. Out of the following which is a genetically engineered antiviral protein ?
(a) Humulin (b) Interferon
(c) Fumagillin (d) Griseofulvin
Punjab MET-2007

Ans. (b) : Interferon - Viral infected cell are produced interferon at this it is also called the antiviral protein.

226. The chemical which are produced by host plants due to infection as a defence reaction to pathogen, are called :
(a) phytotoxin (b) toxin
(c) phytotron (d) phytoalexins
Punjab MET-2006

Ans. (d) : Phythoalexins are chemical which are produced by host plant due to infection as a defense reaction to pathogen. Actually it produced by plant by microorganism or by naturally occuring chemical reaction.
Phytol is the side chain in chlorophyll.
Phytotoxin are substance that are toxic to plant growth.
Toxin - The poisonous substance which are produce by bacteria and plant, animal called toxin.
Phytotron - Phytotron help to studies of the response of plant to their environment.

227. Elevated blood levels of certain enzymes suggest a related disease. Match the enzyme in column I with related disease in column II.

	Column - I		Column –II
A.	Amylase	1.	Liver disease
B.	Glutamate dehydrogenase	2.	Myocardial infarction
C.	Alkaline phosphatase	3.	Liver or bone disease
D.	Creatine kinase	4.	Pancreatic disease

Codes
(a) A-1 B-2 C-3 D-4 (b) A-4 B-3 C-2 D-1
(c) A-3 B-4 C-1 D-2 (d) A-4 B-1 C-3 D-2
MGIMS Wardha-2015

And : (d)

	Enzyme		Diseases
A.	Amylase	4.	Pancreatic disease
B.	Glutamate dehydrogenase	2.	Liver disease
C.	Alkaline phosphatase	3.	Liver or bone Disease
D.	Creatine kinase	4.	Myocardial infarction

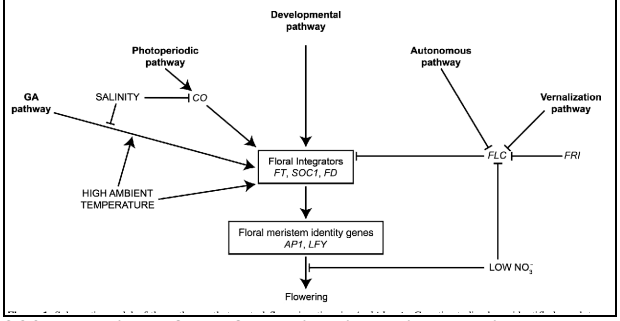
228. Endopeptidase of plant kingdom is
(a) Trypsin (b) Pepsin
(c) Papain (d) Urease
Punjab MET-2011

Ans. (c) : Endopeptidase are a group of hydrolase which catalyze the hydrolysis of peptide bonds and the break of non terminal acid.
One example of endo peptidase pepsin obtained from the latex of papaya fruit.
Pepsin-it is produced in the gastric chief cell of the stomach.
It breakdown protein into smaller peptides.
Trypsin - A digestive enzyme which break down protein in the small intestine.
Ureases - It is found in numerous bacteria fungi, algae, plant and some invertebrates.

F. Plasticity

229. Plants follow different pathways in response to environment or phases of life to form different kinds of structures. This ability is called
(a) Maturity (b) Elasticity
(c) Flexibility (d) Plasticity
NEET-2021

Ans. (d) : The ability of an organism to change its phenotype in response to different environment, termed plasticity, is a particularly important characteristic to enable sessile plants to rapid changes in their surroundings.
Elasticity is deforming and reforming without losing energy.
Flexibility bending of plant without break.
Maturity is when plant become to harvested.



230. Which of the following is an innovative remedy for plastic waste?
(a) Electrostatic precipitator
(b) Burning in the absence of oxygen
(c) Burying 500 m deep below soil surface
(d) Polyblend
NEET (Odisha)-2019

Ans. (d) : Polyblend is an innovative remedy of plastic waste. Polyblend is mixed with the bitumen that is used to lay roads.
- The blends of polyblend and bitumen, enhanced the bitumen's water repellent properties, and helped to increase road life by this factor.
- Plastic waste and pollution are now threatening the health and well being of humans and ecosystems the world over.

231. A plant species when grown in shade tends to produce thinner leaves with more surface area, and when grown under abundant sunlight starts producing thicker leaves with reduced surface area. This phenomenon is an example of
(a) Character displacement
(b) Phenotypic plasticity
(c) Natural selection
(d) Genotypic variation
KVPY SB & SX-2019

Ans. (b) : A plant species when grown in shade tends to produce thinner leaves with more surface area, and when grown under abundant sunlight starts producing thicker leaves with reduced surface area. This phenomenon is an example of phenotypic plasticity.

@apna_pdf

232. A plant bearing different type of leaves is called:
(a) heterophylly (b) heterotrophy
(c) heterozygosity (d) heteronasty
Haryana PMT-2006

Ans. (a) : A plant bearing different type of leaves is called heterophylly. It is the development of different leaf forms in a single plant depending on the environmental conditions. It is observed in amphibious aquatic plants that can grow under both aerial and submerged condition.

233. Which type of movement is present in Mimosa pudica?
(a) Nyctinastic (b) Seismonastic
(c) Chemonastic (d) Phototrophic
Rajasthan PMT-2006, 1998

Ans. (b) : Seismic movement is present in Mimosa pudica. The extent of the seismonastic movement depends upon factors like the intensity of the stimulus, the vigor and age of the plant and therefore the time elapsed since the last stimulus.
The non directional movement of a plant part in response to an external stimulus is known as a nastic movement to the stimulus that is attained by the plant can be in the form of biological, electrical, chemical touch etc.

234. A sleep movement in plants is a nastic response, that occurs daily in response to
(a) dark (b) light
(c) water (d) both (a) and (b)
AMU-2005

Ans. (d) : Nyctinasty is the proper name for the "sleep movement of leaves" is a well know example of a nastic response.
In this, plants close up their leaves and petals in response to the one set of darkness by changes in cellular turgor.

235. Which of the following movement is induced by injury ?
(a) Aerotropism (b) Geotropism
(c) Tromonasty (d) Traumatropism
AMU-2003

Ans. (d) : Traumatropism is the growth response a pound or the growth movement of the plant as result of injury.
Unilateral injury to the tip of a root produce negative traumatropism that is bending of the root in a opposite direction to the injured side. Unilateral injury the shoot apex produce positive traumatropism that is bending in toward direction of the injury.

236. Thermonastic movement is related to
(a) High temperature (b) Light
(c) Touch (d) Chemicals
UP CPMT-2013

Ans. (a) : Response of plant movement related to temperature is called thermonastic movement
Response to light – photonastic movement
Response to touch – thigmonastic movement
Response to chemical – chemonastic movement.

237. Opening and closing of lowers represent a kind
(a) nastic movement (b) tropic movement
(c) mautation (d) autonomic movement
BVP-2003

Ans. (a) : Opening of flower is example of the epinesty. In the epinesty a plant part bent outward to inward. Epinastic process found in nastic movement. This movement is response to the direction of stimulus that meance opening and closing of flower in response to light and darkness is called photonasty.
Tropic movement – Movement of plant response to environmental stimuli
Autonomic movement – If the movement of plant found without any external stimuli spontaneously called the autonomic movement or autonomous movement.

238. When an animal turns sideways to the Sun to get the maximum amount of Sun on its flanks, this is an example of :
(a) motivation (b) habitation
(c) posture (d) orientation
BVP-2008

Ans. (d) : Orientation refers to the ability of an organism to direct its position and movement in space in relation to gravity and external stimulus like heat.

G. Vernalisation and seed dormancy

239. Treatment of seed at low temperature under moist conditions to break its dormancy is called
(a) scarification (b) vernalization
(c) chelation (d) stratification
JCECE-2014, 2013, 2009
CMC Ludhiana-2009
AFMC-2008 / AIPMT-2006

Ans. (d) : Treatment of seed at low temperature under moist conditions to break its dormancy is called stratification. It is the process of breaking of dormancy it involves the treatment of seeds at low temperature (5–10ºC) under sufficiently moist conditions to break its dormancy and induce germination.

240. Hormone replacing the requirement vernalization is
(a) ethylene (b) auxin
(c) gibberellins (d) cytokinin
CMC Vellore-2009 / UPCPMT-2009
Rajasthan PMT-2009 / Punjab MET-2009

Ans. (c) : Hormone replacing the requirement vernalization is gibberellins.

241. Asseriton (A): Vernalization is seen in Biennials
Reason (R): Cold treatment stimulate photo periodic flowering response in cabbage.
(a) Both A and R are correct. R is the correct explanation of A.
(b) Both A and R are correct, but R is not the correct explanation of A.
(c) A is correct but R is incorrect.
(d) A is incorrect but R is correct.
AP EAPCET-23.05.2023, Shift-II

Ans. (a) : Vernalization is a process by which plants are induced to flower by exposure to cold temperatures. Biennials are plants that require a period of vernalization before they can flower.
• The cold treatment that is given to cabbage plants to induced flowering is a type of photoperiodim. Photoperiodim is the response of plants to the length of day and night. In the case of cabbage, the cold treatment stimulates the shorts days of winter, which triggers the plants to flower.

@apna_pdf

242. Inhibitory substances in dormant seeds cannot be removed by subjecting seeds to:
(a) Chilling conditions (b) Gibberellic acid
(c) Nitrate (d) Ascorbic acid

NEET-2020 Phase-II

Ans. (d) : Seed dormancy can be prevent by chemical such as abscisic acid and phenolic acids present in the seed prevent germination.
Inhibitory substances in dormant seed can be removed by subjecting seed to ascorbic acid.

243. Germination of seed inside fruit is a peculiar characteristic
(a) mangrooves/halophytes
(b) mesophytes
(c) xerophytes
(d) emergant hydrophytes

BVP-2013

Ans. (a) : Germination of seed inside fruit is a peculiar characteristic mangroves/halophytes or called viviparous germination.
Mesophytes- plant grow moderate climates
Xerophytes- plant grow in dry condition.

244. The production and storage of energy in mitochondria increases during:
(a) seed germination (b) dormant seed
(c) ripening seed (d) seed maturation

AFMC-2001

Ans. (a) : The production and storage of energy in mitochondria increases during seed germination. The reserves food materials are rapidly oxidized and release energy for various biosynthetic activities going on in the germinating seed.

245. Secondary dormancy is due to the absence of
(a) suitable plant
(b) hormones
(c) favourable conditions
(d) unfavourable conditions

Haryana PMT-2011

Ans. (c) : Secondary dormancy is due to the absence of favourable condition. An important function of seed dormancy is delay germination which allows dispersal and prevents simultaneous germination of all seeds secondary dormancy occurs due to unfavourable conditions occur after the seed has been dispersed.

246. Which one of the following does not exhibit seed dormancy ?
(a) Rhizophora (b) Xanthium
(c) Phaseolus (d) Cassia

UP CPMT-2004

Ans. (a) : Rhizophora does not exhibit seed dormancy while being attached to the parent plant. As viviparous plant, Rhizphora creates a propagate that is in reality a living tree. Hence, option (a) is correct answer.

247. Removal of seed coat in dormant seeds, by mechamical method is called :
(a) separation (b) vernalization
(c) emasculation (d) scarification

AFMC-2000

Ans. (d) : Removal of seed coat in dormant seeds by meachanical method is called scarification. It involves weakening, breaking, opening, scratching or altering the coat of seed, testa, by chemical or mechanical method to encourage germination.

248. Energy for the early growth of a developing bean embryo comes from
(a) sunlight (b) water in the soil
(c) food in the soil (d) leaves in the seed

CG PMT-2007

Ans. (d) : Energy for the early growth of a developing bean embryo comes from leaves in the seed vave cotyledon which store food material for provided to the developing or germinating embryo. The cotyledons become leaf of the seed after seed germination leaf take energy from sun. The seed also develop young cotyledon leaves which provide energy for the development of the embryo. Seed plants have developed an evolutionarily better way to protect their young generation from harsh environmental.

249. Dry seeds can induce higher temperature that the germinating seeds because
(a) dry seeds have more reserve food
(b) hydration makes the enzymes more sensitive to temperature
(c) dry seeds are hard
(d) the seedlings are tender

CG PMT-2007

Ans. (b) : Dry seeds induce higher temperature that the germinating seeds because hydration makes the enzymes more sensitive. Dry seeds are produced by those plants that usually produce pods capsules and seed heads. Seed germination is a process by which the embryo inside the seed will give rise to a plant. The seed coat is mainly composed of proteins that will be broken down by the enzyme poteases.

250. The form of pigment which inhibits germination is:
(a) P_{760} (b) P_{730}
(c) P_{650} (d) all of these

Haryana PMT-2005
JIPMER-2005

Ans. (c) : The seed germination is promoted by red wavelength (650 nm) and inhibited by far red (730 nm). This is due to the pigment phytochrome behaving in the following manner.
Germination $\leftarrow P_{730} \rightleftharpoons P_{650} \rightarrow$ No germination

251. When a seed germinates, while fruit is still attached to plant
(a) vivipary (b) scarification
(c) germination (d) None of these

CG PMT-2006

Ans. (a) : When a seed germinates, while fruit is still attached to plant. This phenomenon is called vivipary. It is the phenomenon of germination of seeds inside the fruit while it is still attached to the parent tree, such adaptation is found in halophytes. Viviparous plants produce seeds that germinate before they detach from its parent.

252. Which of the following hormones can replace vernalisation?
(a) Auxin (b) Cytokinin
(c) Gibberellins (d) Ethylene

AIPMT-1989

Ans. (c) : Chailakhyan (1968) reported that under long - day conditions vernalin hormone turn into gibberellins and thus in some plants, the temperature for vernalisation is overcome by gibberellins.
